The bus transmitter establishes the connection to the next X2X Link based I/O node. It is important to be sure that only the data lines are connected on. X2X Link supply is system dependant.

| System | X2X Link supply |
|---|-------------------------|
| X67 system | System supply X67PS1300 |
| Remote I/O with X2X Link (XX modules) | 24 VDC external supply |
| Remote valve terminal connection (XV modules) | 24 VDC external supply |

Figure 96: X2X Link supply depending on the system

9.6.4.10 Register description

9.6.4.10.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section ["General data points" on page 3790](#).

9.6.4.10.2 Function model 0 - Standard

| Register | Fixed offset | Name | Data type | Read | | Write | |
|----------|--------------|-------------------------------|-----------|--------|------------|--------|------------|
| | | | | Cyclic | Non-cyclic | Cyclic | Non-cyclic |
| 0 | 1 | Module status | USINT | • | | | |
| | | StatusInput01 | Bit 0 | | | | |
| | | StatusInput02 | Bit 2 | | | | |
| 4 | 3 | SupplyVoltage | USINT | • | | | |

Fixed modules require their data points to be in a specific order in the X2X frame. Cyclic access occurs according to a predefined offset, not based on the register address.

Acyclic access continues to be based on the register numbers.

9.6.4.10.3 Function model 254 - Bus controller

| Register | Offset ¹⁾ | Name | Data type | Read | | Write | |
|----------|----------------------|-------------------------------|-----------|--------|------------|--------|------------|
| | | | | Cyclic | Non-cyclic | Cyclic | Non-cyclic |
| 0 | 0 | Module status | UINT | • | | | |
| | | StatusInput01 | Bit 0 | | | | |
| | | StatusInput02 | Bit 2 | | | | |
| 4 | 4 | SupplyVoltage | UINT | • | | | |

1) The offset specifies the position of the register within the CAN object.

9.6.4.10.3.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see ["Using I/O modules on the bus controller" on page 3789](#).

9.6.4.10.3.2 CAN I/O bus controller

The module occupies 1 analog logical slot on CAN I/O.

9.6.4.10.4 Module status

Name:

Module status

The following module supply voltages are monitored in this register:

Bus supply voltage: Bus supply voltage <4.7 V is displayed as a warning.

24 VDC I/O supply voltage: I/O supply voltage <20.4 V is displayed as a warning.

| Function model | Data type | Values |
|----------------------|-----------|------------------------|
| 0 - Standard | USINT | See the bit structure. |
| 254 - Bus controller | UINT | See the bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|-------|---------------|-------|--|
| 0 | StatusInput01 | 0 | No error |
| | | 1 | Bus supply warning - Undervoltage (<4.7 V) |
| 1 | Reserved | 0 | |
| 2 | StatusInput02 | 0 | I/O power supply above the warning limit of 20.4 V |
| | | 1 | I/O power supply below the warning limit of 20.4 V |
| 3 - x | Reserved | 0 | |

9.6.4.10.5 Bus supply voltage

Name:

SupplyVoltage

This register indicates the bus supply voltage measured at a resolution of 0.1 V.

| Function model | Data type |
|----------------------|-----------|
| 0 - Standard | USINT |
| 254 - Bus controller | UINT |

9.6.4.10.6 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time |
|--------------------|
| 100 μ s |

9.6.4.10.7 Minimum I/O update time

The minimum I/O update time specifies how far the bus cycle can be reduced so that an I/O update is performed in each cycle.

| Minimum I/O update time |
|-------------------------|
| 2 ms |

9.6.5 X20BT9400

Data sheet version: 3.08

9.6.5.1 General information

To connect an X20 system to an X67 system, a bus transmitter is simple added to the end of the X20 block, so that the X2X Link cable can be connected. The bus transmitter also provides the X2X supply voltage for the X67 system. There is no longer a need for an X67 system supply module.

- X2X Link bus transmitter
- For seamless expansion of the system
- Up to 100 m segment lengths
- Feed for internal I/O supply
- Integrated X2X Link supply for the X67 system
- Operation only on the slot to the far right

Information:

The bus transmitter modules may only be operated with a bus module where the internal I/O supply is connected through (e.g. X20BM11).

If the incoming voltage is used for internal I/O supply, then this potential group must not be supplied by any other module. An I/O module with bus module X20BM01 should be used to separate the potential group.

9.6.5.2 Order data

| Model number | Short description | Figure |
|----------------|--|---|
| | Bus receivers and transmitters |  |
| X20BT9400 | X20 bus transmitter X2X Link, feed for internal I/O supply, X2X Link supply for X67 modules, reverse polarity protection, short circuit protection, overload protection, parallel connection possible, redundancy operation possible | |
| | Required accessories | |
| | Bus modules | |
| X20BM11 | X20 bus module, 24 VDC keyed, internal I/O supply continuous | |
| X20BM15 | X20 bus module, with node number switch, 24 VDC keyed, internal I/O supply continuous | |
| | Terminal blocks | |
| X20TB12 | X20 terminal block, 12-pin, 24 VDC keyed | |
| | Optional accessories | |
| | X2X Link cable | |
| X67CA0X99.1000 | Cable for custom assembly, 100 m | |
| X67CA0X99.5000 | Cable for custom assembly, 500 m | |

| Transport | 5 to 95%, non-condensing |
| Mechanical properties | |
| Note | Order 1x X20TB12 terminal block separately Order 1x X20BM11 or 1x X20BM15 bus module separately |
| Spacing | 12.5 ^{+0.2} mm |

Table 161: X20BT9400 - Technical data

- 1) The specified values are maximum values. For examples of the exact calculation, see section "Mechanical and electrical configuration" of the X20 system user's manual.
- 2) In parallel operation with an X67 system supply module, the power rating of the bus transmitter is not permitted to be added to the total power. Only the power provided by system supply module X67PS1300 is permitted to be used to calculate the total number of X67 modules.

9.6.5.4 LED status indicators

For a description of the various operating modes, see "Diagnostic LEDs" on page 3787.

| Figure | LED | Color | Status | Description |
|---|-------|-----------------------------|--|---|
|  | r | Green | Off | No power to module |
| | | | Single flash | RESET mode |
| | | | Blinking | PREOPERATIONAL mode |
| | | | On | RUN mode |
| | e | Red | Off | No power to module or everything OK |
| | | | Double flash | LED indicates one of the following states: <ul style="list-style-type: none"> • I/O supply too low • X2X Link voltage too low |
| | e + r | Red on / Green single flash | Invalid firmware | |
| | X | Orange | Off | No X2X Link communication |
| | | | On | X2X Link communication active |
| | l | Red | Off | The X67 / X2X Link supply is within the valid limits |
| On | | | The X67 / X2X Link supply for the power supply is overloaded Remedy: Use additional X67PS1300 supply modules | |

9.6.5.5 Pinout

9.6.5.6 Connection examples

With 2 separate supplies

With a supply and jumper

No feed for internal I/O supply

9.6.5.7 Supply via bus transmitter

The bus transmitter has an integrated internal I/O supply feed. This saves a power supply module for the last potential group.

Keep in mind: this potential group is separated from the rest of the potential groups by an I/O module with the x20(c)BM01 bus module.

Figure 97: Protection when supplied via bus transmitter

1) Recommended for line protection.

9.6.5.8 Connection between X20 and X67 system

The bus transmitter establishes the link between the X20 system and the X67 system. In addition to the data lines, the X2X Link supply is also fed through. The module can supply up to 8 X67 modules. An additional X67 supply module is only needed if operating more than 8 X67 modules.

Information:

Only the X67PS1300 system supply module can be used for calculating the total number of X67 modules.

9.6.5.9 Register description

9.6.5.9.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section ["General data points" on page 3790](#).

9.6.5.9.2 Function model 0 - Standard

| Register | Fixed offset | Name | Data type | Read | | Write | |
|----------|--------------|---------------|-----------|--------|------------|--------|------------|
| | | | | Cyclic | Non-cyclic | Cyclic | Non-cyclic |
| 0 | 1 | Module status | USINT | • | | | |
| | | StatusInput01 | Bit 0 | | | | |
| | | StatusInput02 | Bit 2 | | | | |
| 2 | 2 | SupplyCurrent | USINT | • | | | |
| 4 | 3 | SupplyVoltage | USINT | • | | | |

Fixed modules require their data points to be in a specific order in the X2X frame. Cyclic access occurs according to a predefined offset, not based on the register address.

Acyclic access continues to be based on the register numbers.

9.6.5.9.3 Function model 254 - Bus controller

| Register | Offset ¹⁾ | Name | Data type | Read | | Write | |
|----------|----------------------|---------------|-----------|--------|------------|--------|------------|
| | | | | Cyclic | Non-cyclic | Cyclic | Non-cyclic |
| 0 | 0 | Module status | UINT | • | | | |
| | | StatusInput01 | Bit 0 | | | | |
| | | StatusInput02 | Bit 2 | | | | |
| 2 | 2 | SupplyCurrent | UINT | • | | | |
| 4 | 4 | SupplyVoltage | UINT | • | | | |

1) The offset specifies the position of the register within the CAN object.

9.6.5.9.3.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see ["Using I/O modules on the bus controller" on page 3789](#).

9.6.5.9.3.2 CAN I/O bus controller

The module occupies 1 analog logical slot on CAN I/O.

9.6.5.9.4 Module status

Name:

Module status

The following module supply voltages are monitored in this register:

| | |
|----------------------------|--|
| X67 bus supply current: | An X67 bus supply current of >0.4 A is displayed as a warning. |
| X67 bus supply voltage: | A bus supply voltage of <18 V is displayed as a warning. |
| 24 VDC I/O supply voltage: | An I/O supply voltage of <20.4 V is displayed as a warning. |

| Function model | Data type | Values |
|----------------------|-----------|------------------------|
| 0 - Standard | USINT | See the bit structure. |
| 254 - Bus controller | UINT | See the bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|-------|---------------|-------|---|
| 0 | StatusInput01 | 0 | No error |
| | | 1 | X67 bus supply warning for undervoltage (18 V) or when over-current (0.4 A) |
| 1 | Reserved | 0 | |
| 2 | StatusInput02 | 0 | I/O supply above the warning level of 20.4 V |
| | | 1 | I/O supply below the warning level of 20.4 V |
| 3 - x | Reserved | 0 | |

9.6.5.9.5 X67 bus supply current

Name:
SupplyCurrent

This register shows the X67 bus supply current with a resolution of 0.01 A.

| Function model | Data type |
|----------------------|-----------|
| 0 - Standard | USINT |
| 254 - Bus controller | UINT |

9.6.5.9.6 X67 bus supply voltage

Name:
SupplyVoltage

This register shows the X67 bus supply voltage with a resolution of 0.1 V.

| Function model | Data type |
|----------------------|-----------|
| 0 - Standard | USINT |
| 254 - Bus controller | UINT |

9.6.5.9.7 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time |
|--------------------|
| 100 μ s |

9.6.5.9.8 Minimum I/O update time

The minimum I/O update time specifies how far the bus cycle can be reduced so that an I/O update is performed in each cycle.

| Minimum I/O update time |
|-------------------------|
| 2 ms |

9.7 Compact CPUs

Compact CPUs have a modular design that allows them to be quickly and easily assembled according to the requirements of the respective application. All CPUs are based on embedded microprocessors and available in 2 performance classes.

Available interfaces

Communication takes place over an Ethernet interface and RS232. An optional CAN interface is also available.

Maintenance-free CPU

The CPUs were designed without fans or batteries in order to make them as easy as possible to service. This makes them completely maintenance-free.

Compact design

The supply for the CPU, X2X Link network and I/O modules is part of the CPU. No additional power supply modules are required.

9.7.1 Summary

| Model number | Short description | Page |
|--------------|---|------|
| X20CP0201 | X20 compact CPU, μ P 16, 100 kB SRAM, 1 MB FlashPROM, support of RS232, CAN bus according to compact CPU base, order bus base, power supply module and terminal block separately | 994 |
| X20CP0291 | X20 compact CPU, μ P 16, 100 kB SRAM, 1 MB FlashPROM, support of RS232, CAN bus according to compact CPU base, 1 Ethernet interface 100 Base-T, order bus base, power supply module and terminal block separately | 994 |
| X20CP0292 | X20 compact CPU, μ P 25, 100 kB SRAM, 1 MB FlashPROM, support of RS232, CAN bus according to compact CPU base, 3 Ethernet interface 750 Base-T, order bus base, power supply module and terminal block separately | 994 |

9.7.2 X20CP02xx

Data sheet version: 2.24

9.7.2.1 General information

Compact CPUs are ideal for situations where cycle times in the millisecond range are sufficient and a cost-benefit analysis plays a decisive role. A range of models with CAN and Ethernet can adapt optimally to all demands. The result: extremely sleek automation solutions.

- Embedded μ P 16 / μ P 25 with additional I/O processor
- 100/750 kB User SRAM
- 1/3 MB User FlashPROM
- X20CP0291 and X20CP0292: Onboard Ethernet
- Only 37.5 mm wide
- No battery

9.7.2.2 Order data

|  | |
|---|---|
| CP0201 | CP0291, CP0292 |
| Model number | Short description |
| Compact CPUs | |
| X20CP0201 | X20 compact CPU, μ P 16, 100 kB SRAM, 1 MB FlashPROM, support of RS232, CAN bus according to compact CPU base, order bus base, power supply module and terminal block separately |
| X20CP0291 | X20 compact CPU, μ P 16, 100 kB SRAM, 1 MB FlashPROM, support of RS232, CAN bus according to compact CPU base, 1 Ethernet interface 100 Base-T, order bus base, power supply module and terminal block separately |
| X20CP0292 | X20 compact CPU, μ P 25, 100 kB SRAM, 1 MB FlashPROM, support of RS232, CAN bus according to compact CPU base, 3 Ethernet interface 750 Base-T, order bus base, power supply module and terminal block separately |

Table 163: X20CP0201, X20CP0291, X20CP0292 - Technical data

- 1) The real-time clock is buffered for approx. 1000 hours by a gold foil capacitor. The gold foil capacitor is completely charged after 18 continuous hours of operation.
- 2) This FRAM stores its contents ferroelectrically. Therefore, no backup battery is needed.
- 3) Not buffered.
- 4) For technical data, see the data sheet for the X20PS9500 power supply module.
- 5) For technical data, see the data sheet for the X20PS9502 power supply module.
- 6) Spacing is based on the width of the compact CPU base X20BB22 or X20BB27. An X20PS9500 or X20PS9502 supply module is also always required for the CPU.

9.7.2.4 LED status indicators

X20CP0201

| | | Red | On | SERVICE mode |
| | | | Off | ¹⁾ |
| | RDY | Yellow | On | SERVICE mode |
| | | | Off | ¹⁾ |
| | L/A | Green | On | A link to the peer station has been established. |
| | | | Blinking | A link to the peer station has been established. Indicates Ethernet activity is taking place on the bus. |

- 1) BOOT mode: R/E and RDY LEDs are off and the power supply LED is blinking

9.7.2.5 Operating and connection elements

X20CP0201

X20CP0291 and X20CP0292

9.7.2.6 Node number switches

The node number is set using the two hex switches. The switch setting can be evaluated by the application program at any time. The operating system only evaluates the switch position when the device is switched on.

| Switch position | Operating mode | Description |
|-----------------|----------------|---|
| 0x00 | BOOT | In this switch position, the operating system can be installed via the RS232 interface configured as the online interface. User Flash is deleted only after the update begins. |
| 0x01 - 0xFE | RUN | RUN mode, the application is running. |
| 0xFF | Diagnostics | Boots the CPU in Diagnostics mode. Program sections in User RAM and User FlashPROM are not initialized. Following diagnostics mode, the CPU always boots with a cold restart . |

X20CP0201

When used with the X20BB27 bus module, the X20CP0201 has access to a CAN bus interface. The INA2000 station number for CAN is set using the node number switches.

X20CP0291 and X20CP0292

Both of these CPUs are equipped with an onboard Ethernet interface. When used with the X20BB27 bus module, they also have access to a CAN bus interface.

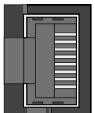

The number set using the two hex switches defines the INA2000 station number of both the CAN and the Ethernet interface.

9.7.2.7 Ethernet interface (IF2)

The X20CP0291 and X20CP0292 are equipped with an Ethernet interface. The connection is made using a 100 BASE-T twisted pair RJ45 socket.

Pinout

| Interface | Pinout | | |
|--|--------|-------------|----------------|
| | Pin | Ethernet | |
|  Shielded RJ45 | 1 | RXD | Receive data |
| | 2 | RXD\ | Receive data\ |
| | 3 | TXD | Transmit data |
| | 4 | Termination | |
| | 5 | Termination | |
| | 6 | TXD\ | Transmit data\ |
| | 7 | Termination | |
| | 8 | Termination | |

For information about wiring X20 modules with an Ethernet interface, see "[Cabling guidelines for X20 modules with an Ethernet cable](#)" on page 58.

Information:

The Ethernet interface (IF2) is not suited for POWERLINK.

Starting with operating system version 1.07, CPUs have a default IP address.

IP address: 192.168.0.1
 Subnet mask: 255.255.0.0

9.7.2.8 Programming the system flash memory

General information

CPUs are delivered with a runtime system. When delivered, the node number switch is set to switch position 0x00 (bootstrap loader mode).

A suitable switch position must be set (0x01 to 0xFE) in order to boot the PLC in RUN mode. Updating the runtime system is only possible in RUN mode.

Runtime system update

The runtime system can be updated via the programming environment. When updating the runtime system via an online connection, the following procedure must be carried out:

1. An online runtime system update is only possible if the processor is in RUN mode. For this to be true, the node number must be set to a value in the range 0x01 to 0xFE.
2. Switch on the power.
3. The runtime system update is performed via the existing online connection. The online connection can be established via the onboard serial RS232 interface, for example. If a CPU has an Ethernet interface, then it too can be used to perform the update.
4. Start B&R Automation Studio.
5. Start the update procedure by selecting **Online** from the **Project** menu. Select **Transfer Automation Runtime** from the pop-up menu. Now follow the instructions given by B&R Automation Studio.
6. A window opens up for setting the runtime system version. The runtime system version is already pre-selected by the project settings made by the user. The drop-down menu can be used to select one of the runtime system versions stored in the project. Clicking on the **Browse** button allows a runtime system version to be loaded from the hard drive or CD.

Clicking on **Next** opens a pop-up window that allows the user to select whether modules with target memory SYSTEM ROM should be transferred during the subsequent runtime system update. If not, these modules can also be transferred later during an application download.

Clicking on **Next** opens a dialog box where the user can set the CAN transfer rate, CAN ID and CAN node number (the CAN node number set here is only relevant if an interface module does not have a CAN node number switch). The CAN node number must be between decimal 01 and 99. Assigning a unique node number is especially important with online communication over a CAN network (INA2000 protocol).

7. The update procedure is started by clicking on **Next**. Update progress is shown in a message box.

Information:

User flash memory is deleted.

8. When the update procedure is complete, the online connection is reestablished automatically.
9. The PLC is now ready for use.

Updating the runtime system is possible not only via an online connection, but also via a CAN network, serial network (INA2000 protocol) or Ethernet network, depending on the system configuration.

9.8 Compact CPUs system modules

The X20 system Compact CPUs consist of the Compact CPU, Compact CPU system modules and the X20TB12 terminal block.

The Compact CPU system modules also include the X20BB22 and X20BB27 base modules as well as the X20PS9500 supply module for supplying the entire system with voltage.

9.8.1 Summary

| Model number | Short description | Page |
|--------------|--|------|
| X20BB22 | X20 compact CPU base, for compact CPU and compact CPU power supply module, base for integrated RS232 interface, X20 connection, X20 locking plates (left and right) X20AC0SL1/X20AC0SR1 included | 1001 |
| X20BB27 | X20 compact CPU base, for compact CPU and compact CPU power supply module, base for integrated RS232 and CAN bus interface, X20 connection, X20 locking plates (left and right) X20AC0SL1/X20AC0SR1 included | 1003 |
| X20PS9500 | X20 power supply module for Compact and Fieldbus CPUs and internal I/O power supply, X2X Link power supply | 1006 |
| X20PS9502 | X20 power supply module, for Compact and Fieldbus CPUs and internal I/O power supply, X2X Link power supply, supply not electrically isolated | 1012 |

9.8.2 X20BB22

Data sheet version: 2.22

9.8.2.1 General information

The bus module is the base for all X20 Compact CPUs.

The left and right end plates are included in the delivery.

- Base for all X20 Compact CPUs
- RS232 connection

9.8.2.2 Order data

| Model number | Short description | Figure |

9.8.3.4 Voltage routing

9.8.3.5 Terminating resistor for CAN bus

The bus module has an integrated CAN bus terminating resistor. The terminating resistor is switched on or off using a switch. An enabled terminating resistor is indicated on the power supply module by LED "T".

9.8.4 X20PS9500

Data sheet version: 3.20

9.8.4.1 General information

The power supply module is used together with an X20 Compact or Fieldbus CPU. It is equipped with a supply for the Compact or Fieldbus CPU, X2X Link network and internal I/O power supply.

- Supply for Compact or Fieldbus CPU, X2X Link network and internal I/O power supply
- Electrical isolation of supply and CPU / X2X Link power supply
- Redundancy of CPU / X2X Link supply possible by operating multiple supply modules simultaneously
- RS232 configurable as an online interface
- CAN bus

9.8.4.2 Order data

| On | | | Terminating resistor integrated in bus module X20BB27, X20BB37 or X20BB47 switched on | |

9.8.4.5 Pinout

9.8.4.6 Connection examples

With 2 isolated power supplies

With 1 power supply and jumper

9.8.4.7 Derating

The nominal output power for the power supply is 7 W. Depending on the mounting orientation, derating must be taken into account.

9.8.4.8 Register description

9.8.4.8.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section "[General data points](#)" on page 3790.

9.8.4.8.2 Function model 0 - Standard

| Register | Fixed offset | Name | Data type | Read | | Write | |
|----------|--------------|----------------------|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| 0 | 1 | Status of the module | USINT | • | | | |
| | | StatusInput01 | Bit 0 | | | | |
| | | StatusInput02 | Bit 2 | | | | |
| 2 | 2 | SupplyCurrent | USINT | • | | | |
| 4 | 3 | SupplyVoltage | USINT | • | | | |

Fixed modules require their data points to be in a specific order in the X2X frame. Cyclic access occurs according to a predefined offset, not based on the register address.

Acyclic access continues to be based on the register numbers.

9.8.4.8.3 Status of the module

Name:

StatusInput01 to StatusInput02

The following module power supply voltages are monitored in this register:

| | |
|----------------------------|--|
| Bus power supply current: | Bus power supply current >2.3 A is displayed as a warning. |
| Bus supply voltage: | Bus supply voltage <4.7 V is displayed as a warning. |
| 24 VDC I/O supply voltage: | I/O supply voltage <20.4 V is displayed as a warning. |

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|---------------|-------|---|
| 0 | StatusInput01 | 0 | No error |
| | | 1 | Warning in the event of overcurrent (>2.3 A) or undervoltage (<4.7 V) |
| 1 | Reserved | 0 | |
| 2 | StatusInput02 | 0 | I/O power supply above the warning limit of 20.4 V |
| | | 1 | I/O power supply below the warning limit of 20.4 V |
| 3 - x | Reserved | 0 | |

9.8.4.8.4 Bus power supply current

Name:

SupplyCurrent

This register displays the bus power supply current measured at a resolution of 0.1 A.

| Function model | Data type |
|----------------|-----------|
| 0 - Standard | USINT |

9.8.4.8.5 Bus supply voltage

Name:

SupplyVoltage

This register indicates the bus supply voltage measured at a resolution of 0.1 V.

| Function model | Data type |
|----------------|-----------|
| 0 - Standard | USINT |

9.8.4.8.6 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time |
|--------------------|
| 100 μ s |

9.8.4.8.7 Minimum I/O update time

The minimum I/O update time specifies how far the bus cycle can be reduced so that an I/O update is performed in each cycle.

| Minimum I/O update time |
|-------------------------|
| 2 ms |

9.8.5 X20PS9502

Data sheet version: 3.07

9.8.5.1 General information

The power supply module is used together with an X20 Compact or Fieldbus CPU. It is equipped with a supply for the Compact or Fieldbus CPU, X2X Link network and internal I/O power supply.

This module is intended as a cost-effective power supply module for small X20 systems. The use of potential groups is possible. Expansion or redundancy of the X2X Link network with power supply module X20PS3300 or X20PS3310 is not possible. Expanding the X20 system with a bus transmitter is also not permitted.

- Supply for Compact or Fieldbus CPU, X2X Link network and internal I/O power supply
- Cost-effective power supply module for small X20 systems
- No electrical isolation of supply and CPU / X2X Link power supply
- Expansion or redundancy of CPU / X2X Link power supply not possible by operating multiple power supply modules simultaneously
- RS232 configurable as an online interface
- CAN bus

9.8.5.2 Order data

Table 171: X20PS9502 - Technical data

- 1) CAN bus only when used with bus module X20BB27 or X20BB37.
- 2) The specified values are maximum values. For examples of the exact calculation, see section "Mechanical and electrical configuration" of the X20 system user's manual.

9.8.5.4 LED status indicators

For a description of the various operating modes, see "Diagnostic LEDs" on page 3787.

| Figure | LED | Color | Status | Description |
|---|-----|--------|---|--|
|  | r | Green | Off | No power to module |
| | | | Single flash | Mode RESET |
| | | | Blinking | Mode PREOPERATIONAL |
| | | | On | Mode RUN |
| | e | Red | Off | No power to module or everything OK |
| | | | Double flash | LED indicates one of the following states: <ul style="list-style-type: none"> • Power supply for CPU / X2X Link overloaded • I/O power supply too low • Input voltage for CPU / X2X Link power supply too low |
| | | | Solid red / Single green flash | Invalid firmware |
| | S | Yellow | Off | CPU not transmitting data via the RS232 interface |
| | On | | CPU transmitting data via the RS232 interface | |
| | C | Yellow | Off | CPU not transmitting data via the CAN bus interface |
| | | | On | CPU transmitting data via the CAN bus interface |
| | T | Yellow | Off | Terminating resistor integrated in bus module X20BB27, X20BB37 or X20BB47 switched off |
| On | | | Terminating resistor integrated in bus module X20BB27, X20BB37 or X20BB47 switched on | |

9.8.5.5 Pinout

9.8.5.6 Connection examples

With 2 isolated power supplies

With 1 power supply and jumper

9.8.5.7 Derating for CPU / X2X Link power supply

The nominal output power for the CPU / X2X Link power supply is 7.0 W. Derating may need to be taken into account depending on the mounting orientation.

9.8.5.8 Register description

9.8.5.8.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section "[General data points](#)" on page 3790.

9.8.5.8.2 Function model 0 - Standard

| Register | Fixed offset | Name | Data type | Read | | Write | |
|----------|--------------|--------------------------------------|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| 0 | 1 | Status of the module | USINT | • | | | |
| | | StatusInput01 | Bit 0 | | | | |
| | | StatusInput02 | Bit 2 | | | | |
| 4 | 3 | SupplyVoltage | USINT | • | | | |

Fixed modules require their data points to be in a specific order in the X2X frame. Cyclic access occurs according to a predefined offset, not based on the register address.

Acyclic access continues to be based on the register numbers.

9.8.5.8.3 Status of the module

Name:

Module status

The following module power supply voltages are monitored in this register:

Bus supply voltage: Bus supply voltage <4.7 V is displayed as a warning.
24 VDC I/O supply voltage: I/O supply voltage <20.4 V is displayed as a warning.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|-------|---------------|-------|--|
| 0 | StatusInput01 | 0 | No error |
| | | 1 | Bus supply warning - Undervoltage (<4.7 V) |
| 1 | Reserved | 0 | |
| 2 | StatusInput02 | 0 | I/O power supply above the warning limit of 20.4 V |
| | | 1 | I/O power supply below the warning limit of 20.4 V |
| 3 - x | Reserved | 0 | |

9.8.5.8.4 Bus supply voltage

Name:

SupplyVoltage

This register indicates the bus supply voltage measured at a resolution of 0.1 V.

| Function model | Data type |
|----------------------|-----------|
| 0 - Standard | USINT |
| 254 - Bus controller | UINT |

9.8.5.8.5 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time |
|--------------------|
| 100 µs |

9.8.5.8.6 Minimum I/O update time

The minimum I/O update time specifies how far the bus cycle can be reduced so that an I/O update is performed in each cycle.

| Minimum I/O update time |
|-------------------------|
| 2 ms |

9.9 Compact-S CPUs

Compact-S CPUs have a modular design that allows them to be quickly and easily assembled according to the requirements of the respective application. All CPUs are based on the ARM Cortex-A9 processor and available in 2 performance classes.

Available interfaces

With POWERLINK, Ethernet, 2x USB and RS232, the CPUs offer a wide range of communication options. An optional CAN interface is also available. If needed, up to 2 slots are also available for modular interface expansion.

Maintenance-free CPU

The CPUs were designed without fans or batteries in order to make them as easy as possible to service. This makes them completely maintenance-free.

Compact design

The supply for the CPU, X2X Link network and I/O modules is part of the CPU. No additional power supply modules are required.

9.9.1 Summary

| Model number | Short description | Page |
|--------------|---|------|
| X20CP0410 | X20 Compact-S CPU, ARM Cortex-A9-166 (compatible), 128 MB DDR3 RAM, 8 kB FRAM, 256 MB onboard flash drive, 2 USB interfaces, 1 RS232 interface, 1 Ethernet interface 10/100BASE-T. Order bus base, power supply module and terminal block separately! | 1019 |
| X20CP0411 | X20 Compact-S CPU, ARM Cortex-A9-240, 128 MB DDR3 RAM, 16 kB FRAM, 512 MB onboard flash drive, 2 USB interfaces, 1 RS232 interface, 1 Ethernet interface 10/100BASE-T. Order bus base, power supply module and terminal block separately! | 1019 |
| X20CP0420 | X20 Compact-S CPU, ARM Cortex-A9-166 (compatible), 128 MB DDR3 RAM, 8 kB FRAM, 256 MB onboard flash drive, 2 USB interfaces, 1 RS232 interface, 2 Ethernet interfaces 10/100BASE-T (switch). Order bus base, power supply module and terminal block separately! | 1019 |
| X20CP0482 | X20 Compact-S CPU, ARM Cortex-A9-300, 128 MB DDR3 RAM, 16 kB FRAM, 1 GB onboard flash drive, 2 USB interfaces, 1 RS232 interface, 1 POWERLINK interface, 1 Ethernet interface 10/100BASE-T, can be expanded with X20 interface slot. Order bus base, power supply module and terminal block separately! | 1019 |
| X20CP0483 | X20 Compact-S CPU, ARM Cortex-A9-500, 256 MB DDR3 RAM, 32 kB FRAM, 1 GB onboard flash drive, 2 USB interfaces, 1 RS232 interface, 1 POWERLINK interface, 1 Ethernet interface 10/100BASE-T, can be expanded with X20 interface slot. Order bus base, power supply module and terminal block separately! | 1019 |
| X20CP0484 | X20 Compact-S CPU, ARM Cortex-A9-667, 256 MB DDR3 RAM, 64 kB FRAM, 2 GB onboard flash drive, 2 USB interfaces, 1 RS232 interface, 1 POWERLINK interface, 1 Ethernet interface 10/100BASE-T, can be expanded with X20 interface slot. Order bus base, power supply module and terminal block separately! | 1019 |
| X20CP0484-1 | X20 Compact-S CPU, ARM Cortex-A9-667, 512 MB DDR3 RAM, 64 kB FRAM, 2 GB onboard flash drive, 2 USB interfaces, 1 RS232 interface, 1 POWERLINK interface, 1 Ethernet interface 10/100BASE-T, can be expanded with X20 interface slot. Order bus base, power supply module and terminal block separately! | 1019 |

9.9.2 X20CP041x, X20CP0420 and X20CP048x

Data sheet version: 2.04

9.9.2.1 General information

The CPUs in the X20 Compact-S family are available in different variants. This way, customers get the product that best meets the requirements of the machine – technically and economically.

The processor performance of the compact CPUs ranges from 166 MHz (compatible) to 667 MHz. The most economical variant is equipped with 128 MB RAM, 8 kB nonvolatile RAM and a 256 MB flash drive. The most powerful variant of the Compact-S CPUs achieves cycle times up to 400 μ s. It is equipped with 512 MB RAM, 64 kB nonvolatile RAM and a 2 GB internal flash drive.

With POWERLINK, Ethernet, USB and RS232, the CPUs offer a wide range of communication options. An optional CAN interface is also available. If the application requires additional interfaces, the CPU can be modularly expanded by one or two X20 interface slots. This allows the entire product range of X20 fieldbus interfaces to be used.

The fanless, battery-free design of Compact-S CPUs means they are completely maintenance-free.

- ARM Cortex-A9 processor with 166 MHz (compatible) to 667 MHz and integrated I/O processor
- Depending on the variant: POWERLINK with poll-response chaining
- 2x onboard USB
- Up to 2 slots for modular interface expansions
- 128 to 512 MB DDR3 SDRAM
- 256 MB to 2 GB onboard flash drive
- Fanless
- No battery
- Extremely compact

| Figure | LED | Color | Status | Description |
|---|---------|-----------|---|--|
|  | R/E | Green | On | Application running |
| | | | Blinking | System startup: The CPU is initializing the application, all bus systems and I/O modules. ¹⁾ |
| | | | Double flash | System startup during firmware update ¹⁾ |
| | | Red | On | Mode SERVICE ²⁾ |
| | | | Blinking | If LED "R/E" blinks red and LED "RDY/F" blinks yellow, a license violation has occurred. |
| | | | | |
| | RDY/F | Yellow | On | Mode SERVICE ²⁾ or BOOT ²⁾ |
| | | | Blinking | If LED "RDY/F" blinks yellow and LED "R/E" blinks red, a license violation has occurred. |
| | S/E | Green/Red | | Status/Error LED. LED states are described in section "LED "S/E" (LED "Status/Error")" on page 1026. |
| | IF3/PLK | Green | On | The link to the POWERLINK remote station is established. |
| | | | Blinking | The link to the POWERLINK remote station is established. The LED blinks if Ethernet activity is taking place on the bus. |
| | IF2/ETH | Green | On | The link to the Ethernet remote station is established. |
| Blinking | | | The link to the Ethernet remote station is established. The LED blinks if Ethernet activity is taking place on the bus. | |

- 1) This process can take several minutes depending on the configuration.
- 2) The operating states are described in Automation Help under "Real-time operating system - Method of operation - Operating states".

9.9.2.5.1.1 LED "S/E" (LED "Status/Error")

This LED is a green/red dual LED and indicates the state of the POWERLINK interface. The LED states have a different meaning depending on the operating mode of the POWERLINK interface.

Ethernet mode

In this mode, the interface is operated as an Ethernet interface.

| LED "S/E" | | Description |
|-----------|-----|---|
| Green | Red | |
| On | Off | The interface is operated as an Ethernet interface. |

Table: LED "S/E": Interface in Ethernet mode

POWERLINK V2 mode

Error message

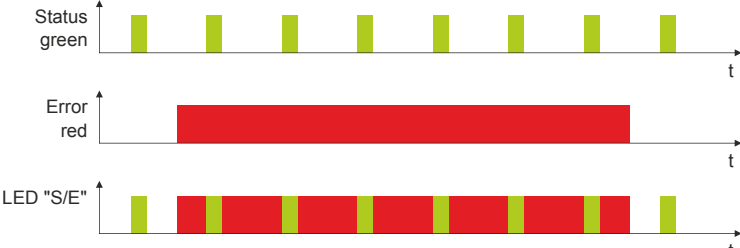

| LED "S/E" | | Description |
|-----------|-----|--|
| Green | Red | |
| Off | On | The interface is in error mode (failed Ethernet frames, increased number of collisions on the network, etc.). Note: Several red blinking signals are displayed immediately after the device is switched on. These are not errors, however. |
| Blinking | On | If an error occurs in the following modes, then the green LED blinks over the red LED: <ul style="list-style-type: none"> • PRE_OPERATIONAL_1 • PRE_OPERATIONAL_2 • READY_TO_OPERATE  |

Table: LED "S/E" - Error message (interface in POWERLINK mode)

Interface status

| LED "S/E" | | Description |
|--------------------------------|-----|---|
| Green | Red | |
| Off | Off | <p>Mode: NOT_ACTIVE The interface is either in mode NOT_ACTIVE or one of the following modes or errors is present:</p> <ul style="list-style-type: none"> The device is switched off. The LED status indicator is disabled. The device is in the startup phase. The interface or device is not configured correctly in Automation Studio. The interface or device is defective. <p>Managing node (MN) The network is monitored for POWERLINK frames. If a frame is not received within the configured time window (timeout), the interface immediately enters mode PRE_OPERATIONAL_1. If POWERLINK communication is detected before the time has elapsed, however, the MN is not started.</p> <p>Controlled node (CN) The network is monitored for POWERLINK frames. If a frame is not received within the configured time window (timeout), the interface immediately enters mode BASIC_ETHERNET. If POWERLINK communication is detected before this time expires, however, the interface immediately enters mode PRE_OPERATIONAL_1.</p> |
| Flickering (approx. 10 Hz) | Off | <p>Mode: BASIC_ETHERNET The interface is in mode BASIC_ETHERNET. The interface is operated in Ethernet mode.</p> <p>Managing node (MN) This mode can only be exited by resetting the controller.</p> <p>Controlled node (CN) If POWERLINK communication is detected during this mode, the interface enters mode PRE_OPERATIONAL_1.</p> |
| Single flash (approx. 1 Hz) | Off | <p>Mode: PRE_OPERATIONAL_1 The interface is in mode PRE_OPERATIONAL_1.</p> <p>Managing node (MN) The MN is in "reduced cycle" operation. The CNs are configured in this mode. Cyclic communication is not yet taking place.</p> <p>Controlled node (CN) The CN can be configured by the MN in this mode. The CN waits until it receives an SoC frame and then switches to mode PRE_OPERATIONAL_2.</p> |
| | On | <p>Controlled node (CN) If the red LED lights up in this mode, this means that the MN has failed.</p> |
| Double flash (approx. 1 Hz) | Off | <p>Mode: PRE_OPERATIONAL_2 The interface is in mode PRE_OPERATIONAL_2.</p> <p>Managing node (MN) The MN starts cyclic communication (cyclic input data is not yet evaluated). The CNs are configured in this mode.</p> <p>Controlled node (CN) The CN can be configured by the MN in this mode. A command then switches the mode to READY_TO_OPERATE.</p> |
| | On | <p>Controlled node (CN) If the red LED lights up in this mode, this means that the MN has failed.</p> |
| Triple flash (approx. 1 Hz) | Off | <p>Mode: READY_TO_OPERATE The interface is in mode READY_TO_OPERATE.</p> <p>Managing node (MN) Cyclic and asynchronous communication. Received PDO data is ignored.</p> <p>Controlled node (CN) The configuration of the CN is completed. Normal cyclic and asynchronous communication. The transmitted PDO data corresponds to the PDO mapping. However, cyclic data is not yet evaluated.</p> |
| | On | <p>Controlled node (CN) If the red LED lights up in this mode, this means that the MN has failed.</p> |
| On | Off | <p>Mode: OPERATIONAL The interface is in mode OPERATIONAL. PDO mapping is active and cyclic data is evaluated.</p> |
| Blinking (approx. 2.5 Hz) | Off | <p>Mode: STOPPED The interface is in mode STOPPED.</p> <p>Managing node (MN) This mode does not occur for the MN.</p> <p>Controlled node (CN) Output data is not being output, and no input data is being provided. This mode can only be reached and exited by a corresponding command from the MN.</p> |

Table: LED "S/E" - Interface state (interface in POWERLINK mode)

Blink times

9.9.2.5.1.2 System stop error codes

A system stop error can occur due to incorrect configuration or defective hardware.

The error code is indicated by LED "S/E" blinking red. The blinking signal of the error code consists of 4 switch-on phases with short (150 ms) or long (600 ms) duration. The error code is repeated every 2 seconds.

| Error | Error description |
|----------------|---|
| RAM error | The device is defective and must be replaced. |
| Hardware error | The device or a system component is defective and must be replaced. |

9.9.2.5.2 Button for reset and operating mode

9.9.2.5.2.1 Reset

The button must be pressed for less than 2 seconds to trigger a reset. This triggers a hardware reset on the CPU, which means that:

- All application programs are stopped.
- All outputs are set to zero.

The controller then boots into service mode by default. The startup mode that follows after pressing the reset button can be set in Automation Studio.

- Service mode (default)
- Warm restart
- Cold restart
- Diagnostic mode

9.9.2.5.2.2 Operating mode

3 operating modes can be set using different button sequences:

| Operating mode | Button sequence | Description |
|---------------------------|---|---|
| BOOT ¹⁾ | Boot mode is enabled by the following button sequence: <ul style="list-style-type: none"> • Press the button for less than 2 s. As soon as LED "Error" lights RED, the button can be released. • Then press the button within 2 s for longer than 2 s. As soon as LED "Error" goes dark, the button can be released. | Boot AR is started, and the runtime system can be installed via the online interface (Automation Studio). User flash memory is erased only when the download begins. |
| SERVICE/RUN ¹⁾ | Press the button for less than 2 s. As soon as LED "Error" lights RED , the button can be released. | Mode SERVICE/RUN: Triggering and startup behavior correspond to triggering a hardware reset (see "Reset" on page 1029). |
| DIAGNOSE ¹⁾ | Press the button for more than 2 s. LED "Error" lights RED and then goes dark. As soon as LED "Error" goes dark, the button can be released. | The CPU boots in diagnostic mode. Program sections in User RAM and User FlashPROM are not initialized. After diagnostic mode, the CPU always boots with a warm restart. |

1) The operating states are described in Automation Help under "Real-time operating system - Method of operation - Operating states".

9.9.2.5.3 Flash drive

This application memory is implemented as an integrated flash drive.

9.9.2.5.4 Project installation

Project installation is described in Automation Help under "Project management / Project installation".

9.9.2.5.5 RS232 interface (IF1)

The non-galvanically isolated RS232 interface is designed as an online interface for communication with the programming device. The terminal connections for the signals are located on the power supply module.

9.9.2.5.6 Ethernet interface (IF2)

General information

IF2 is a 10BASE-T/100BASE-TX Ethernet interface.

The INA2000 node number is set using the B&R Automation Studio software.

For information about wiring X20 modules with an Ethernet interface, see ["Cabling guidelines for X20 modules with an Ethernet cable" on page 58](#).

Information:

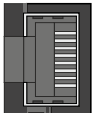

The Ethernet interface (IF2) is not suitable for POWERLINK.

X20CP0420

The interface is equipped with 2 female RJ45 connections. Both connections lead to an integrated switch. This makes daisy-chain wiring easy.

The X20CP0420 supports half-duplex and full-duplex communication. Mixed operation is not possible. Both interfaces must be operated in either half-duplex or full-duplex communication mode.

Pinout

| Interface | Pinout | | |
|--|--------|-------------|----------------|
| | Pin | Ethernet | |
|  Shielded RJ45 | 1 | RXD | Receive data |
| | 2 | RXD\ | Receive data\ |
| | 3 | TXD | Transmit data |
| | 4 | Termination | |
| | 5 | Termination | |
| | 6 | TXD\ | Transmit data\ |
| | 7 | Termination | |
| | 8 | Termination | |

9.9.2.5.7 POWERLINK interface (IF3)

X20CP048x Compact-S CPUs are equipped with a POWERLINK V2 interface.

POWERLINK

By default, the POWERLINK interface is operated as a managing node (MN). In the managing node, the node number is set to a fixed value of 240.

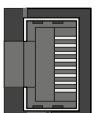

If the POWERLINK node is operated as a controlled node (CN), a node number from 1 to 239 can be set in the POWERLINK configuration in Automation Studio.

Ethernet mode

In this mode, the interface is operated as an Ethernet interface. The INA2000 station number is set using the B&R Automation Studio software.

Pinout

For information about wiring X20 modules with an Ethernet interface, see ["Cabling guidelines for X20 modules with an Ethernet cable" on page 58](#).

| Interface | Pinout | | |
|--|--------|-------------|----------------|
| | Pin | Ethernet | |
|  Shielded RJ45 | 1 | RXD | Receive data |
| | 2 | RXD\ | Receive data\ |
| | 3 | TXD | Transmit data |
| | 4 | Termination | |
| | 5 | Termination | |
| | 6 | TXD\ | Transmit data\ |
| | 7 | Termination | |
| | 8 | Termination | |

9.9.2.5.8 USB interfaces (IF4 and IF5)

IF4 and IF5 are non-galvanically isolated USB interfaces. The abbreviation USB stands for "Universal Serial Bus". Both USB interfaces support the USB 1.1 and 2.0 standards.

Information:

USB peripheral devices can be connected to the USB interfaces. Due to the variety of USB devices available on the market, B&R cannot guarantee their functionality. The functionality of USB devices available from B&R is guaranteed.

Information:

- The USB interfaces cannot be used as online communication interfaces.
- Only devices isolated from GND are permitted to be connected to the USB interfaces.
- Current-carrying capacity is listed in the technical data.

9.9.2.5.9 CAN bus interface (IF7)

When used with bus base X20BB57, X20BB67 or X20BB77, the CPUs have access to a CAN bus interface. The terminal connections for the signals are located on the power supply module.

9.9.2.5.10 Slot for interface modules

Up to 2 interface modules can be connected to the left side of X20CP048x Compact-S CPUs. Different bus or network systems can be flexibly integrated into the X20 system by selecting the appropriate interface module.

| CPU base | Slots for interface modules |
|------------------|-----------------------------|
| X20BB62, X20BB67 | 1 |
| X20BB72, X20BB77 | 2 |

9.9.2.5.10.1 Information regarding operation of interface modules on the X20CP048x

Some X20 interface modules must have a certain minimum firmware version or minimum upgrade version for operation with an X20CP048x, but these are not included in the Automation Studio 4.3.3 release. A hardware upgrade may be necessary. This can be installed from Automation Studio by selecting **Tools/Upgrades** from the menu.

The following table contains a corresponding overview of affected interface modules. No special requirements apply to all other interface modules:

| Model number | Minimum upgrade version |
|--------------|-------------------------|
| X20IF1082-2 | 1.5.0.0 |
| X20IF1082 | 1.5.0.0 |
| X20IF1086-2 | 1.5.0.0 |
| X20IF2181-2 | 1.3.0.0 |
| X20clF1082-2 | 1.5.0.0 |
| X20clF2181-2 | 1.3.0.0 |
| X20IF1091 | 1.1.0.0 |
| X20IF2792 | 1.1.0.0 |

9.9.2.5.11 Data and real-time clock retention

The CPUs do not use a battery. This makes them completely maintenance-free. The following measures make operation without a backup battery possible.

| Data and real-time clock retention | Backup type | Note |
|------------------------------------|---------------------|---|
| Remanent variables | FRAM | This FRAM stores its contents ferroelectrically. Unlike normal SRAM, this does not require a battery. |
| Real-time clock | Gold foil capacitor | The real-time clock is backed up for approx. 1000 hours @ 25°C by a gold foil capacitor. The gold foil capacitor is completely charged after 3 continuous hours of operation. |

9.9.2.6 Overtemperature shutdown

To prevent damage, the CPU is shut down / reset at the following board temperature:

- X20CP041x and X20CP0420: 95°C
- X20CP048x: 105°C

The following errors are entered in the logbook in the event of shutdown:

| Error number | Short error text |
|--------------|--|
| 9204 | PLC restart triggered by the PLC CPU's temperature monitoring. |
| 9210 | Warning: Halt/Service after watchdog or manual reset. |

9.9.2.7 System requirements

X20CP041x and X20CP048x

The following minimum versions are recommended to generally be able to use all functions:

- Automation Studio 4.3.3
- Automation Runtime 4.34
- For error-free support by Automation Studio, **all** Compact-S hardware upgrades must be installed separately via the Automation Studio **Tools / Upgrades** menu:
 - X20CP04xx
 - X20BB5x/6x/7x
 - X20PS960x
- Starting with Automation Studio 4.4, all Compact-S components are included in the installation package.

X20CP0420

The following minimum versions are recommended to generally be able to use all functions:

- Automation Studio 4.7.1
- Automation Runtime 4.73

X20CP0484-1

The following minimum versions are recommended to generally be able to use all functions:

- Automation Studio 4.5
- Automation Runtime 4.5

9.9.2.8 General data points

This CPU is equipped with general data points. These are not CPU-specific; instead, they contain general information such as system time and heat sink temperature.

General data points are described in section ["General CPU data points" on page 3792](#).

9.10 Compact-S CPUs system modules

The X20 system Compact CPUs consist of the Compact-S CPU, Compact-S CPU system modules and the X20TB12 terminal block.

The Compact CPU system modules also include the X20BB5x, X20BB6x and X20BB7x base modules as well as the X20PS9602 supply module for supplying the entire system with voltage.

9.10.1 Summary

| Model number | Short description | Page |
|--------------|---|------|
| X20BB52 | X20 Compact-S bus base, for Compact-S CPU and Compact-S CPU power supply module, base for integrated RS232 interface, X20 connection, X20 end cover plates (left and right) X20AC0SL1/X20AC0SR1 included | 1035 |
| X20BB57 | X20 Compact-S bus base, for Compact-S CPU and Compact-S CPU power supply module, base for integrated RS232 and CAN bus interface, X20 connection, X20 end cover plates (left and right) X20AC0SL1/X20AC0SR1 included | 1037 |
| X20BB62 | X20 Compact-S bus base, for Compact-S CPU and Compact-S CPU power supply module, base for integrated RS232 interface, slots for X20 interface module, X20 connection, X20 end cover plates (left and right) X20AC0SL1/X20AC0SR1 included | 1039 |
| X20BB67 | X20 Compact-S bus base, for Compact-S CPU and Compact-S CPU power supply module, base for integrated RS232 and CAN bus interface, slot for X20 interface module, X20 connection, X20 end cover plates (left and right) X20AC0SL1/X20AC0SR1 included | 1041 |
| X20BB72 | X20 Compact-S bus base, for Compact-S CPU and Compact-S CPU power supply module, base for integrated RS232 interface, 2 slots for X20 interface modules, X20 connection, X20 end cover plates (left and right) X20AC0SL1/X20AC0SR1 included | 1043 |
| X20BB77 | X20 Compact-S bus base, for Compact-S CPU and Compact-S CPU power supply module, base for integrated RS232 and CAN bus interface, 2 slots for X20 interface modules, X20 connection, X20 end cover plates (left and right) X20AC0SL1/X20AC0SR1 included | 1045 |
| X20PS9600 | X20 power supply module, for Compact-S CPU and internal I/O power supply, X2X Link power supply | 1047 |

9.10.8 X20PS9600

Data sheet version: 1.06

9.10.8.1 General information

The power supply module is used together with an X20 Compact-S CPU. It has a feed for the Compact-S CPU, X2X Link and the internal I/O power supply.

- Supply for Compact-S CPU, X2X Link and internal I/O power supply
- Electrical isolation of supply and CPU / X2X Link power supply
- Redundancy of CPU / X2X Link supply possible by operating multiple supply modules simultaneously
- RS232 configurable as an online interface
- CAN bus

9.10.8.5 Pinout

9.10.8.6 Connection examples

With 2 isolated power supplies

With 1 power supply and jumper

9.10.8.7 Derating

9.10.8.7.1 CPU / X2X Link power supply

The nominal output power for CPU / X2X Link power supply is 7 W. Derating may occur depending on the mounting orientation.

9.10.8.7.2 I/O power supply

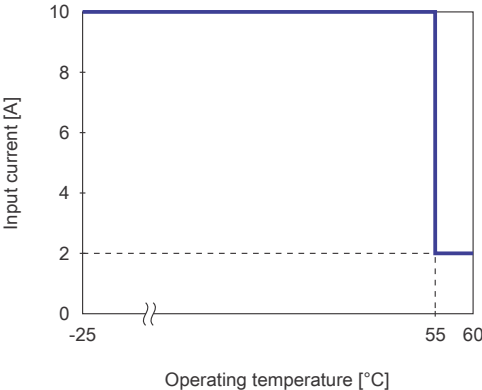

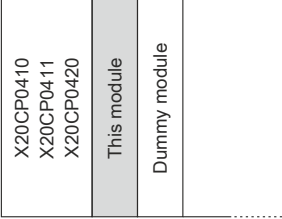

Information:

The specified maximum temperature and derating values are based on worst-case conditions. The CPU contains an internal temperature sensor that triggers a reset if 95°C is exceeded. Depending on the environmental conditions (artificial convection), maintaining the internal temperature at <90°C can prevent derating.

9.10.8.7.2.1 X20CP0410, X20CP0411 and X20CP0420

Horizontal installation

Derating is not required in the temperature range -25 to 55°C. 1 of the following 2 derating variants must be applied at temperatures above 55°C:

| Variant 1 | Variant 2 |
|---|--|
| <p>Max. 2 A input current on the I/O power supply.</p>  <p>The graph plots Input current [A] on the y-axis (0 to 10) against Operating temperature [°C] on the x-axis (-25 to 60). A horizontal line at 10 A spans from -25°C to 55°C. At 55°C, the current drops to 2 A and remains constant until 60°C. A dashed horizontal line is drawn at 2 A. A break symbol is shown on the x-axis between -25 and 55.</p> | <p>A dummy module must be connected next to the power supply module.</p>  <p>The diagram shows a horizontal row of five modules. The first three are labeled X20CP0410, X20CP0411, and X20CP0420. The fourth is shaded and labeled 'This module'. The fifth is labeled 'Dummy module'.</p> |

Vertical installation

Derating is not required in the vertical mounting orientation.

9.10.8.7.2.2 X20CP0482, X20CP0483, X20CP0484 and X20CP0484-1

Horizontal installation

Derating is not required in the temperature range -25 to 50°C. The following 2 derating variants must be applied at temperatures above 50°C:

Information:

Both derating variants must always be applied!

Vertical installation

Derating is not required in the temperature range -25 to 40°C. The following 2 derating variants must be applied at temperatures above 40°C:

Information:

Both derating variants must always be applied!

9.10.8.8 Register description

9.10.8.8.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section "[General data points](#)" on page 3790.

9.10.8.8.2 Function model 0 - Standard

| Register | Fixed offset | Name | Data type | Read | | Write | |
|----------|--------------|----------------------|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| 0 | 1 | Status of the module | USINT | • | | | |
| | | StatusInput01 | Bit 0 | | | | |
| | | StatusInput02 | Bit 2 | | | | |
| 2 | 2 | SupplyCurrent | USINT | • | | | |
| 4 | 3 | SupplyVoltage | USINT | • | | | |

Fixed modules require their data points to be in a specific order in the X2X frame. Cyclic access occurs according to a predefined offset, not based on the register address.

Acyclic access continues to be based on the register numbers.

9.10.8.8.3 Status of the module

Name:

Module status

The following module power supply voltages are monitored in this register:

| | |
|----------------------------|--|
| Bus power supply current: | Bus power supply current >2.3 A is displayed as a warning. |
| Bus supply voltage: | Bus supply voltage <4.7 V is displayed as a warning. |
| 24 VDC I/O supply voltage: | I/O supply voltage <20.4 V is displayed as a warning. |

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|---------------|-------|---|
| 0 | StatusInput01 | 0 | No error |
| | | 1 | Warning in the event of overcurrent (>2.3 A) or undervoltage (<4.7 V) |
| 1 | Reserved | 0 | |
| 2 | StatusInput02 | 0 | I/O power supply above the warning limit of 20.4 V |
| | | 1 | I/O power supply below the warning limit of 20.4 V |
| 3 - x | Reserved | 0 | |

9.10.8.8.4 Bus power supply current

Name:

SupplyCurrent

This register displays the bus power supply current measured at a resolution of 0.1 A.

| Function model | Data type |
|----------------|-----------|
| 0 - Standard | USINT |

9.10.8.8.5 Bus supply voltage

Name:

SupplyVoltage

This register indicates the bus supply voltage measured at a resolution of 0.1 V.

| Function model | Data type |
|----------------|-----------|
| 0 - Standard | USINT |

9.10.8.8.6 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time |
|--------------------|
| 100 μ s |

9.10.8.8.7 Minimum I/O update time

The minimum I/O update time specifies how far the bus cycle can be reduced so that an I/O update is performed in each cycle.

| Minimum I/O update time |
|-------------------------|
| 2 ms |

9.10.9 X20PS9602

Data sheet version: 1.06

9.10.9.1 General information

The power supply module is used together with an X20 Compact-S CPU. It has a feed for the Compact-S CPU, X2X Link and the internal I/O power supply.

This module is intended as an inexpensive power supply module for small X20 systems. Potential groups are able to be formed. An expansion or redundancy of the X2X Link with the X20PS3300 or X20PS3310 supply module is not possible. Expansion of the X20 system with a bus transmitter is not permitted either.

- Supply for Compact-S CPU, X2X Link and internal I/O power supply
- Low-cost supply module for small X20 system
- No electrical isolation of supply and CPU / X2X Link power supply
- Expansion or redundancy of CPU / X2X Link supply not possible by operating multiple supply modules simultaneously
- RS232 configurable as an online interface
- CAN bus

9.10.9.2 Order data

| Model number | Short description | Figure |
|--------------|---|--|
| | System modules for Compact-S CPUs |  |
| X20PS9602 | X20 power supply module, for Compact-S CPU and internal I/O power supply, X2X Link power supply, power supply not electrically isolated | |

| On | | | Terminating resistor integrated in bus module X20BB57, X20BB67 or X20BB77 switched on | |

9.10.9.5 Pinout

9.10.9.6 Connection examples

With 2 isolated power supplies

With 1 power supply and jumper

9.10.9.7 Derating

9.10.9.7.1 CPU / X2X Link power supply

The nominal output power for CPU / X2X Link power supply is 7 W. Derating may occur depending on the mounting orientation.

9.10.9.7.2 I/O power supply

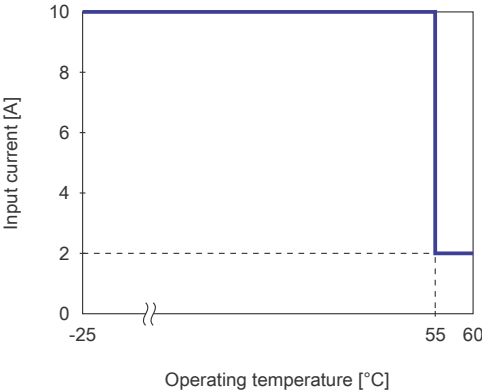

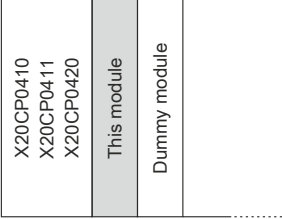

Information:

The specified maximum temperature and derating values are based on worst-case conditions. The CPU contains an internal temperature sensor that triggers a reset if 95°C is exceeded. Depending on the environmental conditions (artificial convection), maintaining the internal temperature at <90°C can prevent derating.

9.10.9.7.2.1 X20CP0410, X20CP0411 and X20CP0420

Horizontal installation

Derating is not required in the temperature range -25 to 55°C. 1 of the following 2 derating variants must be applied at temperatures above 55°C:

| Variant 1 | Variant 2 |
|---|--|
| <p>Max. 2 A input current on the I/O power supply.</p>  <p>The graph plots Input current [A] on the y-axis (0 to 10) against Operating temperature [°C] on the x-axis (-25 to 60). A horizontal line at 10 A spans from -25°C to 55°C. At 55°C, the current drops to 2 A and remains constant until 60°C. A dashed horizontal line is drawn at 2 A. A break symbol is shown on the x-axis between -25 and 55.</p> | <p>A dummy module must be connected next to the power supply module.</p>  <p>The diagram shows a horizontal row of five modules. The first three are labeled X20CP0410, X20CP0411, and X20CP0420. The fourth is shaded and labeled 'This module'. The fifth is labeled 'Dummy module'.</p> |

Vertical installation

Derating is not required in the vertical mounting orientation.

9.10.9.7.2.2 X20CP0482, X20CP0483, X20CP0484 and X20CP0484-1

Horizontal installation

Derating is not required in the temperature range -25 to 50°C. The following 2 derating variants must be applied at temperatures above 50°C:

Information:

Both derating variants must always be applied!

Vertical installation

Derating is not required in the temperature range -25 to 40°C. The following 2 derating variants must be applied at temperatures above 40°C:

Information:

Both derating variants must always be applied!

9.10.9.8 Register description

9.10.9.8.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section ["General data points" on page 3790](#).

9.10.9.8.2 Function model 0 - Standard

| Register | Fixed offset | Name | Data type | Read | | Write | |
|----------|--------------|----------------------|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| 0 | 1 | Status of the module | USINT | • | | | |
| | | StatusInput01 | Bit 0 | | | | |
| | | StatusInput02 | Bit 2 | | | | |
| 4 | 3 | SupplyVoltage | USINT | • | | | |

Fixed modules require their data points to be in a specific order in the X2X frame. Cyclic access occurs according to a predefined offset, not based on the register address.

Acyclic access continues to be based on the register numbers.

9.10.9.8.3 Status of the module

Name:

Module status

The following module power supply voltages are monitored in this register:

Bus supply voltage: Bus supply voltage <4.7 V is displayed as a warning.
24 VDC I/O supply voltage: I/O supply voltage <20.4 V is displayed as a warning.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|-------|---------------|-------|--|
| 0 | StatusInput01 | 0 | No error |
| | | 1 | Bus supply warning - Undervoltage (<4.7 V) |
| 1 | Reserved | 0 | |
| 2 | StatusInput02 | 0 | I/O power supply above the warning limit of 20.4 V |
| | | 1 | I/O power supply below the warning limit of 20.4 V |
| 3 - x | Reserved | 0 | |

9.10.9.8.4 Bus supply voltage

Name:

SupplyVoltage

This register indicates the bus supply voltage measured at a resolution of 0.1 V.

| Function model | Data type |
|----------------------|-----------|
| 0 - Standard | USINT |
| 254 - Bus controller | UINT |

9.10.9.8.5 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time |
|--------------------|
| 100 µs |

9.10.9.8.6 Minimum I/O update time

The minimum I/O update time specifies how far the bus cycle can be reduced so that an I/O update is performed in each cycle.

| Minimum I/O update time |
|-------------------------|
| 2 ms |

9.11 Counter modules

Counter modules are used for position detection. Each signal on a counter module is assigned to a status LED.

9.11.1 Summary

| Model number | Short description | Page |
|--------------|--|------|
| X20CM1941 | X20 resolver module, 14-bit resolver input, converter up to 12-bit ABR output | 1063 |
| X20DC1176 | X20 digital counter module, 1 ABR incremental encoder, 5 V, 600 kHz input frequency, 4x evaluation, encoder monitoring, NetTime function | 1071 |
| X20DC1178 | X20 digital counter module, 1 SSI absolute encoder, 5 V, 1 Mbit/s, 32-bit, encoder monitoring, NetTime function | 1087 |
| X20DC1196 | X20 digital counter module, 1 ABR incremental encoders, 5 V, 600 kHz input frequency, 4x resolution | 1105 |
| X20DC1198 | X20 digital counter module, 1 SSI absolute encoder, 5 V, 1 Mbit/s, 32-bit | 1115 |
| X20DC11A6 | X20 digital counter module, 1 ABR incremental encoder, 5 V, 5 MHz input frequency, 4x evaluation, encoder monitoring, NetTime function | 1122 |
| X20DC1376 | X20 digital counter module, 1 ABR incremental encoder, 24 V, 100 kHz input frequency, 4x evaluation, encoder monitoring, NetTime function | 1137 |
| X20DC137A | X20 digital counter module, 1 ABR incremental encoder, 24 V (differential), 300 kHz input frequency, 4x evaluation, encoder monitoring, NetTime function | 1153 |
| X20DC1396 | X20 digital counter module, 1 ABR incremental encoders, 24 V, 100 kHz input frequency, 4x evaluation | 1169 |
| X20DC1398 | X20 digital counter module, 1 SSI absolute encoder, 24 V, 125 kbit/s, 32-bit | 1179 |
| X20DC1976 | X20 digital counter module, 1 ABR incremental encoder, 5 V (single-ended), 250 kHz input frequency, 4x evaluation, encoder monitoring, NetTime function | 1186 |
| X20DC2190 | X20 digital counter module, ultrasonic transducer module, interfaces: EP start/stop, DPI/IP, 2 transducer rods, 4-position detection | 1202 |
| X20DC2395 | X20 digital counter module, 1 SSI absolute encoder, 24 V, 1 ABR incremental encoder, 24 V, 2 AB incremental encoders, 24 V, 4 event counters or 2 PWM, local time measurement function | 1216 |
| X20DC2396 | X20 digital counter module, 2 ABR incremental encoders, 24 V, 100 kHz input frequency, 4x evaluation | 1256 |
| X20DC2398 | X20 digital counter module, 2 SSI absolute encoder, 24 V, 125 kbit/s, 32-bit | 1267 |
| X20DC4395 | X20 digital counter module, 2 SSI absolute encoders, 24 V, 2 ABR incremental encoders, 24 V, 4 AB incremental encoders, 24 V, 8 event counters or 4 PWM, local time measurement functions | 1275 |
| X20cDC1196 | X20 digital counter module, coated, 1 ABR incremental encoder, 5 V, 600 kHz input frequency, 4x resolution | 1105 |
| X20cDC1198 | X20 digital counter module, coated, 1 SSI absolute encoders, 5 V, 1 Mbit/s, 32-bit | 1115 |
| X20cDC1396 | X20 digital counter module, coated, 1 ABR incremental encoders, 24 V, 100 kHz input frequency, 4x evaluation | 1169 |
| X20cDC2190 | X20 digital counter module, coated, ultrasonic transducer module, interfaces: EP start/stop, DPI/IP, 2 transducer rods, 4-position detection | 1202 |
| X20cDC2395 | X20 digital counter module, coated, 1 SSI absolute encoder, 24 V, 1 ABR incremental encoder, 24 V, 2 AB incremental encoders, 24 V, 4 event counters or 2 PWM, local time measurement function | 1216 |

9.11.2 X20CM1941

Data sheet version: 3.06

9.11.2.1 General information

The module is equipped with a resolver input and a configurable ABR output.

- Resolver input (differential), with angular position and cyclic counter
- 14-bit resolution for the angular position
- ABR output (configurable)

9.11.2.2 Order data

| Model number | Short description | Figure |

Table 192: X20CM1941 - Technical data

1) Configurable

9.11.2.4 LED status indicators

For a description of the various operating modes, see "[Diagnostic LEDs](#)" on page 3787.

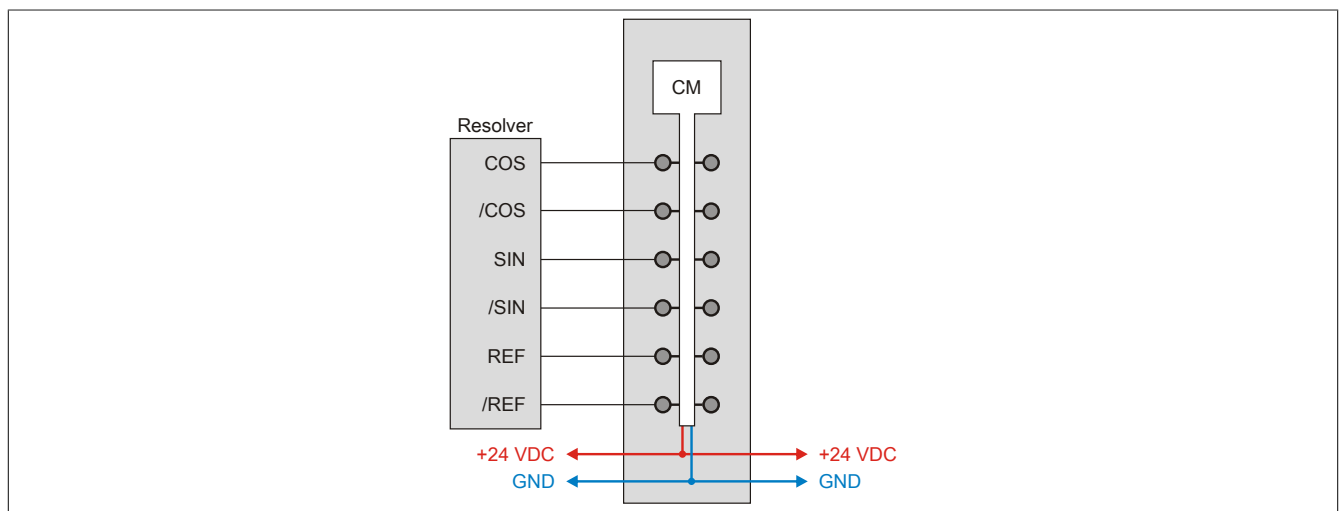

| Figure | LED | Color | Status | Description |
|---|-------|--------|-----------------------------|---|
|  | r | Green | Off | No power to module |
| | | | Single flash | RESET mode |
| | | | Double flash | BOOT mode (during firmware update) ¹⁾ |
| | | | Blinking | PREOPERATIONAL mode |
| | e | Red | On | RUN mode |
| | | | Off | No power to module or everything OK |
| | e + r | | Red on / Green single flash | Warning/Error on an I/O channel. Level monitoring for digital outputs has been triggered. |
| | 1 | Green | On | Resolver connected and OK |
| | | | Off | Open line or no resolver connected |
| | U | | Orange | UP: Counts up |
| D | | Orange | DOWN: Counts down | |

1) Depending on the configuration, a firmware update can take up to several minutes.

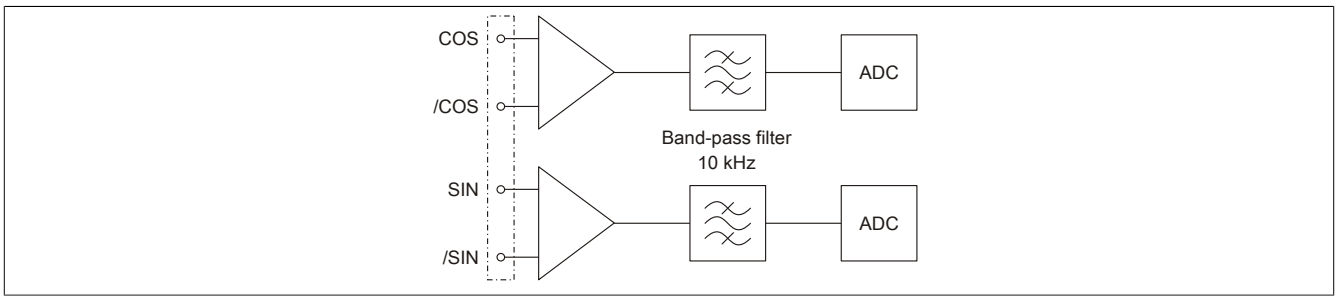

9.11.2.5 Pinout

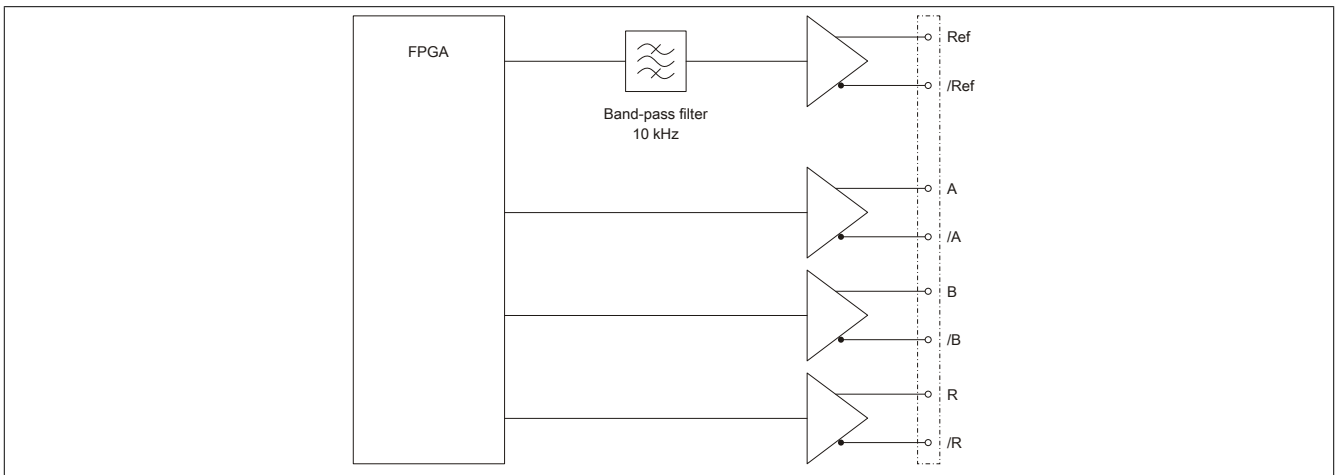

9.11.2.6 Connection example

9.11.2.7 Input circuit diagram

9.11.2.8 Output circuit diagram

9.11.2.9 ABR encoder

Up to firmware version 4

The module measures the resolver's current angular position every 100 μ s. The value for A, B or R is generated immediately from the highest value bits (depending on configuration bit 8 to 10).

Firmware version 5 or higher

The procedure shown above reaches its limits as soon as more than one LSB difference occurs from one position measurement to the next since only one edge of A or B is possible every 100 μ s.

To achieve higher clock rates on the ABR encoder (and therefore higher rotational speeds) while simultaneously improving temporal jitter, the ABR signal is no longer derived directly from the most recent measurement value, but rather generated through interpolation between consecutive position measurements determined every 100 μ s.

Information:

In comparison to firmware versions ≤ 4 , the ABR outputs have a constant time offset of 250 μ s. See also "[Comparison of the timing of the ABR outputs between Firmware version 4 and 5](#)".

Comparison of the timing of the ABR outputs between Firmware version 4 and 5

9.11.2.10 Register description

9.11.2.10.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section ["General data points" on page 3790](#).

9.11.2.10.2 Function model 0 - Standard

| Register | Name | Data type | Read | | Write | |
|----------------------|--------------------------------|-----------|--------|---------|--------|---------|
| | | | Cyclic | Acyclic | Cyclic | Acyclic |
| Configuration | | | | | | |
| 20 | ConfigOutput01 | UINT | | | | • |
| 22 | ConfigOutput02 | USINT | | | | • |
| Communication | | | | | | |
| 0 | Position | DINT | • | | | |
| 10 | StatusInput | USINT | • | | | |

9.11.2.10.3 Function model 254 - Bus controller

| Register | Offset ¹⁾ | Name | Data type | Read | | Write | |
|----------------------|----------------------|--------------------------------|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| Configuration | | | | | | | |
| 20 | - | ConfigOutput01 | UINT | | | | • |
| 22 | - | ConfigOutput02 | USINT | | | | • |
| Communication | | | | | | | |
| 0 | 0 | Position | DINT | • | | | |
| 10 | 4 | StatusInput | USINT | • | | | |

1) The offset specifies the position of the register within the CAN object.

9.11.2.10.3.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see ["Using I/O modules on the bus controller" on page 3789](#).

9.11.2.10.3.2 CAN I/O bus controller

The module occupies 1 analog logical slot on CAN I/O.

9.11.2.10.4 Set the zero position

Name:

ConfigOutput01

"Offset" in the Automation Studio I/O configuration.

The zero position for the resolver can be defined or shifted in this register. The zero position/offset specification refers to the current resolver position.

| Data type | Values | Information |
|-----------|-------------|-----------------------------------|
| UINT | 0 to 65,535 | Bus controller default setting: 0 |

9.11.2.10.5 Encoder emulation configuration

Name:

ConfigOutput02

"ABR configuration" in the Automation Studio I/O configuration.

The resolution of ABR emulation can be configured in this register.

| Data type | Values | Bus controller default setting |
|-----------|------------------------|--------------------------------|
| USINT | See the bit structure. | 0 |

Bit structure:

| Bit | Description | Value | Information |
|-------|----------------|-------|---|
| 0 - 2 | Number of bits | 0 | 8 bits = 256 increments/rotation (bus controller default setting) |
| | | 1 | 9 bits = 512 increments/rotation |
| | | 2 | 10 bits = 1024 increments/rotation |
| | | 3 | 11 bits = 2048 increments/rotation |
| | | 4 | 12 bits = 4096 increments/rotation |
| | | 5 - 7 | Not permitted |
| 3 - 7 | Reserved | - | |

9.11.2.10.6 Current encoder position

Name:

Position

The current angle position of the resolver is shown in this register. The value consists of:

- The two upper bytes, which correspond to the number of rotations counted from -32768 (0x8000xxxx) to +32767 (0x7FFFxxxx)
- The two lower bytes, which correspond to the angle position within the current rotation 1 LSB = 360° / 65536

The position value can, however, be interpreted exactly as an individual 32-bit long angle with resolution 1 / 65536 * 360°.

| Data type | Value | Information |
|-----------|--------------------------|--|
| DINT | 0x0000xxxx to 0xFFFFxxxx | Number of rotations (cyclic) |
| | 0xxxxx0000 to 0xxxxxFFFF | Angle position within the current rotation |

Example

0x7FFF0080 corresponds to 32767 rotations, and $128 / 65536 * 360 = 0.703^\circ$.

9.11.2.10.7 Connection status

Name:

StatusInput

This register shows a potential open line between the module and the encoder.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|-------------|-------|--------------|
| 0 | Open line | 0 | No open line |
| | | 1 | Open line |
| 1 - 7 | Reserved | - | |

9.11.2.10.8 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time |
|--------------------|
| 100 μ s |

9.11.2.10.9 Minimum I/O update time

The minimum I/O update time specifies how far the bus cycle can be reduced so that an I/O update is performed in each cycle.

| Minimum I/O update time |
|-------------------------|
| 200 μ s |

9.11.3 X20DC1176

Data sheet version: 2.41

9.11.3.1 General information

The module is equipped with 1 input for an ABR incremental encoder with RS422-based output signals and 5 V encoder supply. The encoder inputs are monitored (A, B, R, A\, B\, R\).

- 1 ABR incremental encoder 5 V
- Encoder input monitoring
- 2 additional inputs, e.g. for latch input
- 5 VDC, 24 VDC and GND for encoder supply
- NetTime timestamp: Counter change
- Can be used with a SafeLOGIC controller

NetTime timestamp of the counter

For many applications, not only the counter value is important, but also the exact time of the counter change. For this purpose, the module has a NetTime function that provides the recorded counter value with a timestamp accurate to microseconds.

The module provides the PLC with the counter value and timestamp as an absolute time value. The NetTime mechanisms ensure that the PLC NetTime clock and the local NetTime clock on the module have the same absolute time at all times.

9.11.3.2 Order data

| Model number | Short description | Figure |
|--------------|--|--|
| | Counter functions |  |
| X20DC1176 | X20 digital counter module, 1 ABR incremental encoder, 5 V, 600 kHz input frequency, 4x evaluation, encoder monitoring, NetTime function | |

| | | PowerSupply02 | Bit 1 | | | | |

1) The offset specifies the position of the register within the CAN object.

9.11.3.8.3.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see ["Using I/O modules on the bus controller" on page 3789](#).

9.11.3.8.3.2 CAN I/O bus controller

The module occupies 1 analog logical slot on CAN I/O.

9.11.3.8.4 Encoder - Configuration

The following registers are used for setting functions and configuring the module.

9.11.3.8.4.1 Enabling error monitoring for the signal lines

Name:

CfO_BWCNTEnableMaskChannel7_0

This register requires individually enabling error monitoring for each of the signal channels. "Open line", "short circuit" and "voltage level too low" are reported as error states. Any errors that occur are reported in the error status registers "BW_Channel_x" on page 1081.

| Data type | Value | Bus controller default setting |
|-----------|--------------------|--------------------------------|
| USINT | See bit structure. | 7 |

Bit structure:

| Bit | Name | Value | Information |
|-------|--|-------|--|
| 0 | Enable error monitoring for signal A lines | 0 | Error monitoring - Encoder Signal A disabled |
| | | 1 | Error monitoring - Encoder signal A enabled (bus controller default setting) |
| 1 | Enable error monitoring for signal B lines | 0 | Error monitoring - Encoder Signal B disabled |
| | | 1 | Error monitoring - Encoder signal B enabled (bus controller default setting) |
| 2 | Enable error monitoring for signal R lines | 0 | Error monitoring - Encoder Signal R disabled |
| | | 1 | Error monitoring - Encoder signal R enabled (bus controller default setting) |
| 3 - 7 | Reserved | 0 | |

9.11.3.8.4.2 Timing for automatic error acknowledgment

Name:

CfO_BWQuitTime_0

This register can be used to enable an additional [automatic acknowledgment](#) of the error status through timing. If a valid time is set, then the acknowledgment can still be made [manually](#), the only difference is that automatic acknowledgment will take place on the module after the defined amount of time has passed. If the error state has not yet been corrected, then the error status remains and the time is reset. Make sure that the time is set long enough for the higher-level system to reliably detect the status messages.

If the timing = 0, then acknowledgment is only possible using the cyclic acknowledgment registers.

| Data type | Value | Information |
|-----------|--------------------|--|
| UDINT | 0 | No automatic acknowledgment. Bus controller default setting |
| | 1 to 2.147.483.647 | Time for automatic acknowledgment [µs] |

9.11.3.8.4.3 Setting the latch mode

Name:

CfO_LatchMode

This register is used to set the latch mode:

- Single shot latch mode:
The latch function must be enabled/set. After a successful latch procedure, the activation must be reset in order for a new latch procedure to be activated.
- Continuous latch mode:
The latch function only has to be enabled/set as long as latching is desired.

A changed counter state on "[Encoder01LatchCount](#)" on page 1080 indicates that the latch procedure has been performed. The counter value is stored in the latch register "[Encoder01Latch](#)" on page 1080.

| Data type | Value | Information |
|-----------|-------|--|
| USINT | 0 | Single-shot latch procedure (bus controller default setting) |
| | 1 | Continuous latch procedure |

9.11.3.8.4.4 Signal channels for triggering latch procedure

Name:

CfO_LatchComparator

This register defines the signal channels and their level for triggering the latch procedure.

- This mainly configures which channels are linked to generate the latch event. All three signals from the encoder and digital input 1 can be used for the "AND" operation.
- The "active voltage level" needed for the latch procedure can now be used according to the physical signals.

| Data type | Values | Bus controller default setting |
|-----------|------------------------|--------------------------------|
| USINT | See the bit structure. | 0 |

Bit structure:

| Bit | Name | Value | Information |
|-----|---|-------|---|
| 0 | Defines signal level for encoder signal A | 0 | Low (bus controller default setting) |
| | | 1 | High |
| 1 | Defines signal level for encoder signal B | 0 | Low (bus controller default setting) |
| | | 1 | High |
| 2 | Defines signal level for encoder signal R | 0 | Low (bus controller default setting) |
| | | 1 | High |
| 3 | Defines signal level for digital input 1 | 0 | Low (bus controller default setting) |
| | | 1 | High |
| 4 | Use encoder signal A to trigger latch procedure | 0 | Disabled (bus controller default setting) |
| | | 1 | Latch function linked to encoder signal A |
| 5 | Use encoder signal B to trigger latch procedure | 0 | Disabled (bus controller default setting) |
| | | 1 | Latch function linked to encoder signal B |
| 6 | Use encoder signal R to trigger latch procedure | 0 | Disabled (bus controller default setting) |
| | | 1 | Latch function linked to encoder signal R |
| 7 | Use digital input 1 to trigger latch procedure | 0 | Disabled (bus controller default setting) |
| | | 1 | Latch function linked to digital input 1 |

9.11.3.8.4.5 Physical configuration

The following registers must be set to the specified constant value for correct physical configuration:

Constant register "CfO_SlframeGenID"

Name:

CfO_SlframeGenID

| Data type | Value | Information |
|-----------|-------|--------------------------------|
| USINT | 9 | Bus controller default setting |

Constant register "CfO_SystemCycleTime"

Name:

CfO_SystemCycleTime

Cycle time of encoder acquisition in 1/8 μ s steps. 1 encoder value is acquired as the counter value per cycle.

| Data type | Value | Information |
|-----------|-------|--|
| UINT | 800 | 800 = 100 μ s. Bus controller default setting |

Constant register "CfO_PhyIOConfigCh0x"

Name:

CfO_PhyIOConfigCh01 to CfO_PhyIOConfigCh05

| Data type | Value | Information |
|-----------|-------|--------------------------------|
| USINT | 0 | Bus controller default setting |

Constant register "CfO_BWQuitTimeSelChannel7_0"

Name:

CfO_BWQuitTimeSelChannel7_0

| Data type | Value | Information |
|-----------|-------|--------------------------------|
| USINT | 0 | Bus controller default setting |

Constant register "CfO_CounterCycleSelect"

Name:

CfO_CounterCycleSelect

| Data type | Value | Information |
|-----------|-------|--------------------------------|
| USINT | 2 | Bus controller default setting |

Constant register "CfO_CounterMode"

Name:

CfO_CounterMode

| Data type | Value | Information |
|-----------|-------|--------------------------------|
| USINT | 3 | Bus controller default setting |

9.11.3.8.5 Encoder - Communication**9.11.3.8.5.1 Counter for verifying the data frame**

Name:

SDCLifeCount

The 8-bit counter register is needed for the SDC software package. It is incremented with the system clock to allow the SDC to check the validity of the data frame.

| Data type | Values |
|-----------|-------------|
| SINT | -128 to 127 |

9.11.3.8.5.2 Display of the counter state

Name:

Encoder01

The counter state of the incremental encoder is displayed as a 16 or 32-bit counter value. Only the 16-bit value is available in the bus controller function model.

| Data type | Value |
|--------------------|----------------------------------|
| INT | -32768 to 32767 |
| DINT ¹⁾ | -2.147.483.648 bis 2.147.483.647 |

1) Can only be configured in the standard function model

9.11.3.8.5.3 NetTime of the last valid counter value

Name:

Encoder01TimeValid

The NetTime of the last valid counter value is the time of the last valid counter value recorded on the module (see register "[Cfo_SystemCycleTime](#)" on page 1078). The user is able to determine the validity of the counter value by evaluating its age in the program. This means that the module and error status bits do not have to be checked additionally to determine the validity of the value.

The NetTime of the last valid counter value that was read is displayed as a 16 or 32-bit value. Only the 16-bit value is available in the bus controller function model.

For more information about NetTime and timestamps, see "[NetTime Technology](#)" on page 3035.

| Data type | Value | Information |
|--------------------|---------------------------------|--------------------|
| INT | -32768 to 32767 | NetTime in μ s |
| DINT ¹⁾ | -2.147.483.648 to 2.147.483.647 | |

1) Can only be configured in the standard function model

9.11.3.8.5.4 NetTime of the last counter value change

Name:

Encoder01TimeChanged

For slow X2X Link cycles, the NetTime of the last counter value change can be used to determine the speed more accurately.

The NetTime of the last counter value change is displayed as a 16 or 32-bit value. Only the 16-bit value is available in the bus controller function model.

For more information about NetTime and timestamps, see "[NetTime Technology](#)" on page 3035.

| Data type | Value | Information |
|--------------------|---------------------------------|--------------------|
| INT | -32768 to 32767 | NetTime in μ s |
| DINT ¹⁾ | -2.147.483.648 to 2.147.483.647 | |

1) Can only be configured in the standard function model

9.11.3.8.5.5 Counter value at the time of the last latch

Name:

Encoder01Latch

The counter value at the time of the last latch is displayed as a 16 or 32-bit value. Only the 16-bit value is available in the bus controller function model.

| Data type | Value |
|--------------------|----------------------------------|
| INT | -32768 to 32767 |
| DINT ¹⁾ | -2.147.483.648 bis 2.147.483.647 |

1) Can only be configured in the standard function model

9.11.3.8.5.6 Counter value of latch event

Name:

Encoder01LatchCount

The latch events are counted and stored in a cyclic 8-bit counter. This counter is incremented with each latch event, thereby indicating a new occurrence. The new latched counter value is stored in the respective latch register.

| Data type | Value |
|-----------|-------------|
| SINT | -128 to 127 |

9.11.3.8.5.7 Encoder commands

Name:

Encoder01Command

This register can be used to

- 1) reset the counter value. The counter is kept at zero until this command is reset.
- 2) enable the latch procedure. If the latch configuration is valid and matches the hardware signals, then this activation causes the counter value to be saved in the latch register.

The two different latch configurations that are possible (see "[Setting the latch mode](#)" on page 1077) must be handled as follows:

- Single shot latch mode:
After successful latching, indicated by the latch event counter, activation must be reset before any more latching is possible. The activation must be set again if additional latching is needed.
- Continuous latch mode:
The latch function only has to be enabled/set as long as latching is desired. The latch event counter is incremented with each event.

| Data type | Value |
|-----------|--------------------|
| USINT | See bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|-------|----------------------|-------|------------------------|
| 0 | Encoder01Reset | 0 | Do not reset |
| | | 1 | Set encoder value to 0 |
| 1 | Encoder01LatchEnable | 0 | Do not activate latch |
| | | 1 | Latching |
| 2 - 7 | Reserved | 0 | |

9.11.3.8.5.8 Input status of signal lines

Name:

Encoder01_A

Encoder01_B

Encoder01_R

DigitalInput01 to DigitalInput02

This register displays the input status of the signal lines from the encoder and the digital inputs.

| Data type | Value |
|-----------|--------------------|
| USINT | See bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|-------|----------------|-------|---------------------------------|
| 0 | Encoder01_A | 0/1 | Input state of encoder signal A |
| 1 | Encoder01_B | 0/1 | Input state of encoder signal B |
| 2 | Encoder01_R | 0/1 | Input state of encoder signal R |
| 3 | Reserved | 0 | |
| 4 | DigitalInput01 | 0/1 | Input state - Digital input 1 |
| 5 | DigitalInput02 | 0/1 | Input state - Digital input 2 |
| 6 - 7 | Reserved | 0 | |

9.11.3.8.5.9 Error status of signal lines

The error states are latched when they occur and are maintained until acknowledged. The counter and time registers are not updated if there are pending or unacknowledged errors.

Status of signal lines

Name:

BW_Channel_A

BW_Channel_B

BW_Channel_R

This register displays the error states of the signal lines from the encoder. The error states are latched when they occur and are maintained until acknowledged. The counter and time registers are not updated if there are pending or unacknowledged errors.

| Data type | Value |
|-----------|--------------------|
| USINT | See bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|-------|--------------|-------|---|
| 0 | BW_Channel_A | 0 | No error in encoder signal A |
| | | 1 | Open line, short circuit or voltage level too low |
| 1 | BW_Channel_B | 0 | No error in encoder signal B |
| | | 1 | Open line, short circuit or voltage level too low |
| 2 | BW_Channel_R | 0 | No error in encoder signal R |
| | | 1 | Open line, short circuit or voltage level too low |
| 3 - 7 | Reserved | 0 | |

Acknowledging error status of signal lines

Name:

BW_QuitChannel_A

BW_QuitChannel_B

BW_QuitChannel_R

This register can be used to acknowledge the latched error states of the signal lines from the encoder. However, if there are still pending errors remaining, then the error status remains active. After acknowledging the errors, the bits must also be reset or else any repetition of the error would be undetected.

| Data type | Value |
|-----------|--------------------|
| USINT | See bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|-------|------------------|-------|---|
| 0 | BW_QuitChannel_A | 0 | No acknowledgment |
| | | 1 | Acknowledgment of error status - Encoder signal A |
| 1 | BW_QuitChannel_B | 0 | No acknowledgment |
| | | 1 | Acknowledgment of error status - Encoder signal B |
| 2 | BW_QuitChannel_R | 0 | No acknowledgment |
| | | 1 | Acknowledgment of error status - Encoder signal R |
| 3 - 7 | Reserved | 0 | |

Manual acknowledgment of latched error states

The latched error states of the signal lines from the encoder can be acknowledged manually. However, if there are still pending errors remaining, then the error status remains active. After successfully acknowledging the errors (latched error status = 0), the acknowledge bits must still be reset by the user or else a re-occurrence of an error could be overlooked by the user.

Example 1: Cause of error corrected before being acknowledged

An error has occurred on a signal line. The error state is detected and latched by the module. The error is acknowledged by the user after the cause of error has been corrected. The latched error status changes to zero.

The manual acknowledge must now be reset so that any new errors will be recognized by the user.

Figure 98: Cause of error corrected before being acknowledged

Example 2: Cause of error not yet corrected before being acknowledged

An error has occurred on a signal line. The error state is detected and latched by the module. The error is acknowledged by the user before the cause of error has been corrected. The latched error status remains set because the error is still remaining.

Acknowledgment is only successful after the cause of error has been corrected. The latched error status changes to zero. The manual acknowledge must now be reset so that any new errors will be recognized by the user.

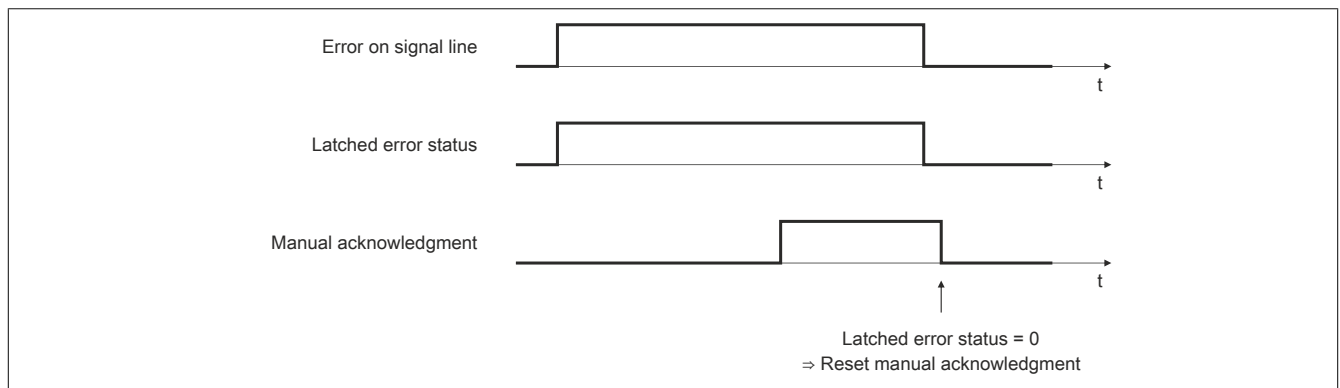

Figure 99: Cause of error not yet corrected before being acknowledged

Automatic acknowledgment of latched error states

In addition to manual acknowledgment, automatic acknowledgment of the latched error states after a specified amount of time can also be enabled. Make sure that the time is set long enough for the higher-level system to reliably detect the status messages and for the validity of the counter value to be determined using its age.

If the time specification = 0, then only manual acknowledgment is possible.

Example 1: An error has occurred on a signal line. The error state is detected and latched by the module. The time for automatic acknowledgment starts counting after the cause of error has been corrected. The error is acknowledged as soon as the time expires. The latched error status changes to zero.

Figure 100: Latched error state acknowledged automatically

Example 2: Automatic and manual acknowledge used
 An error has occurred on a signal line. The error state is detected and latched by the module. The time for automatic acknowledgment starts counting after the cause of error has been corrected. The error is acknowledged manually by the user before the time expires. The latched error status changes to zero. The manual acknowledge must now be reset so that any new errors will be recognized by the user.

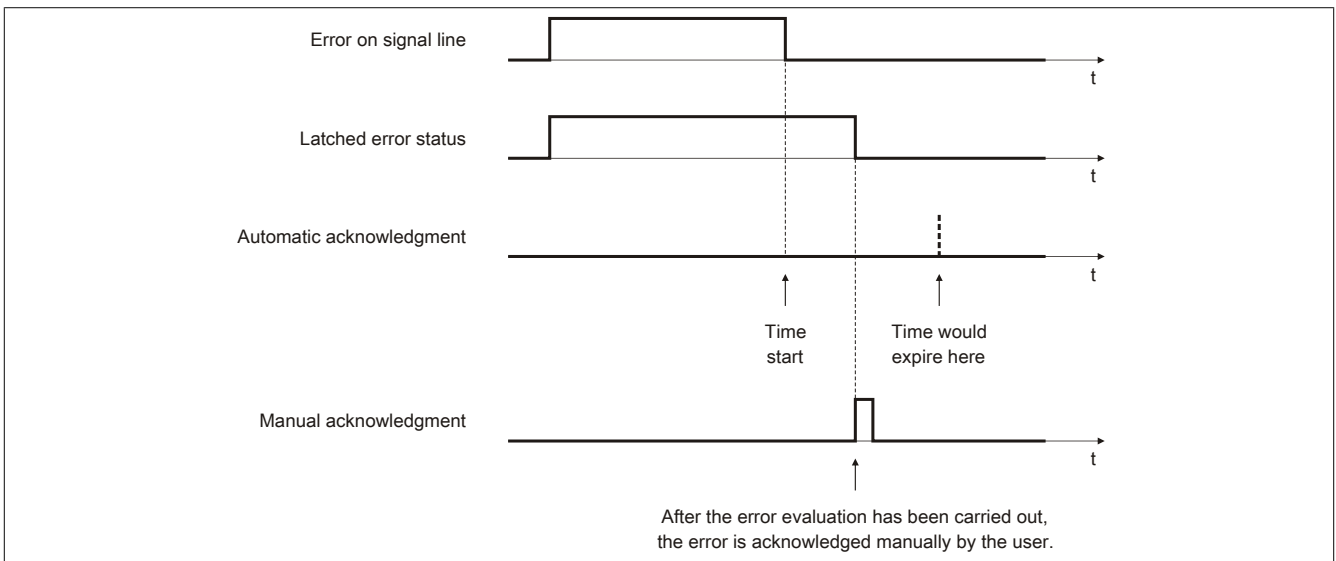

Figure 101: Automatic and manual acknowledge used

9.11.3.8.5.10 Status of encoder supplies

Name:

PowerSupply01 to PowerSupply02

This register shows the status of the integrated encoder supplies. A faulty encoder power supply is displayed as a warning.

| Data type | Value |
|-----------|--------------------|
| USINT | See bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|-------|---------------|-------|------------------------------------|
| 0 | PowerSupply01 | 0 | 24 VDC encoder power supply OK |
| | | 1 | 24 VDC encoder power supply faulty |
| 1 | PowerSupply02 | 0 | 5 VDC encoder power supply OK |
| | | 1 | 5 VDC encoder power supply faulty |
| 2 - 7 | Reserved | - | |

9.11.3.8.6 DATA_to_SafeDATA

Function DATA_to_SafeDATA determines a safe signal from 2 independent standard signals. For this purpose, the standard data of 2 I/O modules are transferred to the SafeLOGIC controller and compared with each other there. With the functions provided in SafeDESIGNER, the resulting data can be used for applications up to PL d.

Function DATA_to_SafeDATA is enabled and the register calls take place using SafeDESIGNER. For more detailed information about the calls, see library DATA_to_SafeDATA_SF contained in SafeDESIGNER.

9.11.3.8.6.1 Counter state of the encoder

Name:

Encoder01

This register represents the counter value of the encoder. The register is only active if function DATA_to_SafeDATA is enabled.

| Data type | Values |
|-----------|---------------------------------|
| DINT | -2,147,483,648 to 2,147,483,647 |

9.11.3.8.6.2 NetTime of the counter value

Name:

Encoder01TimeValid

This register represents the NetTime of the most recent valid counter value. The register is only active if function DATA_to_SafeDATA is enabled.

For a description of NetTime Technology, see ["NetTime Technology" on page 3035](#).

| Data type | Values |
|-----------|---------------------------------|
| DINT | -2,147,483,648 to 2,147,483,647 |

9.11.3.8.6.3 Displaying the SourceRef address

Name:

DTS_SourceRef

This register cyclically displays the SourceRef address set in the configuration. The register is only active if function DATA_to_SafeDATA is enabled.

| Data type | Values |
|-----------|-----------------|
| INT | -32768 to 32767 |

9.11.3.8.6.4 Checksum

Name:

DTS_CheckSum

This register contains a checksum formed from the 3 cyclic data points [Encoder01](#), [Encoder01TimeValid](#) and [DTS_SourceRef](#). The register is only active if function DATA_to_SafeDATA is enabled.

| Data type | Values |
|-----------|-----------------|
| INT | -32768 to 32767 |

9.11.3.8.6.5 SourceRef address

Name:

CfO_DTS_SourceRef

This register contains the acyclically configurable SourceRef address that is transmitted back by the module as a cyclic data point. The register is only active if function DATA_to_SafeDATA is enabled.

| Data type | Values |
|-----------|-----------------|
| INT | -32768 to 32767 |

9.11.3.8.6.6 Constant cycle register

Name:

CfO_DTS_CycleSelect

This register determines the cycle used internally and is not permitted to be changed.

| Data type | Value |
|-----------|-------|
| USINT | 2 |

9.11.3.8.7 NetTime Technology

For a description of NetTime Technology, see ["NetTime Technology" on page 3035](#).

9.11.3.8.8 Minimum cycle time

The minimum cycle time defines how far the bus cycle can be reduced without causing a communication error or impaired functionality. It should be noted that very fast cycles decrease the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time |
|--------------------|
| 150 µs |

9.11.3.8.9 Minimum I/O update time

The minimum I/O update time defines how far the bus cycle can be reduced while still allowing an I/O update to take place in each cycle.

| Minimum I/O update time |
|-------------------------|
| 150 µs |

9.11.4 X20DC1178

Data sheet version: 2.21

9.11.4.1 General information

This module is equipped with one input for SSI absolute encoders with 5 V encoder signal. The data signal is monitored (Data, Data).

- 1 SSI absolute encoder 5 V
- Monitoring the data signal
- 2 additional inputs
- 5 VDC, 24 VDC and GND for encoder supply
- NetTime timestamp: Counter change
- Can be used with a SafeLOGIC controller

NetTime timestamp of the counter

For many applications, not only the counter value is important, but also the exact time of the counter change. For this purpose, the module has a NetTime function that provides the recorded counter value with a timestamp accurate to microseconds.

The module provides the PLC with the counter value and timestamp as an absolute time value. The NetTime mechanisms ensure that the PLC NetTime clock and the local NetTime clock on the module have the same absolute time at all times.

9.11.4.2 Order data

| Model number | Short description | Figure |
|--------------|---|--|
| | Counter functions |  |
| X20DC1178 | X20 digital counter module, 1 SSI absolute encoder, 5 V, 1 Mbit/s, 32-bit, encoder monitoring, NetTime function | |

9.11.4.4 LED status indicators

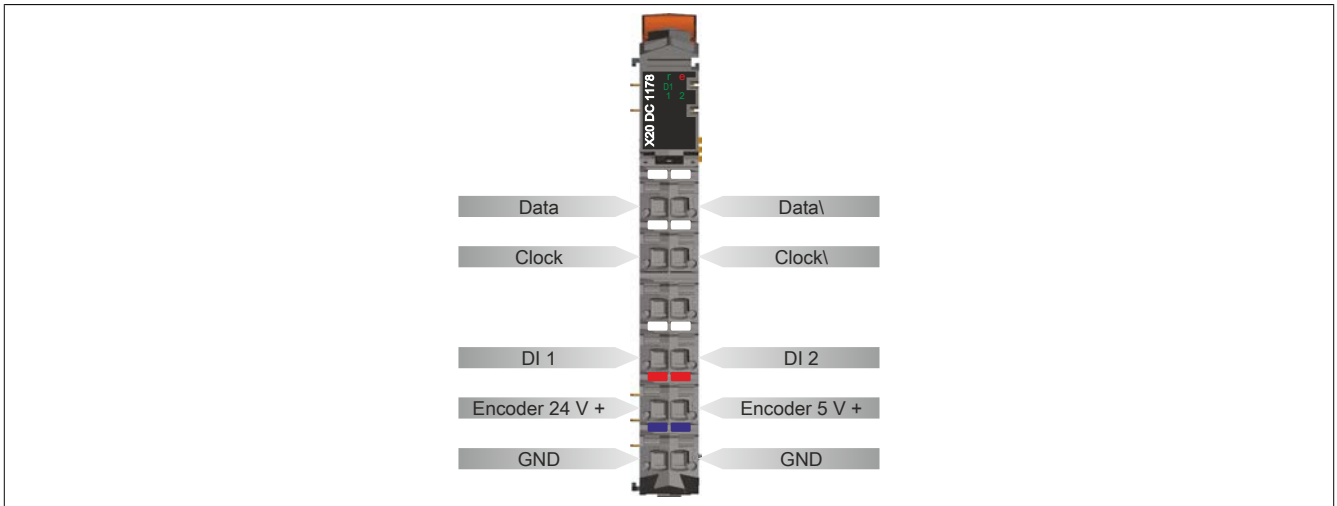

For a description of the various operating modes, see "[Diagnostic LEDs](#)" on page 3787.

| Figure | LED | Color | Status | Description |
|--|-------|-------|--------------|--|
|  | r | Green | Off | No power to module |
| | | | Single flash | RESET mode |
| | | | Double flash | BOOT mode (during firmware update) ¹⁾ |
| | | | Blinking | PREOPERATIONAL mode |
| | | | On | RUN mode |
| | e | Red | Off | No power to module or everything OK |
| | | | Single flash | Either the encoder monitor has detected a line fault on the encoder inputs or a transfer error has occurred. The status bits must be evaluated in order to provide a more detailed definition of this error. The following error states are detected: <ul style="list-style-type: none"> • Open line • Short-circuit or voltage level too low • SSI cycle time violation • Parity error |
| | | | On | Error or reset status |
| | D1 | Green | | Input status - Data signal |
| | 1 - 2 | Green | | Input state of the corresponding digital input |

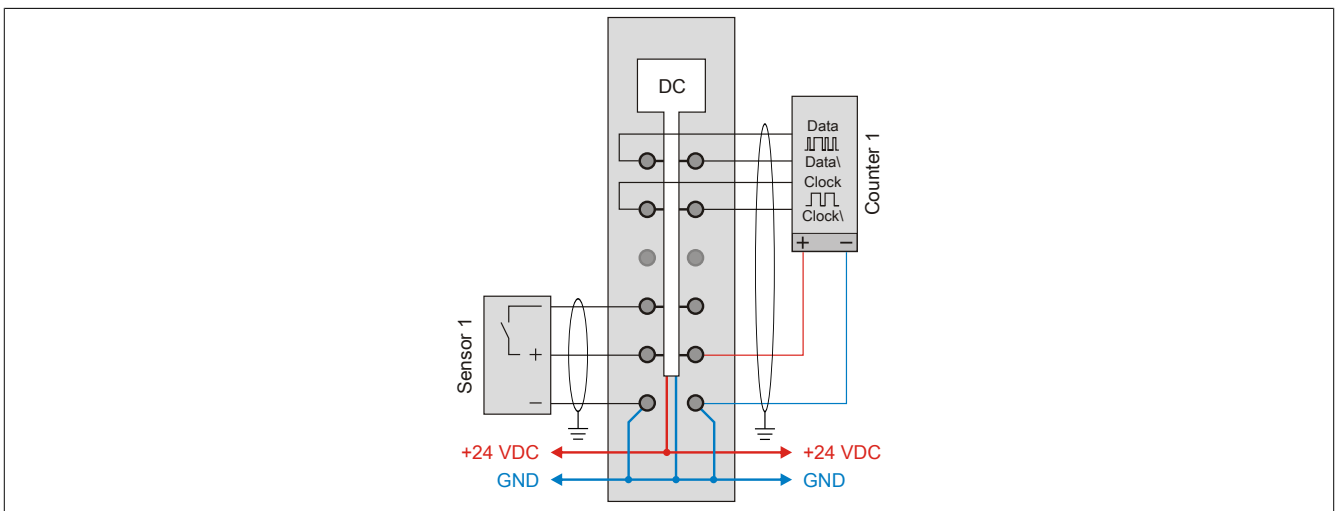

1) Depending on the configuration, a firmware update can take up to several minutes.

9.11.4.5 Pinout

Shielded cables must be used for all signal lines.

1) The offset specifies the position of the register within the CAN object.

9.11.4.9.3.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see ["Using I/O modules on the bus controller" on page 3789](#).

9.11.4.9.3.2 CAN I/O bus controller

The module occupies 1 analog logical slot on CAN I/O.

9.11.4.9.4 Encoder - Configuration

The following registers are used for setting functions and configuring the module.

9.11.4.9.4.1 Setting the SSI sampling cycle time

The following two registers define the cycle time for SSI sampling.

Setting the interrupt

Name:

CfO_CycleSelect

This register assigns the principle interrupt setting:

- **Timer configuration (time setting with "CfO_SystemCyclePrescaler" on page 1094 register):** The SSI transfer can be started independently of the X2X cycle. The timer is synchronized with X2X Link.
- **AOAI:** Configuration with X2X interrupt, one-time start of the SSI transfer in the X2X cycle. The SSI transfer may require an entire X2X cycle.
- **SOSI:** Configuration with X2X interrupt, one-time start of the SSI transfer in the X2X cycle. The reaction time can be optimized with this setting if the SSI transfer doesn't exceed half of an X2X cycle.

| Data type | Value | Filter |
|-----------|-------|---|
| USINT | 3 | Timer [µsec] ... Time setting with register "CfO_SystemCyclePrescaler" on page 1094 |
| | 10 | AOAI (bus controller default setting) |
| | 14 | SOSI |

Setting the cycle time

Name:

CfO_SystemCyclePrescaler

The desired cycle time must be configured additionally for the timer setting using this register.

| Data type | Value | Filter |
|-----------|-------|---|
| USINT | 1 | 50 µs |
| | 2 | 100 µsec (bus controller default setting) |
| | 4 | 200 µs |
| | 8 | 400 µs |
| | 16 | 800 µs |
| | 0 | All other settings in the "CfO_CycleSelect" on page 1094 register |

9.11.4.9.4.2 Setting operating parameters

Name:

CfO_PhysicalMode

This register defines the operating parameters for the SSI encoder to correctly evaluate the data from the encoder.

- **Parity:** Data with or without parity; an error is reported if there is an even or uneven parity mismatch.
- **Monoflop check:** The encoder uses the monoflop to signal the readiness to accept a new clock cycle.
- **Data coding:** Binary or gray coding of the data bits
- **Clock rate:** Speed of data transfer

| Data type | Values | Bus controller default setting |
|-----------|------------------------|--------------------------------|
| USINT | See the bit structure. | 0 |

Bit structure:

| Bit | Name | Value | Information |
|-------|----------------------------------|-------|--|
| 0 - 1 | Parity bit | 00 | No parity bit (no clock bit output) (bus controller default setting) |
| | | 01 | Even parity bit |
| | | 10 | Uneven parity bit |
| | | 11 | Ignore parity bit (clock bit is output, but the result is ignored) |
| 2 - 3 | Monostable multivibrator testing | 00 | No monostable multivibrator check (no clock bit output) (bus controller default setting) |
| | | 01 | Check - Low level |
| | | 10 | Check - High level |
| | | 11 | Check - Ignore level (clock bit is output, but the result is ignored) |
| 4 | Data coding | 0 | Binary coding (bus controller default setting) |
| | | 1 | Gray coding |
| 5 | Reserved | 0 | |
| 6 - 7 | Clock rate | 00 | 1 MHz (bus controller default setting) |
| | | 01 | 500 kHz |
| | | 10 | 250 kHz |
| | | 11 | 125 kHz |

Transferring using Synchronous Serial Interface

Processing the measured value

- 1) Start bit ... The measured value is saved.
- 2) Output of the first data bit
- 3) All data bits are transferred; the monostable multivibrator time starts to run.
- 4) The monostable multivibrator returns to its initial state; a new transfer can be started.

9.11.4.9.4.3 Number of data bits

Name:

Cfo_DataBits

This register can be used to define the number of SSI encoder data bits.

| Data type | Value | Filter |
|-----------|---------|---|
| USINT | 1 to 32 | Number of SSI data bits; Bus controller default setting: 0 |

9.11.4.9.4.4 Leading zeros of the encoder

Name:

Cfo_NullBits

This register can be used to define the number of SSI encoder leading zeros.

| Data type | Value | Filter |
|-----------|---------|---|
| USINT | 1 to 32 | Number of leading zeros; Bus controller default setting: 0 |

9.11.4.9.4.5 Timing for automatic error acknowledgment

Name:

CfO_BWQuitTime_0

This register can be used to enable an additional [automatic acknowledgment](#) of the error status through timing. If a valid time is set, then the acknowledgment can still be made [manually](#), the only difference is that automatic acknowledgment will take place on the module after the defined amount of time has passed. If the error state has not yet been corrected, then the error status remains and the time is reset. Make sure that the time is set long enough for the higher-level system to reliably detect the status messages.

If the timing = 0, then acknowledgment is only possible using the cyclic acknowledgment registers.

| Data type | Value | Information |
|-----------|--------------------|--|
| UDINT | 0 | No automatic acknowledgment. Bus controller default setting |
| | 1 to 2.147.483.647 | Time for automatic acknowledgment [µs] |

Automatic acknowledgment of latched error states

In addition to manual acknowledgment, automatic acknowledgment of the latched error states after a specified amount of time can also be enabled. Make sure that the time is set long enough for the higher-level system to reliably detect the status messages and for the validity of the counter value to be determined using its age.

If the time specification = 0, then only manual acknowledgment is possible.

Example 1: An error has occurred on a signal line. The error state is detected and latched by the module. The time for automatic acknowledgment starts counting after the cause of error has been corrected. The error is acknowledged as soon as the time expires. The latched error status changes to zero.

Figure 102: Latched error state acknowledged automatically

Example 2: Automatic and manual acknowledge used
An error has occurred on a signal line. The error state is detected and latched by the module. The time for automatic acknowledgment starts counting after the cause of error has been corrected. The error is acknowledged manually by the user before the time expires. The latched error status changes to zero. The manual acknowledge must now be reset so that any new errors will be recognized by the user.

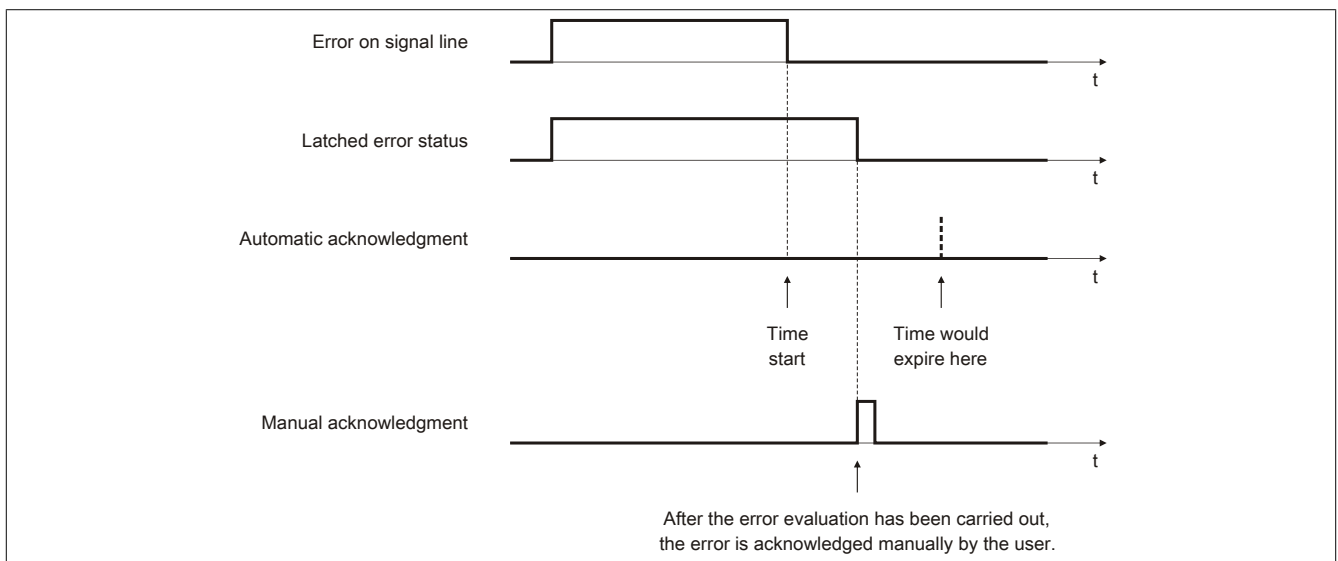

Figure 103: Automatic and manual acknowledge used

Manual acknowledgment of latched error states

The latched error states of the signal lines from the encoder can be acknowledged manually. However, if there are still pending errors remaining, then the error status remains active. After successfully acknowledging the errors (latched error status = 0), the acknowledge bits must still be reset by the user or else a re-occurrence of an error could be overlooked by the user.

Example 1: Cause of error corrected before being acknowledged

An error has occurred on a signal line. The error state is detected and latched by the module. The error is acknowledged by the user after the cause of error has been corrected. The latched error status changes to zero.

The manual acknowledge must now be reset so that any new errors will be recognized by the user.

Figure 104: Cause of error corrected before being acknowledged

Example 2: Cause of error not yet corrected before being acknowledged

An error has occurred on a signal line. The error state is detected and latched by the module. The error is acknowledged by the user before the cause of error has been corrected. The latched error status remains set because the error is still remaining.

Acknowledgment is only successful after the cause of error has been corrected. The latched error status changes to zero. The manual acknowledge must now be reset so that any new errors will be recognized by the user.

Figure 105: Cause of error not yet corrected before being acknowledged

9.11.4.9.4.6 Enable/disable error monitoring for the signal channels

Name:

CfO_BWSSIEnableMaskChannel7_0

This register allows error monitoring for each of the signal channels to be enabled individually. "Open line", "short circuit" and "voltage level too low" are reported as error states. Any errors that occur are reported in the error status registers.

| Data type | Values | Bus controller default setting |
|-----------|--------------------|--------------------------------|
| USINT | See bit structure. | 1 |

Bit structure:

| Bit | Name | Value | Information |
|-------|------------------|-------|---|
| 0 | Encoder signal D | 0 | Error monitoring switched off |
| | | 1 | Error monitoring enabled (bus controller default setting) |
| 1 - 7 | Reserved | 0 | |

9.11.4.9.4.7 Physical configuration

The following registers must be set to the specified constant value for correct physical configuration:

Constant register "CfO_BWQuitTimeSelChannel7_0"

Name:

CfO_BWQuitTimeSelChannel7_0

| Data type | Value | Information |
|-----------|-------|--------------------------------|
| USINT | 0 | Bus controller default setting |

9.11.4.9.5 Encoder - Communication

9.11.4.9.5.1 Counter for verifying the data frame

Name:
SDCLifeCount

The 8-bit counter register is needed for the SDC software package. It is incremented with the system clock to allow the SDC to check the validity of the data frame.

| Data type | Values |
|-----------|-------------|
| SINT | -128 to 127 |

9.11.4.9.5.2 Input status of signal lines

Name:
DigitalInput0 to DigitalInput02

This register displays the input states for the digital inputs.

| Data type | Value |
|-----------|--------------------|
| USINT | See bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|-------|----------------|--------|-------------------------------|
| 0 - 3 | Reserved | 0 | |
| 4 | DigitalInput01 | 0 or 1 | Input state - Digital input 1 |
| 5 | DigitalInput02 | 0 or 1 | Input state - Digital input 2 |
| 6 - 7 | Reserved | 0 | |

9.11.4.9.5.3 Display of the counter state

Name:
Encoder01

The counter state of the incremental encoder is displayed as a 16 or 32-bit counter value.

| Data type | Value |
|--------------------|---------------------------------|
| UDINT | 0 to 4.294.967.295 |
| DINT | -2.147.483.648 to 2.147.483.647 |
| UINT ¹⁾ | 0 to 65535 |

1) Only available in function model 0

9.11.4.9.5.4 NetTime of the last valid counter value

Name:
Encoder01TimeValid

The NetTime of the last valid counter value is the time of the last valid counter value recorded on the module. The user is able to determine the validity of the counter value by evaluating its age in the program. This means that the module and error status bits do not have to be checked additionally to determine the validity of the value.

The NetTime of the last valid counter value that was read is displayed as a 16 or 32-bit value. Only the 16-bit value is available in the bus controller function model.

For more information about NetTime and timestamps, see "[NetTime Technology](#)" on page 3035.

| Data type | Value | Information |
|--------------------|---------------------------------|--------------------|
| INT | -32768 to 32767 | NetTime in μ s |
| DINT ¹⁾ | -2.147.483.648 to 2.147.483.647 | |

1) Can only be configured in the standard function model

9.11.4.9.5.5 NetTime of the last counter value change

Name:

Encoder01TimeChanged

For slow X2X Link cycles, the NetTime of the last counter value change can be used to determine the speed more accurately.

The NetTime of the last counter value change is displayed as a 16 or 32-bit value. Only the 16-bit value is available in the bus controller function model.

For more information about NetTime and timestamps, see "[NetTime Technology](#)" on page 3035.

| Data type | Value | Information |
|--------------------|---------------------------------|--------------------|
| INT | -32768 to 32767 | NetTime in μ s |
| DINT ¹⁾ | -2.147.483.648 to 2.147.483.647 | |

1) Can only be configured in the standard function model

9.11.4.9.5.6 State of the encoder

Name:

EncoderCycleTimeViolation

EncoderDataError

This register displays the error states that occurred while determining the position. The error states are latched when they occur and are maintained until acknowledged.

A cycle time error is triggered if:

- Transfer is still active: This means that the defined cycle time is shorter than the time resulting from the sum of the data bits and stop bits and the clock rate.
- The monoflop level does not match the defined start level
- There is an error pending on the signal line (open line, short circuit).

A data error is triggered if:

- The parity bit does not match.
- An error occurs on the signal line (open line, short circuit) during transfer.

| Data type | Value |
|-----------|--------------------|
| USINT | See bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|-------|---------------------------|-------|-------------------------------------|
| 0 | EncoderCycleTimeViolation | 0 | No error |
| | | 1 | Error status - Cycle time violation |
| 1 | EncoderDataError | 0 | No error |
| | | 1 | Error status - Data error |
| 2 - 7 | Reserved | 0 | |

9.11.4.9.5.7 Acknowledging error status of the encoder

Name:

EncoderQuitCycleTimeViolation

EncoderQuitDataError

This register can be used to acknowledge the latched data error states from the encoder. However, if there are still pending errors remaining, then the error status remains active. After acknowledging the errors, the bits must also be reset or else any repetition of the error would be undetected.

| Data type | Value |
|-----------|--------------------|
| USINT | See bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|-------|-------------------------------|-------|---|
| 0 | EncoderQuitCycleTimeViolation | 0 | No acknowledgment |
| | | 1 | Confirmation of error status - Cycle time violation |
| 1 | EncoderQuitDataError | 0 | No acknowledgment |
| | | 1 | Confirmation of error status - Data error |
| 2 - 7 | Reserved | 0 | |

9.11.4.9.5.8 Status of signal lines

Name:

BW_Channel_D

This register displays the error state of the signal line from the encoder. The error state is latched when it occurs and is maintained until acknowledged. The counter and time registers are not updated if there are pending or unacknowledged errors.

| Data type | Value |
|-----------|--------------------|
| USINT | See bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|-------|--------------|-------|---|
| 0 | BW_Channel_D | 0 | No error - Encoder signal D |
| | | 1 | Error status - Open line or short circuit (voltage level too low) |
| 1 - 7 | Reserved | 0 | |

9.11.4.9.5.9 Acknowledging error status of the signal line

Name:

BW_QuitChannel_D

This register can be used to acknowledge the latched error states of the signal lines from the encoder. However, if there are still pending errors remaining, then the error status remains active. After acknowledging the errors, the bit must also be reset or else any repetition of the error will be undetected.

| Data type | Value |
|-----------|--------------------|
| USINT | See bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|-------|------------------|-------|--------------------------------|
| 0 | BW_QuitChannel_D | 0 | No acknowledgment |
| | | 1 | Acknowledgment of error status |
| 1 - 7 | Reserved | 0 | |

9.11.4.9.5.10 Status of encoder supplies

Name:

PowerSupply01 to PowerSupply02

This register shows the status of the integrated encoder supplies. A faulty encoder power supply is displayed as a warning.

| Data type | Value |
|-----------|--------------------|
| USINT | See bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|-------|---------------|-------|------------------------------------|
| 0 | PowerSupply01 | 0 | 24 VDC encoder power supply OK |
| | | 1 | 24 VDC encoder power supply faulty |
| 1 | PowerSupply02 | 0 | 5 VDC encoder power supply OK |
| | | 1 | 5 VDC encoder power supply faulty |
| 2 - 7 | Reserved | - | |

9.11.4.9.6 DATA_to_SafeDATA

Function DATA_to_SafeDATA determines a safe signal from 2 independent standard signals. For this purpose, the standard data of 2 I/O modules are transferred to the SafeLOGIC controller and compared with each other there. With the functions provided in SafeDESIGNER, the resulting data can be used for applications up to PL d.

Function DATA_to_SafeDATA is enabled and the register calls take place using SafeDESIGNER. For more detailed information about the calls, see library DATA_to_SafeDATA_SF contained in SafeDESIGNER.

9.11.4.9.6.1 Counter state of the encoder

Name:

Encoder01

This register represents the counter value of the encoder. The register is only active if function DATA_to_SafeDATA is enabled.

| Data type | Values |
|-----------|---------------------------------|
| DINT | -2,147,483,648 to 2,147,483,647 |

9.11.4.9.6.2 NetTime of the counter value

Name:

Encoder01TimeValid

This register represents the NetTime of the most recent valid counter value. The register is only active if function DATA_to_SafeDATA is enabled.

For a description of NetTime Technology, see ["NetTime Technology" on page 3035](#).

| Data type | Values |
|-----------|---------------------------------|
| DINT | -2,147,483,648 to 2,147,483,647 |

9.11.4.9.6.3 Displaying the SourceRef address

Name:

DTS_SourceRef

This register cyclically displays the SourceRef address set in the configuration. The register is only active if function DATA_to_SafeDATA is enabled.

| Data type | Values |
|-----------|-----------------|
| INT | -32768 to 32767 |

9.11.4.9.6.4 Checksum

Name:

DTS_CheckSum

This register contains a checksum formed from the 3 cyclic data points [Encoder01](#), [Encoder01TimeValid](#) and [DTS_SourceRef](#). The register is only active if function DATA_to_SafeDATA is enabled.

| Data type | Values |
|-----------|-----------------|
| INT | -32768 to 32767 |

9.11.4.9.6.5 SourceRef address

Name:

CfO_DTS_SourceRef

This register contains the acyclically configurable SourceRef address that is transmitted back by the module as a cyclic data point. The register is only active if function DATA_to_SafeDATA is enabled.

| Data type | Values |
|-----------|-----------------|
| INT | -32768 to 32767 |

9.11.4.9.6.6 Constant cycle register

Name:

CfO_DTS_CycleSelect

This register determines the cycle used internally and is not permitted to be changed.

| Data type | Value |
|-----------|-------|
| USINT | 2 |

9.11.4.9.7 NetTime Technology

For a description of NetTime Technology, see ["NetTime Technology" on page 3035](#).

9.11.4.9.8 Minimum cycle time

The minimum cycle time defines how far the bus cycle can be reduced without causing a communication error or impaired functionality. It should be noted that very fast cycles decrease the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time |
|--------------------|
| 150 μ s |

9.11.4.9.9 Minimum I/O update time

The minimum I/O update time defines how far the bus cycle can be reduced while still allowing an I/O update to take place in each cycle.

| Minimum I/O update time |
|-------------------------|
| 150 μ s |

9.11.5 X20(c)DC1196

Data sheet version: 3.23

9.11.5.1 General information

The module is equipped with 1 input for an ABR incremental encoder with 5 V encoder signal.

- 1 ABR incremental encoder 5 V
- 2 additional inputs e.g. for home enable switch
- 5 VDC, 24 VDC and GND for encoder supply

9.11.5.2 Coated modules

Coated modules are X20 modules with a protective coating for the electronics component. This coating protects X20c modules from condensation and corrosive gases.

The modules' electronics are fully compatible with the corresponding X20 modules.

For simplification purposes, only images and module IDs of uncoated modules are used in this data sheet.

The coating has been certified according to the following standards:

- Condensation: BMW GS 95011-4, 2x 1 cycle
- Corrosive gas: EN 60068-2-60, method 4, exposure 21 days

9.11.5.2.1 Starting temperature

The starting temperature describes the minimum permissible ambient temperature when the power is switched off at the time the coated module is switched on. This is permitted to be as low as -40°C . During operation, the conditions as specified in the technical data continue to apply.

Information:

It is important to absolutely ensure that there is no forced cooling by air currents in a closed control cabinet, for example using a fan or ventilation slots.

9.11.5.3 Order data

| Model number | Short description | Figure |
|--------------|--|--------|
| | Counter functions | |
| X20DC1196 | X20 digital counter module, 1 ABR incremental encoders, 5 V, 600 kHz input frequency, 4x resolution | |
| X20cDC1196 | X20 digital counter module, coated, 1 ABR incremental encoder, 5 V, 600 kHz input frequency, 4x resolution | |
| | Required accessories | |
| | Bus modules | |
| X20BM11 | X20 bus module, 24 VDC keyed, internal I/O supply continuous | |
| X20BM15 | X20 bus module, with node number switch, 24 VDC keyed, internal I/O supply continuous | |
| X20cBM11 | X20 bus module, coated, 24 VDC keyed, internal I/O supply continuous | |
| | Terminal blocks | |
| X20TB12 | X20 terminal block, 12-pin, 24 VDC keyed | |

9.11.5.9 Register description

9.11.5.9.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section ["General data points" on page 3790](#).

9.11.5.9.2 Function model 0 - Standard and Function model 1 - Standard with 32-bit encoder counter value

The difference between function model 0 and function model 1 is the size of the data type for some registers.

- Function model 0 uses data type INT
- Function model 1 uses data type DINT (specified in parentheses)

| Register | Name | Data type | Read | | Write | |
|----------------------|--|-----------|--------|---------|--------|---------|
| | | | Cyclic | Acyclic | Cyclic | Acyclic |
| Configuration | | | | | | |
| 4104 | CfO_EdgeDetectFalling | USINT | | | | • |
| 4106 | CfO_EdgeDetectRising | USINT | | | | • |
| 2064 | CfO_PresetABR01_1_(32Bit) | (D)INT | | | | • |
| 2068 | CfO_PresetABR01_2_(32Bit) | (D)INT | | | | • |
| 512 | ConfigOutput24 | UINT | | | | • |
| 522 | ConfigOutput26 | USINT | | | | • |
| 520 | ConfigOutput27 | USINT | | | | • |

| 264 | Input state of digital inputs 1 to 2 | USINT | • | | | |
| | DigitalInput01 | Bit 4 | | | | |
| | DigitalInput02 | Bit 5 | | | | |
| 2118 | StatusInput01 | USINT | • | | | |
| 40 | Status of encoder supplies | USINT | • | | | |
| | PowerSupply01 | Bit 0 | | | | |
| | PowerSupply02 | Bit 1 | | | | |

9.11.5.9.3 Function model 254 - Bus controller

| Register | Offset ¹⁾ | Name | Data type | Read | | Write | |
|----------------------|----------------------|--|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| Configuration | | | | | | | |
| 4104 | - | CfO_EdgeDetectFalling | USINT | | | | • |
| 4106 | - | CfO_EdgeDetectRising | USINT | | | | • |
| 2064 | - | CfO_PresetABR01_1 | INT | | | | • |
| 2068 | - | CfO_PresetABR01_2 | INT | | | | • |
| 512 | - | ConfigOutput24 | UINT | | | | • |
| 522 | - | ConfigOutput26 | USINT | | | | • |
| 520 | - | ConfigOutput27 | USINT | | | | • |
| Communication | | | | | | | |
| 2116 | 0 | ReferenceModeEncoder01 | USINT | | | • | |
| 2080 | 0 | Encoder01 | INT | • | | | |
| 264 | 2 | Input state of digital inputs 1 to 2 | USINT | • | | | |
| | | DigitalInput01 | Bit 4 | | | | |
| | | DigitalInput02 | Bit 5 | | | | |
| 2118 | 4 | StatusInput01 | USINT | • | | | |
| 40 | 3 | Status of encoder supplies | USINT | • | | | |
| | | PowerSupply01 | Bit 0 | | | | |
| | | PowerSupply02 | Bit 1 | | | | |

1) The offset specifies the position of the register within the CAN object.

9.11.5.9.3.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see ["Using I/O modules on the bus controller" on page 3789](#).

9.11.5.9.3.2 CAN I/O bus controller

The module occupies 1 analog logical slot on CAN I/O.

9.11.5.9.4 ABR encoder - Configuration registers**9.11.5.9.4.1 Reference pulse**

The following registers must be configured by a single acyclic write with the listed values so that the homing procedure is completed on the edge of the reference pulse.

The homing procedure can take place on:

- Rising edge
- Falling edge (default configuration)

Constant register "CfO_EdgeDetectFalling"

Name:

CfO_EdgeDetectFalling

| Data type | Value | Information |
|-----------|-------|---|
| USINT | 0x00 | Configuration value for rising edge |
| | 0x04 | Configuration value for falling edge (bus controller default setting) |

Constant register "CfO_EdgeDetectRising"

Name:

CfO_EdgeDetectRising

| Data type | Value | Information |
|-----------|-------|---|
| USINT | 0x04 | Configuration value for rising edge |
| | 0x00 | Configuration value for falling edge (bus controller default setting) |

Constant register "ConfigOutput24"

Name:

ConfigOutput24

This register contains the value for ABR encoder 1.

| Data type | Value | Information |
|-----------|--------|---|
| UINT | 0x1012 | Configuration value for rising edge |
| | 0x1002 | Configuration value for falling edge (bus controller default setting) |

9.11.5.9.4.2 Setting the home position

Name:

Cfo_PresetABR01_1 to Cfo_PresetABR01_2

CfO_PresetABR01_1_32Bit to CfO_PresetABR01_2_32Bit (only in function model 1)

It is possible to specify 2 home positions with these registers through a one-off acyclic write, for example. The configured values are applied to the counter values after a completed homing procedure.

| Data type | Value | Information |
|--------------------|---------------------------------|-----------------------------------|
| INT | -32,768 to 32,767 | Bus controller default setting: 0 |
| DINT ¹⁾ | -2,147,483,648 to 2,147,483,647 | |

1) Only in function model 1

9.11.5.9.4.3 Homing with reference enable input

Regardless of the referencing mode, it is possible using this register to prevent the home position from being applied when the corresponding reference input voltage level occurs (see ["Input state of digital inputs 1 to 2" on page 1112](#): bit 4). The desired setting can be configured by a one-off acyclic write.

Voltage level for reference enable activation

Name:

ConfigOutput26

The voltage level of the digital inputs to activate reference enable is configured with this register.

| Data type | Value | Information |
|-----------|-------|---|
| USINT | 0x00 | Reference enable is active at 0 VDC (bus controller default setting). |
| | 0x10 | Reference enable for digital input 1 is active at 24 VDC |
| | 0x20 | Reference enable for digital input 2 is active at 24 VDC |
| | 0x30 | Reference enable for both digital inputs is active at 24 VDC |

Reference enable of the input

Name:

ConfigOutput27

This register can be used to define whether the reference enable is activated.

| Data type | Value | Information |
|-----------|-------|--|
| USINT | 0x00 | Reference enable input disabled (bus controller default setting) |
| | 0x10 | Reference enable input 1 enabled |
| | 0x20 | Reference enable input 2 enabled |
| | 0x30 | Reference enable input 1 and 2 enabled |

9.11.5.9.5 ABR encoder - Configuration registers

9.11.5.9.5.1 Counter state of the encoder

Name:
Encoder01

The encoder values are represented as 16-bit or 32-bit counter values in this register.

| Data type | Value |
|--------------------|---------------------------------|
| INT | -32,768 to 32,767 |
| DINT ¹⁾ | -2,147,483,648 to 2,147,483,647 |

1) Only in function model 1

9.11.5.9.5.2 Input state of digital inputs 1 to 2

Name:
DigitalInput01 to DigitalInput02.

This register displays the input status of the encoders and the digital inputs.

| Data type | Value |
|-----------|--------------------|
| USINT | See bit structure. |

| Bit | Name | Value | Information |
|-----|----------------|--------|--------------------------------|
| 0 | Encoder A | 0 or 1 | Input state |
| 1 | Encoder B | 0 or 1 | Input state |
| 2 | Encoder A + B | 0 or 1 | Input state of reference pulse |
| 4 | DigitalInput01 | 0 or 1 | Input state - Digital input 1 |
| 5 | DigitalInput02 | 0 or 1 | Input state - Digital input 2 |

9.11.5.9.5.3 Reading the referencing mode

Name:
ReferenceModeEncoder01

This register determines the referencing mode.

| Data type | Value |
|-----------|--------------------|
| USINT | See bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|-------|------|-------|--------------------------|
| 0 - 1 | | 00 | Referencing OFF |
| | | 01 | Single shot referencing |
| | | 11 | Continuous referencing |
| 2 - 5 | | 0 | Bits permanently set = 0 |
| 6 - 7 | | 00 | Referencing OFF |
| | | 11 | Bits permanently set = 1 |

This results in the following values:

| Binary | Hex | Function |
|----------|------|-------------------------|
| 00000000 | 0x00 | Referencing OFF |
| 11000001 | 0xC1 | Single shot referencing |

For a new start after the completed homing procedure:

- Write value 0x00
- Wait until bit 0 to bit 3 of the StatusInput01 register takes on the value 0. Counter bits 4 to 7 are not erased
- Switch homing procedure on again

| | | |
|----------|------|--|
| 11000011 | 0xC3 | Continuous referencing Referencing occurs at every reference pulse. |
|----------|------|--|

It is important to know how the optional reference enable is configured. See ["Homing with reference enable input" on page 1111](#)

9.11.5.9.5.4 Status of the homing procedure

Name:

StatusInput01

This register contains information regarding whether the referencing process is off, active or complete.

| Data type | Value |
|-----------|--------------------|
| USINT | See bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|-------|--|--------|--|
| 0 | Reference pulse without homing ¹⁾ | 0 | No reference impulse without homing has occurred yet |
| | | 1 | At least a reference impulse without homing has occurred |
| 1 | State change | 0 or 1 | Changes with each reference pulse without homing |
| 2 | Reference pulse with homing ¹⁾ | 0 | No homing has occurred yet |
| | | 1 | At least one homing procedure has occurred |
| 3 | State change | 0 or 1 | Changes with each homing procedure that has taken place |
| 4 | Reference pulse | 0 | The last reference pulse didn't bring about a homing procedure |
| | | 1 | The last reference pulse brought about a homing procedure |
| 5 - 7 | Counter | x | Free-running counter, increased with each reference pulse |

1) Always 1 after the first reference pulse that has occurred

Examples of possible values:

| Binary | Hex | Function |
|------------|-------|---|
| 0x00000000 | 0x00 | Referencing OFF or homing procedure already active |
| 0x00111100 | 0x3CE | First homing procedure complete Reference value applied in the Encoder01 register |
| 0xxxx11100 | 0xxB | Bits 5 to 7 are changed with each reference pulse |
| 0xxxx1x100 | 0xxx | Continuously changing the bits with the "Continuous referencing" setting. The reference value is applied to the Encoder01 register on each reference pulse. |

It is important to know how the optional reference enable (see "[Homing with reference enable input](#)" on page 1111) is configured.

9.11.5.9.5.5 Status of encoder supplies

Name:

PowerSupply01 to PowerSupply02

This register shows the status of the integrated encoder supplies. A faulty encoder power supply is displayed as a warning.

| Data type | Value |
|-----------|--------------------|
| USINT | See bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|-------|---------------|-------|------------------------------------|
| 0 | PowerSupply01 | 0 | 24 VDC encoder power supply OK |
| | | 1 | 24 VDC encoder power supply faulty |
| 1 | PowerSupply02 | 0 | 5 VDC encoder power supply OK |
| | | 1 | 5 VDC encoder power supply faulty |
| 2 - 7 | Reserved | - | |

9.11.5.9.6 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time |
|--------------------|
| 128 μ s |

9.11.5.9.7 Maximum cycle time

The maximum cycle time specifies the time up to which the bus cycle can be increased without internal counter overflows causing module malfunctions.

| Minimum cycle time |
|--------------------|
| 16 ms |

9.11.5.9.8 Minimum I/O update time

The minimum I/O update time specifies how far the bus cycle can be reduced so that an I/O update is performed in each cycle.

| Minimum I/O update time |
|-------------------------|
| 128 μ s |

9.11.6 X20(c)DC1198

Data sheet version: 3.23

9.11.6.1 General information

This module is equipped with one input for SSI absolute encoders with 5 V encoder signal.

- 1 SSI absolute encoder 5 V
- 2 additional inputs
- 5 VDC, 24 VDC and GND for encoder supply

9.11.6.2 Coated modules

Coated modules are X20 modules with a protective coating for the electronics component. This coating protects X20c modules from condensation and corrosive gases.

The modules' electronics are fully compatible with the corresponding X20 modules.

For simplification purposes, only images and module IDs of uncoated modules are used in this data sheet.

The coating has been certified according to the following standards:

- Condensation: BMW GS 95011-4, 2x 1 cycle
- Corrosive gas: EN 60068-2-60, method 4, exposure 21 days

9.11.6.2.1 -40°C starting temperature

The starting temperature describes the minimum permissible ambient temperature when the power is switched off at the time the coated module is switched on. This is permitted to be as low as -40°C. During operation, the conditions as specified in the technical data continue to apply.

Information:

It is important to absolutely ensure that there is no forced cooling by air currents in a closed control cabinet, for example using a fan or ventilation slots.

9.11.6.3 Order data

| Model number | Short description | Figure |
|--------------|---|--------|
| | Counter functions | |
| X20DC1198 | X20 digital counter module, 1 SSI absolute encoder, 5 V, 1 Mbit/s, 32-bit | |

9.11.6.10 Register description

9.11.6.10.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section ["General data points" on page 3790](#).

9.11.6.10.2 Function model 0 - Standard

| Register | Name | Data type | Read | | Write | |
|----------------------|--|-----------|--------|---------|--------|---------|
| | | | Cyclic | Acyclic | Cyclic | Acyclic |
| Configuration | | | | | | |
| 7176 | ConfigOutput14 | UINT | | | | • |
| 7172 | ConfigAdvanced | UDINT | | | | • |
| Communication | | | | | | |
| 7184 | Encoder01 | UDINT | • | | | |
| 264 | Input state of digital inputs 1 to 2 | USINT | • | | | |
| | DigitalInput01 | Bit 4 | | | | |
| | DigitalInput02 | Bit 5 | | | | |
| 40 | Status of encoder supplies | USINT | • | | | |
| | PowerSupply01 | Bit 0 | | | | |
| | PowerSupply02 | Bit 1 | | | | |

9.11.6.10.3 Function model 254 - Bus controller

| Register | Offset ¹⁾ | Name | Data type | Read | | Write | |
|----------------------|----------------------|--|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| Configuration | | | | | | | |
| 7176 | - | ConfigOutput14 | UINT | | | | • |
| 7172 | - | ConfigAdvanced | UDINT | | | | • |
| Communication | | | | | | | |
| 7184 | 0 | Encoder01 | UDINT | • | | | |
| 264 | 4 | Input state of digital inputs 1 to 2 | USINT | • | | | |
| | | DigitalInput01 | Bit 4 | | | | |
| | | DigitalInput02 | Bit 5 | | | | |
| 40 | 5 | Status of encoder supplies | USINT | • | | | |
| | | PowerSupply01 | Bit 0 | | | | |
| | | PowerSupply02 | Bit 1 | | | | |

1) The offset specifies the position of the register within the CAN object.

9.11.6.10.3.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see ["Using I/O modules on the bus controller" on page 3789](#).

9.11.6.10.3.2 CAN I/O bus controller

The module occupies 1 analog logical slot on CAN I/O.

9.11.6.10.4 SSI encoder configuration registers

9.11.6.10.4.1 Standard configuration

Name:

ConfigOutput14

This configuration register sets the encoding, clock rate and number of bits. Default = 0. This must be set once using an acyclic write command.

| Data type | Values | Bus controller default setting |
|-----------|------------------------|--------------------------------|
| UINT | See the bit structure. | 0 |

Bit structure:

| Bit | Name | Value | Information |
|--------|----------------------|-------|--|
| 0 - 5 | SSI value valid bits | x | Bus controller default setting: 0 |
| 6 - 7 | Clock rate | 00 | 1 MHz (bus controller default setting) |
| | | 01 | 500 kHz |
| | | 10 | 250 kHz |
| | | 11 | 125 kHz |
| 8 - 13 | SSI number of bits | x | Number of bits including leading zeros. Bus controller default setting: 0 |
| 14 | Reserved | 0 | |
| 15 | Keying | 0 | Binary encoding (bus controller default setting) |
| | | 1 | Gray coding |

9.11.6.10.4.2 Extended configuration

Name:

ConfigAdvanced

This configuration register is used to set the encoding, clock rate, number of bits and monostable multivibrator settings. This must be set once using an acyclic write command.

It only differs from "ConfigOutput14" on page 1120 by data length and additional monostable multivibrator testing.

| Data type | Values | Bus controller default setting |
|-----------|------------------------|--------------------------------|
| UDINT | See the bit structure. | 65536 |

Bit structure:

| Bit | Name | Value | Information |
|---------|----------------------------------|-------|--|
| 0 - 5 | SSI value valid bits | x | Bus controller default setting: 0 |
| 6 - 7 | Clock rate | 00 | 1 MHz (bus controller default setting) |
| | | 01 | 500 kHz |
| | | 10 | 250 kHz |
| | | 11 | 125 kHz |
| 8 - 13 | SSI number of bits | x | Number of bits including leading zeros. Bus controller default setting: 0 |
| 14 | Reserved | 0 | |
| 15 | Keying | 0 | Binary encoding (bus controller default setting) |
| | | 1 | Gray coding |
| 16 - 17 | Monostable multivibrator testing | 00 | Check OFF, no additional clock bit |
| | | 01 | Check set to high level (bus controller default setting) |
| | | 10 | Check set to Low level |
| | | 11 | Level is clocked but ignored |
| 18 - 31 | Reserved | 0 | Reserved |

Transferring using Synchronous Serial Interface

Processing the measured value

- 1) Start bit ... The measured value is saved.
- 2) Output of the first data bit
- 3) All data bits are transferred; the monostable multivibrator time starts to run.
- 4) The monostable multivibrator returns to its initial state; a new transfer can be started.

9.11.6.10.5 SSI encoder communication registers

9.11.6.10.5.1 SSI position values

Name:
Encoder01

The SSI encoder value is displayed as a 32-bit position value. The SSI position value is generated synchronously with the X2X cycle.

| Data type | Value | Filter |
|-----------|--------------------|--------------|
| UDINT | 0 to 4,294,967,295 | SSI position |

9.11.6.10.5.2 Input state of digital inputs 1 to 2

Name:
DigitalInput01 to DigitalInput02

This register is used to indicate the input state of digital inputs 1 to 2.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|-----|----------------|--------|-------------------------------|
| 4 | DigitalInput01 | 0 or 1 | Input state - Digital input 1 |
| 5 | DigitalInput02 | 0 or 1 | Input state - Digital input 2 |

9.11.6.10.5.3 Status of encoder supplies

Name:
PowerSupply01 to PowerSupply02

This register shows the status of the integrated encoder supplies. A faulty encoder power supply is displayed as a warning.

| Data type | Value |
|-----------|--------------------|
| USINT | See bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|-------|---------------|-------|------------------------------------|
| 0 | PowerSupply01 | 0 | 24 VDC encoder power supply OK |
| | | 1 | 24 VDC encoder power supply faulty |
| 1 | PowerSupply02 | 0 | 5 VDC encoder power supply OK |
| | | 1 | 5 VDC encoder power supply faulty |
| 2 - 7 | Reserved | - | |

9.11.6.10.6 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time |
|--------------------|
| 128 μ s |

9.11.6.10.7 Maximum cycle time

The maximum cycle time specifies the time up to which the bus cycle can be increased without internal counter overflows causing module malfunctions.

| Minimum cycle time |
|--------------------|
| 16 ms |

9.11.6.10.8 Minimum I/O update time

The minimum I/O update time specifies how far the bus cycle can be reduced so that an I/O update is performed in each cycle.

| Minimum I/O update time |
|-------------------------|
| 128 μ s |

9.11.7 X20DC11A6

Data sheet version: 2.21

9.11.7.1 General information

The module is equipped with 1 input for an ABR incremental encoder with RS422-based output signals and 5 V encoder supply. The encoder inputs are monitored (A, B, R, A\, B\, R\).

- 1 ABR incremental encoder 5 V
- Encoder input monitoring (up to 250 kHz input frequency)
- 2 additional inputs, e.g. for latch input
- 5 VDC, 24 VDC and GND for encoder supply
- NetTime timestamp: Counter change

NetTime timestamp of the counter

For many applications, not only the counter value is important, but also the exact time of the counter change. For this purpose, the module has a NetTime function that provides the recorded counter value with a timestamp accurate to microseconds.

The module provides the PLC with the counter value and timestamp as an absolute time value. The NetTime mechanisms ensure that the PLC NetTime clock and the local NetTime clock on the module have the same absolute time at all times.

9.11.7.2 Order data

| Model number | Short description | Figure |
|--------------|--|--|
| | Counter functions |  |
| X20DC11A6 | X20 digital counter module, 1 ABR incremental encoder, 5 V, 5 MHz input frequency, 4x evaluation, encoder monitoring, NetTime function | |
| | Required accessories | |
| | Bus modules | |
| X20BM11 | X20 bus module, 24 VDC keyed, internal I/O supply continuous | |
| X20BM15 | X20 bus module, with node number switch, 24 VDC keyed, internal I/O supply continuous | |
| | Terminal blocks | |
| X20TB12 | X20 terminal block, 12-pin, 24 VDC keyed | |
| | | |

Table 202: X20DC11A6 - Technical data

9.11.7.4 LED status indicators

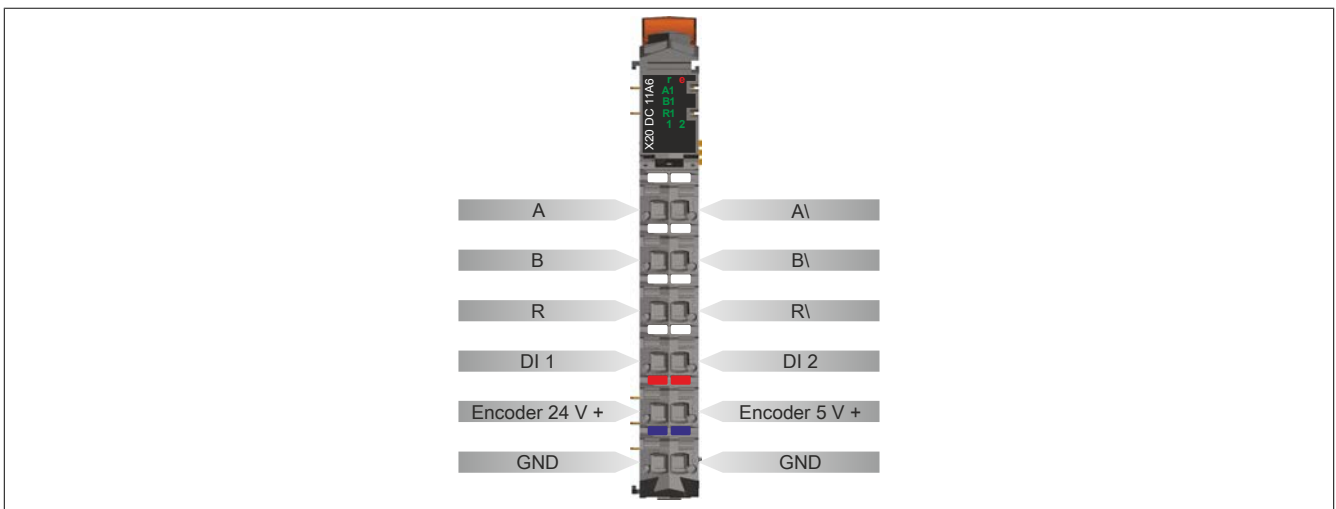

For a description of the various operating modes, see ["Diagnostic LEDs" on page 3787](#).

| Figure | LED | Color | Status | Description |
|--|-------|-------|--|---|
|  | r | Green | Off | No power to module |
| | | | Single flash | RESET mode |
| | | | Double flash | BOOT mode (during firmware update) ¹⁾ |
| | | | Blinking | PREOPERATIONAL mode |
| | | | On | RUN mode |
| | e | Red | Off | No power to module or everything OK |
| | | | Single flash | The encoder monitor has detected a line fault on the encoder inputs. The status bits must be evaluated in order to provide a more detailed definition of this error. The following error states are detected: <ul style="list-style-type: none"> Broken connection (up to 250 kHz input frequency) Short-circuit or voltage level too low |
| | | | On | Error or reset status |
| | A1 | Green | | Input state of counter input A |
| | B1 | Green | | Input state of counter input B |
| R1 | Green | | Input state of reference pulse R | |
| 1 - 2 | Green | | Input state of the corresponding digital input | |

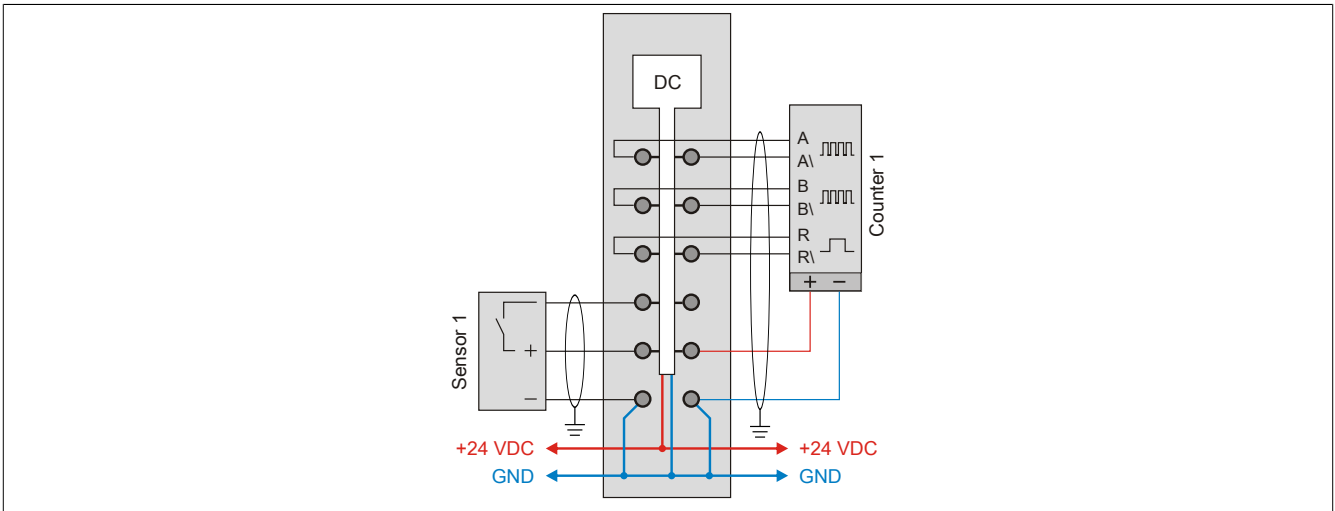

1) Depending on the configuration, a firmware update can take up to several minutes.

9.11.7.5 Pinout

Shielded cables must be used for all signal lines.

9.11.7.8 Register description

9.11.7.8.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section "General data points" on page 3790.

9.11.7.8.2 Function model 0 - Standard

| Register | Name | Data type | Read | | Write | |

| | | PowerSupply02 | Bit 1 | | | | |

1) The offset specifies the position of the register within the CAN object.

9.11.7.8.3.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see ["Using I/O modules on the bus controller" on page 3789](#).

9.11.7.8.3.2 CAN I/O bus controller

The module occupies 1 analog logical slot on CAN I/O.

9.11.7.8.4 Encoder - Configuration

The following registers are used for setting functions and configuring the module.

9.11.7.8.4.1 Enabling error monitoring for the signal lines

Name:

CfO_BWCNTEnableMaskChannel7_0

This register requires individually enabling error monitoring for each of the signal channels. "Open line", "short circuit" and "voltage level too low" are reported as error states. Any errors that occur are reported in the error status registers "BW_Channel_x" on page 1132.

| Data type | Value | Bus controller default setting |
|-----------|--------------------|--------------------------------|
| USINT | See bit structure. | 7 |

Bit structure:

| Bit | Name | Value | Information |
|-------|--|-------|--|
| 0 | Enable error monitoring for signal A lines | 0 | Error monitoring - Encoder Signal A disabled |
| | | 1 | Error monitoring - Encoder signal A enabled (bus controller default setting) |
| 1 | Enable error monitoring for signal B lines | 0 | Error monitoring - Encoder Signal B disabled |
| | | 1 | Error monitoring - Encoder signal B enabled (bus controller default setting) |
| 2 | Enable error monitoring for signal R lines | 0 | Error monitoring - Encoder Signal R disabled |
| | | 1 | Error monitoring - Encoder signal R enabled (bus controller default setting) |
| 3 - 7 | Reserved | 0 | |

9.11.7.8.4.2 Timing for automatic error acknowledgment

Name:

CfO_BWQuitTime_0

This register can be used to enable an additional [automatic acknowledgment](#) of the error status through timing. If a valid time is set, then the acknowledgment can still be made [manually](#), the only difference is that automatic acknowledgment will take place on the module after the defined amount of time has passed. If the error state has not yet been corrected, then the error status remains and the time is reset. Make sure that the time is set long enough for the higher-level system to reliably detect the status messages.

If the timing = 0, then acknowledgment is only possible using the cyclic acknowledgment registers.

| Data type | Value | Information |
|-----------|--------------------|--|
| UDINT | 0 | No automatic acknowledgment. Bus controller default setting |
| | 1 to 2.147.483.647 | Time for automatic acknowledgment [µs] |

9.11.7.8.4.3 Setting the latch mode

Name:

CfO_LatchMode

This register is used to set the latch mode:

- Single shot latch mode:
The latch function must be enabled/set. After a successful latch procedure, the activation must be reset in order for a new latch procedure to be activated.
- Continuous latch mode:
The latch function only has to be enabled/set as long as latching is desired.

A changed counter state on "[Encoder01LatchCount](#)" on page 1131 indicates that the latch procedure has been performed. The counter value is stored in the latch register "[Encoder01Latch](#)" on page 1131.

| Data type | Value | Information |
|-----------|-------|--|
| USINT | 0 | Single-shot latch procedure (bus controller default setting) |
| | 1 | Continuous latch procedure |

9.11.7.8.4.4 Signal channels for triggering latch procedure

Name:

CfO_LatchComparator

This register defines the signal channels and their level for triggering the latch procedure.

- This mainly configures which channels are linked to generate the latch event. All three signals from the encoder and digital input 1 can be used for the "AND" operation.
- The "active voltage level" needed for the latch procedure can now be used according to the physical signals.

| Data type | Values | Bus controller default setting |
|-----------|------------------------|--------------------------------|
| USINT | See the bit structure. | 0 |

Bit structure:

| Bit | Name | Value | Information |
|-----|---|-------|---|
| 0 | Defines signal level for encoder signal A | 0 | Low (bus controller default setting) |
| | | 1 | High |
| 1 | Defines signal level for encoder signal B | 0 | Low (bus controller default setting) |
| | | 1 | High |
| 2 | Defines signal level for encoder signal R | 0 | Low (bus controller default setting) |
| | | 1 | High |
| 3 | Defines signal level for digital input 1 | 0 | Low (bus controller default setting) |
| | | 1 | High |
| 4 | Use encoder signal A to trigger latch procedure | 0 | Disabled (bus controller default setting) |
| | | 1 | Latch function linked to encoder signal A |
| 5 | Use encoder signal B to trigger latch procedure | 0 | Disabled (bus controller default setting) |
| | | 1 | Latch function linked to encoder signal B |
| 6 | Use encoder signal R to trigger latch procedure | 0 | Disabled (bus controller default setting) |
| | | 1 | Latch function linked to encoder signal R |
| 7 | Use digital input 1 to trigger latch procedure | 0 | Disabled (bus controller default setting) |
| | | 1 | Latch function linked to digital input 1 |

9.11.7.8.4.5 Physical configuration

The following registers must be set to the specified constant value for correct physical configuration:

Constant register "CfO_SlframeGenID"

Name:

CfO_SlframeGenID

| Data type | Value | Information |
|-----------|-------|--------------------------------|
| USINT | 9 | Bus controller default setting |

Constant register "CfO_SystemCycleTime"

Name:

CfO_SystemCycleTime

Cycle time of encoder acquisition in 1/8 μ s steps. 1 encoder value is acquired as the counter value per cycle.

| Data type | Value | Information |
|-----------|-------|--|
| UINT | 800 | 800 = 100 μ s. Bus controller default setting |

Constant register "CfO_PhyIOConfigCh0x"

Name:

CfO_PhyIOConfigCh01 to CfO_PhyIOConfigCh05

| Data type | Value | Information |
|-----------|-------|--------------------------------|
| USINT | 0 | Bus controller default setting |

Constant register "CfO_BWQuitTimeSelChannel7_0"

Name:

CfO_BWQuitTimeSelChannel7_0

| Data type | Value | Information |
|-----------|-------|--------------------------------|
| USINT | 0 | Bus controller default setting |

Constant register "CfO_CounterCycleSelect"

Name:

CfO_CounterCycleSelect

| Data type | Value | Information |
|-----------|-------|--------------------------------|
| USINT | 2 | Bus controller default setting |

Constant register "CfO_CounterMode"

Name:

CfO_CounterMode

| Data type | Value | Information |
|-----------|-------|--------------------------------|
| USINT | 3 | Bus controller default setting |

9.11.7.8.5 Encoder - Communication**9.11.7.8.5.1 Counter for verifying the data frame**

Name:

SDCLifeCount

The 8-bit counter register is needed for the SDC software package. It is incremented with the system clock to allow the SDC to check the validity of the data frame.

| Data type | Values |
|-----------|-------------|
| SINT | -128 to 127 |

9.11.7.8.5.2 Display of the counter state

Name:

Encoder01

The counter state of the incremental encoder is displayed as a 16 or 32-bit counter value. Only the 16-bit value is available in the bus controller function model.

| Data type | Value |
|--------------------|----------------------------------|
| INT | -32768 to 32767 |
| DINT ¹⁾ | -2.147.483.648 bis 2.147.483.647 |

1) Can only be configured in the standard function model

9.11.7.8.5.3 NetTime of the last valid counter value

Name:

Encoder01TimeValid

The NetTime of the last valid counter value is the time of the last valid counter value recorded on the module (see register "[Cfo_SystemCycleTime](#)" on page 1129). The user is able to determine the validity of the counter value by evaluating its age in the program. This means that the module and error status bits do not have to be checked additionally to determine the validity of the value.

The NetTime of the last valid counter value that was read is displayed as a 16 or 32-bit value. Only the 16-bit value is available in the bus controller function model.

For more information about NetTime and timestamps, see "[NetTime Technology](#)" on page 3035.

| Data type | Value | Information |
|--------------------|---------------------------------|--------------------|
| INT | -32768 to 32767 | NetTime in μ s |
| DINT ¹⁾ | -2.147.483.648 to 2.147.483.647 | |

1) Can only be configured in the standard function model

9.11.7.8.5.4 NetTime of the last counter value change

Name:

Encoder01TimeChanged

For slow X2X Link cycles, the NetTime of the last counter value change can be used to determine the speed more accurately.

The NetTime of the last counter value change is displayed as a 16 or 32-bit value. Only the 16-bit value is available in the bus controller function model.

For more information about NetTime and timestamps, see "[NetTime Technology](#)" on page 3035.

| Data type | Value | Information |
|--------------------|---------------------------------|--------------------|
| INT | -32768 to 32767 | NetTime in μ s |
| DINT ¹⁾ | -2.147.483.648 to 2.147.483.647 | |

1) Can only be configured in the standard function model

9.11.7.8.5.5 Counter value at the time of the last latch

Name:

Encoder01Latch

The counter value at the time of the last latch is displayed as a 16 or 32-bit value. Only the 16-bit value is available in the bus controller function model.

| Data type | Value |
|--------------------|----------------------------------|
| INT | -32768 to 32767 |
| DINT ¹⁾ | -2.147.483.648 bis 2.147.483.647 |

1) Can only be configured in the standard function model

9.11.7.8.5.6 Counter value of latch event

Name:

Encoder01LatchCount

The latch events are counted and stored in a cyclic 8-bit counter. This counter is incremented with each latch event, thereby indicating a new occurrence. The new latched counter value is stored in the respective latch register.

| Data type | Value |
|-----------|-------------|
| SINT | -128 to 127 |

9.11.7.8.5.7 Encoder commands

Name:

Encoder01Command

This register can be used to

- 1) reset the counter value. The counter is kept at zero until this command is reset.
- 2) enable the latch procedure. If the latch configuration is valid and matches the hardware signals, then this activation causes the counter value to be saved in the latch register.

The two different latch configurations that are possible (see "[Setting the latch mode](#)" on page 1128) must be handled as follows:

- Single shot latch mode:
After successful latching, indicated by the latch event counter, activation must be reset before any more latching is possible. The activation must be set again if additional latching is needed.
- Continuous latch mode:
The latch function only has to be enabled/set as long as latching is desired. The latch event counter is incremented with each event.

| Data type | Value |
|-----------|--------------------|
| USINT | See bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|-------|----------------------|-------|------------------------|
| 0 | Encoder01Reset | 0 | Do not reset |
| | | 1 | Set encoder value to 0 |
| 1 | Encoder01LatchEnable | 0 | Do not activate latch |
| | | 1 | Latching |
| 2 - 7 | Reserved | 0 | |

9.11.7.8.5.8 Input status of signal lines

Name:

Encoder01_A

Encoder01_B

Encoder01_R

DigitalInput01 to DigitalInput02

This register displays the input status of the signal lines from the encoder and the digital inputs.

| Data type | Value |
|-----------|--------------------|
| USINT | See bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|-------|----------------|-------|---------------------------------|
| 0 | Encoder01_A | 0/1 | Input state of encoder signal A |
| 1 | Encoder01_B | 0/1 | Input state of encoder signal B |
| 2 | Encoder01_R | 0/1 | Input state of encoder signal R |
| 3 | Reserved | 0 | |
| 4 | DigitalInput01 | 0/1 | Input state - Digital input 1 |
| 5 | DigitalInput02 | 0/1 | Input state - Digital input 2 |
| 6 - 7 | Reserved | 0 | |

9.11.7.8.5.9 Error status of signal lines

The error states are latched when they occur and are maintained until acknowledged. The counter and time registers are not updated if there are pending or unacknowledged errors.

Status of signal lines

Name:

BW_Channel_A

BW_Channel_B

BW_Channel_R

This register displays the error states of the signal lines from the encoder. The error states are latched when they occur and are maintained until acknowledged. The counter and time registers are not updated if there are pending or unacknowledged errors.

| Data type | Value |
|-----------|--------------------|
| USINT | See bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|-------|--------------|-------|---|
| 0 | BW_Channel_A | 0 | No error in encoder signal A |
| | | 1 | Open line, short circuit or voltage level too low |
| 1 | BW_Channel_B | 0 | No error in encoder signal B |
| | | 1 | Open line, short circuit or voltage level too low |
| 2 | BW_Channel_R | 0 | No error in encoder signal R |
| | | 1 | Open line, short circuit or voltage level too low |
| 3 - 7 | Reserved | 0 | |

Acknowledging error status of signal lines

Name:

BW_QuitChannel_A

BW_QuitChannel_B

BW_QuitChannel_R

This register can be used to acknowledge the latched error states of the signal lines from the encoder. However, if there are still pending errors remaining, then the error status remains active. After acknowledging the errors, the bits must also be reset or else any repetition of the error would be undetected.

| Data type | Value |
|-----------|--------------------|
| USINT | See bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|-------|------------------|-------|---|
| 0 | BW_QuitChannel_A | 0 | No acknowledgment |
| | | 1 | Acknowledgment of error status - Encoder signal A |
| 1 | BW_QuitChannel_B | 0 | No acknowledgment |
| | | 1 | Acknowledgment of error status - Encoder signal B |
| 2 | BW_QuitChannel_R | 0 | No acknowledgment |
| | | 1 | Acknowledgment of error status - Encoder signal R |
| 3 - 7 | Reserved | 0 | |

Manual acknowledgment of latched error states

The latched error states of the signal lines from the encoder can be acknowledged manually. However, if there are still pending errors remaining, then the error status remains active. After successfully acknowledging the errors (latched error status = 0), the acknowledge bits must still be reset by the user or else a re-occurrence of an error could be overlooked by the user.

Example 1: Cause of error corrected before being acknowledged

An error has occurred on a signal line. The error state is detected and latched by the module. The error is acknowledged by the user after the cause of error has been corrected. The latched error status changes to zero.

The manual acknowledge must now be reset so that any new errors will be recognized by the user.

Figure 106: Cause of error corrected before being acknowledged

Example 2: Cause of error not yet corrected before being acknowledged

An error has occurred on a signal line. The error state is detected and latched by the module. The error is acknowledged by the user before the cause of error has been corrected. The latched error status remains set because the error is still remaining.

Acknowledgment is only successful after the cause of error has been corrected. The latched error status changes to zero. The manual acknowledge must now be reset so that any new errors will be recognized by the user.

Figure 107: Cause of error not yet corrected before being acknowledged

Automatic acknowledgment of latched error states

In addition to manual acknowledgment, automatic acknowledgment of the latched error states after a specified amount of time can also be enabled. Make sure that the time is set long enough for the higher-level system to reliably detect the status messages and for the validity of the counter value to be determined using its age.

If the time specification = 0, then only manual acknowledgment is possible.

Example 1: An error has occurred on a signal line. The error state is detected and latched by the module. The time for automatic acknowledgment starts counting after the cause of error has been corrected. The error is acknowledged as soon as the time expires. The latched error status changes to zero.

Figure 108: Latched error state acknowledged automatically

Example 2: Automatic and manual acknowledge used
An error has occurred on a signal line. The error state is detected and latched by the module. The time for automatic acknowledgment starts counting after the cause of error has been corrected. The error is acknowledged manually by the user before the time expires. The latched error status changes to zero. The manual acknowledge must now be reset so that any new errors will be recognized by the user.

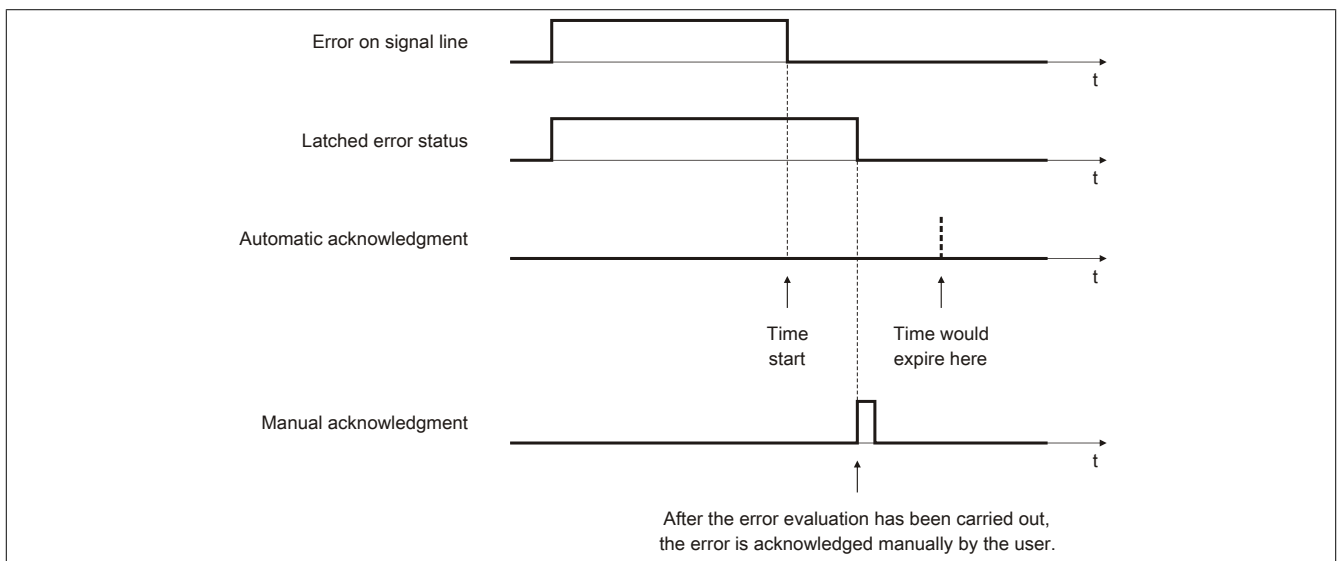

Figure 109: Automatic and manual acknowledge used

9.11.7.8.5.10 Status of encoder supplies

Name:

PowerSupply01 to PowerSupply02

This register shows the status of the integrated encoder supplies. A faulty encoder power supply is displayed as a warning.

| Data type | Value |
|-----------|--------------------|
| USINT | See bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|-------|---------------|-------|------------------------------------|
| 0 | PowerSupply01 | 0 | 24 VDC encoder power supply OK |
| | | 1 | 24 VDC encoder power supply faulty |
| 1 | PowerSupply02 | 0 | 5 VDC encoder power supply OK |
| | | 1 | 5 VDC encoder power supply faulty |
| 2 - 7 | Reserved | - | |

9.11.7.8.6 NetTime Technology

For a description of NetTime Technology, see ["NetTime Technology" on page 3035](#).

9.11.7.8.7 Minimum cycle time

The minimum cycle time defines how far the bus cycle can be reduced without causing a communication error or impaired functionality. It should be noted that very fast cycles decrease the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time |
|--------------------|
| 150 µs |

9.11.7.8.8 Minimum I/O update time

The minimum I/O update time defines how far the bus cycle can be reduced while still allowing an I/O update to take place in each cycle.

| Minimum I/O update time |
|-------------------------|
| 150 µs |

9.11.8 X20DC1376

Data sheet version: 2.31

9.11.8.1 General information

The module is equipped with 1 input for an ABR incremental encoder with 24 V encoder supply. The encoder inputs are monitored (A, B, R). The module is suitable for incremental encoders with push-pull outputs with no complementary signal.

- 1 ABR incremental encoder 24 V, asymmetric
- Encoder input monitoring
- 2 additional inputs, e.g. for latch input
- 24 VDC and GND for encoder supply
- NetTime timestamp: Counter change

NetTime timestamp of the counter

For many applications, not only the counter value is important, but also the exact time of the counter change. For this purpose, the module has a NetTime function that provides the recorded counter value with a timestamp accurate to microseconds.

The module provides the PLC with the counter value and timestamp as an absolute time value. The NetTime mechanisms ensure that the PLC NetTime clock and the local NetTime clock on the module have the same absolute time at all times.

9.11.8.2 Order data

| Model number | Short description | Figure |

9.11.8.4 LED status indicators

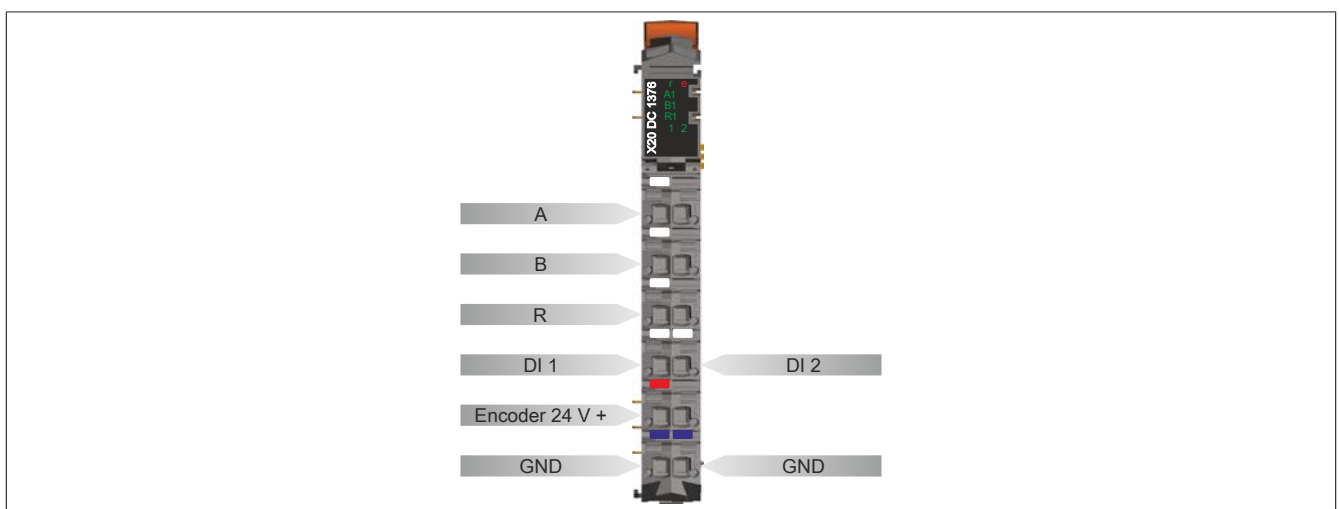

For a description of the various operating modes, see "[Diagnostic LEDs](#)" on page 3787.

| Figure | LED | Color | Status | Description |
|--|-------|-------|----------------------------------|---|
|  | r | Green | Off | No power to module |
| | | | Single flash | RESET mode |
| | | | Double flash | BOOT mode (during firmware update) ¹⁾ |
| | | | Blinking | PREOPERATIONAL mode |
| | | | On | RUN mode |
| | e | Red | Off | No power to module or everything OK |
| | | | Single flash | The encoder monitor has detected a line fault on the encoder inputs. The status bits must be evaluated in order to provide a more detailed definition of this error. The following error states are detected: <ul style="list-style-type: none"> • Open line • Short-circuit or voltage level too low |
| | | | On | Error or reset status |
| | A1 | Green | | Input state of counter input A |
| | B1 | Green | | Input state of counter input B |
| R1 | Green | | Input state of reference pulse R | |
| 1 - 2 | Green | | Input status - digital input | |

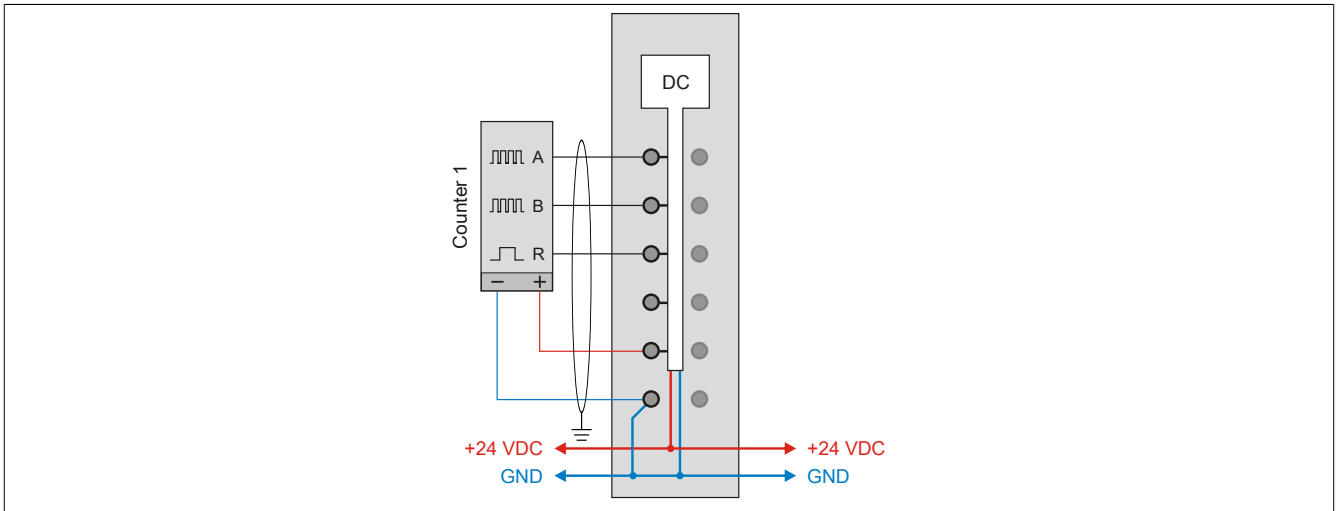

1) Depending on the configuration, a firmware update can take up to several minutes.

9.11.8.5 Pinout

Shielded cables must be used for all signal lines.

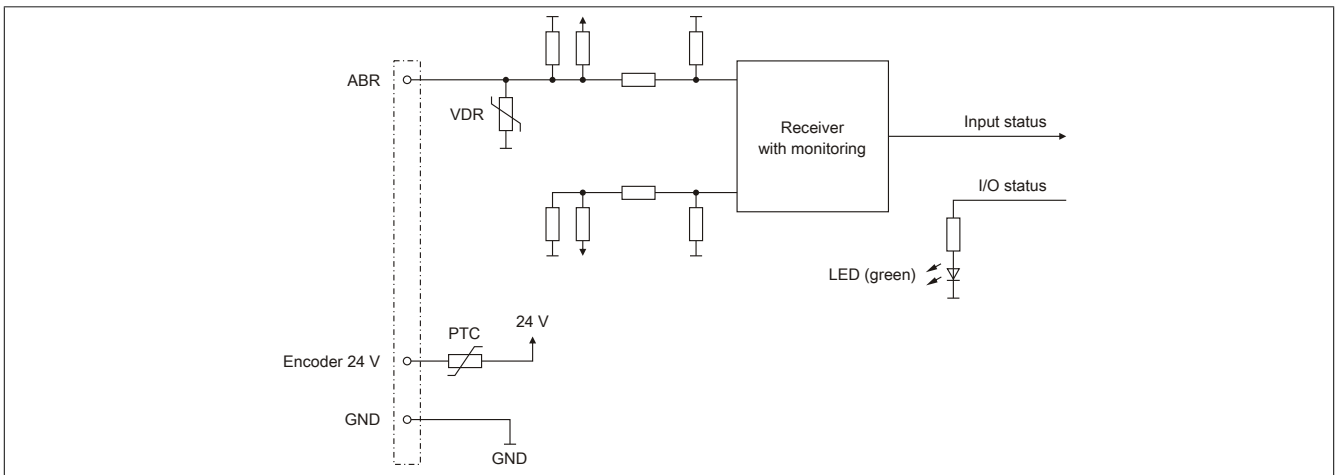

9.11.8.6 Connection example

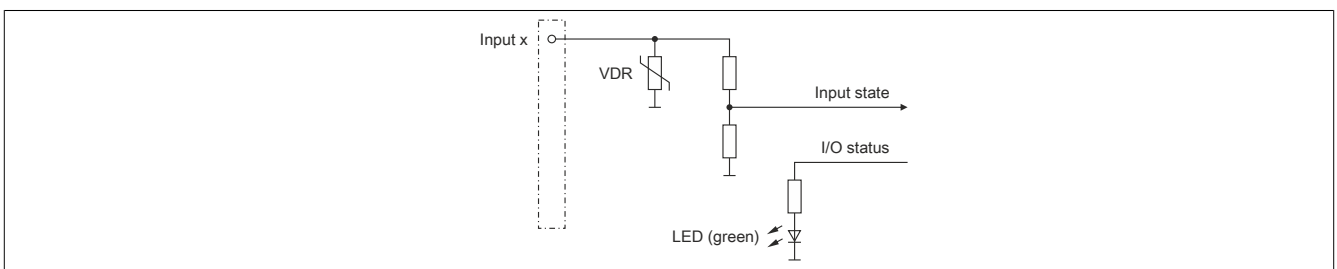

9.11.8.7 Input circuit diagram

Counter inputs

Standard inputs

9.11.8.8 Derating

There is no derating when operated below 55°C.

During operation over 55°C, the power dissipation of the modules to the left and right of this module is not permitted to exceed 1.15 W!

For an example of calculating the power dissipation of I/O modules, see section "Power dissipation calculation of I/O modules" on page 101.

9.11.8.9 Open line monitoring

Open line monitoring is only possible if the encoder itself is equipped with pull-up or pull-down resistances (pull-up: max. 5.6 kΩ, pull-down: max. 3.9 kΩ) and the module is configured for encoders with push-pull outputs.

9.11.8.10 Register description

9.11.8.10.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section "General data points" on page 3790.

9.11.8.10.2 Function model 0 - Standard

| Register | Name | Data type | Read | | Write | |

1) The offset specifies the position of the register within the CAN object.

9.11.8.10.3.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see ["Using I/O modules on the bus controller" on page 3789](#).

9.11.8.10.3.2 CAN I/O bus controller

The module occupies 1 analog logical slot on CAN I/O.

9.11.8.10.4 Encoder - Configuration

The following registers are used for setting functions and configuring the module.

9.11.8.10.4.1 Enabling error monitoring for the signal lines

Name:

CfO_BWCNTEnableMaskChannel7_0

This register requires individually enabling error monitoring for each of the signal channels. "Open line", "short circuit" and "voltage level too low" are reported as error states. Any errors that occur are reported in the error status registers "BW_Channel_x" on page 1148.

| Data type | Value | Bus controller default setting |
|-----------|--------------------|--------------------------------|
| USINT | See bit structure. | 7 |

Bit structure:

| Bit | Name | Value | Information |
|-------|--|-------|--|
| 0 | Enable error monitoring for signal A lines | 0 | Error monitoring - Encoder Signal A disabled |
| | | 1 | Error monitoring - Encoder signal A enabled (bus controller default setting) |
| 1 | Enable error monitoring for signal B lines | 0 | Error monitoring - Encoder Signal B disabled |
| | | 1 | Error monitoring - Encoder signal B enabled (bus controller default setting) |
| 2 | Enable error monitoring for signal R lines | 0 | Error monitoring - Encoder Signal R disabled |
| | | 1 | Error monitoring - Encoder signal R enabled (bus controller default setting) |
| 3 - 7 | Reserved | 0 | |

9.11.8.10.4.2 Timing for automatic error acknowledgment

Name:

CfO_BWQuitTime_0

This register can be used to enable an additional [automatic acknowledgment](#) of the error status through timing. If a valid time is set, then the acknowledgment can still be made [manually](#), the only difference is that automatic acknowledgment will take place on the module after the defined amount of time has passed. If the error state has not yet been corrected, then the error status remains and the time is reset. Make sure that the time is set long enough for the higher-level system to reliably detect the status messages.

If the timing = 0, then acknowledgment is only possible using the cyclic acknowledgment registers.

| Data type | Value | Information |
|-----------|--------------------|--|
| UDINT | 0 | No automatic acknowledgment. Bus controller default setting |
| | 1 to 2.147.483.647 | Time for automatic acknowledgment [µs] |

9.11.8.10.4.3 Setting the latch mode

Name:

CfO_LatchMode

This register is used to set the latch mode:

- Single shot latch mode:
The latch function must be enabled/set. After a successful latch procedure, the activation must be reset in order for a new latch procedure to be activated.
- Continuous latch mode:
The latch function only has to be enabled/set as long as latching is desired.

A changed counter state on "[Encoder01LatchCount](#)" on page 1147 indicates that the latch procedure has been performed. The counter value is stored in the latch register "[Encoder01Latch](#)" on page 1147.

| Data type | Value | Information |
|-----------|-------|--|
| USINT | 0 | Single-shot latch procedure (bus controller default setting) |
| | 1 | Continuous latch procedure |

9.11.8.10.4.4 Signal channels for triggering latch procedure

Name:

CfO_LatchComparator

This register defines the signal channels and their level for triggering the latch procedure.

- This mainly configures which channels are linked to generate the latch event. All three signals from the encoder and digital input 1 can be used for the "AND" operation.
- The "active voltage level" needed for the latch procedure can now be used according to the physical signals.

| Data type | Values | Bus controller default setting |
|-----------|------------------------|--------------------------------|
| USINT | See the bit structure. | 0 |

Bit structure:

| Bit | Name | Value | Information |
|-----|---|-------|---|
| 0 | Defines signal level for encoder signal A | 0 | Low (bus controller default setting) |
| | | 1 | High |
| 1 | Defines signal level for encoder signal B | 0 | Low (bus controller default setting) |
| | | 1 | High |
| 2 | Defines signal level for encoder signal R | 0 | Low (bus controller default setting) |
| | | 1 | High |
| 3 | Defines signal level for digital input 1 | 0 | Low (bus controller default setting) |
| | | 1 | High |
| 4 | Use encoder signal A to trigger latch procedure | 0 | Disabled (bus controller default setting) |
| | | 1 | Latch function linked to encoder signal A |
| 5 | Use encoder signal B to trigger latch procedure | 0 | Disabled (bus controller default setting) |
| | | 1 | Latch function linked to encoder signal B |
| 6 | Use encoder signal R to trigger latch procedure | 0 | Disabled (bus controller default setting) |
| | | 1 | Latch function linked to encoder signal R |
| 7 | Use digital input 1 to trigger latch procedure | 0 | Disabled (bus controller default setting) |
| | | 1 | Latch function linked to digital input 1 |

9.11.8.10.4.5 Physical configuration

The following registers must be set to the specified constant value for correct physical configuration:

Constant register "CfO_SlframeGenID"

Name:

CfO_SlframeGenID

| Data type | Value | Information |
|-----------|-------|--------------------------------|
| USINT | 9 | Bus controller default setting |

Constant register "CfO_SystemCycleTime"

Name:

CfO_SystemCycleTime

Cycle time of encoder acquisition in 1/8 μ s steps. 1 encoder value is acquired as the counter value per cycle.

| Data type | Value | Information |
|-----------|-------|--|
| UINT | 800 | 800 = 100 μ s. Bus controller default setting |

Constant register "CfO_PhyIOConfigCh0x"

Name:

CfO_PhyIOConfigCh01 to CfO_PhyIOConfigCh05

| Data type | Value | Information |
|-----------|-------|--------------------------------|
| USINT | 0 | Bus controller default setting |

Constant register "CfO_BWQuitTimeSelChannel7_0"

Name:

CfO_BWQuitTimeSelChannel7_0

| Data type | Value | Information |
|-----------|-------|--------------------------------|
| USINT | 0 | Bus controller default setting |

Constant register "CfO_CounterCycleSelect"

Name:

CfO_CounterCycleSelect

| Data type | Value | Information |
|-----------|-------|--------------------------------|
| USINT | 2 | Bus controller default setting |

Constant register "CfO_CounterMode"

Name:

CfO_CounterMode

| Data type | Value | Information |
|-----------|-------|--------------------------------|
| USINT | 3 | Bus controller default setting |

9.11.8.10.5 Encoder - Communication**9.11.8.10.5.1 Counter for verifying the data frame**

Name:

SDCLifeCount

The 8-bit counter register is needed for the SDC software package. It is incremented with the system clock to allow the SDC to check the validity of the data frame.

| Data type | Values |
|-----------|-------------|
| SINT | -128 to 127 |

9.11.8.10.5.2 Display of the counter state

Name:

Encoder01

The counter state of the incremental encoder is displayed as a 16 or 32-bit counter value. Only the 16-bit value is available in the bus controller function model.

| Data type | Value |
|--------------------|----------------------------------|
| INT | -32768 to 32767 |
| DINT ¹⁾ | -2.147.483.648 bis 2.147.483.647 |

1) Can only be configured in the standard function model

9.11.8.10.5.3 NetTime of the last valid counter value

Name:

Encoder01TimeValid

The NetTime of the last valid counter value is the time of the last valid counter value recorded on the module (see register "[Cfo_SystemCycleTime](#)" on page 1145). The user is able to determine the validity of the counter value by evaluating its age in the program. This means that the module and error status bits do not have to be checked additionally to determine the validity of the value.

The NetTime of the last valid counter value that was read is displayed as a 16 or 32-bit value. Only the 16-bit value is available in the bus controller function model.

For more information about NetTime and timestamps, see "[NetTime Technology](#)" on page 3035.

| Data type | Value | Information |
|--------------------|---------------------------------|--------------------|
| INT | -32768 to 32767 | NetTime in μ s |
| DINT ¹⁾ | -2.147.483.648 to 2.147.483.647 | |

1) Can only be configured in the standard function model

9.11.8.10.5.4 NetTime of the last counter value change

Name:

Encoder01TimeChanged

For slow X2X Link cycles, the NetTime of the last counter value change can be used to determine the speed more accurately.

The NetTime of the last counter value change is displayed as a 16 or 32-bit value. Only the 16-bit value is available in the bus controller function model.

For more information about NetTime and timestamps, see "[NetTime Technology](#)" on page 3035.

| Data type | Value | Information |
|--------------------|---------------------------------|--------------------|
| INT | -32768 to 32767 | NetTime in μ s |
| DINT ¹⁾ | -2.147.483.648 to 2.147.483.647 | |

1) Can only be configured in the standard function model

9.11.8.10.5.5 Counter value at the time of the last latch

Name:

Encoder01Latch

The counter value at the time of the last latch is displayed as a 16 or 32-bit value. Only the 16-bit value is available in the bus controller function model.

| Data type | Value |
|--------------------|----------------------------------|
| INT | -32768 to 32767 |
| DINT ¹⁾ | -2.147.483.648 bis 2.147.483.647 |

1) Can only be configured in the standard function model

9.11.8.10.5.6 Counter value of latch event

Name:

Encoder01LatchCount

The latch events are counted and stored in a cyclic 8-bit counter. This counter is incremented with each latch event, thereby indicating a new occurrence. The new latched counter value is stored in the respective latch register.

| Data type | Value |
|-----------|-------------|
| SINT | -128 to 127 |

9.11.8.10.5.7 Encoder commands

Name:

Encoder01Command

This register can be used to

- 1) reset the counter value. The counter is kept at zero until this command is reset.
- 2) enable the latch procedure. If the latch configuration is valid and matches the hardware signals, then this activation causes the counter value to be saved in the latch register.

The two different latch configurations that are possible (see "[Setting the latch mode](#)" on page 1144) must be handled as follows:

- Single shot latch mode:
After successful latching, indicated by the latch event counter, activation must be reset before any more latching is possible. The activation must be set again if additional latching is needed.
- Continuous latch mode:
The latch function only has to be enabled/set as long as latching is desired. The latch event counter is incremented with each event.

| Data type | Value |
|-----------|--------------------|
| USINT | See bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|-------|----------------------|-------|------------------------|
| 0 | Encoder01Reset | 0 | Do not reset |
| | | 1 | Set encoder value to 0 |
| 1 | Encoder01LatchEnable | 0 | Do not activate latch |
| | | 1 | Latching |
| 2 - 7 | Reserved | 0 | |

9.11.8.10.5.8 Input status of signal lines

Name:

Encoder01_A

Encoder01_B

Encoder01_R

DigitalInput01 to DigitalInput02

This register displays the input status of the signal lines from the encoder and the digital inputs.

| Data type | Value |
|-----------|--------------------|
| USINT | See bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|-------|----------------|-------|---------------------------------|
| 0 | Encoder01_A | 0/1 | Input state of encoder signal A |
| 1 | Encoder01_B | 0/1 | Input state of encoder signal B |
| 2 | Encoder01_R | 0/1 | Input state of encoder signal R |
| 3 | Reserved | 0 | |
| 4 | DigitalInput01 | 0/1 | Input state - Digital input 1 |
| 5 | DigitalInput02 | 0/1 | Input state - Digital input 2 |
| 6 - 7 | Reserved | 0 | |

9.11.8.10.5.9 Error status of signal lines

The error states are latched when they occur and are maintained until acknowledged. The counter and time registers are not updated if there are pending or unacknowledged errors.

Status of signal lines

Name:

BW_Channel_A

BW_Channel_B

BW_Channel_R

This register displays the error states of the signal lines from the encoder. The error states are latched when they occur and are maintained until acknowledged. The counter and time registers are not updated if there are pending or unacknowledged errors.

| Data type | Value |
|-----------|--------------------|
| USINT | See bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|-------|--------------|-------|---|
| 0 | BW_Channel_A | 0 | No error in encoder signal A |
| | | 1 | Open line, short circuit or voltage level too low |
| 1 | BW_Channel_B | 0 | No error in encoder signal B |
| | | 1 | Open line, short circuit or voltage level too low |
| 2 | BW_Channel_R | 0 | No error in encoder signal R |
| | | 1 | Open line, short circuit or voltage level too low |
| 3 - 7 | Reserved | 0 | |

Acknowledging error status of signal lines

Name:

BW_QuitChannel_A

BW_QuitChannel_B

BW_QuitChannel_R

This register can be used to acknowledge the latched error states of the signal lines from the encoder. However, if there are still pending errors remaining, then the error status remains active. After acknowledging the errors, the bits must also be reset or else any repetition of the error would be undetected.

| Data type | Value |
|-----------|--------------------|
| USINT | See bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|-------|------------------|-------|---|
| 0 | BW_QuitChannel_A | 0 | No acknowledgment |
| | | 1 | Acknowledgment of error status - Encoder signal A |
| 1 | BW_QuitChannel_B | 0 | No acknowledgment |
| | | 1 | Acknowledgment of error status - Encoder signal B |
| 2 | BW_QuitChannel_R | 0 | No acknowledgment |
| | | 1 | Acknowledgment of error status - Encoder signal R |
| 3 - 7 | Reserved | 0 | |

Manual acknowledgment of latched error states

The latched error states of the signal lines from the encoder can be acknowledged manually. However, if there are still pending errors remaining, then the error status remains active. After successfully acknowledging the errors (latched error status = 0), the acknowledge bits must still be reset by the user or else a re-occurrence of an error could be overlooked by the user.

Example 1: Cause of error corrected before being acknowledged

An error has occurred on a signal line. The error state is detected and latched by the module. The error is acknowledged by the user after the cause of error has been corrected. The latched error status changes to zero.

The manual acknowledge must now be reset so that any new errors will be recognized by the user.

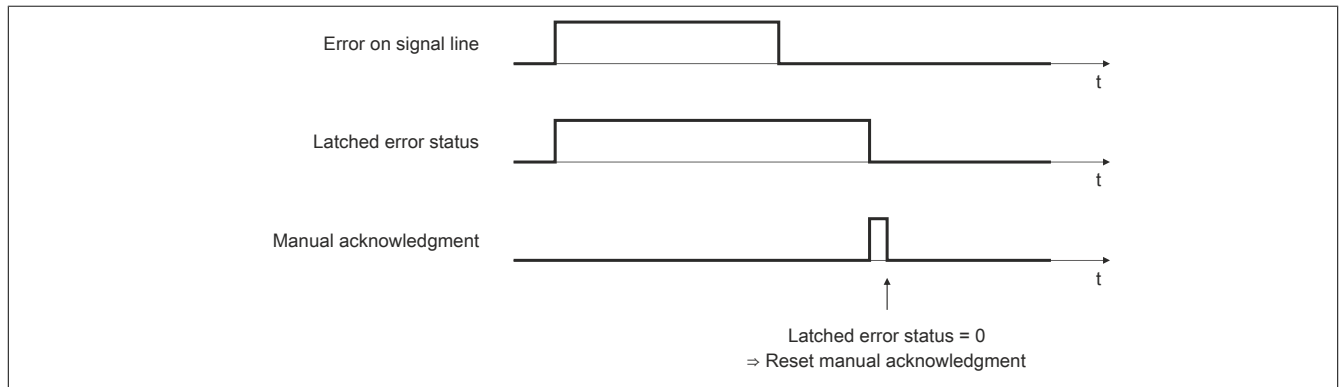

Figure 110: Cause of error corrected before being acknowledged

Example 2: Cause of error not yet corrected before being acknowledged

An error has occurred on a signal line. The error state is detected and latched by the module. The error is acknowledged by the user before the cause of error has been corrected. The latched error status remains set because the error is still remaining.

Acknowledgment is only successful after the cause of error has been corrected. The latched error status changes to zero. The manual acknowledge must now be reset so that any new errors will be recognized by the user.

Figure 111: Cause of error not yet corrected before being acknowledged

Automatic acknowledgment of latched error states

In addition to manual acknowledgment, automatic acknowledgment of the latched error states after a specified amount of time can also be enabled. Make sure that the time is set long enough for the higher-level system to reliably detect the status messages and for the validity of the counter value to be determined using its age.

If the time specification = 0, then only manual acknowledgment is possible.

Example 1: An error has occurred on a signal line. The error state is detected and latched by the module. The time for automatic acknowledgment starts counting after the cause of error has been corrected. The error is acknowledged as soon as the time expires. The latched error status changes to zero.

Figure 112: Latched error state acknowledged automatically

Example 2: Automatic and manual acknowledge used
 An error has occurred on a signal line. The error state is detected and latched by the module. The time for automatic acknowledgment starts counting after the cause of error has been corrected. The error is acknowledged manually by the user before the time expires. The latched error status changes to zero. The manual acknowledge must now be reset so that any new errors will be recognized by the user.

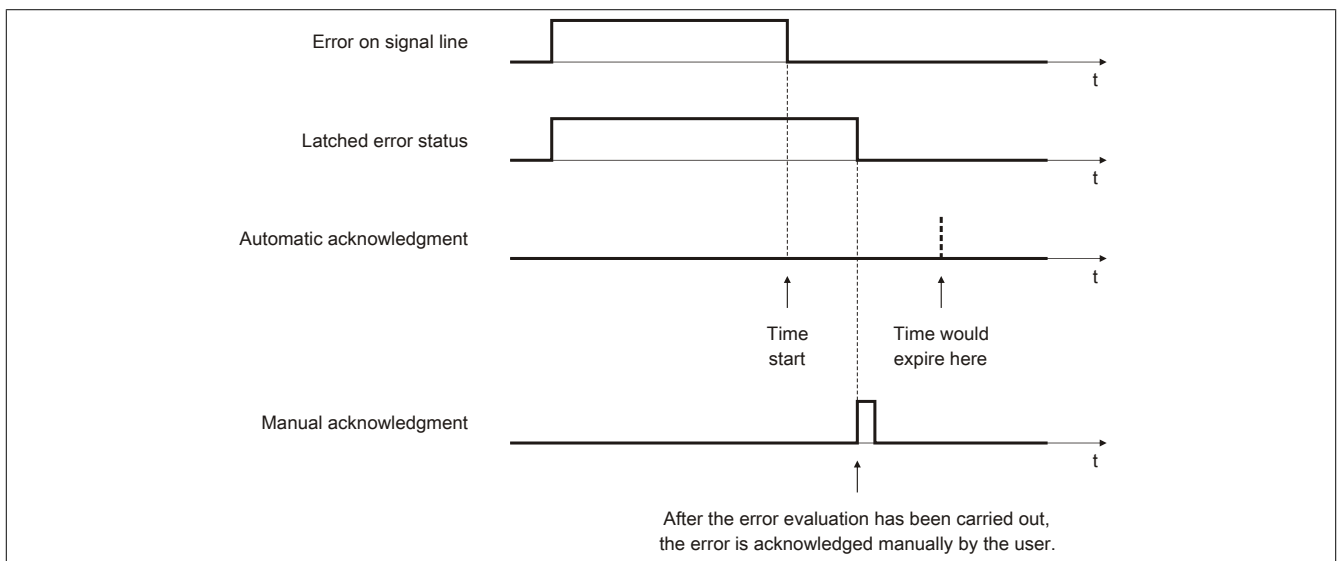

Figure 113: Automatic and manual acknowledge used

9.11.8.10.5.10 Status of encoder power supply

Name:

PowerSupply01

This register indicates the state of the integrated encoder power supply. A faulty encoder power supply is output as a warning.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|---------------|-------|------------------------------------|
| 0 | PowerSupply01 | 0 | 24 VDC encoder power supply OK |
| | | 1 | 24 VDC encoder power supply faulty |
| 1 - 7 | Reserved | - | |

9.11.8.10.6 NetTime Technology

For a description of NetTime Technology, see ["NetTime Technology" on page 3035](#).

9.11.8.10.7 Minimum cycle time

The minimum cycle time defines how far the bus cycle can be reduced without causing a communication error or impaired functionality. It should be noted that very fast cycles decrease the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time |
|--------------------|
| 150 µs |

9.11.8.10.8 Minimum I/O update time

The minimum I/O update time defines how far the bus cycle can be reduced while still allowing an I/O update to take place in each cycle.

| Minimum I/O update time |
|-------------------------|
| 150 µs |

9.11.9 X20DC137A

Data sheet version: 1.31

9.11.9.1 General information

The module is equipped with 1 input for an ABR incremental encoder with 24 V encoder supply. The encoder inputs are monitored (A, B, R, A\, B\, R\). The module is suitable for incremental encoders with symmetrical push-pull outputs.

The plug-in module does not come equipped with line terminating resistors. For this reason, it is possible to connect encoders with low output current; nevertheless, the module is suitable only for low counter frequencies or short encoder cables due to possible line reflections.

- 1 ABR incremental encoder 24 V, differential
- Encoder input monitoring
- 2 additional inputs, e.g. for latch input
- 24 VDC and GND for encoder supply
- NetTime timestamp: Counter change

NetTime timestamp of the counter

For many applications, not only the counter value is important, but also the exact time of the counter change. For this purpose, the module has a NetTime function that provides the recorded counter value with a timestamp accurate to microseconds.

The module provides the PLC with the counter value and timestamp as an absolute time value. The NetTime mechanisms ensure that the PLC NetTime clock and the local NetTime clock on the module have the same absolute time at all times.

9.11.9.2 Order data

| Model number | Short description | Figure |
|--------------|--|---|
| | Counter functions |  |
| X20DC137A | X20 digital counter module, 1 ABR incremental encoder, 24 V (differential), 300 kHz input frequency, 4x evaluation, encoder monitoring, NetTime function | |

9.11.9.4 LED status indicators

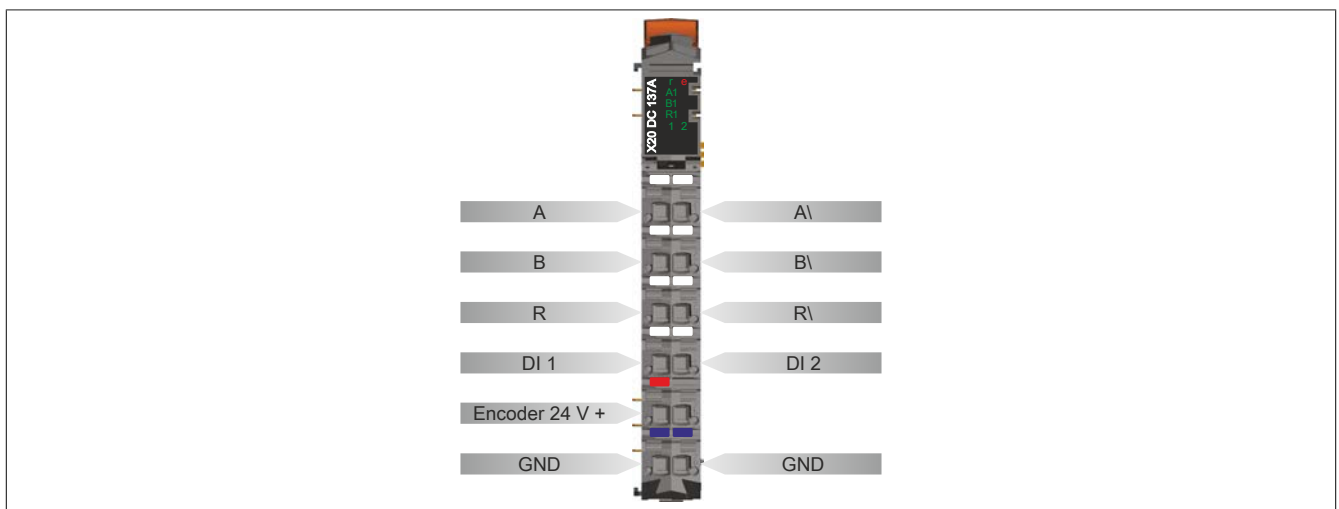

For a description of the various operating modes, see "[Diagnostic LEDs](#)" on page 3787.

| Figure | LED | Color | Status | Description |
|--|-------|-------|--|---|
|  | r | Green | Off | No power to module |
| | | | Single flash | RESET mode |
| | | | Double flash | BOOT mode (during firmware update) ¹⁾ |
| | | | Blinking | PREOPERATIONAL mode |
| | | | On | RUN mode |
| | e | Red | Off | No power to module or everything OK |
| | | | Single flash | The encoder monitor has detected a line fault on the encoder inputs. The status bits must be evaluated in order to provide a more detailed definition of this error. The following error states are detected: <ul style="list-style-type: none"> • Open line • Short-circuit or voltage level too low |
| | | | On | Error or reset status |
| | A1 | Green | | Input state of counter input A |
| | B1 | Green | | Input state of counter input B |
| R1 | Green | | Input state of reference pulse R | |
| 1 - 2 | Green | | Input state of the corresponding digital input | |

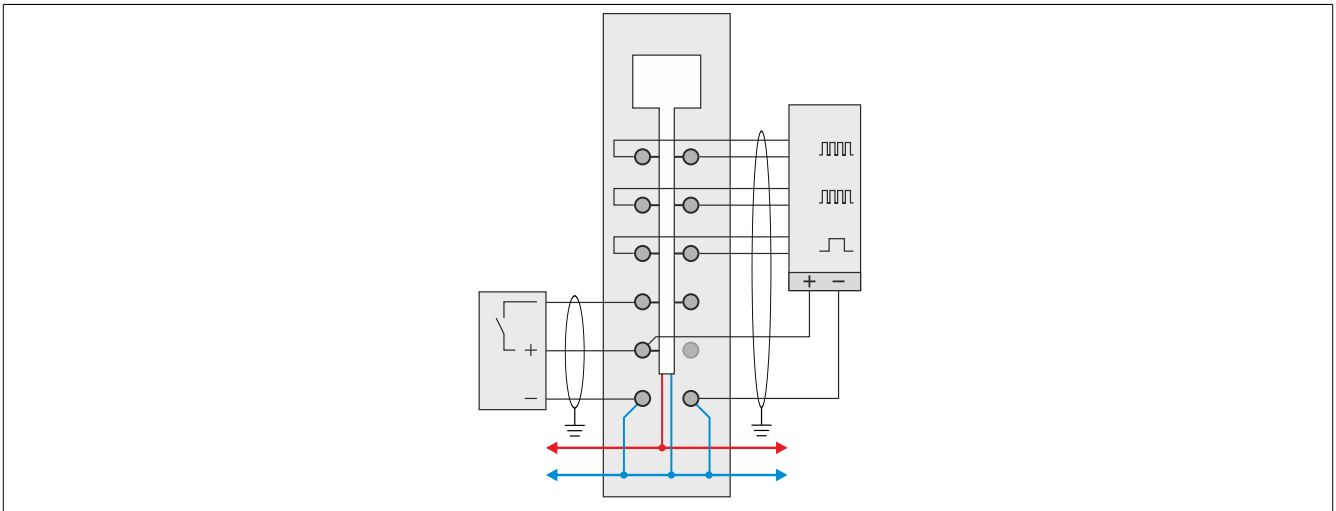

1) Depending on the configuration, a firmware update can take up to several minutes.

9.11.9.5 Pinout

Shielded cables must be used for all signal lines.

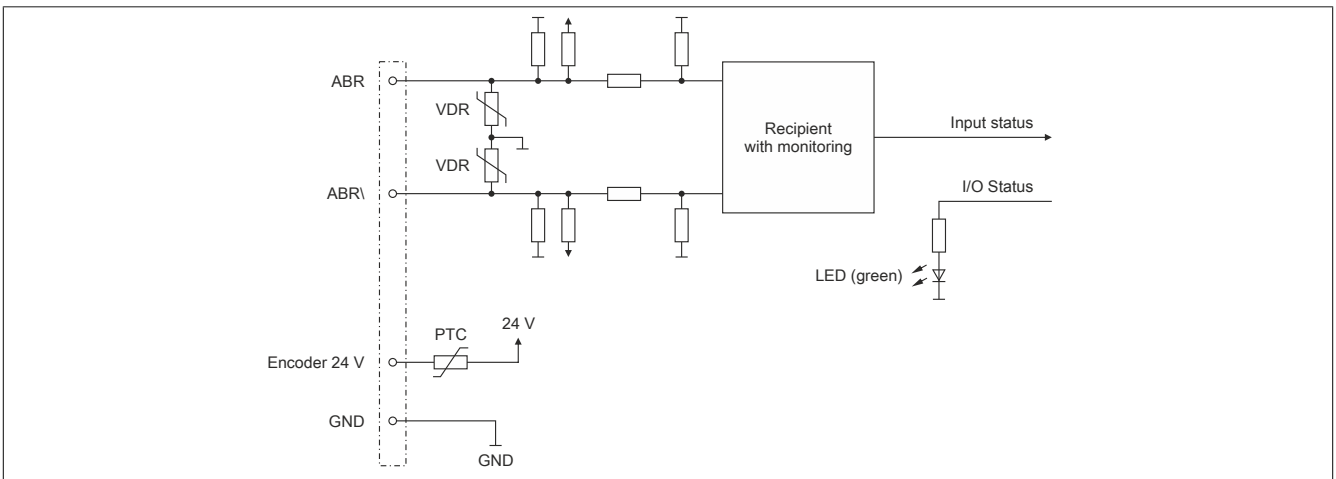

9.11.9.6 Connection example

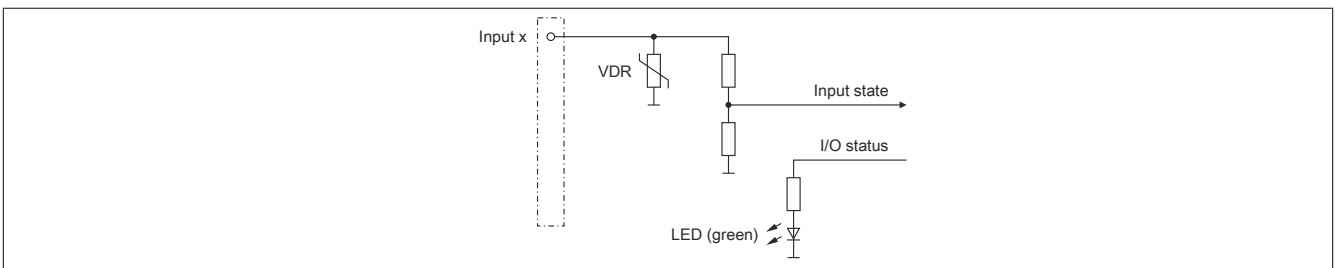

9.11.9.7 Input circuit diagram

Counter inputs

Standard inputs

9.11.9.8 Derating

There is no derating when operated below 55°C.

During operation over 55°C, the power dissipation of the modules to the left and right of this module is not permitted to exceed 1.15 W!

For an example of calculating the power dissipation of I/O modules, see section "[Power dissipation calculation of I/O modules](#)" on page 101.

9.11.9.9 Register description

9.11.9.9.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section "General data points" on page 3790.

9.11.9.9.2 Function model 0 - Standard

1) The offset specifies the position of the register within the CAN object.

9.11.9.3.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see ["Using I/O modules on the bus controller" on page 3789](#).

9.11.9.3.2 CAN I/O bus controller

The module occupies 1 analog logical slot on CAN I/O.

9.11.9.9.4 Encoder - Configuration

The following registers are used for setting functions and configuring the module.

9.11.9.9.4.1 Enabling error monitoring for the signal lines

Name:

CfO_BWCNTEnableMaskChannel7_0

This register requires individually enabling error monitoring for each of the signal channels. "Open line", "short circuit" and "voltage level too low" are reported as error states. Any errors that occur are reported in the error status registers "BW_Channel_x" on page 1164.

| Data type | Value | Bus controller default setting |
|-----------|--------------------|--------------------------------|
| USINT | See bit structure. | 7 |

Bit structure:

| Bit | Name | Value | Information |
|-------|--|-------|--|
| 0 | Enable error monitoring for signal A lines | 0 | Error monitoring - Encoder Signal A disabled |
| | | 1 | Error monitoring - Encoder signal A enabled (bus controller default setting) |
| 1 | Enable error monitoring for signal B lines | 0 | Error monitoring - Encoder Signal B disabled |
| | | 1 | Error monitoring - Encoder signal B enabled (bus controller default setting) |
| 2 | Enable error monitoring for signal R lines | 0 | Error monitoring - Encoder Signal R disabled |
| | | 1 | Error monitoring - Encoder signal R enabled (bus controller default setting) |
| 3 - 7 | Reserved | 0 | |

9.11.9.9.4.2 Timing for automatic error acknowledgment

Name:

CfO_BWQuitTime_0

This register can be used to enable an additional [automatic acknowledgment](#) of the error status through timing. If a valid time is set, then the acknowledgment can still be made [manually](#), the only difference is that automatic acknowledgment will take place on the module after the defined amount of time has passed. If the error state has not yet been corrected, then the error status remains and the time is reset. Make sure that the time is set long enough for the higher-level system to reliably detect the status messages.

If the timing = 0, then acknowledgment is only possible using the cyclic acknowledgment registers.

| Data type | Value | Information |
|-----------|--------------------|--|
| UDINT | 0 | No automatic acknowledgment. Bus controller default setting |
| | 1 to 2.147.483.647 | Time for automatic acknowledgment [µs] |

9.11.9.9.4.3 Setting the latch mode

Name:

CfO_LatchMode

This register is used to set the latch mode:

- Single shot latch mode:
The latch function must be enabled/set. After a successful latch procedure, the activation must be reset in order for a new latch procedure to be activated.
- Continuous latch mode:
The latch function only has to be enabled/set as long as latching is desired.

A changed counter state on "[Encoder01LatchCount](#)" on page 1163 indicates that the latch procedure has been performed. The counter value is stored in the latch register "[Encoder01Latch](#)" on page 1163.

| Data type | Value | Information |
|-----------|-------|--|
| USINT | 0 | Single-shot latch procedure (bus controller default setting) |
| | 1 | Continuous latch procedure |

9.11.9.9.4.4 Signal channels for triggering latch procedure

Name:

CfO_LatchComparator

This register defines the signal channels and their level for triggering the latch procedure.

- This mainly configures which channels are linked to generate the latch event. All three signals from the encoder and digital input 1 can be used for the "AND" operation.
- The "active voltage level" needed for the latch procedure can now be used according to the physical signals.

| Data type | Values | Bus controller default setting |
|-----------|------------------------|--------------------------------|
| USINT | See the bit structure. | 0 |

Bit structure:

| Bit | Name | Value | Information |
|-----|---|-------|---|
| 0 | Defines signal level for encoder signal A | 0 | Low (bus controller default setting) |
| | | 1 | High |
| 1 | Defines signal level for encoder signal B | 0 | Low (bus controller default setting) |
| | | 1 | High |
| 2 | Defines signal level for encoder signal R | 0 | Low (bus controller default setting) |
| | | 1 | High |
| 3 | Defines signal level for digital input 1 | 0 | Low (bus controller default setting) |
| | | 1 | High |
| 4 | Use encoder signal A to trigger latch procedure | 0 | Disabled (bus controller default setting) |
| | | 1 | Latch function linked to encoder signal A |
| 5 | Use encoder signal B to trigger latch procedure | 0 | Disabled (bus controller default setting) |
| | | 1 | Latch function linked to encoder signal B |
| 6 | Use encoder signal R to trigger latch procedure | 0 | Disabled (bus controller default setting) |
| | | 1 | Latch function linked to encoder signal R |
| 7 | Use digital input 1 to trigger latch procedure | 0 | Disabled (bus controller default setting) |
| | | 1 | Latch function linked to digital input 1 |

9.11.9.9.4.5 Physical configuration

The following registers must be set to the specified constant value for correct physical configuration:

Constant register "CfO_SlframeGenID"

Name:

CfO_SlframeGenID

| Data type | Value | Information |
|-----------|-------|--------------------------------|
| USINT | 9 | Bus controller default setting |

Constant register "CfO_SystemCycleTime"

Name:

CfO_SystemCycleTime

Cycle time of encoder acquisition in 1/8 μ s steps. 1 encoder value is acquired as the counter value per cycle.

| Data type | Value | Information |
|-----------|-------|--|
| UINT | 800 | 800 = 100 μ s. Bus controller default setting |

Constant register "CfO_PhyIOConfigCh0x"

Name:

CfO_PhyIOConfigCh01 to CfO_PhyIOConfigCh05

| Data type | Value | Information |
|-----------|-------|--------------------------------|
| USINT | 0 | Bus controller default setting |

Constant register "CfO_BWQuitTimeSelChannel7_0"

Name:

CfO_BWQuitTimeSelChannel7_0

| Data type | Value | Information |
|-----------|-------|--------------------------------|
| USINT | 0 | Bus controller default setting |

Constant register "CfO_CounterCycleSelect"

Name:

CfO_CounterCycleSelect

| Data type | Value | Information |
|-----------|-------|--------------------------------|
| USINT | 2 | Bus controller default setting |

Constant register "CfO_CounterMode"

Name:

CfO_CounterMode

| Data type | Value | Information |
|-----------|-------|--------------------------------|
| USINT | 3 | Bus controller default setting |

9.11.9.9.5 Encoder - Communication**9.11.9.9.5.1 Counter for verifying the data frame**

Name:

SDCLifeCount

The 8-bit counter register is needed for the SDC software package. It is incremented with the system clock to allow the SDC to check the validity of the data frame.

| Data type | Values |
|-----------|-------------|
| SINT | -128 to 127 |

9.11.9.9.5.2 Display of the counter state

Name:

Encoder01

The counter state of the incremental encoder is displayed as a 16 or 32-bit counter value. Only the 16-bit value is available in the bus controller function model.

| Data type | Value |
|--------------------|----------------------------------|
| INT | -32768 to 32767 |
| DINT ¹⁾ | -2.147.483.648 bis 2.147.483.647 |

1) Can only be configured in the standard function model

9.11.9.9.5.3 NetTime of the last valid counter value

Name:

Encoder01TimeValid

The NetTime of the last valid counter value is the time of the last valid counter value recorded on the module (see register "[Cfo_SystemCycleTime](#)" on page 1161). The user is able to determine the validity of the counter value by evaluating its age in the program. This means that the module and error status bits do not have to be checked additionally to determine the validity of the value.

The NetTime of the last valid counter value that was read is displayed as a 16 or 32-bit value. Only the 16-bit value is available in the bus controller function model.

For more information about NetTime and timestamps, see "[NetTime Technology](#)" on page 3035.

| Data type | Value | Information |
|--------------------|---------------------------------|--------------------|
| INT | -32768 to 32767 | NetTime in μ s |
| DINT ¹⁾ | -2.147.483.648 to 2.147.483.647 | |

1) Can only be configured in the standard function model

9.11.9.9.5.4 NetTime of the last counter value change

Name:

Encoder01TimeChanged

For slow X2X Link cycles, the NetTime of the last counter value change can be used to determine the speed more accurately.

The NetTime of the last counter value change is displayed as a 16 or 32-bit value. Only the 16-bit value is available in the bus controller function model.

For more information about NetTime and timestamps, see "[NetTime Technology](#)" on page 3035.

| Data type | Value | Information |
|--------------------|---------------------------------|--------------------|
| INT | -32768 to 32767 | NetTime in μ s |
| DINT ¹⁾ | -2.147.483.648 to 2.147.483.647 | |

1) Can only be configured in the standard function model

9.11.9.9.5.5 Counter value at the time of the last latch

Name:

Encoder01Latch

The counter value at the time of the last latch is displayed as a 16 or 32-bit value. Only the 16-bit value is available in the bus controller function model.

| Data type | Value |
|--------------------|----------------------------------|
| INT | -32768 to 32767 |
| DINT ¹⁾ | -2.147.483.648 bis 2.147.483.647 |

1) Can only be configured in the standard function model

9.11.9.9.5.6 Counter value of latch event

Name:

Encoder01LatchCount

The latch events are counted and stored in a cyclic 8-bit counter. This counter is incremented with each latch event, thereby indicating a new occurrence. The new latched counter value is stored in the respective latch register.

| Data type | Value |
|-----------|-------------|
| SINT | -128 to 127 |

9.11.9.9.5.7 Encoder commands

Name:

Encoder01Command

This register can be used to

- 1) reset the counter value. The counter is kept at zero until this command is reset.
- 2) enable the latch procedure. If the latch configuration is valid and matches the hardware signals, then this activation causes the counter value to be saved in the latch register.

The two different latch configurations that are possible (see "[Setting the latch mode](#)" on page 1160) must be handled as follows:

- Single shot latch mode:
After successful latching, indicated by the latch event counter, activation must be reset before any more latching is possible. The activation must be set again if additional latching is needed.
- Continuous latch mode:
The latch function only has to be enabled/set as long as latching is desired. The latch event counter is incremented with each event.

| Data type | Value |
|-----------|--------------------|
| USINT | See bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|-------|----------------------|-------|------------------------|
| 0 | Encoder01Reset | 0 | Do not reset |
| | | 1 | Set encoder value to 0 |
| 1 | Encoder01LatchEnable | 0 | Do not activate latch |
| | | 1 | Latching |
| 2 - 7 | Reserved | 0 | |

9.11.9.9.5.8 Input status of signal lines

Name:

Encoder01_A

Encoder01_B

Encoder01_R

DigitalInput01 to DigitalInput02

This register displays the input status of the signal lines from the encoder and the digital inputs.

| Data type | Value |
|-----------|--------------------|
| USINT | See bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|-------|----------------|-------|---------------------------------|
| 0 | Encoder01_A | 0/1 | Input state of encoder signal A |
| 1 | Encoder01_B | 0/1 | Input state of encoder signal B |
| 2 | Encoder01_R | 0/1 | Input state of encoder signal R |
| 3 | Reserved | 0 | |
| 4 | DigitalInput01 | 0/1 | Input state - Digital input 1 |
| 5 | DigitalInput02 | 0/1 | Input state - Digital input 2 |
| 6 - 7 | Reserved | 0 | |

9.11.9.9.5.9 Error status of signal lines

The error states are latched when they occur and are maintained until acknowledged. The counter and time registers are not updated if there are pending or unacknowledged errors.

Status of signal lines

Name:

BW_Channel_A

BW_Channel_B

BW_Channel_R

This register displays the error states of the signal lines from the encoder. The error states are latched when they occur and are maintained until acknowledged. The counter and time registers are not updated if there are pending or unacknowledged errors.

| Data type | Value |
|-----------|--------------------|
| USINT | See bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|-------|--------------|-------|---|
| 0 | BW_Channel_A | 0 | No error in encoder signal A |
| | | 1 | Open line, short circuit or voltage level too low |
| 1 | BW_Channel_B | 0 | No error in encoder signal B |
| | | 1 | Open line, short circuit or voltage level too low |
| 2 | BW_Channel_R | 0 | No error in encoder signal R |
| | | 1 | Open line, short circuit or voltage level too low |
| 3 - 7 | Reserved | 0 | |

Acknowledging error status of signal lines

Name:

BW_QuitChannel_A

BW_QuitChannel_B

BW_QuitChannel_R

This register can be used to acknowledge the latched error states of the signal lines from the encoder. However, if there are still pending errors remaining, then the error status remains active. After acknowledging the errors, the bits must also be reset or else any repetition of the error would be undetected.

| Data type | Value |
|-----------|--------------------|
| USINT | See bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|-------|------------------|-------|---|
| 0 | BW_QuitChannel_A | 0 | No acknowledgment |
| | | 1 | Acknowledgment of error status - Encoder signal A |
| 1 | BW_QuitChannel_B | 0 | No acknowledgment |
| | | 1 | Acknowledgment of error status - Encoder signal B |
| 2 | BW_QuitChannel_R | 0 | No acknowledgment |
| | | 1 | Acknowledgment of error status - Encoder signal R |
| 3 - 7 | Reserved | 0 | |

Manual acknowledgment of latched error states

The latched error states of the signal lines from the encoder can be acknowledged manually. However, if there are still pending errors remaining, then the error status remains active. After successfully acknowledging the errors (latched error status = 0), the acknowledge bits must still be reset by the user or else a re-occurrence of an error could be overlooked by the user.

Example 1: Cause of error corrected before being acknowledged

An error has occurred on a signal line. The error state is detected and latched by the module. The error is acknowledged by the user after the cause of error has been corrected. The latched error status changes to zero.

The manual acknowledge must now be reset so that any new errors will be recognized by the user.

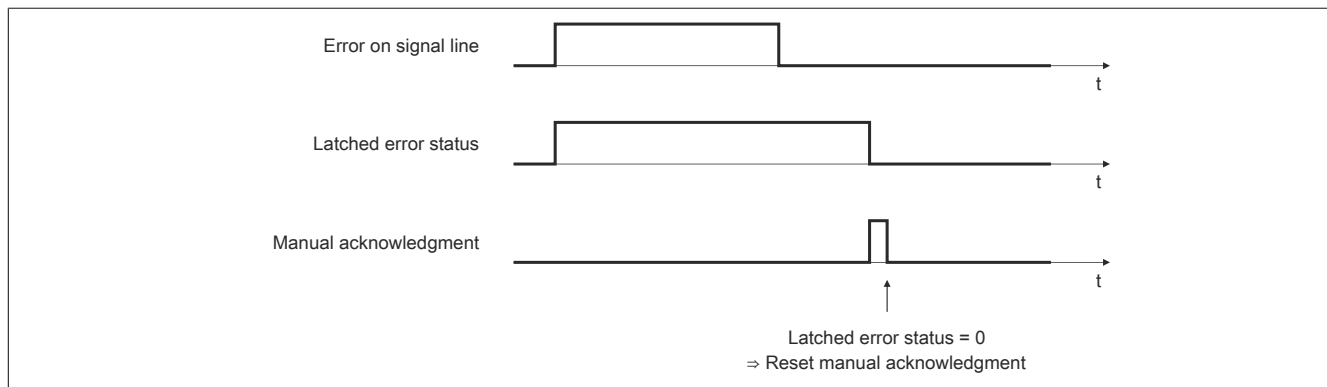

Figure 114: Cause of error corrected before being acknowledged

Example 2: Cause of error not yet corrected before being acknowledged

An error has occurred on a signal line. The error state is detected and latched by the module. The error is acknowledged by the user before the cause of error has been corrected. The latched error status remains set because the error is still remaining.

Acknowledgment is only successful after the cause of error has been corrected. The latched error status changes to zero. The manual acknowledge must now be reset so that any new errors will be recognized by the user.

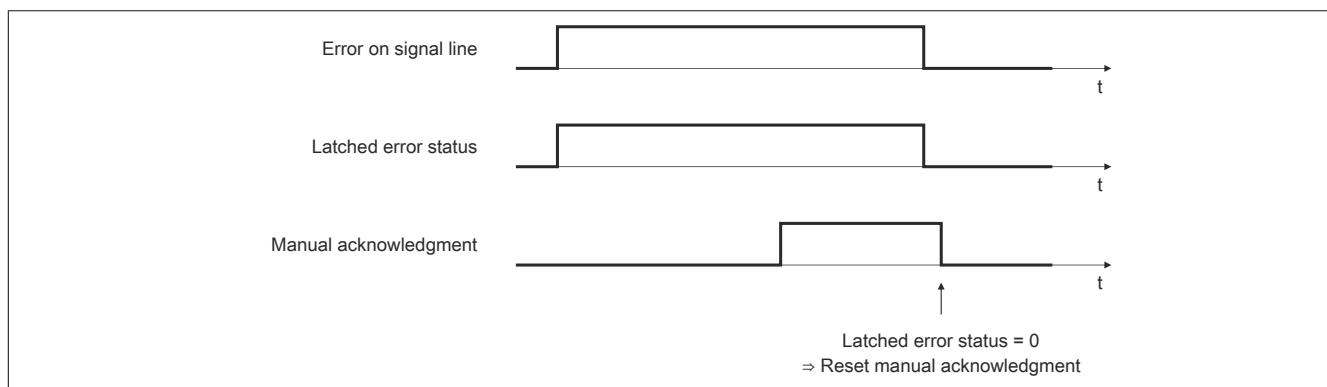

Figure 115: Cause of error not yet corrected before being acknowledged

Automatic acknowledgment of latched error states

In addition to manual acknowledgment, automatic acknowledgment of the latched error states after a specified amount of time can also be enabled. Make sure that the time is set long enough for the higher-level system to reliably detect the status messages and for the validity of the counter value to be determined using its age.

If the time specification = 0, then only manual acknowledgment is possible.

Example 1: An error has occurred on a signal line. The error state is detected and latched by the module. The time for automatic acknowledgment starts counting after the cause of error has been corrected. The error is acknowledged as soon as the time expires. The latched error status changes to zero.

Figure 116: Latched error state acknowledged automatically

Example 2: Automatic and manual acknowledge used
 An error has occurred on a signal line. The error state is detected and latched by the module. The time for automatic acknowledgment starts counting after the cause of error has been corrected. The error is acknowledged manually by the user before the time expires. The latched error status changes to zero. The manual acknowledge must now be reset so that any new errors will be recognized by the user.

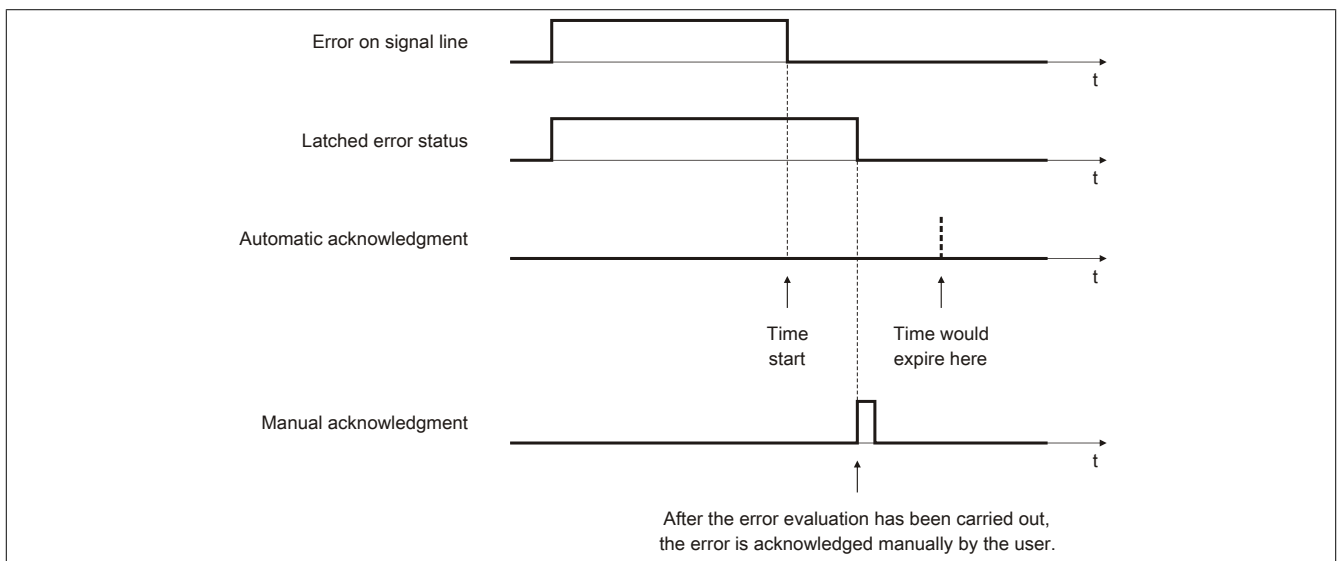

Figure 117: Automatic and manual acknowledge used

9.11.9.9.5.10 Status of encoder power supply

Name:

PowerSupply01

This register indicates the state of the integrated encoder power supply. A faulty encoder power supply is output as a warning.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|---------------|-------|------------------------------------|
| 0 | PowerSupply01 | 0 | 24 VDC encoder power supply OK |
| | | 1 | 24 VDC encoder power supply faulty |
| 1 - 7 | Reserved | - | |

9.11.9.9.6 NetTime Technology

For a description of NetTime Technology, see ["NetTime Technology" on page 3035](#).

9.11.9.9.7 Minimum cycle time

The minimum cycle time defines how far the bus cycle can be reduced without causing a communication error or impaired functionality. It should be noted that very fast cycles decrease the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time |
|--------------------|
| 150 μ s |

9.11.9.9.8 Minimum I/O update time

The minimum I/O update time defines how far the bus cycle can be reduced while still allowing an I/O update to take place in each cycle.

| Minimum I/O update time |
|-------------------------|
| 150 μ s |

9.11.10 X20(c)DC1396

Data sheet version: 3.21

9.11.10.1 General information

The module is equipped with 1 input for an ABR incremental encoder with 24 V encoder signal.

- 1 ABR incremental encoder 24 V
- 1 additional input e.g. for home enable switch
- 24 VDC and GND for encoder supply

9.11.10.2 Coated modules

Coated modules are X20 modules with a protective coating for the electronics component. This coating protects X20c modules from condensation and corrosive gases.

The modules' electronics are fully compatible with the corresponding X20 modules.

For simplification purposes, only images and module IDs of uncoated modules are used in this data sheet.

The coating has been certified according to the following standards:

- Condensation: BMW GS 95011-4, 2x 1 cycle
- Corrosive gas: EN 60068-2-60, method 4, exposure 21 days

9.11.10.3 Order data

9.11.10.9 Register description

9.11.10.9.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section ["General data points" on page 3790](#).

9.11.10.9.2 Function model 0 - Standard and Function model 1 - Standard with 32-bit encoder counter value

The difference between function model 0 and function model 1 is the size of the data type for some registers.

- Function model 0 uses data type INT
- Function model 1 uses data type DINT (specified in parentheses)

| Register | Name | Data type | Read | | Write | |
|----------------------|--|-----------|--------|---------|--------|---------|
| | | | Cyclic | Acyclic | Cyclic | Acyclic |
| Configuration | | | | | | |
| 4104 | CfO_EdgeDetectFalling | USINT | | | | • |
| 4106 | CfO_EdgeDetectRising | USINT | | | | • |
| 2064 | CfO_PresetABR01_1(32Bit) | (D)INT | | | | • |
| 2068 | CfO_PresetABR01_2(32Bit) | (D)INT | | | | • |
| 512 | ConfigOutput24 | UINT | | | | • |
| 522 | ConfigOutput26 | USINT | | | | • |
| 520 | ConfigOutput27 | USINT | | | | • |
| Communication | | | | | | |
| 2116 | ReferenceModeEncoder01 | USINT | | | • | |
| 2080 | Encoder01 | (D)INT | • | | | |
| 264 | Input state of the digital input | USINT | • | | | |
| | DigitalInput01 | Bit 3 | | | | |
| 2118 | StatusInput01 | USINT | • | | | |
| 40 | Status of encoder power supply | USINT | • | | | |
| | PowerSupply01 | Bit 0 | | | | |

9.11.10.9.3 Function model 254 - Bus controller

| Register | Offset ¹⁾ | Name | Data type | Read | | Write | |
|----------------------|----------------------|--|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| Configuration | | | | | | | |
| 4104 | - | CfO_EdgeDetectFalling | USINT | | | | • |
| 4106 | - | CfO_EdgeDetectRising | USINT | | | | • |
| 2064 | - | CfO_PresetABR01_1 | INT | | | | • |
| 2068 | - | CfO_PresetABR01_2 | INT | | | | • |
| 512 | - | ConfigOutput24 | UINT | | | | • |
| 522 | - | ConfigOutput26 | USINT | | | | • |
| 520 | - | ConfigOutput27 | USINT | | | | • |
| Communication | | | | | | | |
| 2116 | 0 | ReferenceModeEncoder01 | USINT | | | • | |
| 2080 | 0 | Encoder01 | INT | • | | | |
| 264 | 2 | Input state of the digital input | USINT | • | | | |
| | | DigitalInput01 | Bit 3 | | | | |
| 2118 | 4 | StatusInput01 | USINT | • | | | |
| 40 | 3 | Status of encoder power supply | USINT | • | | | |
| | | PowerSupply01 | Bit 0 | | | | |

1) The offset specifies the position of the register within the CAN object.

9.11.10.9.3.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see ["Using I/O modules on the bus controller" on page 3789](#).

9.11.10.9.3.2 CAN I/O bus controller

The module occupies 1 analog logical slot on CAN I/O.

9.11.10.9.4 ABR encoder - Configuration registers

9.11.10.9.4.1 Reference pulse

The following registers must be configured by a single acyclic write with the listed values so that the homing procedure is completed on the edge of the reference pulse.

The homing procedure can take place on:

- Rising edge
- Falling edge (default configuration)

Constant register "CfO_EdgeDetectFalling"

Name:

CfO_EdgeDetectFalling

| Data type | Value | Filter |
|-----------|-------|---|
| USINT | 0x00 | Configuration value for rising edge |
| | 0x04 | Configuration value for falling edge (bus controller default setting) |

Constant register "CfO_EdgeDetectRising"

Name:

CfO_EdgeDetectRising

| Data type | Value | Filter |
|-----------|-------|---|
| USINT | 0x04 | Configuration value for rising edge |
| | 0x00 | Configuration value for falling edge (bus controller default setting) |

Constant register "ConfigOutput24"

Name:

ConfigOutput24

This register contains the value for ABR encoder 1.

| Data type | Value | Filter |
|-----------|--------|---|
| UINT | 0x1012 | Configuration value for rising edge |
| | 0x1002 | Configuration value for falling edge (bus controller default setting) |

9.11.10.9.4.2 Setting the home position

Name:

Cfo_PresetABR01_1 to Cfo_PresetABR01_2

CfO_PresetABR01_1_32Bit to CfO_PresetABR01_2_32Bit (only in function model 1)

It is possible to specify 2 home positions with these registers through a one-off acyclic write, for example. The configured values are applied to the counter values after a completed homing procedure.

| Data type | Value | Information |
|--------------------|---------------------------------|-----------------------------------|
| INT | -32,768 to 32,767 | Bus controller default setting: 0 |
| DINT ¹⁾ | -2,147,483,648 to 2,147,483,647 | |

1) Only in function model 1

9.11.10.9.4.3 Homing with reference enable input

Regardless of the referencing mode, it is possible using this register to prevent the home position from being applied when the corresponding reference input voltage level occurs (see ["Input state of the digital input" on page 1176](#): bit 3). The desired setting can be configured by a one-off acyclic write.

Voltage level for reference enable activation

Name:

ConfigOutput26

This register is used to configure the active voltage level of the digital input for the reference enable.

| Data type | Value | Filter |
|-----------|-------|---|
| USINT | 0x00 | Reference enable is active at 0 VDC (bus controller default setting). |
| | 0x08 | Reference enable is active at 24 VDC |

Reference enable of the input

Name:

ConfigOutput27

This register can be used to define whether the reference enable is activated.

| Data type | Value | Filter |
|-----------|-------|--|
| USINT | 0x00 | Reference enable input disabled (bus controller default setting) |
| | 0x08 | Reference enable input activated |

9.11.10.9.5 ABR encoder - Configuration registers

9.11.10.9.5.1 Counter state of the encoder

Name:
Encoder01

The encoder values are represented as 16-bit or 32-bit counter values in this register.

| Data type | Value |
|--------------------|---------------------------------|
| INT | -32,768 to 32,767 |
| DINT ¹⁾ | -2,147,483,648 to 2,147,483,647 |

1) Only in function model 1

9.11.10.9.5.2 Input state of the digital input

Name:
DigitalInput01

This register displays the input status of the encoder and the digital input.

| Data type | Value |
|-----------|--------------------|
| USINT | See bit structure. |

| Bit | Name | Value | Information |
|-------|----------------|--------|--------------------------------|
| 0 | Encoder A | 0 or 1 | Input state |
| 1 | Encoder B | 0 or 1 | Input state |
| 2 | Encoder A + B | 0 or 1 | Input state of reference pulse |
| 3 | DigitalInput01 | 0 or 1 | Input state - Digital input 1 |
| 4 - 7 | Reserved | - | |

9.11.10.9.5.3 Reading the referencing mode

Name:
ReferenceModeEncoder01

This register determines the referencing mode.

| Data type | Value |
|-----------|--------------------|
| USINT | See bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|-------|------|-------|--------------------------|
| 0 - 1 | | 00 | Referencing OFF |
| | | 01 | Single shot referencing |
| | | 11 | Continuous referencing |
| 2 - 5 | | 0 | Bits permanently set = 0 |
| 6 - 7 | | 00 | Referencing OFF |
| | | 11 | Bits permanently set = 1 |

This results in the following values:

| Binary | Hex | Function |
|----------|------|-------------------------|
| 00000000 | 0x00 | Referencing OFF |
| 11000001 | 0xC1 | Single shot referencing |

For a new start after the completed homing procedure:

- Write value 0x00
- Wait until bit 0 to bit 3 of the StatusInput01 register takes on the value 0. Counter bits 4 to 7 are not erased
- Switch homing procedure on again

| | | |
|----------|------|--|
| 11000011 | 0xC3 | Continuous referencing Referencing occurs at every reference pulse. |
|----------|------|--|

It is important to know how the optional reference enable is configured. See ["Homing with reference enable input" on page 1175](#)

9.11.10.9.5.4 Status of the homing procedure

Name:

StatusInput01

This register contains information regarding whether the referencing process is off, active or complete.

| Data type | Value |
|-----------|--------------------|
| USINT | See bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|-------|--|--------|--|
| 0 | Reference pulse without homing ¹⁾ | 0 | No reference impulse without homing has occurred yet |
| | | 1 | At least a reference impulse without homing has occurred |
| 1 | State change | 0 or 1 | Changes with each reference pulse without homing |
| 2 | Reference pulse with homing ¹⁾ | 0 | No homing has occurred yet |
| | | 1 | At least one homing procedure has occurred |
| 3 | State change | 0 or 1 | Changes with each homing procedure that has taken place |
| 4 | Reference pulse | 0 | The last reference pulse didn't bring about a homing procedure |
| | | 1 | The last reference pulse brought about a homing procedure |
| 5 - 7 | Counter | x | Free-running counter, increased with each reference pulse |

1) Always 1 after the first reference pulse that has occurred

Examples of possible values:

| Binary | Hex | Function |
|------------|-------|---|
| 0x00000000 | 0x00 | Referencing OFF or homing procedure already active |
| 0x00111100 | 0x3CE | First homing procedure complete Reference value applied in the Encoder01 register |
| 0xxxx11100 | 0xxB | Bits 5 to 7 are changed with each reference pulse |
| 0xxxx1x100 | 0xxx | Continuously changing the bits with the "Continuous referencing" setting. The reference value is applied to the Encoder01 register on each reference pulse. |

It is important to know how the optional reference enable (see ["Homing with reference enable input" on page 1175](#)) is configured.

9.11.10.9.5.5 Status of encoder power supply

Name:

PowerSupply01

This register indicates the state of the integrated encoder power supply. A faulty encoder power supply is output as a warning.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|---------------|-------|------------------------------------|
| 0 | PowerSupply01 | 0 | 24 VDC encoder power supply OK |
| | | 1 | 24 VDC encoder power supply faulty |
| 1 - 7 | Reserved | - | |

9.11.10.9.6 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time |
|--------------------|
| 128 μ s |

9.11.10.9.7 Maximum cycle time

The maximum cycle time specifies the time up to which the bus cycle can be increased without internal counter overflows causing module malfunctions.

| Minimum cycle time |
|--------------------|
| 16 ms |

9.11.10.9.8 Minimum I/O update time

The minimum I/O update time specifies how far the bus cycle can be reduced so that an I/O update is performed in each cycle.

| Minimum I/O update time |
|-------------------------|
| 128 μ s |

9.11.11 X20DC1398

Data sheet version: 3.11

9.11.11.1 General information

This module is equipped with one input for SSI absolute encoders with 24 V encoder signal.

- 1 SSI absolute encoder 24 V
- 1 additional input
- 24 VDC and GND for encoder supply

9.11.11.2 Order data

| Model number | Short description | Figure |
|--------------|---|---|
| | Counter functions |  |

9.11.11.9 Register description

9.11.11.9.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section "[General data points](#)" on page 3790.

9.11.11.9.2 Function model 0 - Standard

| Register | Name | Data type | Read | | Write | |
|----------------------|--|-----------|--------|---------|--------|---------|
| | | | Cyclic | Acyclic | Cyclic | Acyclic |
| Configuration | | | | | | |
| 7176 | ConfigOutput14 | UINT | | | | • |
| 7172 | ConfigAdvanced | UDINT | | | | • |
| Communication | | | | | | |
| 7184 | Encoder01 | UDINT | • | | | |
| 264 | Input state of the digital input 1 | USINT | • | | | |
| | DigitalInput01 | Bit 3 | | | | |
| 40 | Status of encoder power supply | USINT | • | | | |
| | PowerSupply01 | Bit 0 | | | | |

9.11.11.9.3 Function model 254 - Bus controller

| Register | Offset ¹⁾ | Name | Data type | Read | | Write | |
|----------------------|----------------------|--|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| Configuration | | | | | | | |
| 7176 | - | ConfigOutput14 | UINT | | | | • |
| 7172 | - | ConfigAdvanced | UDINT | | | | • |
| Communication | | | | | | | |
| 7184 | 0 | Encoder01 | UDINT | • | | | |
| 264 | 4 | Input state of the digital input 1 | USINT | • | | | |
| | | DigitalInput01 | Bit 3 | | | | |
| 40 | 5 | Status of encoder power supply | USINT | • | | | |
| | | PowerSupply01 | Bit 0 | | | | |

1) The offset specifies the position of the register within the CAN object.

9.11.11.9.3.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see "[Using I/O modules on the bus controller](#)" on page 3789.

9.11.11.9.3.2 CAN I/O bus controller

The module occupies 1 analog logical slot on CAN I/O.

9.11.11.9.4 SSI encoder configuration registers

9.11.11.9.4.1 Standard configuration

Name:

ConfigOutput14

This configuration register sets the encoding, clock rate and number of bits. Default = 0. This must be set once using an acyclic write command.

| Data type | Values | Bus controller default setting |
|-----------|------------------------|--------------------------------|
| UINT | See the bit structure. | 0 |

Bit structure:

| Bit | Name | Value | Information |
|--------|----------------------|-------|--|
| 0 - 5 | SSI value valid bits | x | Bus controller default setting: 0 |
| 6 - 7 | Clock rate | 11 | 125 kHz. Bus controller default setting: 0 |
| 8 - 13 | SSI number of bits | | Number of bits including leading zeros. Bus controller default setting: 0 |
| 14 | Reserved | 0 | |
| 15 | Keying | 0 | Binary encoding (bus controller default setting) |
| | | 1 | Gray coding |

9.11.11.9.4.2 Extended configuration

Name:

ConfigAdvanced

This configuration register is used to set the encoding, clock rate, number of bits and monostable multivibrator settings. This must be set once using an acyclic write command.

It only differs from "[ConfigOutput14](#)" on page 1184 by data length and additional monostable multivibrator testing.

| Data type | Values | Bus controller default setting |
|-----------|------------------------|--------------------------------|
| UDINT | See the bit structure. | 65536 |

Bit structure:

| Bit | Name | Value | Information |
|---------|--------------------------------|-------|--|
| 0 - 5 | SSI value valid bits | x | Bus controller default setting: 0 |
| 6 - 7 | Clock rate | 11 | 125 kHz. Bus controller default setting: 0 |
| 8 - 13 | SSI number of bits | x | Number of bits including leading zeros. Bus controller default setting: 0 |
| 14 | Reserved | 0 | |
| 15 | Keying | 0 | Binary encoding (bus controller default setting) |
| | | 1 | Gray coding |
| 16 - 17 | Monostable multivibrator check | 00 | Check OFF, no additional clock bit |
| | | 01 | Check set to high level (bus controller default setting) |
| | | 10 | Check set to Low level |
| | | 11 | Level is clocked but ignored |
| 18 - 31 | Reserved | 0 | |

Transferring using Synchronous Serial Interface

Processing the measured value

- 1) Start bit ... The measured value is saved.
- 2) Output of the first data bit
- 3) All data bits are transferred; the monostable multivibrator time starts to run.
- 4) The monostable multivibrator returns to its initial state; a new transfer can be started.

9.11.11.9.5 SSI encoder communication registers

9.11.11.9.5.1 SSI position values

Name:
Encoder01

The SSI encoder value is displayed as a 32-bit position value. The SSI position value is generated synchronously with the X2X cycle.

| Data type | Value | Filter |
|-----------|--------------------|--------------|
| UDINT | 0 to 4,294,967,295 | SSI position |

9.11.11.9.5.2 Input state of the digital input 1

Name:
DigitalInput01

This register displays the input state of the digital input.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|-----|----------------|--------|-------------------------------|
| 3 | DigitalInput01 | 0 or 1 | Input state - Digital input 1 |

9.11.11.9.5.3 Status of encoder power supply

Name:
PowerSupply01

This register indicates the state of the integrated encoder power supply. A faulty encoder power supply is output as a warning.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|---------------|-------|------------------------------------|
| 0 | PowerSupply01 | 0 | 24 VDC encoder power supply OK |
| | | 1 | 24 VDC encoder power supply faulty |
| 1 - 7 | Reserved | - | |

9.11.11.9.6 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time |
|--------------------|
| 128 μ s |

9.11.11.9.7 Maximum cycle time

The maximum cycle time specifies the time up to which the bus cycle can be increased without internal counter overflows causing module malfunctions.

| Minimum cycle time |
|--------------------|
| 16 ms |

9.11.11.9.8 Minimum I/O update time

The minimum I/O update time specifies how far the bus cycle can be reduced so that an I/O update is performed in each cycle.

| Minimum I/O update time |
|-------------------------|
| 128 μ s |

9.11.12 X20DC1976

Data sheet version: 2.21

9.11.12.1 General information

The module is equipped with 1 input for an ABR incremental encoder with 5 V encoder supply. The encoder inputs are monitored (A, B, R). The module is suitable for incremental encoders with push-pull outputs with no complementary signal.

- 1 ABR incremental encoder 5 V, asymmetric
- Encoder input monitoring
- 2 additional inputs, e.g. for latch input
- 5 VDC, 24 VDC and GND for encoder supply
- NetTime timestamp: Counter change

NetTime timestamp of the counter

For many applications, not only the counter value is important, but also the exact time of the counter change. For this purpose, the module has a NetTime function that provides the recorded counter value with a timestamp accurate to microseconds.

The module provides the PLC with the counter value and timestamp as an absolute time value. The NetTime mechanisms ensure that the PLC NetTime clock and the local NetTime clock on the module have the same absolute time at all times.

9.11.12.2 Order data

| Model number | Short description | Figure |
|--------------|---|--|
| | Counter functions |  |

Table 212: X20DC1976 - Technical data

9.11.12.4 LED status indicators

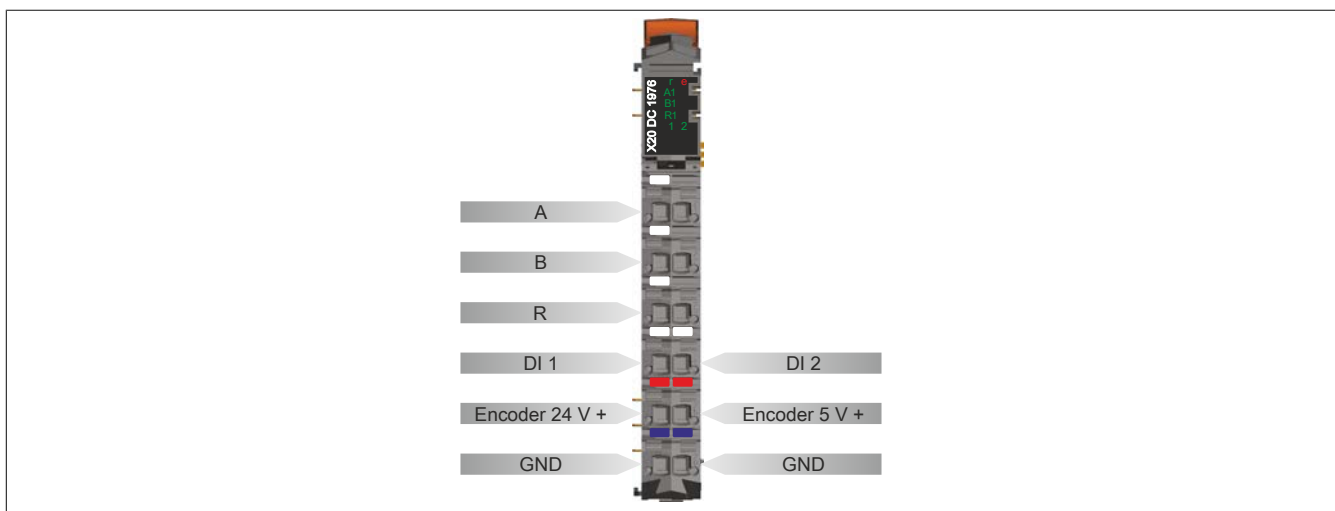

For a description of the various operating modes, see ["Diagnostic LEDs" on page 3787](#).

| Figure | LED | Color | Status | Description |
|--|-------|-------|--|---|
|  | r | Green | Off | No power to module |
| | | | Single flash | RESET mode |
| | | | Double flash | BOOT mode (during firmware update) ¹⁾ |
| | | | Blinking | PREOPERATIONAL mode |
| | e | Red | On | RUN mode |
| | | | Off | No power to module or everything OK |
| | | | Single flash | The encoder monitor has detected a line fault on the encoder inputs. The status bits must be evaluated in order to provide a more detailed definition of this error. The following error states are detected: <ul style="list-style-type: none"> • Open line • Short-circuit or voltage level too low |
| | | | On | Error or reset status |
| | A1 | Green | | Input state of counter input A |
| | B1 | Green | | Input state of counter input B |
| R1 | Green | | Input state of reference pulse R | |
| 1 - 2 | Green | | Input state of the corresponding digital input | |

1) Depending on the configuration, a firmware update can take up to several minutes.

9.11.12.5 Pinout

Shielded cables must be used for all signal lines.

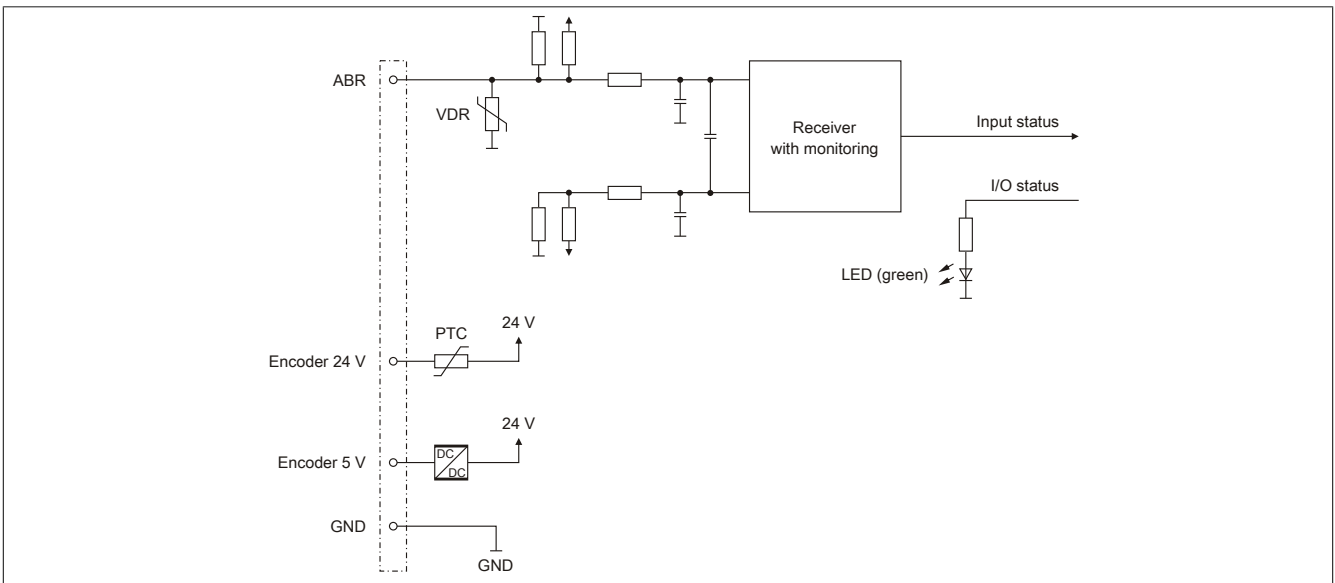

9.11.12.6 Connection example

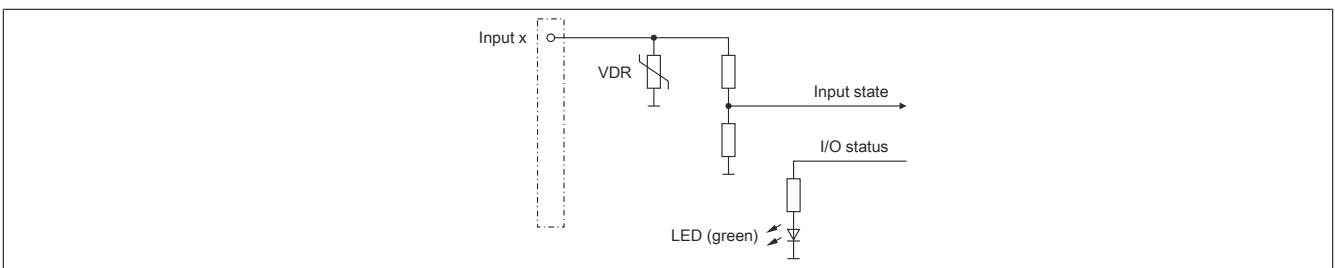

9.11.12.7 Input circuit diagram

Counter inputs

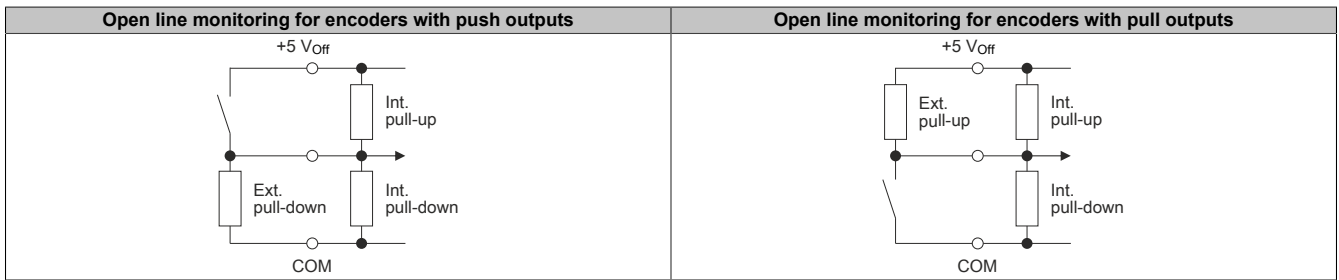

Standard inputs

9.11.12.8 Open line monitoring

Open line monitoring is only possible if the encoder itself is equipped with pull-up or pull-down resistances (pull-up: max. 2 k Ω , pull-down: max. 560 Ω) and the module is configured for encoders with push-pull outputs.

9.11.12.9 Register description

9.11.12.9.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section "General data points" on page 3790.

9.11.12.9.2 Function model 0 - Standard

| Register | Name | Data type | Read | | Write | |
|----------------------|--|-----------|--------|---------|--------|---------|

| | | PowerSupply02 | Bit 1 | | | | |

1) The offset specifies the position of the register within the CAN object.

9.11.12.9.3.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see ["Using I/O modules on the bus controller" on page 3789](#).

9.11.12.9.3.2 CAN I/O bus controller

The module occupies 1 analog logical slot on CAN I/O.

9.11.12.9.4 Encoder - Configuration

The following registers are used for setting functions and configuring the module.

9.11.12.9.4.1 Enabling error monitoring for the signal lines

Name:

CfO_BWCNTEnableMaskChannel7_0

This register requires individually enabling error monitoring for each of the signal channels. "Open line", "short circuit" and "voltage level too low" are reported as error states. Any errors that occur are reported in the error status registers "BW_Channel_x" on page 1197.

| Data type | Value | Bus controller default setting |
|-----------|--------------------|--------------------------------|
| USINT | See bit structure. | 7 |

Bit structure:

| Bit | Name | Value | Information |
|-------|--|-------|--|
| 0 | Enable error monitoring for signal A lines | 0 | Error monitoring - Encoder Signal A disabled |
| | | 1 | Error monitoring - Encoder signal A enabled (bus controller default setting) |
| 1 | Enable error monitoring for signal B lines | 0 | Error monitoring - Encoder Signal B disabled |
| | | 1 | Error monitoring - Encoder signal B enabled (bus controller default setting) |
| 2 | Enable error monitoring for signal R lines | 0 | Error monitoring - Encoder Signal R disabled |
| | | 1 | Error monitoring - Encoder signal R enabled (bus controller default setting) |
| 3 - 7 | Reserved | 0 | |

9.11.12.9.4.2 Timing for automatic error acknowledgment

Name:

CfO_BWQuitTime_0

This register can be used to enable an additional [automatic acknowledgment](#) of the error status through timing. If a valid time is set, then the acknowledgment can still be made [manually](#), the only difference is that automatic acknowledgment will take place on the module after the defined amount of time has passed. If the error state has not yet been corrected, then the error status remains and the time is reset. Make sure that the time is set long enough for the higher-level system to reliably detect the status messages.

If the timing = 0, then acknowledgment is only possible using the cyclic acknowledgment registers.

| Data type | Value | Information |
|-----------|--------------------|--|
| UDINT | 0 | No automatic acknowledgment. Bus controller default setting |
| | 1 to 2.147.483.647 | Time for automatic acknowledgment [µs] |

9.11.12.9.4.3 Setting the latch mode

Name:

CfO_LatchMode

This register is used to set the latch mode:

- Single shot latch mode:
The latch function must be enabled/set. After a successful latch procedure, the activation must be reset in order for a new latch procedure to be activated.
- Continuous latch mode:
The latch function only has to be enabled/set as long as latching is desired.

A changed counter state on "[Encoder01LatchCount](#)" on page 1196 indicates that the latch procedure has been performed. The counter value is stored in the latch register "[Encoder01Latch](#)" on page 1196.

| Data type | Value | Information |
|-----------|-------|--|
| USINT | 0 | Single-shot latch procedure (bus controller default setting) |
| | 1 | Continuous latch procedure |

9.11.12.9.4.4 Signal channels for triggering latch procedure

Name:

CfO_LatchComparator

This register defines the signal channels and their level for triggering the latch procedure.

- This mainly configures which channels are linked to generate the latch event. All three signals from the encoder and digital input 1 can be used for the "AND" operation.
- The "active voltage level" needed for the latch procedure can now be used according to the physical signals.

| Data type | Values | Bus controller default setting |
|-----------|------------------------|--------------------------------|
| USINT | See the bit structure. | 0 |

Bit structure:

| Bit | Name | Value | Information |
|-----|---|-------|---|
| 0 | Defines signal level for encoder signal A | 0 | Low (bus controller default setting) |
| | | 1 | High |
| 1 | Defines signal level for encoder signal B | 0 | Low (bus controller default setting) |
| | | 1 | High |
| 2 | Defines signal level for encoder signal R | 0 | Low (bus controller default setting) |
| | | 1 | High |
| 3 | Defines signal level for digital input 1 | 0 | Low (bus controller default setting) |
| | | 1 | High |
| 4 | Use encoder signal A to trigger latch procedure | 0 | Disabled (bus controller default setting) |
| | | 1 | Latch function linked to encoder signal A |
| 5 | Use encoder signal B to trigger latch procedure | 0 | Disabled (bus controller default setting) |
| | | 1 | Latch function linked to encoder signal B |
| 6 | Use encoder signal R to trigger latch procedure | 0 | Disabled (bus controller default setting) |
| | | 1 | Latch function linked to encoder signal R |
| 7 | Use digital input 1 to trigger latch procedure | 0 | Disabled (bus controller default setting) |
| | | 1 | Latch function linked to digital input 1 |

9.11.12.9.4.5 Physical configuration

The following registers must be set to the specified constant value for correct physical configuration:

Constant register "CfO_SlframeGenID"

Name:

CfO_SlframeGenID

| Data type | Value | Information |
|-----------|-------|--------------------------------|
| USINT | 9 | Bus controller default setting |

Constant register "CfO_SystemCycleTime"

Name:

CfO_SystemCycleTime

Cycle time of encoder acquisition in 1/8 μ s steps. 1 encoder value is acquired as the counter value per cycle.

| Data type | Value | Information |
|-----------|-------|--|
| UINT | 800 | 800 = 100 μ s. Bus controller default setting |

Constant register "CfO_PhyIOConfigCh0x"

Name:

CfO_PhyIOConfigCh01 to CfO_PhyIOConfigCh05

| Data type | Value | Information |
|-----------|-------|--------------------------------|
| USINT | 0 | Bus controller default setting |

Constant register "CfO_BWQuitTimeSelChannel7_0"

Name:

CfO_BWQuitTimeSelChannel7_0

| Data type | Value | Information |
|-----------|-------|--------------------------------|
| USINT | 0 | Bus controller default setting |

Constant register "CfO_CounterCycleSelect"

Name:

CfO_CounterCycleSelect

| Data type | Value | Information |
|-----------|-------|--------------------------------|
| USINT | 2 | Bus controller default setting |

Constant register "CfO_CounterMode"

Name:

CfO_CounterMode

| Data type | Value | Information |
|-----------|-------|--------------------------------|
| USINT | 3 | Bus controller default setting |

9.11.12.9.5 Encoder - Communication**9.11.12.9.5.1 Counter for verifying the data frame**

Name:

SDCLifeCount

The 8-bit counter register is needed for the SDC software package. It is incremented with the system clock to allow the SDC to check the validity of the data frame.

| Data type | Values |
|-----------|-------------|
| SINT | -128 to 127 |

9.11.12.9.5.2 Display of the counter state

Name:

Encoder01

The counter state of the incremental encoder is displayed as a 16 or 32-bit counter value. Only the 16-bit value is available in the bus controller function model.

| Data type | Value |
|--------------------|----------------------------------|
| INT | -32768 to 32767 |
| DINT ¹⁾ | -2.147.483.648 bis 2.147.483.647 |

1) Can only be configured in the standard function model

9.11.12.9.5.3 NetTime of the last valid counter value

Name:

Encoder01TimeValid

The NetTime of the last valid counter value is the time of the last valid counter value recorded on the module (see register "[Cfo_SystemCycleTime](#)" on page 1194). The user is able to determine the validity of the counter value by evaluating its age in the program. This means that the module and error status bits do not have to be checked additionally to determine the validity of the value.

The NetTime of the last valid counter value that was read is displayed as a 16 or 32-bit value. Only the 16-bit value is available in the bus controller function model.

For more information about NetTime and timestamps, see "[NetTime Technology](#)" on page 3035.

| Data type | Value | Information |
|--------------------|---------------------------------|--------------------|
| INT | -32768 to 32767 | NetTime in μ s |
| DINT ¹⁾ | -2.147.483.648 to 2.147.483.647 | |

1) Can only be configured in the standard function model

9.11.12.9.5.4 NetTime of the last counter value change

Name:

Encoder01TimeChanged

For slow X2X Link cycles, the NetTime of the last counter value change can be used to determine the speed more accurately.

The NetTime of the last counter value change is displayed as a 16 or 32-bit value. Only the 16-bit value is available in the bus controller function model.

For more information about NetTime and timestamps, see "[NetTime Technology](#)" on page 3035.

| Data type | Value | Information |
|--------------------|---------------------------------|--------------------|
| INT | -32768 to 32767 | NetTime in μ s |
| DINT ¹⁾ | -2.147.483.648 to 2.147.483.647 | |

1) Can only be configured in the standard function model

9.11.12.9.5.5 Counter value at the time of the last latch

Name:

Encoder01Latch

The counter value at the time of the last latch is displayed as a 16 or 32-bit value. Only the 16-bit value is available in the bus controller function model.

| Data type | Value |
|--------------------|----------------------------------|
| INT | -32768 to 32767 |
| DINT ¹⁾ | -2.147.483.648 bis 2.147.483.647 |

1) Can only be configured in the standard function model

9.11.12.9.5.6 Counter value of latch event

Name:

Encoder01LatchCount

The latch events are counted and stored in a cyclic 8-bit counter. This counter is incremented with each latch event, thereby indicating a new occurrence. The new latched counter value is stored in the respective latch register.

| Data type | Value |
|-----------|-------------|
| SINT | -128 to 127 |

9.11.12.9.5.7 Encoder commands

Name:

Encoder01Command

This register can be used to

- 1) reset the counter value. The counter is kept at zero until this command is reset.
- 2) enable the latch procedure. If the latch configuration is valid and matches the hardware signals, then this activation causes the counter value to be saved in the latch register.

The two different latch configurations that are possible (see "[Setting the latch mode](#)" on page 1193) must be handled as follows:

- Single shot latch mode:
After successful latching, indicated by the latch event counter, activation must be reset before any more latching is possible. The activation must be set again if additional latching is needed.
- Continuous latch mode:
The latch function only has to be enabled/set as long as latching is desired. The latch event counter is incremented with each event.

| Data type | Value |
|-----------|--------------------|
| USINT | See bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|-------|----------------------|-------|------------------------|
| 0 | Encoder01Reset | 0 | Do not reset |
| | | 1 | Set encoder value to 0 |
| 1 | Encoder01LatchEnable | 0 | Do not activate latch |
| | | 1 | Latching |
| 2 - 7 | Reserved | 0 | |

9.11.12.9.5.8 Input status of signal lines

Name:

Encoder01_A

Encoder01_B

Encoder01_R

DigitalInput01 to DigitalInput02

This register displays the input status of the signal lines from the encoder and the digital inputs.

| Data type | Value |
|-----------|--------------------|
| USINT | See bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|-------|----------------|-------|---------------------------------|
| 0 | Encoder01_A | 0/1 | Input state of encoder signal A |
| 1 | Encoder01_B | 0/1 | Input state of encoder signal B |
| 2 | Encoder01_R | 0/1 | Input state of encoder signal R |
| 3 | Reserved | 0 | |
| 4 | DigitalInput01 | 0/1 | Input state - Digital input 1 |
| 5 | DigitalInput02 | 0/1 | Input state - Digital input 2 |
| 6 - 7 | Reserved | 0 | |

9.11.12.9.5.9 Error status of signal lines

The error states are latched when they occur and are maintained until acknowledged. The counter and time registers are not updated if there are pending or unacknowledged errors.

Status of signal lines

Name:

BW_Channel_A

BW_Channel_B

BW_Channel_R

This register displays the error states of the signal lines from the encoder. The error states are latched when they occur and are maintained until acknowledged. The counter and time registers are not updated if there are pending or unacknowledged errors.

| Data type | Value |
|-----------|--------------------|
| USINT | See bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|-------|--------------|-------|---|
| 0 | BW_Channel_A | 0 | No error in encoder signal A |
| | | 1 | Open line, short circuit or voltage level too low |
| 1 | BW_Channel_B | 0 | No error in encoder signal B |
| | | 1 | Open line, short circuit or voltage level too low |
| 2 | BW_Channel_R | 0 | No error in encoder signal R |
| | | 1 | Open line, short circuit or voltage level too low |
| 3 - 7 | Reserved | 0 | |

Acknowledging error status of signal lines

Name:

BW_QuitChannel_A

BW_QuitChannel_B

BW_QuitChannel_R

This register can be used to acknowledge the latched error states of the signal lines from the encoder. However, if there are still pending errors remaining, then the error status remains active. After acknowledging the errors, the bits must also be reset or else any repetition of the error would be undetected.

| Data type | Value |
|-----------|--------------------|
| USINT | See bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|-------|------------------|-------|---|
| 0 | BW_QuitChannel_A | 0 | No acknowledgment |
| | | 1 | Acknowledgment of error status - Encoder signal A |
| 1 | BW_QuitChannel_B | 0 | No acknowledgment |
| | | 1 | Acknowledgment of error status - Encoder signal B |
| 2 | BW_QuitChannel_R | 0 | No acknowledgment |
| | | 1 | Acknowledgment of error status - Encoder signal R |
| 3 - 7 | Reserved | 0 | |

Manual acknowledgment of latched error states

The latched error states of the signal lines from the encoder can be acknowledged manually. However, if there are still pending errors remaining, then the error status remains active. After successfully acknowledging the errors (latched error status = 0), the acknowledge bits must still be reset by the user or else a re-occurrence of an error could be overlooked by the user.

Example 1: Cause of error corrected before being acknowledged

An error has occurred on a signal line. The error state is detected and latched by the module. The error is acknowledged by the user after the cause of error has been corrected. The latched error status changes to zero.

The manual acknowledge must now be reset so that any new errors will be recognized by the user.

Figure 118: Cause of error corrected before being acknowledged

Example 2: Cause of error not yet corrected before being acknowledged

An error has occurred on a signal line. The error state is detected and latched by the module. The error is acknowledged by the user before the cause of error has been corrected. The latched error status remains set because the error is still remaining.

Acknowledgment is only successful after the cause of error has been corrected. The latched error status changes to zero. The manual acknowledge must now be reset so that any new errors will be recognized by the user.

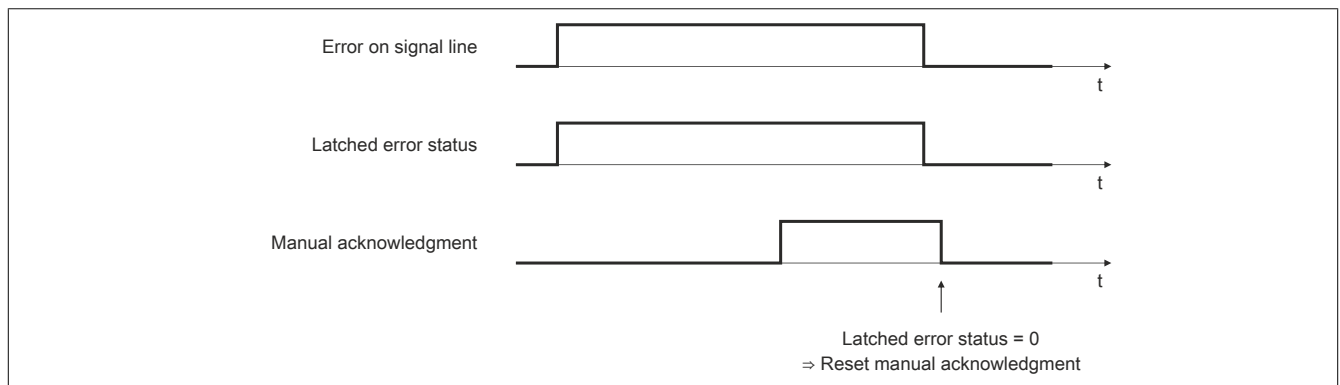

Figure 119: Cause of error not yet corrected before being acknowledged

Automatic acknowledgment of latched error states

In addition to manual acknowledgment, automatic acknowledgment of the latched error states after a specified amount of time can also be enabled. Make sure that the time is set long enough for the higher-level system to reliably detect the status messages and for the validity of the counter value to be determined using its age.

If the time specification = 0, then only manual acknowledgment is possible.

Example 1: An error has occurred on a signal line. The error state is detected and latched by the module. The time for automatic acknowledgment starts counting after the cause of error has been corrected. The error is acknowledged as soon as the time expires. The latched error status changes to zero.

Figure 120: Latched error state acknowledged automatically

Example 2: Automatic and manual acknowledge used
 An error has occurred on a signal line. The error state is detected and latched by the module. The time for automatic acknowledgment starts counting after the cause of error has been corrected. The error is acknowledged manually by the user before the time expires. The latched error status changes to zero. The manual acknowledge must now be reset so that any new errors will be recognized by the user.

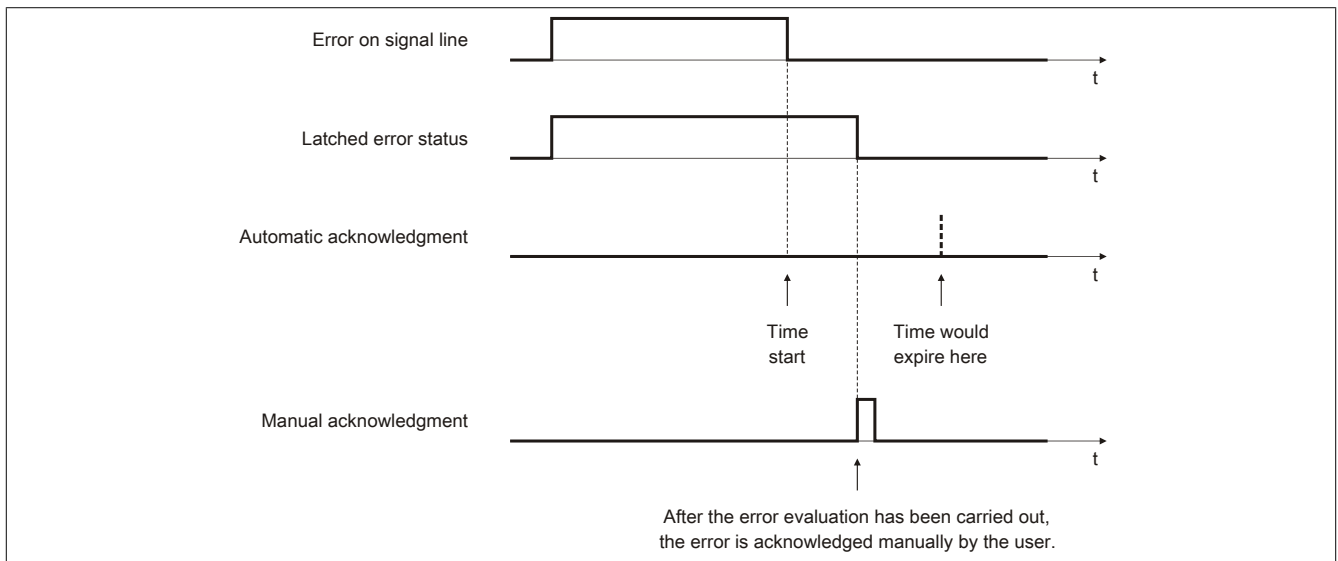

Figure 121: Automatic and manual acknowledge used

9.11.12.9.5.10 Status of encoder supplies

Name:

PowerSupply01 to PowerSupply02

This register shows the status of the integrated encoder supplies. A faulty encoder power supply is displayed as a warning.

| Data type | Value |
|-----------|--------------------|
| USINT | See bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|-------|---------------|-------|------------------------------------|
| 0 | PowerSupply01 | 0 | 24 VDC encoder power supply OK |
| | | 1 | 24 VDC encoder power supply faulty |
| 1 | PowerSupply02 | 0 | 5 VDC encoder power supply OK |
| | | 1 | 5 VDC encoder power supply faulty |
| 2 - 7 | Reserved | - | |

9.11.12.9.6 NetTime Technology

For a description of NetTime Technology, see ["NetTime Technology" on page 3035](#).

9.11.12.9.7 Minimum cycle time

The minimum cycle time defines how far the bus cycle can be reduced without causing a communication error or impaired functionality. It should be noted that very fast cycles decrease the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time |
|--------------------|
| 150 μ s |

9.11.12.9.8 Minimum I/O update time

The minimum I/O update time defines how far the bus cycle can be reduced while still allowing an I/O update to take place in each cycle.

| Minimum I/O update time |
|-------------------------|
| 150 μ s |

9.11.13 X20(c)DC2190

Data sheet version: 2.31

9.11.13.1 General information

This module can be used to determine paths and to calculate speeds at the same time. The ultrasonic transducer rods are connected directly to the RS422 interface. Communication to the transducer rod takes place using start/stop signals. With the DPI/IP protocol, it is also possible, for example, to read operational properties directly from the transducer. During service (when a transducer is being exchanged) the machine can be started again quickly without additional configuration work.

The module is designed for connecting 2 transducer rods with a total of up to 4 paths. That means, for example, that 2 ultrasonic transducers with 2 magnets each or one with 4 magnets can be used. The combination 3/1 is also possible. The module provides 24 VDC as an external supply for the sensor.

- Ultrasonic transducer module
- Path measurement (resolution 10 µm)
- Speed measurement (resolution 100 µm/s)
- 1, 2, 3 and 4 magnetic rod measurements possible
- DPI/IP protocol supported

9.11.13.2 Coated modules

Coated modules are X20 modules with a protective coating for the electronics component. This coating protects X20c modules from condensation and corrosive gases.

The modules' electronics are fully compatible with the corresponding X20 modules.

For simplification purposes, only images and module IDs of uncoated modules are used in this data sheet.

The coating has been certified according to the following standards:

- Condensation: BMW GS 95011-4, 2x 1 cycle
- Corrosive gas: EN 60068-2-60, method 4, exposure 21 days

9.11.13.3 Order data

| Model number | Short description | Figure |
|--------------|--|---|
| | Counter functions |  |
| X20DC2190 | X20 digital counter module, ultrasonic transducer module, interfaces: EP start/stop, DPI/IP, 2 transducer rods, 4-position detection | |
| X20cDC2190 | X20 digital counter module, coated, ultrasonic transducer module, interfaces: EP start/stop, DPI/IP, 2 transducer rods, 4-position detection | |
| | Required accessories | |
| | Bus modules | |
| X20BM11 | X20 bus module, 24 VDC keyed, internal I/O supply continuous | |
| X20BM15 | X20 bus module, with node number switch, 24 VDC keyed, internal I/O supply continuous | |
| X20cBM11 | X20 bus module, coated, 24 VDC keyed, internal I/O supply continuous | |
| | Terminal blocks | |
| X20TB12 | X20 terminal block, 12-pin, 24 VDC keyed | |

Table 214: X20DC2190, X20cDC2190 - Technical data

9.11.13.5 LED status indicators

For a description of the various operating modes, see "Diagnostic LEDs" on page 3787.

| Figure | LED | Color | Status | Description |
|---|-------|--------|--------------|---|
|  | r | Green | Off | No power to module |
| | | | Single flash | Reset mode |
| | | | Double flash | Boot mode (during firmware update) ¹⁾ |
| | | | Blinking | PREOPERATIONAL mode |
| | | | On | RUN mode |
| | e | Red | Off | No power to module or everything OK |
| | | | On | Error or reset status |
| | 1 - 2 | Yellow | Off | No transducer rod connected |
| | | | On | Transducer rod is connected to the respective measurement channel |

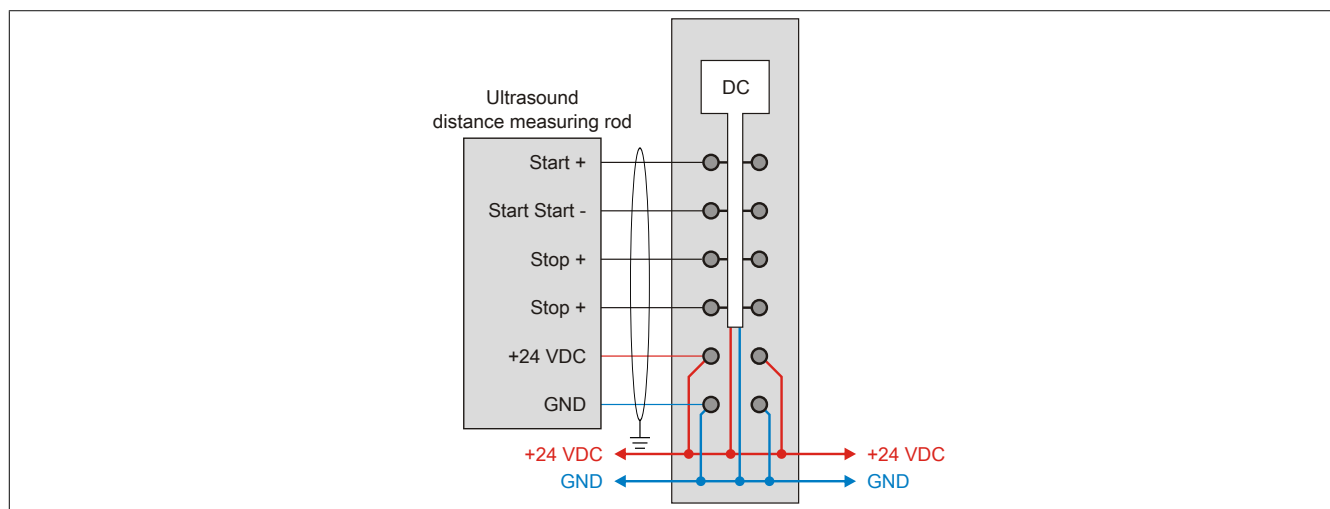

1) Depending on the configuration, a firmware update can take up to several minutes.

9.11.13.6 Pinout

The ultrasonic transducers should be connected using a shielded cable. The shield of the encoder cable is connected to the ground via the shield connection on the X20 bus module.

9.11.13.7 Connection example

9.11.13.8 Register description

9.11.13.8.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section "General data points" on page 3790.

1) The offset specifies the position of the register within the CAN object.

In the bus controller function model, the measurements made from the module are not synchronized with the X2X Link. The time between two measurements is defined by the configured recovery time for the rod (see "[Channel configuration](#)" on page 1211) unlike on the X2X where it is the smallest multiple of the X2X cycle time that is larger than the configured recovery time.

9.11.13.8.3.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see "[Using I/O modules on the bus controller](#)" on page 3789.

9.11.13.8.3.2 CAN I/O bus controller

The module occupies 4 analog logical slots on CAN I/O.

9.11.13.8.4 Commissioning a transducer rod

Two registers need to be configured to initialize an ultrasonic transducer rod and receive valid measurements. The first step is to enter the length of the rod (see "Rod length 1 and 2" on page 1211). The wave propagation speed for the rod must then be defined (see "Ultrasonic speed specification" on page 1209). This information can usually be found directly on the transducer rod itself or in its data sheet.

If the plausibility limits remain set to 0 (default value), one of the respective ErrorStatus registers will now indicate faulty readings or plausibility errors. If this is the case, plausibility mode can be disabled using the "ConfigOutput01" register (see "Module configuration" on page 1210). This will cause the positions of the magnets to be displayed on the rod.

9.11.13.8.5 Reading the magnet position

Name:

Position01 - Position04

These registers contain the position of the individual magnets on the transducer rods.

| Data type | Value | Information |
|-----------|------------------------------------|-----------------|
| DINT | -2,147,483,648 to 2,147,483,647 | Resolution 1 µm |

9.11.13.8.6 Reading the magnet speed

Name:

Speed01 to Speed04

These registers contain the speed of the individual magnets on the transducer rods. A resolution of 0.1 mm/s is achieved by calculating the speed from 2 position values within a 100 ms interval.

| Data type | Value | Information |
|-----------|-----------------|---------------------|
| INT | -32768 to 32767 | Resolution 0.1 mm/s |

9.11.13.8.7 Error status

Name:

ErrorStatus01 to ErrorStatus04

These registers can be used to indicate the error status for individual channels.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure

| Bit | Description |
|-------|--|
| 0 - 3 | Counter for plausibility errors (cyclic) |
| 4 - 7 | Counter for mis-measurements (cyclic) |

Possible reasons for plausibility errors:

- Configured max. or min. path of a magnet was exceeded
- Configured max. speed was exceeded

Possible reasons for faulty measurements:

- Configured rod length was exceeded
- Rod failure
- Missing measurement magnet

Information:

If the registers "USSpeed01 and USSpeed02" on page 1209 are unequal to 0 after the module starts up, the respective error counters on slower fieldbus systems (e.g. CAN I/O) may continue to count until the module configuration is completed. In some cases, this is due problems between the respective rod and the default configuration.

9.11.13.8.8 Status information about the transducer rods

Name:
StatusInput01

This register displays the status information for the transducer rods.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|-------|-------------------------|-------|--------------------------------|
| 0 | Supply voltage too low | 0 | Supply voltage OK |
| | | 1 | Supply voltage too low |
| 1 | Supply voltage too high | 0 | Supply voltage OK |
| | | 1 | Supply voltage too high |
| 2 | Transducer Rod 1 | 0 | Ok |
| | | 1 | Deactivated or not initialized |
| 3 | Transducer Rod 2 | 0 | Ok |
| | | 1 | Deactivated or not initialized |
| 4 | Transducer Rod 1 | 0 | Protocol error (invalid data) |
| | | 1 | Protocol OK (valid data) |
| 5 | Transducer Rod 2 | 0 | Protocol error (invalid data) |
| | | 1 | Protocol OK (valid data) |
| 6 - 7 | Reserved | | |

Comment concerning bits 4 + 5

If this bit is set to "1", configuration data was successfully read from the measurement rod using DPI/IP or EP protocol. This data can now be read into the application using asynchronous access.

9.11.13.8.9 Ultrasonic speed specification

Name:
USSpeed01 to USSpeed02

The module does not perform any measurements on the respective rod while these registers have the value 0. Also disabled:

- Automatic check to determine whether a rod is connected
- Parameter upload via DPI/IP or EP protocol

If a value >0 but <1000cm/s is specified here, the module freezes all measurements and error counters of the corresponding rod, regardless of whether plausibility mode is enabled or not. Based on the default ultrasonic speed of 280,000 cm/s, however, periodic measurement start pulses continue to be generated according to the formula in "[Channel configuration](#)" on page 1211. In this case the rod check (inserted/not inserted and parameter upload) continues to be active.

As soon as a valid value (≥ 1000) is specified, the module recalculates the measurement rate (see "[Channel configuration](#)" on page 1211) and begins the position/speed measurement.

| Data type | Value | Information |
|-----------|--------------------|-------------------|
| UDINT | 0 to 4,294,967,296 | Resolution 1 cm/s |

9.11.13.8.10 Applying new magnet offsets

Name:

StatusOutput01

This register makes it easier to more quickly determine new offsets (= zero positions) for the individual magnets. This approach is an alternative or additional method to determining an offset via configuration registers (see "Offset position on the transducer" on page 1212).

If the respective bit changes from 0 to 1 in "StatusOutput01" (see following table) then the current mechanical position of the respective magnet becomes the calculated zero position (register "Position0x" = 0).

From that moment, the current mechanical position will be subtracted from all future measured positions. This is essentially a type of referencing. The max. and min. magnet paths (see "Plausibility check configuration" on page 1212) are now based on the new zero position.

This process can be repeated at any time by setting the bit again.

Information:

An offset position determined in this manner is **NOT** readable. Only the current contents of **ConfigOutput07**, **ConfigOutput08**, **ConfigOutput15** and **ConfigOutput16** can be read using registers **ConfigOutput07Read**, **ConfigOutput08Read**, **ConfigOutput15Read** and **ConfigOutput16Read**.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

| Bit | Name | Value | Information |
|-------|----------|-------|-----------------------|
| 0 | Magnet 1 | 0 | No effect |
| | | 1 | Apply offset magnet 1 |
| ... | | ... | |
| 3 | Magnet 4 | 0 | No effect |
| | | 1 | Apply offset magnet 4 |
| 4 - 7 | Reserved | | |

9.11.13.8.11 Module configuration

Name:

ConfigOutput01

This register configures the module.

| Data type | Values | Bus controller default setting |
|-----------|------------------------|--------------------------------|
| USINT | See the bit structure. | 0 |

Bit structure:

| Bit | Name | Value | Information |
|-------|---|-------|--|
| 0 | Plausibility mode | 0 | The plausibility error counter is incremented with each implausible measurement, and the last plausible measured value is "frozen" (bus controller default setting). |
| | | 1 | The plausibility error counter is incremented with each implausible measurement and the implausible measurement value is forwarded to the controller |
| 1 | Reserved | | |
| 2 - 3 | Tolerance for monitoring the supply voltage | 00 | 25% (bus controller default setting) |
| | | 01 | 20% |
| | | 10 | 15% |
| | | 11 | 10% |
| 4 - 7 | Magnet number | 0000 | 4 magnets on channel 1, channel 2 not available (bus controller default setting) |
| | | 0001 | 3 magnets on channel 1, 1 magnet on channel 2 |
| | | 0010 | 2 magnets on channel 1, 2 magnets on channel 2 |
| | | 0011 | 1 magnet on channel 1, 0 magnets on channel 2 |
| | | 0100 | 2 magnets on channel 1, 0 magnets on channel 2 |
| | | 0101 | 3 magnets on channel 1, 0 magnets on channel 2 |
| | | 0110 | 2 magnets on channel 1, 1 magnet on channel 2 |
| | | 0111 | 1 magnet on channel 1, 1 magnet on channel 2 |
| | | 1xxx | Reserved |

9.11.13.8.12 Channel configuration

Name:
ConfigOutput02

This register can be used to configure the individual channels.

| Data type | Values | Bus controller default setting |
|-----------|------------------------|--------------------------------|
| UINT | See the bit structure. | 0 |

Bit structure:

| Bit | Description | Value | Information |
|---------|--|-------|---|
| 0 - 2 | Transducer Rod 1 | 000 | User parameter (bus controller default setting) |
| | | 001 | DPI/IP (Balluf) |
| | | 010 | EP Start/Stop (MTS) |
| | | 011 | Reserved |
| | | 1xx | Reserved |
| 3 - 4 | Rod 1: Start/Stop IF type | 00 | Start/Stop signal: Rising edge - Rising edge (bus controller default setting) |
| | | 01 | Start/Stop Signal: Falling edge - falling edge |
| | | 10 | Start/Stop Signal: Rising edge - falling edge (gate time) |
| | | 11 | Only Stop Signal: Start when signal is triggered (initialization pulses) |
| 5 | Rod 1: Recovery time factor, minimum time between two measurements | 0 | 3 x USW runtime for rod (bus controller default setting) |
| | | 1 | 2 x USW runtime for rod |
| 6 - 7 | Reserved | | |
| 8 - 10 | Transducer Rod 2 | 000 | User parameter (bus controller default setting) |
| | | 001 | DPI/IP (Balluf) |
| | | 010 | EP Start/Stop (MTS) |
| | | 011 | Reserved |
| | | 1xx | Reserved |
| 11 - 12 | Rod 2: Start/Stop IF type | 00 | Start/Stop signal: Rising edge - Rising edge (bus controller default setting) |
| | | 01 | Start/Stop Signal: Falling edge - falling edge |
| | | 10 | Start/Stop Signal: Rising edge - falling edge (gate time) |
| | | 11 | Only Stop Signal: Start when signal is triggered (initialization pulses) |
| 13 | Rod 2: Recovery time factor, minimum time between two measurements | 0 | 3 x USW runtime for rod (bus controller default setting) |
| | | 1 | 2 x USW runtime for rod |
| 14 - 15 | Reserved | | |

Comment concerning bits 5 + 13

USW transducer rods require a certain recovery time between two measurements to allow the ultrasonic wave to fade. Otherwise there is a risk of interfering with the next measurement (especially when the rod has more than 1 magnet).

Depending on the setting, the module waits at least 2 or 3 times the runtime of the ultrasonic wave for the measurement rod (default = 3x). In the standard function module, the next measurement is then triggered synchronously with the next X2XLink cycle.

The runtime measurement is based on the settings for the rod length (plus a safety margin of 100mm) and the ultrasonic speed:

- $USW \text{ runtime} = (\text{rod length} + 100\text{mm}) / \text{ultrasonic speed}.$

For their rods, BALLUFF recommends a recovery time equal to 3 times the maximum runtime of the ultrasonic wave for the measurement rod. This is the default setting for the module.

The setting can be switched to 2 times the runtime if the measurement rate is otherwise too slow. This may only be done after consulting the manufacturer of the transducer rods!

9.11.13.8.13 Rod length 1 and 2

Name:
ConfigOutput03 to ConfigOutput04

These registers are used to configure the length of the respective rod.

- Rod length 1: ConfigOutput03
- Rod length 2: ConfigOutput04

| Data type | Value | Information |
|-----------|-------------------|---|
| UDINT | 0 to 4,294,967,29 | Resolution 1 mm. Bus controller default setting: 0 |

9.11.13.8.14 Offset position on the transducer

Name:

ConfigOutput07 to ConfigOutput08

ConfigOutput15 to ConfigOutput16

These registers are used to assign the respective magnet an offset position (= zero position) on the transducer. The max. and min. magnet paths refer to these specified offsets (see "[Plausibility check configuration](#)" on page 1212). If the offset is changed using the StatusOutput01 register, this becomes the new zero position. This does not affect the contents of the offset register.

- Offset magnet 1: ConfigOutput07
- Offset magnet 2: ConfigOutput08
- Offset magnet 3: ConfigOutput15
- Offset magnet 4: ConfigOutput16

| Data type | Value | Information |
|-----------|------------------------------------|---|
| DINT | -2,147,483,648 to 2,147,483,647 | Resolution 1 µm. Bus controller default setting: 0 |

9.11.13.8.15 Plausibility check configuration

These registers are used to configure the plausibility check (also see "[Error status](#)" on page 1208).

9.11.13.8.15.1 Min. plausible magnet position

Name:

ConfigOutput09 to ConfigOutput10

ConfigOutput17 to ConfigOutput18

These registers are used to assign the min. plausible magnet position based on the applicable offset.

- Min. path - magnet 1: ConfigOutput09
- Min. path - magnet 2: ConfigOutput10
- Min. path - magnet 3: ConfigOutput17
- Min. path - magnet 4: ConfigOutput18

| Data type | Value | Information |
|-----------|------------------------------------|---|
| DINT | -2,147,483,648 to 2,147,483,647 | Resolution 1 µm. Bus controller default setting: 0 |

9.11.13.8.15.2 Max. plausible magnet position

Name:

ConfigOutput11 to ConfigOutput12

ConfigOutput19 to ConfigOutput20

These registers assign the max. plausible magnet position relative to the valid offset.

- Max. path of magnet 1: ConfigOutput11
- Max. path of magnet 2: ConfigOutput12
- Max. path of magnet 3: ConfigOutput19
- Max. path of magnet 4: ConfigOutput20

| Data type | Values | Information |
|-----------|------------------------------------|---|
| DINT | -2,147,483,648 to 2,147,483,647 | Resolution 1 µm. Bus controller default setting: 0 |

9.11.13.8.15.3 Max. plausible magnet velocity

Name:

ConfigOutput13 to ConfigOutput14

ConfigOutput21 to ConfigOutput22

These registers assign the max. plausible magnet speed.

- Max. speed of magnet 1: ConfigOutput13
- Max. speed of magnet 2: ConfigOutput14
- Max. speed of magnet 3: ConfigOutput21
- Max. speed of magnet 4: ConfigOutput22

| Data type | Values | Information |
|-----------|--------------------|---|
| UDINT | 0 to 4,294,967,296 | Resolution 0.1 mm/s. Bus controller default setting: 0 |

9.11.13.8.16 Dead time for rods 1 and 2

Name:

ConfigOutput23 to ConfigOutput24

These registers configure the dead time of the respective rod.

- Dead time for rod 1: ConfigOutput23
- Dead time for rod 2: ConfigOutput24

To prevent the multiple pulses that occur with some encoders from affecting the measurement, all pulses received within a configurable timespan from the beginning of the measurement are not evaluated. The range for the dead time is between 0 and 255 μ s. The following figure illustrates the effects of defining a dead time:

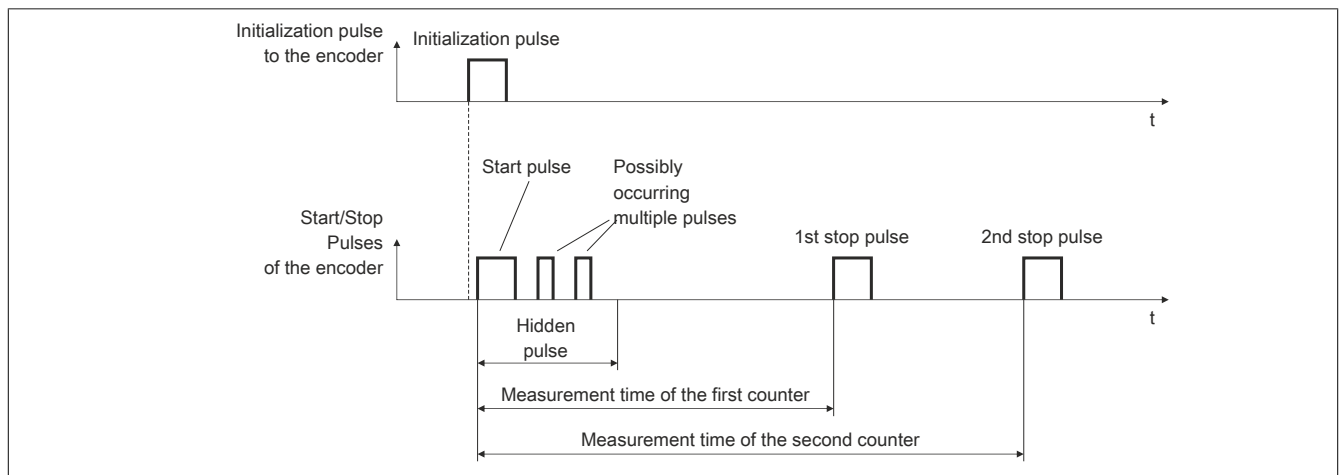

Figure 122: Pulse Ignored after Start Pulse

| Data type | Values | Information |
|-----------|----------|--|
| USINT | 0 to 255 | 1 μ s resolution. Bus controller default setting: 0 |

9.11.13.8.17 Read configuration register

Name:

ConfigOutput01Read to ConfigOutput04Read

ConfigOutput07Read to ConfigOutput24Read

These registers are used to read the states of the corresponding configuration registers.

9.11.13.8.18 Status register

Name:

StatusInput09 to StatusInput36

These registers are used to store the data read after a parameter upload from transducer rods with DPI/IP protocol or EP protocol. The registers "StatusInput19" to "StatusInput36" remain empty (0x0000) on transducer rods with EP protocol.

9.11.13.8.18.1 Parameter overview

The following parameters are stored in the status registers:

| Register | Description | Supported by the protocol | |
|---------------|--|---------------------------|--------|
| | | DPI/IP | EP |
| StatusInput09 | Rod length 1 [mm] | • | • |
| StatusInput10 | Rod length 2 [mm] | • | • |
| StatusInput11 | Ultrasonic speed 1 | • | • |
| StatusInput12 | Ultrasonic speed 2 | • | • |
| StatusInput13 | Rod 1: Zero point offset [µm] | • | • |
| StatusInput14 | Rod 2: Zero point offset [µm] | • | • |
| StatusInput15 | Rod 1: Vendor ID (see transducer rod data sheet) | • | • |
| StatusInput16 | Rod 2: Vendor ID (see transducer rod data sheet) | • | • |
| StatusInput17 | Rod 1: Serial number (Hex coded) | • | • |
| StatusInput18 | Rod 2: Serial number (Hex coded) | • | • |
| StatusInput19 | Rod 1: Type ID 1 (MSB = letter 1) | • | 0x0000 |
| StatusInput20 | Rod 1: Type ID 2 (MSB = letter 5) | • | 0x0000 |
| StatusInput21 | Rod 1: Type ID 3 (MSB = letter 9) | • | 0x0000 |
| StatusInput22 | Rod 1: Type ID 4 (MSB = letter 13) | • | 0x0000 |
| StatusInput23 | Rod 1: Type ID 5 (MSB = letter 17) | • | 0x0000 |
| StatusInput24 | Rod 1: Type ID 6 (MSB = letter 21) | • | 0x0000 |
| StatusInput25 | Rod 2: Type ID 1 (MSB = letter 1) | • | 0x0000 |
| StatusInput26 | Rod 2: Type ID 2 (MSB = letter 5) | • | 0x0000 |
| StatusInput27 | Rod 2: Type ID 3 (MSB = letter 9) | • | 0x0000 |
| StatusInput28 | Rod 2: Type ID 4 (MSB = letter 13) | • | 0x0000 |
| StatusInput29 | Rod 2: Type ID 5 (MSB = letter 17) | • | 0x0000 |
| StatusInput30 | Rod 2: Type ID 6 (MSB = letter 21) | • | 0x0000 |
| StatusInput31 | Rod 1: Serial number ASCII 1 (MSB = letter 1) | • | 0x0000 |
| StatusInput32 | Rod 1: Serial number ASCII 2 (MSB = letter 5) | • | 0x0000 |
| StatusInput33 | Rod 1: Serial number ASCII 3 (MSB = letter 9) | • | 0x0000 |
| StatusInput34 | Rod 2: Serial number ASCII 1 (MSB = letter 1) | • | 0x0000 |
| StatusInput35 | Rod 2: Serial number ASCII 2 (MSB = letter 5) | • | 0x0000 |
| StatusInput36 | Rod 2: Serial number ASCII 3 (MSB = letter 9) | • | 0x0000 |

9.11.13.8.18.2 DPI/IP protocol (BALLUFF) / EP protocol (MTS)

Requirements for a successful upload of the transducer rod parameters to the module:

1. Selection of the communication protocol (DPI/IP or EP). See "[Channel configuration](#)" on page 1211
2. Transducer rod must support the respective protocol.
3. If the transducer rod does not support the selected protocol, the module will detect this after a timeout of approx. 300 ms and will treat the rod as a "normal" transducer rod.

After the module is started or after a transducer rod is connected, the parameter upload should be complete within 200 to 400 ms.

A communication error causes the data upload to cancel. A new upload attempt can be initiated by the user by deactivating and reactivating the communication protocol using asynchronous access.

All rod parameters can be read to the controller using asynchronous access. The read parameters "rod length" and "ultrasonic speed" are **NOT** automatically uploaded to the module.

It is left up to the application whether the upload values for rod length 1 and rod length 2 or for ultrasonic speed 1 and ultrasonic speed 2 are uploaded.

Information:

Keep in mind that no position measurements can be performed on a rod while parameters are being uploaded. The module freezes all existing position/speed data for all magnets on the rod while the parameters are uploading. Parameters should therefore only be uploaded with the machine stopped, and this should be ensured by the application.

9.11.13.8.19 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time |
|--------------------|
| 250 μ s |

9.11.14 X20(c)DC2395

Data sheet version: 3.21

9.11.14.1 General information

This module is a multifunctional counter module. It can be connected to one SSI encoder, one ABR encoder, two AB encoders or four event counters. Two outputs are available for pulse width modulation. The functions can also be mixed.

- 24 VDC encoder inputs
- SSI, ABR, AB or event counters for inputs
- Pulse width modulation for outputs
- 24 VDC and GND for encoder supply

Information:

This module is a multifunctional module. Some bus controllers only support the default function model.

Default function model:

- **2x event counter (24 V)**
- **2x PWM output (24 V)**

9.11.14.2 Coated modules

Coated modules are X20 modules with a protective coating for the electronics component. This coating protects X20c modules from condensation and corrosive gases.

The modules' electronics are fully compatible with the corresponding X20 modules.

For simplification purposes, only images and module IDs of uncoated modules are used in this data sheet.

The coating has been certified according to the following standards:

- Condensation: BMW GS 95011-4, 2x 1 cycle
- Corrosive gas: EN 60068-2-60, method 4, exposure 21 days

9.11.14.3 Order data

| Model number | Short description | Figure |
|--------------|--|--------|
| | Counter functions | |
| X20DC2395 | X20 digital counter module, 1 SSI absolute encoder, 24 V, 1 ABR incremental encoder, 24 V, 2 AB incremental encoders, 24 V, 4 event counters or 2 PWM, local time measurement function | |

Table 216: X20DC2395, X20cDC2395 - Technical data

1) Dead time when switching between push and pull: max. 1.5 µs.

9.11.14.5 LED status indicators

For a description of the various operating modes, see "[Diagnostic LEDs](#)" on page 3787.

| Figure | LED | Color | Status | Description |
|---|-------|-------|--------------|--|
|  | r | Green | Off | No power to module |
| | | | Single flash | RESET mode |
| | | | Double flash | BOOT mode (during firmware update) ¹⁾ |
| | | | Blinking | PREOPERATIONAL mode |
| | e | Red | On | RUN mode |
| | | | Off | No power to module or everything OK |
| | 1 - 4 | Green | On | Error or reset status |
| | | | Off | Status of the corresponding digital signal |

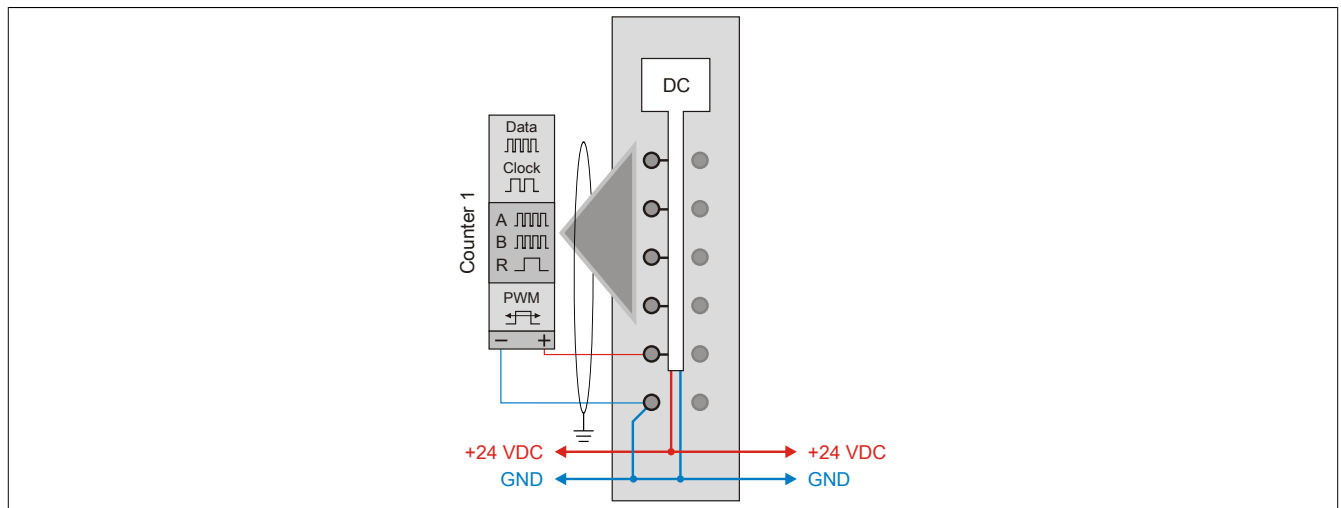

1) Depending on the configuration, a firmware update can take up to several minutes.

9.11.14.6 Pinout

Shielded cables must be used for all signal lines.

9.11.14.7 Connection example

9.11.14.8 Function overview

The following functions can be configured on the module. They cannot all be used at the same time due to the multiple use of the hardware channels and the limited cyclic data length.

- 4 digital channels, 2 of which can be configured as outputs
- 4 event counters with configurable counting direction and optional referencing via digital input
- 2 PWM outputs
- 2 up/down counters, each with optional latch inputs and comparator output
- 2 AB counters, each with optional latch inputs and comparator output
- 1 ABR encoder with configurable reference pulse edge and reference position, optional reference enable input, latch input and comparator output
- 1 SSI counter with optional latch input and comparator output
- 2 edge-triggered time measurement functions with configurable start edge based on current configuration settings

9.11.14.8.1 Description of channel assignments

The functions listed here are directly assigned to the respective hardware channels and cannot be changed:

| Channel | Signal connections |
|---------|--|
| 1 | <ul style="list-style-type: none"> • Digital input 1 • Event counter 1 • AB encoder 1 - signal line A • Up/down counter 1 - frequency • SSI encoder 1 - data line • ABR encoder 1 - signal line A |
| 2 | <ul style="list-style-type: none"> • Digital input 2 • Digital output 2 • Event counter 2 • PWM output 2 • AB encoder 1 - signal line B • Up/down counter 1 - direction • SSI encoder 1 - clock line • ABR encoder 1 - signal line B |
| 3 | <ul style="list-style-type: none"> • Digital input 3 • Event counter 3 • AB encoder 2 - signal line A • Up/down counter 2 - frequency • ABR encoder 1 - signal line R |
| 4 | <ul style="list-style-type: none"> • Digital input 4 • Digital output 4 • Event counter 4 • PWM output 4 • AB encoder 2 - signal line B • Up/down counter 2 - direction • ABR encoder 1 - reference enable input |

Options available in addition to these basic functions, such as comparator outputs or latch inputs, can be configured freely to unused input/output channels.

9.11.14.8.2 Connection options

Channels 1 to 4 can be connected as follows:

| Channel | Function | | | | | |
|---------|----------|---------------|---|------------------|-----------|-----|
| 1 | I | Event counter | A | A | SSI data | |
| 2 | I/O | Event counter | B | B | SSI cycle | PWM |
| 3 | I | Event counter | A | R | | |
| 4 | I/O | Event counter | B | Enable reference | | PWM |

The functions can also be mixed. For example:

| Example 1 | |
|-----------|---------------|
| Channel | Function |
| 1 | SSI data |
| 2 | SSI cycle |
| 3 | Event counter |
| 4 | PWM |

| Example 2 | |
|-----------|-----------|
| Channel | Function |
| 1 | SSI data |
| 2 | SSI cycle |
| 3 | A |
| 4 | B |

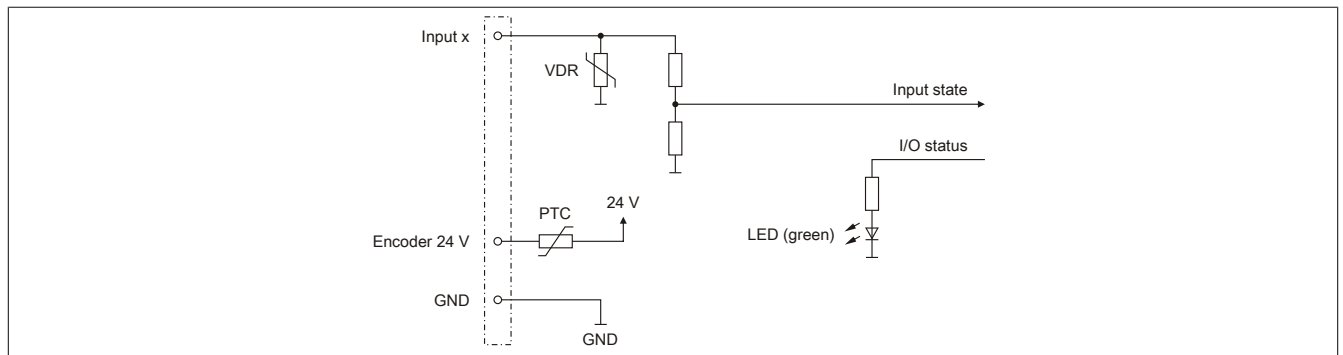

| Example 3 | |
|-----------|---------------|
| Channel | Function |
| 1 | Event counter |
| 2 | PWM |
| 3 | Event counter |
| 4 | PWM |

| Example 4 | |

| 1 | Event counter |
| 2 | PWM |
| 3 | A |
| 4 | B |

9.11.14.9 Input circuit diagram

9.11.14.10 Output circuit diagram

9.11.14.11 Switching inductive loads

9.11.14.12 Calculating the period duration

The outputs of the module can be operated as PWM outputs. The period duration is calculated using the following formula:

$$\text{Period duration} = \frac{n}{48000} \text{ s}$$

A value of 2 to 65535 can be defined for n.

Example

| n | Period duration | Frequency |
|-------|-----------------|-----------|
| 2 | 416 μs | 24 kHz |
| 24000 | 500 ms | 2 Hz |
| 48000 | 1 s | 1 Hz |
| 65535 | 1.36 s | 0.73 Hz |

9.11.14.13 Register description

9.11.14.13.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section "[General data points](#)" on page 3790.

9.11.14.13.2 Function model 0 - Standard and Function model 1 - 32-bit counter

The following 2 models can be selected:

- 16-bit counter, Function model 0
- 32-bit counter, Function model 1 (identified in the table with a "(D)" in the data type and "(_32Bit)" in the name.)

The only difference between these two models is that they use either 16-bit or 32-bit registers for incremental counter functions. These include:

- ABR encoders
- AB encoders
- Up/down counters
- Event counters

All other module functions e.g. SSI, PWM and time measurement, as well as their data types, are identical for the two models.

| Register | Name | Data type | Read | | Write | |

9.11.14.13.3 Function model 254 - Bus controller

Unlike the function models 0 and 1, this model only offers a selection of functions with a limited scope of configuration on the module.

The following functions are provided and can be run at the same time:

- 2 event counter with configurable counting direction
- 2 PWM outputs

| Register | Offset ¹⁾ | Name | Data type | Read | | Write | |
|----------------------|----------------------|-------------------------------------|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| Configuration | | | | | | | |
| (N-1) * 2 | - | CfO_CFGchannel0N (Index N = 1 to 4) | USINT | | | | • |
| 64 + N * 2 | - | CfO_LEDNsource (Index N = 0 to 3) | USINT | | | | • |
| 2,056 | - | CfO_Counter1configReg0 | USINT | | | | • |
| 2,312 | - | CfO_Counter2configReg0 | USINT | | | | • |
| Communication | | | | | | | |
| 2,080 | 0 | EventCounter01 | UINT | • | | | |
| 2,336 | 2 | EventCounter03 | UINT | • | | | |
| 6,146 | 0 | PWMOutput02 | UINT | | | • | |
| 6,162 | 2 | PWMOutput04 | UINT | | | • | |
| 40 | 4 | Status of encoder power supply | USINT | • | | | |
| | | PowerSupply01 | Bit 0 | | | | |

1) The offset specifies the position of the register within the CAN object.

9.11.14.13.3.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see ["Using I/O modules on the bus controller" on page 3789](#).

9.11.14.13.3.2 CAN I/O bus controller

The module occupies 1 analog logical slot on CAN I/O.

9.11.14.13.4 General module registers

9.11.14.13.4.1 Configuring LED status indicators

Name:

CfO_LED0source to CfO_LED3source

These registers can be used to define how the module's LED status indicators are used. Blinking patterns can be generated from the application, and the status of the physical inputs and outputs can be indicated.

| Data type | Values | Bus controller default setting |
|-----------|------------------------|-------------------------------------|
| USINT | See the bit structure. | CfO_LEDNsource N(0 to 3): 32 + N |

Bit structure:

| Bit | Description | Value | Information | |
|----------|---------------------|--|---|--------------------------------------|
| 0 - 3 | MODE = 0 | 0 | LED off | |
| | | 1 | Blinking quickly | |
| | | 2 | Blinking | |
| | | 3 | Blinking slowly | |
| | | 4 | Single flash | |
| | | 5 | Double flash | |
| | MODE = 1 (inverted) | 6 to 15 | Reserved | |
| | | 0 | LED on | |
| | | 1 | Blinking quickly | |
| | | 2 | Blinking | |
| | | 3 | Blinking slowly | |
| | | 4 | Single flash | |
| | MODE = 2 | 4 to 15 | 0 to 3 | Number of the physical input channel |
| | | | 4 to 15 | Reserved |
| | | 0 to 3 | Number of the physical output channel | |
| MODE = 3 | 4 to 15 | Reserved | | |
| | 4 - 7 | Selection of the mode for the LED status indicator | 0 | LED blinking pattern |
| | | 1 | Inverted LED blinking pattern | |
| | | 2 | Displays a channel's physical input status | |
| | | 3 | Displays a channel's physical output status | |
| | | 4 to 15 | Reserved | |

9.11.14.13.4.2 Status of encoder power supply

Name:

PowerSupply01

This register indicates the state of the integrated encoder power supply. A faulty encoder power supply is output as a warning.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|---------------|-------|------------------------------------|
| 0 | PowerSupply01 | 0 | 24 VDC encoder power supply OK |
| | | 1 | 24 VDC encoder power supply faulty |
| 1 - 7 | Reserved | - | |

9.11.14.13.5 Digital inputs and outputs

9.11.14.13.5.1 Configure physical channels

Name:

CfO_CFGchannel01 to CfO_CFGchannel04

This register can be used to configure physical I/O channels 1 to 4.

Information:

Except for bit 2 (inverted input), all other bits are only available for channels 2 and 4.

| Data type | Values | Bus controller default setting |
|-----------|------------------------|---|
| USINT | See the bit structure. | CfO_CFGchannel0N N(1.3): 0 N(2.4): 99 |

Bit structure:

| Bit | Description | Value | Information |
|-------|--------------------|--------|------------------------------|
| 0 | Push ¹⁾ | 0 | Disabled |
| | | 1 | Enabled |
| 1 | Pull ¹⁾ | 0 | Disabled |
| | | 1 | Enabled |
| 2 | Inverted input | 0 | Disabled |
| | | 1 | Enabled |
| 3 | Inverted output | 0 | Disabled |
| | | 1 | Enabled |
| 4 - 7 | Output type | 0 | Direct I/O |
| | | 1 to 5 | Reserved |
| | | 6 | PWM (channel-specific) |
| | | 7 | SSI clock (channel-specific) |

1) To configure a channel as an output, Push and/or Pull must be enabled.

9.11.14.13.5.2 Reset mask of the digital channels

Name:

CfO_OutClearMask

The settings in this register only affect the values written to registers "DigitalOutput02 and 04" on page 1229.

- 0 allows manual reset of digital outputs using registers DigitalOutput02 and 04
- 1 prevents manual reset of digital outputs using registers DigitalOutput02 and 04

When "1" is used, the [output event function](#) can be used to reset the outputs.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|-----------------|-------|---|
| 0 | Reserved | - | |
| 1 | DigitalOutput02 | 0 | Writing 0 to the DigitalOutput02 register resets the output |
| | | 1 | Writing 0 from the DigitalOutput02 register does not reset the output |
| 2 | Reserved | - | |
| 3 | DigitalOutput04 | 0 | Writing 0 to the DigitalOutput04 register resets the output |
| | | 1 | Writing 0 from the DigitalOutput04 register does not reset the output |
| 4 - 7 | Reserved | - | |

9.11.14.13.5.3 Set mask of the digital channels

Name:

CfO_OutSetMask

The settings in this register only affect the values written to registers "DigitalOutput02 and 04" on page 1229.

- 0 allows manual setting of digital outputs using registers DigitalOutput02 and 04
- 1 prevents manual setting of digital outputs using registers DigitalOutput02 and 04

When "1" is used, the [output event function](#) can be used to set the outputs.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|-----------------|-------|---|
| 0 | Reserved | - | |
| 1 | DigitalOutput02 | 0 | Writing 1 to the DigitalOutput02 register sets the output |
| | | 1 | Writing 1 from the DigitalOutput02 register does not set the output |
| 2 | Reserved | - | |
| 3 | DigitalOutput04 | 0 | Writing 1 to the DigitalOutput04 register sets the output |
| | | 1 | Writing 1 from the DigitalOutput04 register does not set the output |
| 4 - 7 | Reserved | - | |

9.11.14.13.5.4 Input states of the channels

Name:

see "Name in the Automation Studio I/O configuration"

This register reads the input status of a physical channel. The polarity settings are accounted for in the value (bit 2 in "CfO_CFGchannel[x]" on page 1227 register).

The bits in this register are shown in the Automation Studio I/O mapping table under different names based on the function used in order to improve readability.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Physical input channel | Value | Name in the Automation Studio I/O configuration |
|-------|------------------------|--------|---|
| 0 | Channel 1 | 0 or 1 | DigitalInput01 |
| 1 | Channel 2 | 0 or 1 | DigitalInput02 |
| | | | StatusDigitalOutput02 |
| 2 | Channel 3 | 0 or 1 | DigitalInput03 |
| 3 | Channel 4 | 0 or 1 | DigitalInput04 |
| | | | StatusDigitalOutput04 |
| | | | ReferenceEnableSwitch01 |
| | | | ComparatorActualValue01 |
| 4 - 7 | Reserved | - | |

9.11.14.13.5.5 Output states of the channels

Name:

DigitalOutput02 and DigitalOutput04

The output status of a physical channel can be written using this register. In order to configure a channel as an output:

- 1) Bit 0 "Push" and/or bit 1 "Pull" must be enabled in the "CfO_CFGchannel[x]" on page 1227 register.
- 2) Bits 4 to 7 in the "CfO_CFGchannel[x]" on page 1227 register must be set to Direct I/O.
- 3) 0 must be set for the respective channel in the "CfO_OutClearMask" on page 1227 and "CfO_OutSetMask" on page 1228 registers.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|-----------------|--------|----------------------------|
| 0 | Reserved | - | |
| 1 | DigitalOutput02 | 0 or 1 | Output status of channel 2 |
| 2 | Reserved | - | |
| 3 | DigitalOutput04 | 0 or 1 | Output status of channel 4 |
| 4 - 7 | Reserved | - | |

9.11.14.13.6 Event functions

The module provides configurable event functions. An event function can be connected to physical I/O and the values derived from them (e.g. counters) or be purely used for internal processing.

Every event function has event inputs and outputs. Event functions can also have only inputs or only outputs. Each event output has a unique event ID. It is possible to configure when an event is generated on an event output. The effect of an event is determined by the respective event function.

Event functions can also be linked to one another. The link takes place using the event input. Every event input has a 16-bit register to which the event number of the linked event output is written.

Information:

The module functions that can be configured in the Automation Studio I/O configuration are primarily based on these event functions and their links. Changes in the Automation Studio I/O configuration have multiple effects on event functions and their links.

9.11.14.13.6.1 List of event IDs

Various hardware and software functions send event IDs or require event IDs in order to start. The following table shows all of the IDs available to configure the module.

| Event ID | Description | |
|-------------------------------------|---|----------------------------------|
| Direct event inputs | | |
| 512 | Comparator condition | FALSE |
| 513 | Comparator condition | TRUE |
| Counter comparator functions | | |
| 2112 | Counter function 1 | Event function 1; FALSE |
| 2113 | | Event function 1; TRUE |
| 2144 | | Event function 2; FALSE |
| 2145 | | Event function 2; TRUE |
| 2368 | Counter function 2 | Event function 1; FALSE |
| 2369 | | Event function 1; TRUE |
| 2400 | | Event function 2; FALSE |
| 2401 | | Event function 2; TRUE |
| Edge events | | |
| 4096 | Falling edge on I/O channel | Channel 1 |
| ... | | ... |
| 4099 | | Channel 4 |
| 4112 | Rising edge on I/O channel | Channel 1 |
| ... | | ... |
| 4115 | | Channel 4 |
| 4128 | Rising or falling edge on I/O channel | Channel 1 |
| ... | | ... |
| 4131 | | Channel 4 |
| SSI counter events | | |
| 7168 | SSI valid | |

| 227 | AOSIEOP (asynchronous out synchronous in end of protocol) | |
| Idle event | | |
| 192 | No-load operation | |

Timer

There are 8 timer events that the module can generate.

Information:

The timers have the highest event priority. All other system functions are interrupted when a timer event occurs, and jitter for the amount of time it takes to process the event.

Idle event

Idle time is the time that remains after the system has processed all higher priority events and operations. The module performs the following functions during idle time:

- Handling of the asynchronous protocol
- Mechanism for (re-)linking events
- Operation of LEDs
- Execution of event functions linked to the idle function

9.11.14.13.6.2 Edge events

For each physical input channel there are 3 event functions

- Falling edge
- Rising edge
- Falling and rising edge

The respective event is triggered when an edge is detected on the hardware input and the "[CfO_EdgeDetectRising](#)" on page 1231 and/or "[CfO_EdgeDetectFalling](#)" on page 1231 register has been configured for the respective channel.

Edges are detected by the hardware and processed for each interrupt. The interrupt handler uses an event distributor, which requires a specific amount of time for each edge to operate the hardware and execute linked event functions. To reduce this time, edge detection can be enabled/disabled individually for each channel. To optimize system load and I/O jitter, it is important to only enable edge detection where it is actually needed.

Information:

Edge detection can also be used for channels that are configured as outputs.

Event frequency limitation

To stabilize the system, there is a mechanism that limits the number of events created through edge recognition. At least one idle event must occur between two edge events for the same edge.

The "[CfO_FallingDisProtection](#)" on page 1232 and "[CfO_RisingDisProtection](#)" on page 1232 registers can be used to disable this limitation for each edge, and then an event will be generated for every edge. However, this can cause a system overload, i.e. I/O operation can fail for up to 100 ms before the module changes to the reset state.

Generate event on falling edge

Name:

CfO_EdgeDetectFalling

This register defines whether an event is generated on a falling edge.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|-------------|-------|---|
| 0 | Channel 1 | 0 | No event generated on falling edge. |
| | | 1 | Events 4096 and 4128 are generated on falling edge. |
| ... | | ... | |
| 3 | Channel 4 | 0 | No event generated on falling edge. |
| | | 1 | Events 4099 and 4131 are generated on falling edge. |
| 4 - 7 | Reserved | - | |

Generate event on rising edge

Name:

CfO_EdgeDetectRising

This register defines whether an event is generated on a rising edge.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|-------------|-------|--|
| 0 | Channel 1 | 0 | No event generated on rising edge. |
| | | 1 | Events 4112 and 4128 are generated on rising edge. |
| ... | | ... | |
| 3 | Channel 4 | 0 | No event generated on rising edge. |
| | | 1 | Events 4115 and 4131 are generated on rising edge. |
| 4 - 7 | Reserved | - | |

Enable limit for falling edges

Name:

CfO_FallingDisProtection

This register can be used to enable/disable the [event frequency limit](#) for falling edges on the respective channel.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|-------------|-------|---------------------------------|
| 0 | Channel 1 | 0 | Event frequency limit enabled. |
| | | 1 | Event frequency limit disabled. |
| ... | | ... | |
| 3 | Channel 4 | 0 | Event frequency limit enabled. |
| | | 1 | Event frequency limit disabled. |
| 4 - 7 | Reserved | - | |

Enable limit for rising edges

Name:

CfO_RisingDisProtection

This register can be used to enable/disable the [event frequency limit](#) for rising edges on the respective channel.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|-------------|-------|---------------------------------|
| 0 | Channel 1 | 0 | Event frequency limit enabled. |
| | | 1 | Event frequency limit disabled. |
| ... | | ... | |
| 3 | Channel 4 | 0 | Event frequency limit enabled. |
| | | 1 | Event frequency limit disabled. |
| 4 - 7 | Reserved | - | |

9.11.14.13.6.3 Direct input function

The module features a direct input function.

This event function is based on comparator functionality. If the event configured in the "CfO_DIREKTIOevent0IDwr" on page 1233 register occurs, the event function compares the status of all Direct I/O channels enabled in the "CfO_EvCompMask" on page 1234 register to a status defined in the "CfO_DIREKTIOeventcompState" on page 1233 register. The event that is generated depends on the results of this comparison.

- If the respective bits are the same, then event number 513 is generated
- If the respective bits are different, then event number 512 is generated

Configure event ID for input function

Name:

CfO_DIREKTIOevent0IDwr

This register holds the event ID generated by the direct input function. For a list of all possible event IDs, see "List of event IDs" on page 1230

| Data type | Value | Information |
|-----------|--------------|----------------------|
| INT | 192 to 7,233 | ID of event function |

Configure the mode of the input function

Name:

CfO_DIREKTIOevent0mode

The mode in which the direct input function operates can be set in this register.

Comparator functions can be operated in 4 different modes. For a description, see "Comparator modes" on page 1243.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|-----------------|-------|--------------|
| 0 - 1 | Comparator mode | 0 | Off |
| | | 1 | Individual |
| | | 2 | State change |
| | | 3 | Continuous |
| 2 - 7 | Reserved | - | |

Comparator status for comparator mask

Name:

CfO_DIREKTIOevent0compState

This register contains the status bits that are compared with the bits specified in the "CfO_Ev0CompMask" on page 1234 register, which contain the I/O input status, when an event is received.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|--------------------------------|--------|-------------|
| 0 | Comparator status of channel 1 | 0 or 1 | |
| ... | | ... | |
| 3 | Comparator status of channel 4 | 0 or 1 | |
| 4 - 7 | Reserved | - | |

Configure the comparator mask for the input function

Name:

CfO_Ev0CompMask

If a bit is set, then the input status of the respective channel is compared with that bit in the "[CfO_DIREKTIOevent-compState](#)" on [page 1233](#) register.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|-------------|-------|-------------------------|
| 0 | Channel 1 | 0 | Do not compare bit |
| | | 1 | Compare bit in register |
| ... | | ... | |
| 3 | Channel 4 | 0 | Do not compare bit |
| | | 1 | Compare bit in register |
| 4 - 7 | Reserved | 0 | |

9.11.14.13.6.4 Direct output functions

The module has 2 of these event functions

The effect of executing this event function is similar to writing to the "[DigitalOutput02 and 04](#)" on [page 1229](#) registers. When this event function is triggered, however, the changed output states are passed on to the hardware immediately, regardless of the X2X cycle.

When this event function is used, the masks of the respective outputs (see "[CfO_OutClearMask](#)" on [page 1227](#) and "[CfO_OutSetMask](#)" on [page 1228](#) registers) must be set to 1. Otherwise the output status would constantly be overwritten by the values in the "[DigitalOutput02 and 04](#)" on [page 1229](#) registers.

Configure event ID for output function

Name:

CfO_DIREKTIOevent0IDwr to CfO_DIREKTIOevent1IDwr

These registers hold the event IDs that trigger the direct output function. For a list of all possible event IDs, see "[List of event IDs](#)" on [page 1230](#)

| Data type | Value | Information |
|-----------|--------------|----------------------|
| INT | 192 to 7,233 | ID of event function |

Configure channels for resetting

Name:

CfO_DIREKTIOoutclearmask0 to CfO_DIREKTIOoutclearmask1

Writing "1" to the bit position that corresponds to a channel resets the output if the [output event function](#) is being executed. This corresponds to writing "0" to the "[DigitalOutput 02 and 04](#)" on [page 1229](#) registers.

The bit that corresponds to channels that should be reset should be set to "1" in the "[CfO_OutClearMask](#)" on [page 1227](#) register.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|-------------|-------|------------------------|
| 0 | Reserved | - | |
| 1 | Channel 2 | 0 | Reset channel 2 |
| | | 1 | Do not reset channel 2 |
| 2 | Reserved | - | |
| 3 | Channel 4 | 0 | Reset channel 4 |
| | | 1 | Do not reset channel 4 |
| 4 - 7 | Reserved | - | |

Configure channels for setting

Name:

CfO_DIREKTIOoutsetmask0 to CfO_DIREKTIOoutsetmask1

Writing "1" to the bit position that corresponds to a channel sets the output if the [output event function](#) is being executed. This corresponds to writing "1" to the ["DigitalOutput 02 and 04" on page 1229](#) registers.

The bit that corresponds to channels that should be reset should be set to "1" in the ["CfO_OutSetMask" on page 1228](#) register.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-----|-------------|-------|----------------------|
| 0 | Reserved | - | |
| 1 | Channel 2 | 0 | Set channel 2 |
| | | 1 | Do not set channel 2 |
| 2 | Reserved | - | |
| 3 | Channel 4 | 0 | Set channel 4 |
| | | 1 | Do not set channel 4 |
| 4 | Reserved | - | |

9.11.14.13.7 Counters and encoders

The module has 2 internal counter functions, each with 2 event counter registers. Each of these 2 counters is permanently assigned to 2 physical inputs. This assignment cannot be changed.

The counter registers perform different functions based on how the event functions are connected. The counter registers can be configured in the following ways:

- ABR counter
- AB counter
- Up/down counters
- Event counters

Different names are used for them in Automation Studio and in the register description to improve clarity.

| Channel | Counter function | Counter register | Name in Automation Studio |
|---------|------------------|------------------|--|
| 1 | 1 | 1 | ABEncoder01 ABREncoder01 Counter01 EventCounter01 |
| 2 | | 2 | EventCounter02 |
| 3 | 2 | 1 | ABEncoder02 Counter02 EventCounter03 |
| 4 | | 2 | EventCounter04 |

9.11.14.13.7.1 Counter value calculation

There are 3 steps for calculating the state of any counter function

1. The counter value is based on the 2 absolute value counters "abs1" and "abs2". They are only used internally in the module and cannot be read. Depending on the **mode**, these registers show the respective physical input signals.

| | Mode | | |
|------|----------------------------|----------------------------------|--|
| | Edge counters | AB encoders | Up/down counter |
| abs1 | Edges of counter channel 1 | Increments in positive direction | Counter channel 2 = 0: Edges of counter channel 1 in up direction |
| abs2 | Edges of counter channel 2 | Increments in negative direction | Counter channel 2 = 1 Edges of counter channel 1 in down direction |

2. From the absolute value registers "abs1" and "abs2", 2 more counters are formed: "counter 1" and "counter 2". These are only used internally in the module and cannot be read. The following values are used for the calculation:

- Absolute value registers "abs1" and "abs2"
- SW_reference_counter 1 and 2: This reference value can be defined by the "[CfO_CounterPresetValue](#)" on page 1241 register to allow referencing $\lt \gt 0$.
- HW_reference_counter 1 and 2: In the "[CfO_CounterEventMode](#)" on page 1244 register, you can configure whether latched values should be copied to these registers when **counter events** occur.

$$\text{counter1} = \text{abs1} + \text{SW_reference_counter1} - \text{HW_reference_counter1}$$

$$\text{counter2} = \text{abs2} + \text{SW_reference_counter2} - \text{HW_reference_counter2}$$

3. The counter registers contain the sum of the two internal counters "counter 1" and "counter 2". The "[CfO_CounterConfigReg](#)" on page 1240 register allows you to define a sign for each "counter" register and define whether or not it should be used.

$$\text{Counter register} = \text{counter1} + \text{counter2}$$

9.11.14.13.7.2 Sample configurations

All of the settings available in Automation Studio for AB encoders, ABR encoders, up/down counters and event counters are based on the two counter functions.

The following configuration examples show the values with which Automation Studio initializes the module registers in order to implement these functions.

I/O configuration - AB encoder

The following table shows how the module's various event functions can be linked in order to configure an AB encoder.

[x] stands for the respective counter function, either 1 or 2

| Register | Value | Comment |
|----------------------------|------------------|--|
| For the function | | |
| CfO_Counter[x]config | 0x01 | Mode = Up/down counter |
| CfO_Counter[x]configReg0 | 0x0D | Configure the calculation of the internal "counter1" and "counter2" registers (see "Counter value calculation" on page 1236 and "Examples of calculation configurations" on page 1240) |
| For the latch | | |
| CfO_Counter[x]event0config | 0x000D | Configuration of the calculation of the first value used for the latch |
| CfO_Counter[x]event0mode | 0x03 | Mode of the first counter event function - Continuous |
| CfO_Counter[x]event0IDwr | (any) | Number of the event that should trigger Latch 1 ("Latch 01 - Channel" in the Automation Studio I/O configuration). |
| CfO_Counter[x]event1config | 0x0D | Configuration of the calculation of the second value used for the latch |
| CfO_Counter[x]event1mode | 0x03 | Mode of the second counter event function - Continuous |
| CfO_Counter[x]event1IDwr | (any) | Number of the event that should trigger Latch 2 |
| For the comparator | | |
| CfO_Counter1event1IDwr | 0x00D0 | Event number of Timer 1 (50 µs) Information: The latch and comparator must not have the same event number! |
| CfO_Counter1event1config | 0x900D or 0xA00D | Configuration of the comparator for the second counter event |
| CfO_Counter1event1mode | 0x03 | Mode of the second counter event function - Continuous |
| CfO_DIREKTIOoutevent0IDwr | 0x0861 | TRUE event output of the second counter to trigger the direct output function (set outputs). |
| CfO_DIREKTIOoutsetmask0 | 0x08, 0x20, 0x80 | Outputs that should be set when comparator condition = TRUE |
| CfO_DIREKTIOoutevent1IDwr | 0x0860 | FALSE event output of the second counter to trigger the direct output function (reset outputs). |
| CfO_DIREKTIOoutclearmask1 | 0x08, 0x20, 0x80 | Outputs that should be reset when comparator condition = FALSE |

I/O configuration - ABR encoder

The following table shows how the module's various event functions can be linked in order to configure an ABR encoder.

| Register | Value | Comment |
|-----------------------------|------------------|--|
| For the function | | |
| CfO_Counter1PresetValue1 | (any) | Desired offset value for referencing |
| CfO_Counter1event0IDwr | 0x0201 | Link between the first counter event and the direct input comparator condition TRUE |
| CfO_Counter1config | 0x01 | Mode = AB encoder |
| CfO_Counter1configReg0 | 0x0D | Configure the calculation of the internal "counter1" and "counter2" registers (see "Counter value calculation" on page 1236 and "Examples of calculation configurations" on page 1240) |
| CfO_DIREKTIOevent0IDwr | 0x1002 or 0x1012 | Selection of the desired input edge as trigger for the ABR encoder function |
| CfO_Counter1event0config | 0x0000 | Configuration of the first counter event (for referencing) |
| CfO_DIREKTIOevent0mode | 0x03 | Mode of the "direct input function" - Continuous |
| CfO_DIREKTIOevent0compState | 0x00 or 0x08 | Comparator status for the "direct input function" |
| CfO_Ev0CompMask | 0x08 | Comparator mask for the "direct input function" |
| For the latch | | |
| CfO_Counter1event0config | 0x000D | Configuration of the calculation of the value used for the latch |
| CfO_Counter1event0mode | 0x03 | Mode of the first counter event function - Continuous |
| CfO_Counter1event0IDwr | (any) | Number of the event that should trigger the latch |
| For the comparator | | |
| CfO_Counter1event1IDwr | 0x00D0 | Event number of Timer 1 (50 µs) Information: The latch and comparator must not have the same event number! |
| CfO_Counter1event1config | 0x900D or 0xA00D | Configuration of the comparator for the second counter event |
| CfO_Counter1event1mode | 0x03 | Mode of the second counter event function - Continuous |
| CfO_DIREKTIOoutevent0IDwr | 0x0861 | TRUE event output of the second counter to trigger the direct output function (set outputs). |
| CfO_DIREKTIOoutsetmask0 | 0x08, 0x20, 0x80 | Outputs that should be set when comparator condition = TRUE |
| CfO_DIREKTIOoutevent1IDwr | 0x0860 | FALSE event output of the second counter to trigger the direct output function (reset outputs). |
| CfO_DIREKTIOoutclearmask1 | 0x08, 0x20, 0x80 | Outputs that should be reset when comparator condition = FALSE |

I/O configuration - Up/down counter

The following table shows how the module's various event functions can be linked in order to configure an up/down counter.

[x] stands for the respective counter function, either 1 or 2

| Register | Value | Comment |
|----------------------------|----------------------------------|--|
| For the function | | |
| CfO_Counter[x]config | 0x03 | Counter mode = Up/down counter |
| CfO_Counter[x]configReg0 | 0x0D, 0x07 | Configure the calculation of the internal "counter1" and "counter2" registers (see "Counter value calculation" on page 1236 and "Examples of calculation configurations" on page 1240) |
| For the latch | | |
| CfO_Counter[x]event0config | 0x0D, 0x07 | Configuration of the calculation of the first value used for the latch |
| CfO_Counter[x]event0mode | 0x03 | Mode of the first counter function - Continuous |
| CfO_Counter[x]event0IDwr | (any) | Number of the event that should trigger Latch 1 |
| CfO_Counter[x]event1config | 0x0D, 0x07 | Configuration of the calculation of the second value used for the latch |
| CfO_Counter[x]event1mode | 0x03 | Mode of the second counter function - Continuous |
| CfO_Counter[x]event1IDwr | (any) | Number of the event that should trigger Latch 2 |
| For the comparator | | |
| CfO_Counter1event1IDwr | 0x00D0 | Event number of Timer 1 (50 µs) Information: The latch and comparator must not have the same event number! |
| CfO_Counter1event1config | 0x900D, 0xA00D or 0x9007, 0xA007 | Configuration of the comparator for the second counter event |
| CfO_Counter1event1mode | 0x03 | Mode of the second counter event function - Continuous |
| CfO_DIREKTIOoutevent0IDwr | 0x0861 | TRUE event output of the second counter to trigger the direct output function (set outputs). |
| CfO_DIREKTIOoutsetmask0 | 0x08, 0x20, 0x80 | Outputs that should be set when comparator condition = TRUE |
| CfO_DIREKTIOoutevent1IDwr | 0x0860 | FALSE event output of the second counter to trigger the direct output function (reset outputs). |
| CfO_DIREKTIOoutclearmask1 | 0x08, 0x20, 0x80 | Outputs that should be reset when comparator condition = FALSE |

I/O configuration - Event counter

The following table shows how the module's various event functions can be linked in order to configure an event counter.

[x] stands for the respective counter function, either 1 or 2

| Register | Value | Comment |
|---|--------------|--|
| For event counters on channels 1 and 3 | | |
| CfO_Counter[x]configReg0 | 0x01 or 0x03 | Configure the calculation of the internal "counter1" and "counter2" registers (see "Counter value calculation" on page 1236 and "Examples of calculation configurations" on page 1240) |
| CfO_Counter[x]event0mode | 0x43 | Mode of the first counter event function and referencing configuration |
| CfO_Counter[x]event0IDwr | (any) | Number of the event that should trigger referencing |
| For event counters on channels 2 and 4 | | |
| CfO_Counter[x]configReg1 | 0x04 or 0x08 | Configure the calculation of the internal "counter1" and "counter2" registers (see "Counter value calculation" on page 1236 and "Examples of calculation configurations" on page 1240) |
| CfO_Counter[x]event1mode | 0x83 | Mode of the second counter event function and referencing configuration |
| CfO_Counter[x]event1IDwr | (any) | Number of the event that should trigger referencing |

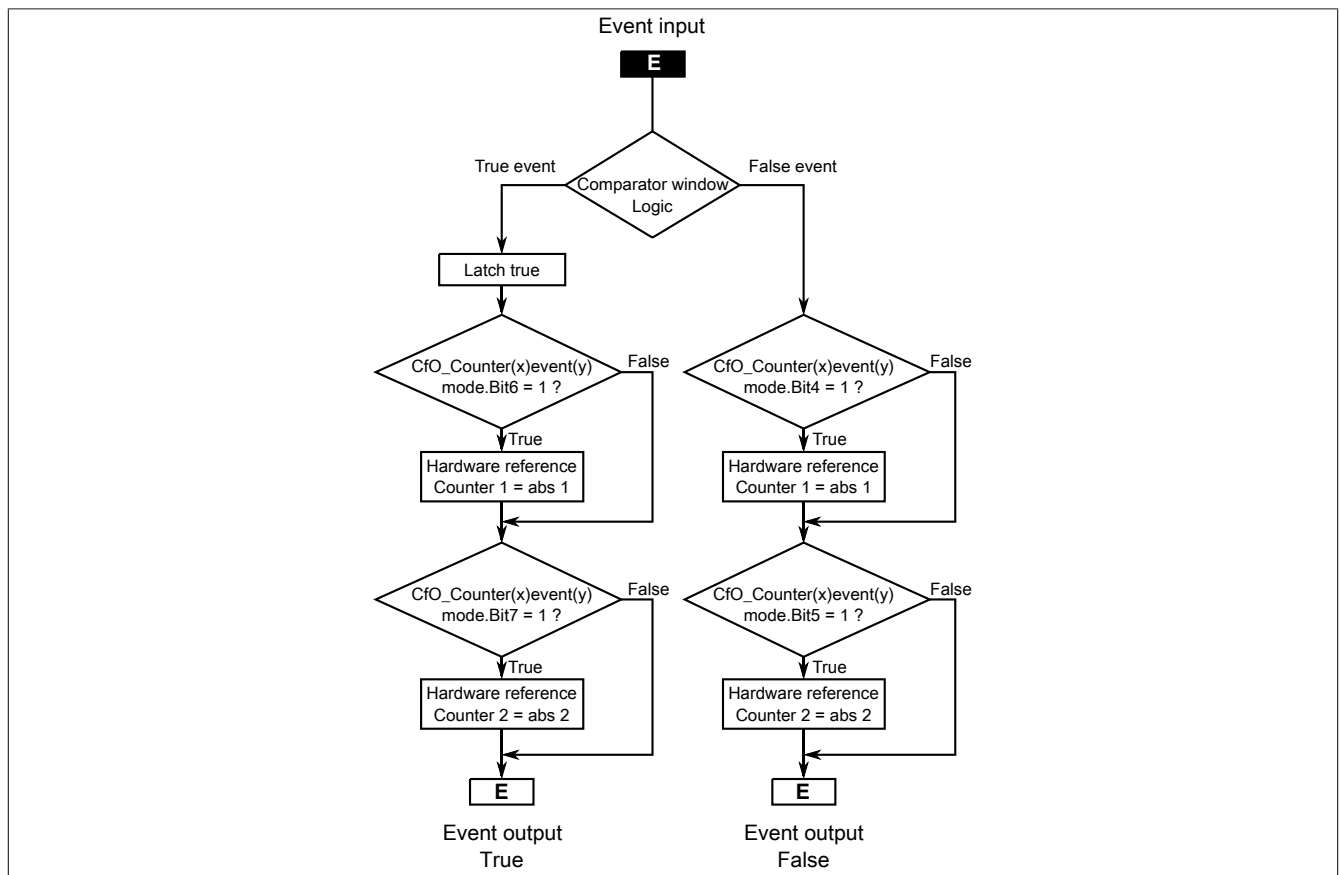

9.11.14.13.7.3 General event functions

Each of the 2 counter functions has 2 counter event functions. These consist of:

- Event ID that triggers the counter event function
- A window comparator
- Latch register for saving the counter value

When the counter event function is complete, a combined event ID in the range 2112 to 2401 (see "List of event IDs" on page 1230) is sent.

Each counter event function also has the option to copy the current counter value to the "HW reference counter" when an event occurs (see "Counter value calculation" on page 1236).

Configure counter mode

Name:

Counter function 1: CfO_Counter1config

Counter function 2: CfO_Counter2config

These registers are used to configure the mode of the counter function. Each counter function can be operated in 3 different modes.

| | Counter function mode | | |
|---------------------------------|---------------------------------|------------|---|
| | Edge counters | AB encoder | Up/down counter |
| Counter channel 1 ¹⁾ | Counting pulses, edge counter 1 | A | Metering pulses |
| Counter channel 2 ¹⁾ | Counting pulses, edge counter 2 | B | Counting direction (0 = positive, 1 = negative) |
| Counter register 1 | Counter value 1 | Position | Counter value |
| Counter register 2 | Counter value 2 | | |

1) Corresponds to the physical channels of the counter functions. See "Description of channel assignments" on page 1220.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|--------------|-------|-----------------|
| 0 - 1 | Counter mode | 00 | Edge counters |
| | | 01 | AB encoder |
| | | 11 | Up/down counter |
| 2 - 7 | Reserved | - | |

Configure calculation of internal counters

Name:

Counter function 1: CfO_Counter1configReg0 to CfO_Counter2configReg0

Counter function 2: CfO_Counter1configReg1 to CfO_Counter2configReg1

The calculation of the internal "counter1" and "counter2" registers can be configured in these registers. For information on using these internal registers, see "Counter value calculation" on page 1236.

| Data type | Values | Bus controller default setting ¹⁾ |
|-----------|------------------------|--|
| USINT | See the bit structure. | 1 |

1) The bus controller default value applies only to the register numbers specified in function model 254.

Bit structure:

| Bit | Description | Value | Information |
|-------|------------------|-------|--|
| 0 | counter 1 - use | 0 | 0 is added instead of "counter 1" |
| | | 1 | "counter 1" is used for addition |
| 1 | counter 1 - sign | 0 | The sign of the "counter 1" register is not changed for addition |
| | | 1 | The sign of the "counter 1" register is reversed for addition |
| 2 | counter 2 - use | 0 | 0 is added instead of "counter 2" |
| | | 1 | "counter 2" is used for addition |
| 3 | counter 2 - sign | 0 | The sign of the "counter 2" register is not changed for addition |
| | | 1 | The sign of the "counter 2" register is reversed for addition |
| 4 - 7 | Reserved | - | |

Examples of calculation configurations

| | | |
|------------|--------|--|
| 0b00000001 | = 0x01 | Only the "counter1 - use" bit is set, entering the contents of the "counter" (edge of counter event channel 1) directly in the counter register. |
| 0b00000011 | = 0x03 | "counter 1 - use" and "counter1 - sign" bits are set. The sign is changed so that the counter register counts in the negative direction. |
| 0b00001101 | = 0x0d | Edges on counter input channel 1 increase the value in the counter register. Edges on counter input channel 2 decrease the value in the counter register. This value is the best setting for modes "AB counter" and "Up/Down counter". |

Offset value for referencing

Name:

Counter function 1: CfO_Counter1PresetValue1 to CfO_Counter2PresetValue1

Counter function 1: CfO_Counter1PresetValue1_32Bit to CfO_Counter2PresetValue1_32Bit

Counter function 2: CfO_Counter1PresetValue2 to CfO_Counter1PresetValue2

Counter function 2: CfO_Counter1PresetValue2_32Bit to CfO_Counter1PresetValue2_32Bit

"Preset value" in the Automation Studio I/O configuration.

These registers can be used to define an offset value for referencing. This value is copied to the internal [SW_reference_counter](#) register of the respective counter register.

| Data type | Value |
|-----------|---------------------------------|
| INT | -32768 to 32767 |
| DINT | -2,147,483,648 to 2,147,483,647 |

Counter register

Name:

Different names are used for these 4 registers depending on their function.

These 4 registers show the results of the [counter value calculation](#) for the respective register. Depending on the function, this corresponds to either the encoder position or the counter value.

For information on the relationship between physical channels and counter registers, see ["Counters and encoders" on page 1236](#) and ["Description of channel assignments" on page 1220](#)

| Counter function 1 | | |
|--------------------|------------------|----------------|
| Counter register | Function | Name |
| 1 | AB encoders | ABEncoder01 |
| | ABR encoders | ABREncoder01 |
| | Up/down counters | Counter01 |
| | Event counters | EventCounter01 |
| 2 | Event counters | EventCounter02 |

| Counter function 2 | | |
|--------------------|------------------|----------------|
| Counter register | Function | Name |
| 1 | AB encoders | ABEncoder02 |
| | Up/down counters | Counter02 |
| | Event counters | EventCounter03 |
| 2 | Event counters | EventCounter04 |

| Data type | Value | Information |
|--------------------|---------------------------------|-----------------------------------|
| INT | -32,768 to 32,767 | Encoder position or counter value |
| DINT ¹⁾ | -2,147,483,648 to 2,147,483,647 | Encoder position or counter value |

1) Only in function model 1

Status of the ABR encoder

Name:

StatusABR01

The referencing status of the ABR encoder is shown in this register.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|--|--------|---|
| 0 - 1 | Reserved | 0 | |
| 2 | Bit is always 1 after the first reference pulse. | 0 | No reference pulses have occurred since the start of referencing. |
| | | 1 | The first reference pulse has occurred. |
| 3 | State change when referencing is complete | 0 or 1 | |
| 4 | Bit is always 1 after the first reference pulse. | 0 | No reference pulses have occurred since the start of referencing. |
| | | 1 | The first reference pulse has occurred. |
| 5 - 7 | Continuous counter | xxx | Increased with each reference pulse |

Examples of possible values

| | | |
|------------|--------|--|
| 0b00000000 | = 0x00 | Referencing OFF or homing procedure already active |
| 0b00111100 | = 0x3C | First reference complete, reference value applied in the "ABREncoder0" on page 1241 register |
| 0bxxx11100 | = 0xxB | Bits 5 to 7 are changed with each reference pulse |
| 0bxxx1x100 | = 0xxx | Bits changed continuously with the setting continuous referencing. With every reference pulse, the reference value is applied to the "ABREncoder0" on page 1241 register |

Configure ABR referencing mode

Name:

ReferenceModeABR01

The bits in this register are used to configure the reaction to the configured reference pulse.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|---------------------------|-------|-------------------------|
| 0 - 1 | Sets the referencing mode | 00 | Referencing OFF |
| | | 01 | Single shot referencing |
| | | 10 | Reserved |
| | | 11 | Continuous referencing |
| 2 - 5 | Reserved | - | |
| 6 - 7 | Reserved | 11 | Must always be 11! |

This results in the following values:

| | | |
|------------|--------|---|
| 0b00000000 | = 0x00 | Referencing OFF |
| 0b11000001 | = 0xC1 | Single shot referencing → When starting over after the referencing process is complete, the value 0x00 must be written to start again. Wait until the "StatusABR" on page 1242 register also takes on the value 0x00, then the value 0xC1 can be written again. |
| 0b11000011 | = 0xC3 | Continuous referencing → Referencing takes place automatically with every reference pulse |

9.11.14.13.7.4 Comparator functions

The ABR and AB counters and the up/down counter have a comparator function. It always works the same and is described here globally for all three.

The comparators are implemented in software form. They do not work actively but rather passively, i.e. the comparison is only carried out when an event is received. The event received is forwarded along the TRUE or FALSE branch depending on the status of the comparator condition. An event function like this generally also offers a latch for the TRUE and FALSE branch to save the value used for the comparator at the time of the event.

Comparator modes

Comparator functions can be operated in 4 different modes.

- **Off**
Events are ignored.
- **Individual**
The event function is executed once and then disables itself automatically. To re-enable it, the "event function mode" must be changed, preferably to "off" and then to the desired mode. This setting allows a hardware latch to be simulated.
- **State change**
The event function only responds when the comparator status has changed, i.e. from false to true (or vice versa). Only the first event for each status is processed, e.g. the first "true" of a sequence of events with the comparator condition "true". After the event function is enabled, the first incoming event is used to determine the starting status and therefore not forwarded. This setting allows a hardware comparator to be simulated.
- **Continuous**
Each incoming event is forwarded to the true or false branch depending on the comparator condition. This setting allows event filters to be created.

Configure event ID for comparator

Name:

Counter function 1: CfO_Counter1event0IDwr to CfO_Counter1event1IDwr

Counter function 2: CfO_Counter2event0IDwr to CfO_Counter2event1IDwr

This register holds the event ID that should trigger the counter event function. For a list of all possible event IDs, see "[List of event IDs](#)" on page 1230

| Data type | Value | Information |
|-----------|--------------|------------------------------|
| INT | 192 to 7,233 | ID of counter event function |

Configure calculation of comparator

Name:

Counter function 1: CfO_Counter1event0config to CfO_Counter1event1config

Counter function 2: CfO_Counter2event0config to CfO_Counter2event1config

These registers are used to configure the counter event function for the respective counter function.

Bits 0 to 3 configure the calculation of the comparison or to latch the value. This calculation is similar to the calculation of the counter register (see "[Counter value calculation](#)" on page 1236)

Bits 8 to 13 can be used to limit the number of bits used for the comparison. A mask is calculated as $2^n - 1$ and linked with an "AND" operation. This makes it possible to generate a comparator pulse every 2^n increments.

| Data type | Values |
|-----------|------------------------|
| UINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|--------|------------------------------------|-------|--|
| 0 | counter 1 - use | 0 | 0 is added instead of "counter 1" |
| | | 1 | "counter 1" is used for addition |
| 1 | counter 1 - sign | 0 | The sign of the "counter 1" register is not changed for addition |
| | | 1 | The sign of the "counter 1" register is reversed for addition |
| 2 | counter 2 - use | 0 | 0 is added instead of "counter 2" |
| | | 1 | "counter 2" is used for addition |
| 3 | counter 1 - sign | 0 | The sign of the "counter 2" register is not changed for addition |
| | | 1 | The sign of the "counter 2" register is reversed for addition |
| 4 - 7 | Reserved | - | |
| 8 - 13 | Number of bits for comparator mask | x | The mask value is calculated as $2^n - 1$, where n is value set in these bits. Default: 0 |
| 14 | Reserved | - | |
| 15 | Margin comparator mode | 0 | <code>MarginComparator01 >= (Current position - OriginComparator01)</code> |
| | | 1 | <code>MarginComparator01 > (Current position - OriginComparator01)</code> |

Configure mode and latching of comparator function

Name:

Counter function 1: CfO_Counter1event0mode to CfO_Counter1event1mode

Counter function 2: CfO_Counter2event0mode to CfO_Counter2event1mode

In these registers you can set the mode for the comparator function and optional copying of the latched registers.

Comparator functions can be operated in 4 different modes. For a description, see "[Comparator modes](#)" on page 1243.

Bits 4 to 7 can be used to define hardware referencing actions.

Based on these bits, the values of the internal absolute value counters "abs1" and "abs2" can be copied to the respective "HW_reference_counter" register at every counter event (see "[Counter value calculation](#)" on page 1236). This function can be used to reference the counter values directly in the hardware.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|-------------------------|-------|---|
| 0 - 1 | Comparator mode | 0 | Off |
| | | 1 | Individual |
| | | 2 | State change |
| | | 3 | Continuous |
| 2 - 3 | Reserved | - | |
| 4 | Copy abs1 counter value | 0 | No action |
| | | 1 | When event is FALSE → hardware reference counter 1 = abs1 |
| 5 | Copy abs2 counter value | 0 | No action |
| | | 1 | When event is FALSE → hardware reference counter 2 = abs2 |
| 6 | Copy abs1 counter value | 0 | No action |
| | | 1 | When event is TRUE → hardware reference counter 1 = abs1 |
| 7 | Copy abs2 counter value | 0 | No action |
| | | 1 | When event is TRUE → hardware reference counter 2 = abs2 |

Comparator origin

Name:

OriginComparator01

This register is available for the comparator function of the ABR encoder, AB counter and up/down counter.

It defines the position value at which the respective configured comparator output channel is set.

| Data type | Value | Information |
|-----------|------------------------------------|----------------------------------|
| INT | -32,768 to 32,767 | Comparator window origin, 16-bit |
| DINT | -2,147,483,648 to 2,147,483,647 | Comparator window origin, 32-bit |

Width of the comparator

Name:

MarginComparator01

This register is available for the AB and ABR encoders and the up/down counters.

It defines the width of the comparator window in the positive direction.

| Data type | Value | Information |
|-----------|------------------------------------|------------------------------------|
| INT | -32768 to 32767 | Width of comparator window, 16-bit |
| DINT | -2,147,483,648 to 2,147,483,647 | Width of comparator window, 32-bit |

Read latch position or counter value

Name:

Different names are used for these 4 registers depending on their function.

If the comparator returns "TRUE", then the current counter value is latched and copied to these registers. The calculation of the comparator value used for the latch can be configured in the ["Configure calculation of comparator" on page 1244](#) register.

| Counter function 1 | | |
|--------------------|------------------|------------------|
| Event function | Function | Name |
| 1 | AB encoders | Latch01AB01 |
| | Up/down counters | Latch01Counter01 |
| 2 | ABR encoders | Latch01ABR01 |
| | AB encoders | Latch02AB01 |
| | Up/down counters | Latch02Counter01 |

| Counter function 2 | | |
|--------------------|------------------|------------------|
| Event function | Function | Name |
| 1 | AB encoders | Latch01AB02 |
| | Up/down counters | Latch01Counter02 |
| | Event counters | Latch02AB02 |
| 2 | Event counters | Latch02Counter02 |

| Data type | Value | Information |
|--------------------|------------------------------------|---|
| INT | -32,768 to 32,767 | Latched encoder position or counter value |
| DINT ¹⁾ | -2,147,483,648 to 2,147,483,647 | Latched encoder position or counter value |

1) Only in function model 1

9.11.14.13.8 SSI encoder interface

The module has 1 SSI encoders available, supported directly in the hardware. Two 24 V output channels are set for the SSI encoder and cannot be changed. (See also "Description of channel assignments" on page 1220)

When using the SSI encoder, the corresponding clock channel can be configured in the "CfO_CFGchannel" on page 1227 register as "Channel-specific" and "Push/Pull".

| SSI encoders | Channel number |
|---------------|----------------|
| Data channel | 1 |
| Clock channel | 2 |

9.11.14.13.8.1 SSI event functions

The SSI counter consists of an event function and an event input. The SSI cycle is started when an event is received on this input.

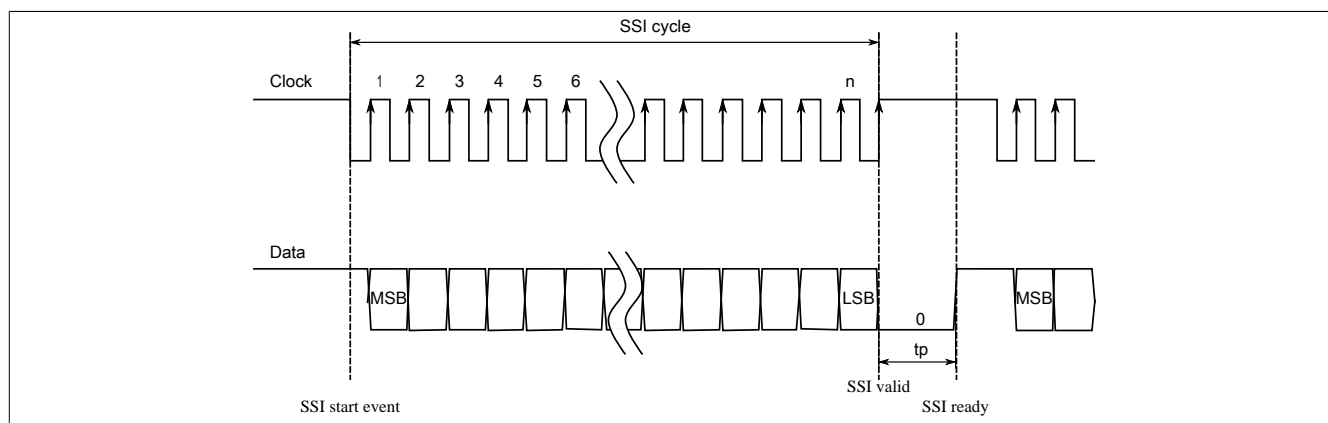

Information:

The SSI event function is not linked to an event by default, i.e. SSI functions are disabled.

2 events are transmitted from the SSI encoder interface.

- An "SSI valid" event is triggered immediately after the end of the SSI cycle if a new counter value is available.
- The "SSI ready" event then shows when the monoflop time has expired (t_p in SSI encoder timing diagram). This is the earliest that the next SSI cycle can be started.

SSI encoder - Timing diagram

Configure event ID for SSI

Name:

CfO_SSI1eventIDwr

This register holds the event ID that should start the SSI cycle. For a list of all possible event IDs, see "List of event IDs" on page 1230

Normally this register is set to network event 225 "AOSISOP"- This ensures that the new encoder position is available at the next "I/O → Synchronous Frame" transfer. Check the SSI transfer time and the X2X cycle time, because the SSI cycle must be completed within this time.

| Data type | Value | Information |
|-----------|--------------|----------------------|
| INT | 192 to 7,233 | ID of event function |

Configure SSI

Name:
CfO_SSI1cfg

This configuration register sets the encoding, clock rate and number of bits. Default = 0. This must be set once using an acyclic write command.

| Data type | Values |
|-----------|------------------------|
| UINT | See the bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|--------|----------------------|-------|--|
| 0 - 5 | SSI value valid bits | x | |
| 6 - 7 | Clock rate | 00 | 1 MHz |
| | | 01 | 500 kHz |
| | | 10 | 250 kHz |
| | | 11 | 125 kHz |
| 8 - 13 | SSI number of bits | x | Number of bits including leading zeros |
| 14 | Reserved | 0 | |
| 15 | Keying | 0 | Binary coding |
| | | 1 | Gray coding |

SSI advanced configuration

Name:
ConfigAdvanced

This configuration register is used to set the encoding, clock rate, number of bits and monostable multivibrator settings. This must be set once using an acyclic write command.

It only differs from "CfO_SSI1cfg" on page 1247 by data length and additional monostable multivibrator testing.

| Data type | Values |
|-----------|------------------------|
| UDINT | See the bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|---------|--------------------------------|-------|--|
| 0 - 5 | SSI value valid bits | x | |
| 6 - 7 | Clock rate | 00 | 1 MHz |
| | | 01 | 500 kHz |
| | | 10 | 250 kHz |
| | | 11 | 125 kHz |
| 8 - 13 | SSI number of bits | x | Number of bits including leading zeros |
| 14 | Reserved | 0 | |
| 15 | Keying | 0 | Binary coding |
| | | 1 | Gray coding |
| 16 - 17 | Monostable multivibrator check | 00 | Check OFF, no additional clock bit |
| | | 01 | Check set to High level |
| | | 10 | Check set to Low level |
| | | 11 | Level is clocked but ignored |
| 18 - 31 | Reserved | 0 | |

Enable SSI event function

Name:
CfO_SSI1control

The two [SSI encoder events](#) can be enabled/disabled using this register.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|--------------------|-------|-------------|
| 0 | Event: "SSI valid" | 0 | Not sent |
| | | 1 | Sent |
| 1 | Event: "SSI ready" | 0 | Not sent |
| | | 1 | Sent |
| 2 - 7 | Reserved | - | |

Read SSI position

Name:

SSIEncoder01

The last transferred SSI position can be read out from this register. The SSI encoder value is displayed as a 32-bit position value. This position value is generated synchronously with the X2X cycle.

| Data type | Value | Information |
|-----------|--------------------|-------------------------------|
| UDINT | 0 to 4,294,967,295 | Last SSI position transferred |

9.11.14.13.8.2 SSI comparator condition

The module has an assigned comparator function for the SSI function. These consist of:

- Event ID that triggers the comparator function
- The window comparator
- Latch register for saving the counter value

When the comparator function is complete, event ID 7232 or 7233 (see ["List of event IDs" on page 1230](#)) is sent.

Configure event ID for SSI comparator

Name:

CfO_SSI1event0IDwr

This register holds the event ID that should start the SSI comparator function. For a list of all possible event IDs, see ["List of event IDs" on page 1230](#)

| Data type | Value | Information |
|-----------|--------------|---------------------------|
| INT | 192 to 7,233 | ID of comparator function |

Configure the mode of the SSI comparator function

Name:

CfO_SSI1event0mode

This register can be used to configure the mode of the comparator function.

Comparator functions can be operated in 4 different modes. For a description, see ["Comparator modes" on page 1243](#).

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|-----------------|-------|--------------|
| 0 - 1 | Comparator mode | 0 | Off |
| | | 1 | Individual |
| | | 2 | State change |
| | | 3 | Continuous |
| 2 - 7 | Reserved | - | |

Configure calculation of SSI comparator

Name:

CfO_SSI1event0config

The calculation of the position value used for the comparator can be configured in this register.

The window comparator condition is calculated as follows:

```

counter_window_value = ssi_counter & (2^ssi_data_bits - 1)
diff = counter_window_value - origin_comparator
if ((diff & (2^(comparator_mask-1))) <= margin_comparator)
condition = True;
else
condition = False;

```

| Data type | Values |
|-----------|------------------------|
| UINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|--------|-----------------|-------|--|
| 0 - 5 | SSI data bits | x | Number of data bits used for masking |
| 6 - 7 | Reserved | - | |
| 8 - 13 | Comparator mask | x | The mask value is calculated from $2^n - 1$, where n is the value configured in SSI data bits. Default: 0 |
| 14 | Comparator mode | 0 | MarginComparator >= SSI position - OriginComparator |
| | | 1 | MarginComparator > SSI position - OriginComparator |

Origin of the SSI comparator

Name:

OriginComparator01_SSI

This register contains the origin of the window comparator.

| Data type | Value | Information |
|-----------|--------------------|----------------------------------|
| UDINT | 0 to 4,294,967,295 | Origin of the window comparator. |

Width of the SSI comparator

Name:

MarginComparator01_SSI

This register provides the width of the window comparator.

| Data type | Value | Information |
|-----------|--------------------|------------------------------------|
| UDINT | 0 to 4,294,967,295 | Width of the SSI window comparator |

Read SSI latch position

Name:

Latch01SSI01

If the SSI window comparator returns "True", then the current SSI position is latched and saved in this register.

| Data type | Value | Information |
|-----------|--------------------|----------------------|
| UDINT | 0 to 4,294,967,295 | Latched SSI position |

9.11.14.13.9 PWM - Pulse width modulation

The module has 2 PWM functions available, supported directly by the hardware. A 24 V output channel is set for each PWM encoder and cannot be changed. (See also "[Description of channel assignments](#)" on page 1220)

When using the PWM function, the corresponding channel can be configured in the "[CfO_CFGchannel](#)" on page 1227 register as "Channel-specific".

| PWM function | Channel |
|--------------|---------|
| PWM1 | 2 |
| PWM2 | 4 |

9.11.14.13.9.1 Configure PWM prescaler

Name:

CfO_PWM0prescaler to CfO_PWM1prescaler

The length of the PWM cycle is configured using this register. The base is a 48 MHz clock, which can be changed (divided) using the setting in this register. One PWM cycle consists of 1000 of the resulting clocks after they have been divided. The period duration of the PWM cycle is calculated as follows:

$$\text{PWM_cycle} = 1000 \frac{\text{prescale}}{48000000} \text{ [s]}$$

| Data type | Value | Information |
|-----------|------------|-------------------------|
| UINT | 2 to 65535 | Prescaler for PWM cycle |

9.11.14.13.9.2 Output PWM values

Name:

PWMOutput02 and PWMOutput04

In this register, a configuration is made for the percentage of the PWM cycle (in 1/10% steps) that the PWM output is logical 1, i.e. ON.

| Data type | Value | Information |
|-----------|----------|-----------------------------|
| UINT | 0 | PWM output always off |
| | 1 to 999 | Turn on time in 1/10% steps |
| | 1000 | PWM output always on |

9.11.14.13.10 Time measurement function

The module has a time measurement function for each I/O channel. It can be configured separately for rising and falling edges on each channel.

A starting edge can be configured for each time measurement function. When a configured starting edge occurs, the value of the internal timer is saved in a FIFO buffer. This FIFO buffer holds up to 16 elements. When the actual trigger edge occurs, the difference in time between the starting edge and the triggered edge is copied to the respective register.

Bits 8 to 11 "Previous start edge" of registers "[CfO_EdgeTimeFallingMode](#)" on page 1251 and "[CfO_EdgeTimeRisingMode](#)" on page 1252 can be used to define which detected starting edge from the FIFO buffer should be used to calculate the difference. In addition, when the trigger edge occurs, the current counter value of the counter internally clocked by bits 12 to 15 "Resolution of time measurement" is copied to registers "[TimeStampFallingCH](#)" on page 1254 and "[TimeStampRisingCH](#)" on page 1254.

Information:

The time measurement function is an extension of edge detection, so all of the channels used must be configured there.

9.11.14.13.10.1 Enable time measurement function

Name:

CfO_EdgeTimeglobalenable

This register enables/disables the time measurement function for the entire module.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|---------------------------|-------|----------------------------|
| 0 | Time measurement function | 0 | Disabled for entire module |
| | | 1 | Enabled for entire module |
| 1 - 7 | Reserved | - | |

9.11.14.13.10.2 Configure time measurement function for the falling edge

Name:

CfO_EdgeTimeFallingMode01 to CfO_EdgeTimeFallingMode04

These registers can be used to configure the time measurement function for the falling edge of the respective channel.

| Data type | Values |
|-----------|------------------------|
| UINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|---------|---|---------|---|
| 0 - 3 | Selects the channel for the starting edge | 0 | Channel 1 |
| | | ... | |
| | | 3 | Channel 4 |
| 4 | Selects the edge for the starting edge | 0 | The falling edge of the channel configured in bits 0 to 3 serves as the starting edge. |
| | | 1 | The rising edge of the channel configured in bits 0 to 3 serves as the starting edge. |
| 5 - 6 | Reserved | - | |
| 7 | Trigger | 0 | Triggered ¹⁾ |
| | | 1 | Continuous ²⁾ |
| 8 - 11 | Previous start edge | 0 to 15 | The value determines which entry in the starting edge FIFO should be used to calculate the time difference. |
| 12 - 15 | Time measurement resolution | 0 | 8 Mhz |
| | | 1 | 4 Mhz |
| | | 2 | 2 Mhz |
| | | 3 | 1 Mhz |
| | | 4 | 500 kHz |
| | | 5 | 250 kHz |
| | | 6 | 125 kHz |
| | | 7 | 625 kHz |

1) The time measurement is triggered by the corresponding bit in the "[TriggerRisingCH](#)" on page 1253 register.

2) Time measurement runs continuously and is triggered at every edge.

9.11.14.13.10.3 Configure time measurement function for the rising edge

Name:

CfO_EdgeTimeRisingMode01 to CfO_EdgeTimeRisingMode04

These registers can be used to configure the time measurement function for the rising edge of the respective channel.

| Data type | Values |
|-----------|------------------------|
| UINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|---------|---|---------|---|
| 0 - 3 | Selects the channel for the starting edge | 0 | Channel 1 |
| | | ... | |
| | | 3 | Channel 4 |
| 4 | Selects the edge for the starting edge | 0 | The falling edge of the channel configured in bits 0 to 3 serves as the starting edge. |
| | | 1 | The rising edge of the channel configured in bits 0 to 3 serves as the starting edge. |
| 5 - 6 | Reserved | - | |
| 7 | Trigger | 0 | Triggered ¹⁾ |
| | | 1 | Continuous ²⁾ |
| 8 - 11 | Previous start edge | 0 to 15 | The value determines which entry in the starting edge FIFO should be used to calculate the time difference. |
| 12 - 15 | Time measurement resolution | 0 | 8 Mhz |
| | | 1 | 4 Mhz |
| | | 2 | 2 Mhz |
| | | 3 | 1 Mhz |
| | | 4 | 500 kHz |
| | | 5 | 250 kHz |
| | | 6 | 125 kHz |
| | | 7 | 625 kHz |

1) The time measurement is triggered by the corresponding bit in the "TriggerRisingCH" on page 1252 register.

2) Time measurement runs continuously and is triggered at every edge.

9.11.14.13.10.4 Trigger falling edge detection

Name:

TriggerFallingCH01 to TriggerFallingCH04

If bit 7 "Trigger" is cleared in the "CfO_EdgeTimeFallingMode" on page 1251 register, then detection of a falling edge on the respective input can be triggered using the respective bit in this register. After a bit has been set, the next falling edge on the corresponding channel is detected.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|--------------------|-------|---|
| 0 | TriggerFallingCH01 | 0 | Falling edges on channel 1 are not detected |
| | | 1 | The next falling edge on channel 1 will be detected |
| ... | | ... | |
| 3 | TriggerFallingCH04 | 0 | Falling edges on channel 4 are not detected |
| | | 1 | The next falling edge on channel 4 will be detected |
| 4 - 7 | Reserved | - | |

9.11.14.13.10.5 Trigger rising edge detection

Name:

TriggerRisingCH01 to TriggerRisingCH04

If bit 7 "Trigger" is cleared in the "[CfO_EdgeTimeRisingMode](#)" on page 1252 register, then detection of a rising edge on the respective input can be triggered using the respective bit in this register. After a bit has been set, the next rising edge on the corresponding channel is detected.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|-------------------|-------|--|
| 0 | TriggerRisingCH01 | 0 | Rising edges on channel 1 are not detected |
| | | 1 | The next rising edge on channel 1 will be detected |
| ... | | ... | |
| 3 | TriggerRisingCH04 | 0 | Rising edges on channel 4 are not detected |
| | | 1 | The next rising edge on channel 4 will be detected |
| 4 - 7 | Reserved | - | |

9.11.14.13.10.6 Show first falling trigger edge

Name:

BusyTriggerFallingCH01 to BusyTriggerFallingCH04

If edges are triggered via the bits in the "[TriggerFallingCH](#)" on page 1252 register, then a set bit in this register indicates that no falling edges have been detected on the respective channel since the corresponding bit was set in the "TriggerFallingCH" register. If a falling edge occurs on the respective channel, then the corresponding BusyTriggerFalling bit is cleared.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|------------------------|-------|--|
| 0 | BusyTriggerFallingCH01 | 0 | Falling edge detected on channel 1 |
| | | 1 | Module waiting for a falling edge on channel 1 |
| ... | | ... | |
| 3 | BusyTriggerFallingCH04 | 0 | Falling edge detected on channel 4 |
| | | 1 | Module waiting for a falling edge on channel 4 |
| 4 - 7 | Reserved | - | |

9.11.14.13.10.7 Show first rising trigger edge

Name:

BusyTriggerRisingCH01 to BusyTriggerRisingCH04

If edges are triggered via the bits in the "[TriggerRisingCH](#)" on page 1253 register, then a set bit in this register indicates that no rising edges have been detected on the respective channel since the corresponding bit was set in the "TriggerRisingCH" register. If a rising edge occurs on the respective channel, then the corresponding BusyTriggerRising bit is cleared.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|-----------------------|-------|---|
| 0 | BusyTriggerRisingCH01 | 0 | Rising edge detected on channel 1 |
| | | 1 | Module waiting for a rising edge on channel 1 |
| ... | | ... | |
| 3 | BusyTriggerRisingCH04 | 0 | Rising edge detected on channel 4 |
| | | 1 | Module waiting for a rising edge on channel 4 |
| 4 - 7 | Reserved | - | |

9.11.14.13.10.8 Count falling trigger edges

Name:

CountFallingCH01 to CountFallingCH04

These registers contain cyclic counters that are incremented with every detected falling edge on the respective channel.

| Data type | Value | Information |
|-----------|----------|---------------------------|
| USINT | 0 to 255 | Counter for falling edges |

9.11.14.13.10.9 Count rising trigger edges

Name:

CountRisingCH01 to CountRisingCH04

These registers contain cyclic counters that are incremented with every detected rising edge on the respective channel.

| Data type | Value | Information |
|-----------|----------|--------------------------|
| USINT | 0 to 255 | Counter for rising edges |

9.11.14.13.10.10 Timestamp of falling edge

Name:

TimeStampFallingCH01 to TimeStampFallingCH04

When a falling edge occurs on the respective channel, the current counter value of the module timer is copied to these registers.

| Data type | Value | Information |
|-----------|------------|----------------------------|
| UINT | 0 to 65535 | Timestamp for rising edges |

9.11.14.13.10.11 Timestamp of the rising edge

Name:

TimeStampRisingCH01 to TimeStampRisingCH04

When a rising edge occurs on the respective channel, the current counter value of the module timer is copied to these registers.

| Data type | Value | Information |
|-----------|-------------|----------------------------|
| UINT | 0 to 65,535 | Timestamp for rising edges |

9.11.14.13.10.12 Time difference of falling edge

Name:

TimeDiffFallingCH01 to TimeDiffFallingCH04

When a falling edge occurs on the respective channel, the time difference compared to the starting edge configured in bit 4 of the "[CfO_EdgeTimeFallingMode](#)" on page 1251 register is copied to this register.

| Data type | Value | Information |
|-----------|-------------|------------------------------------|
| UINT | 0 to 65,535 | Time difference from starting edge |

9.11.14.13.10.13 Time difference of rising edge

Name:

TimeDiffRisingCH01 to TimeDiffRisingCH04

When a rising edge occurs on the respective channel, the time difference compared to the starting edge configured in bit 4 of the "[CfO_EdgeTimeRisingMode](#)" on page 1252 register is copied to this register.

| Data type | Value | Information |
|-----------|-------------|------------------------------------|
| UINT | 0 to 65,535 | Time difference from starting edge |

9.11.14.13.11 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time |
|--------------------|
| 128 μ s |

9.11.14.13.12 Maximum cycle time

The maximum cycle time specifies the time up to which the bus cycle can be increased without internal counter overflows causing module malfunctions.

| Minimum cycle time |
|--------------------|
| 16 ms |

9.11.14.13.13 Minimum I/O update time

The minimum I/O update time specifies how far the bus cycle can be reduced so that an I/O update is performed in each cycle.

| Minimum I/O update time |
|-------------------------|
| 128 μ s |

9.11.15 X20DC2396

Data sheet version: 3.11

9.11.15.1 General information

The module is equipped with two inputs for an ABR incremental encoder with 24 V encoder signal.

- 2 ABR incremental encoder 24 V
- 2 additional inputs e.g. for home enable switch
- 24 VDC and GND for encoder supply

9.11.15.2 Order data

| Model number | Short description | Figure |
|--------------|--|---|
| | Counter functions |  |
| X20DC2396 | X20 digital counter module, 2 ABR incremental encoders, 24 V, 100 kHz input frequency, 4x evaluation | |
| | Required accessories | |
| | Bus modules | |
| X20BM11 | X20 bus module, 24 VDC keyed, internal I/O supply continuous | |
| X20BM15 | X20 bus module, with node number switch, 24 VDC keyed, internal I/O supply continuous | |
| | Terminal blocks | |
| X20TB12 | X20 terminal block, 12-pin, 24 VDC keyed | |
| | | |

9.11.15.8 Register description

9.11.15.8.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section "[General data points](#)" on page 3790.

9.11.15.8.2 Function model 0 - Standard and Function model 1 - Standard with 32-bit encoder counter value

The difference between function model 0 and function model 1 is the size of the data type for some registers.

- Function model 0 uses data type INT
- Function model 1 uses data type DINT (specified in parentheses)

| Register | Name | Data type | Read | | Write | |
|----------------------|--|-----------|--------|---------|--------|---------|
| | | | Cyclic | Acyclic | Cyclic | Acyclic |
| Configuration | | | | | | |
| 4104 | CfO_EdgeDetectFalling | USINT | | | | • |
| 4106 | CfO_EdgeDetectRising | USINT | | | | • |
| 2064 | CfO_PresetABR01_1(_32Bit) | (D)INT | | | | • |
| 2068 | CfO_PresetABR01_2(_32Bit) | (D)INT | | | | • |
| 2576 | CfO_PresetABR02_1(_32Bit) | (D)INT | | | | • |

| 2118 | 6 | StatusInput01 | USINT | • | | | |
| 2630 | 7 | StatusInput02 | USINT | • | | | |
| 40 | 3 | Status of encoder power supply | USINT | • | | | |
| | | PowerSupply01 | Bit 0 | | | | |

1) The offset specifies the position of the register within the CAN object.

9.11.15.8.3.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see ["Using I/O modules on the bus controller" on page 3789](#).

9.11.15.8.3.2 CAN I/O bus controller

The module occupies 1 analog logical slot on CAN I/O.

9.11.15.8.4 ABR encoder - Configuration registers**9.11.15.8.4.1 Reference pulse**

The following registers must be configured by a single acyclic write with the listed values so that the homing procedure is completed on the edge of the reference pulse.

The homing procedure can take place on:

- Rising edge
- Falling edge (default configuration)

Constant register "CfO_EdgeDetectFalling"

Name:

CfO_EdgeDetectFalling

| Data type | Value | Filter |
|-----------|-------|---|
| USINT | 0x00 | Configuration value for rising edge |
| | 0x04 | Encoder 1 - Configuration value for falling edge |
| | 0x40 | Encoder 2 - Configuration value for falling edge |
| | 0x44 | Configuration value for falling edge on encoders 1 and 2 (bus controller default setting) |

Constant register "CfO_EdgeDetectRising"

Name:

CfO_EdgeDetectRising

| Data type | Value | Filter |
|-----------|-------|---|
| USINT | 0x00 | Configuration value for falling edge (bus controller default setting) |
| | 0x04 | Encoder 1 - Configuration value for rising edge |
| | 0x40 | Encoder 2 - Configuration value for rising edge |
| | 0x44 | Encoders 1 and 2 - Configuration value for rising edge |

Constant register "ConfigOutput24"

Name:

ConfigOutput24

This register contains the value for ABR encoder 1.

| Data type | Value | Filter |
|-----------|--------|---|
| UINT | 0x1012 | Configuration value for rising edge |
| | 0x1002 | Configuration value for falling edge (bus controller default setting) |

Constant register "ConfigOutput32"

Name:

ConfigOutput32

This register contains the value for ABR encoder 2.

| Data type | Value | Filter |
|-----------|--------|---|
| UINT | 0x1016 | Configuration value for rising edge |
| | 0x1006 | Configuration value for falling edge (bus controller default setting) |

9.11.15.8.4.2 Setting the home position

Name:

CfO_PresetABR01_1 to CfO_PresetABR01_2

CfO_PresetABR02_1 to CfO_PresetABR02_2

CfO_PresetABR01_1_32Bit to CfO_PresetABR01_2_32Bit

CfO_PresetABR02_1_32Bit to CfO_PresetABR02_2_32Bit (only in function model 1)

It is possible to specify two home positions for each encoder with these registers through a one-off acyclic write, for example (default = 0). The configured values are applied to the counter values after a completed homing procedure.

| Data type | Value | Information |
|--------------------|---------------------------------|-----------------------------------|
| INT | -32,768 to 32,767 | Bus controller default setting: 0 |
| DINT ¹⁾ | -2,147,483,648 to 2,147,483,647 | |

1) Only in function model 1

9.11.15.8.4.3 Homing with reference enable input

Regardless of the referencing mode, it is possible using this register to prevent the home position from being applied when the corresponding reference input voltage level occurs (see "Input state of digital inputs 1 to 2" on page 1264: bit 7). The desired setting can be configured by a one-off acyclic write.

Voltage level for reference enable activation - ABR encoder 1

Name:

ConfigOutput26

The voltage level of the digital input 1 to activate reference enable is configured with this register.

| Data type | Value | Filter |
|-----------|-------|---|
| USINT | 0x00 | Reference enable is active at 0 VDC (bus controller default setting). |
| | 0x08 | Reference enable is active at 24 VDC |

Reference enable of the input - ABR encoder 1

Name:

ConfigOutput27

This register can be used to define whether the reference enable is activated.

| Data type | Value | Filter |
|-----------|-------|--|
| USINT | 0x00 | Reference enable input disabled (bus controller default setting) |
| | 0x08 | Reference enable input activated |

Voltage level for reference enable activation - ABR encoder 2

Name:

ConfigOutput34

The voltage level of the digital input 2 to activate reference enable is configured with this register.

| Data type | Value | Filter |
|-----------|-------|---|
| USINT | 0x00 | Reference enable is active at 0 VDC (bus controller default setting). |
| | 0x80 | Reference enable is active at 24 VDC |

Reference enable of the input - ABR encoder 2

Name:

ConfigOutput35

This register can be used to define whether the reference enable is activated.

| Data type | Value | Filter |
|-----------|-------|--|
| USINT | 0x00 | Reference enable input disabled (bus controller default setting) |
| | 0x80 | Reference enable input activated |

9.11.15.8.5 ABR encoder - Configuration registers**9.11.15.8.5.1 Counter state of the encoders**

Name:

Encoder01 to Encoder02

The encoder values are displayed in this register.

| Data type | Value |
|--------------------|---------------------------------|
| INT | -32,768 to 32,767 |
| DINT ¹⁾ | -2,147,483,648 to 2,147,483,647 |

1) Only in function model 1

9.11.15.8.5.2 Input state of digital inputs 1 to 2

Name:

DigitalInput01 to DigitalInput02.

This register displays the input status of the encoders and the digital inputs.

| Data type | Value |
|-----------|--------------------|
| USINT | See bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|-----|----------------|--------|--------------------------------|
| 0 | Encoder 1 | 0 or 1 | Input state - Signal A |
| 1 | | 0 or 1 | Input state - Signal B |
| 2 | | 0 or 1 | Input state of reference pulse |
| 3 | DigitalInput01 | 0 or 1 | Input state - Digital input 1 |
| 4 | Encoder 2 | 0 or 1 | Input state - Signal A |
| 5 | | 0 or 1 | Input state - Signal B |
| 6 | | 0 or 1 | Input state of reference pulse |
| 7 | DigitalInput02 | 0 or 1 | Input state - Digital input 2 |

9.11.15.8.5.3 Reading the referencing mode

Name:

ReferenceModeEncoder01 to ReferenceModeEncoder02

This register determines the referencing mode.

| Data type | Value |
|-----------|--------------------|
| USINT | See bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|-------|------|-------|--------------------------|
| 0 - 1 | | 00 | Referencing OFF |
| | | 01 | Single shot referencing |
| | | 11 | Continuous referencing |
| 2 - 5 | | 0 | Bits permanently set = 0 |
| 6 - 7 | | 00 | Referencing OFF |
| | | 11 | Bits permanently set = 1 |

This results in the following values:

| Binary | Hex | Function |
|----------|------|---|
| 00000000 | 0x00 | Referencing OFF |
| 11000001 | 0xC1 | Single shot referencing For a new start after the completed homing procedure: <ul style="list-style-type: none"> • Write value 0x00 • Wait until bit 0 to bit 3 of the StatusInput01 register takes on the value 0. Counter bits 4 to 7 are not erased • Switch homing procedure on again |
| 11000011 | 0xC3 | Continuous referencing Referencing occurs at every reference pulse. |

9.11.15.8.5.4 Status of the homing procedure

Name:

StatusInput01 (for encoder 1) to StatusInput02 (for encoder 2)

This register contains information regarding whether the referencing process is off, active or complete.

| Data type | Value |
|-----------|--------------------|
| USINT | See bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|-------|--|--------|--|
| 0 | Reference pulse without homing ¹⁾ | 0 | No reference impulse without homing has occurred yet |
| | | 1 | At least a reference impulse without homing has occurred |
| 1 | State change | 0 or 1 | Changes with each reference pulse without homing |
| 2 | Reference pulse with homing ¹⁾ | 0 | No homing has occurred yet |
| | | 1 | At least one homing procedure has occurred |
| 3 | State change | 0 or 1 | Changes with each homing procedure that has taken place |
| 4 | Reference pulse | 0 | The last reference pulse didn't bring about a homing procedure |
| | | 1 | The last reference pulse brought about a homing procedure |
| 5 - 7 | Counter | x | Free-running counter, increased with each reference pulse |

1) Always 1 after the first reference pulse that has occurred

Examples of possible values:

| Binary | Hex | Function |
|------------|-------|---|
| 0x00000000 | 0x00 | Referencing OFF or homing procedure already active |
| 0x00111100 | 0x3CE | First homing procedure complete Reference value applied in the Encoder01 register |
| 0xxxx11100 | 0xxB | Bits 5 to 7 are changed with each reference pulse |
| 0xxxx1x100 | 0xxx | Continuously changing the bits with the "Continuous referencing" setting. The reference value is applied to the Encoder01 register on each reference pulse. |

9.11.15.8.5.5 Status of encoder power supply

Name:

PowerSupply01

This register indicates the state of the integrated encoder power supply. A faulty encoder power supply is output as a warning.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|---------------|-------|------------------------------------|
| 0 | PowerSupply01 | 0 | 24 VDC encoder power supply OK |
| | | 1 | 24 VDC encoder power supply faulty |
| 1 - 7 | Reserved | - | |

9.11.15.8.6 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time |
|--------------------|
| 128 μ s |

9.11.15.8.7 Maximum cycle time

The maximum cycle time specifies the time up to which the bus cycle can be increased without internal counter overflows causing module malfunctions.

| Minimum cycle time |
|--------------------|
| 16 ms |

9.11.15.8.8 Minimum I/O update time

The minimum I/O update time specifies how far the bus cycle can be reduced so that an I/O update is performed in each cycle.

| Minimum I/O update time |
|-------------------------|
| 128 μ s |

9.11.16 X20DC2398

Data sheet version: 3.11

9.11.16.1 General information

This module is equipped with two inputs for SSI absolute encoders with 24 V encoder signal.

- 2 SSI absolute encoder 24 V
- 2 additional inputs
- 24 VDC and GND for encoder supply

9.11.16.2 Order data

| Model number | Short description | Figure |
|--------------|---|---|
| | Counter functions |  |
| X20DC2398 | X20 digital counter module, 2 SSI absolute encoder, 24 V, 125 kbit/s, 32-bit | |

9.11.16.4 LED status indicators

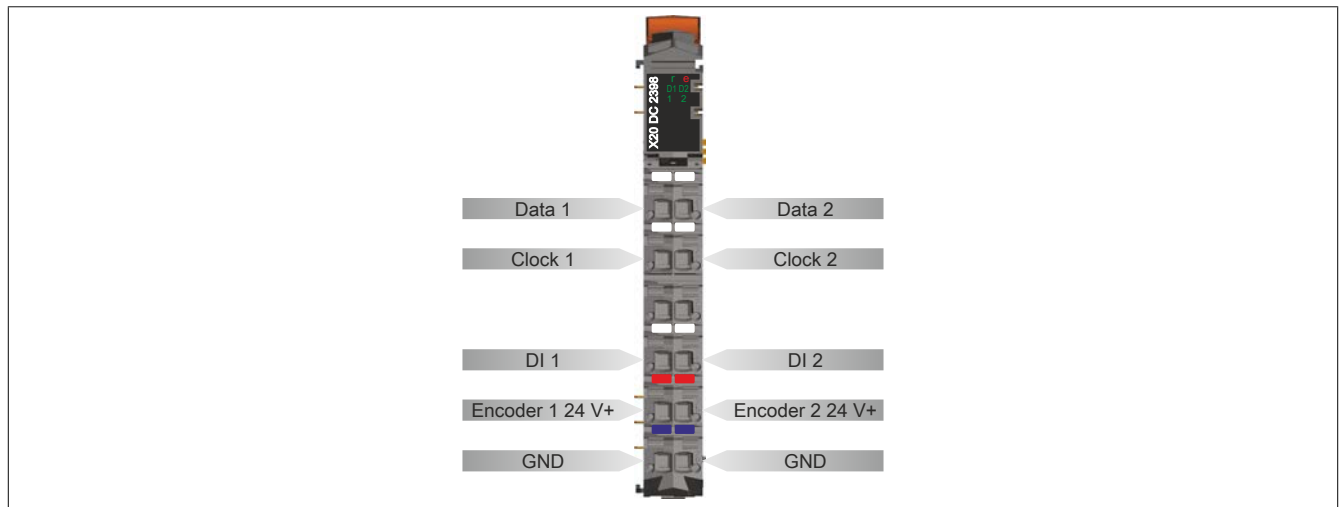

For a description of the various operating modes, see "[Diagnostic LEDs](#)" on page 3787.

| Figure | LED | Color | Status | Description |
|---|--------|-------|--------------|--|
|  | r | Green | Off | No power to module |
| | | | Single flash | RESET mode |
| | | | Double flash | BOOT mode (during firmware update) ¹⁾ |
| | | | Blinking | PREOPERATIONAL mode |
| | | | On | RUN mode |
| | e | Red | Off | No power to module or everything OK |
| | | | On | Error or reset status |
| | D1, D2 | Green | | Input state of data signal 1 or 2 |
| | 1 - 2 | Green | | Input state of the corresponding digital input |

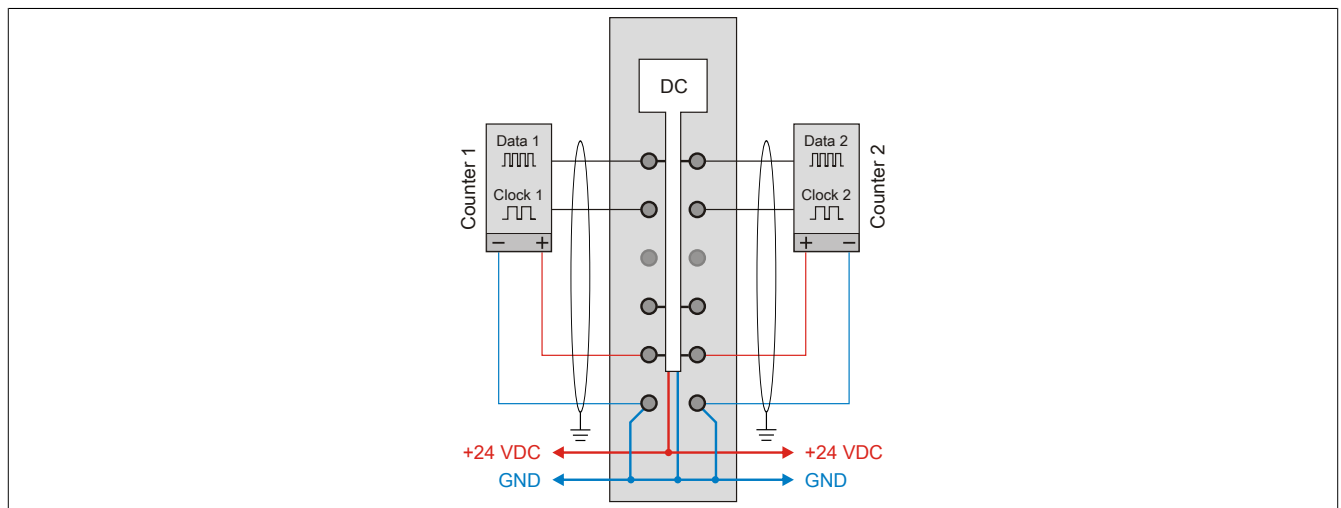

1) Depending on the configuration, a firmware update can take up to several minutes.

9.11.16.5 Pinout

Shielded cables must be used for all signal lines.

9.11.16.9 Register description

9.11.16.9.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section ["General data points" on page 3790](#).

9.11.16.9.2 Function model 0 - Standard

| Register | Name | Data type | Read | | Write | |
|----------------------|--|-----------|--------|---------|--------|---------|
| | | | Cyclic | Acyclic | Cyclic | Acyclic |
| Configuration | | | | | | |
| 7176 | ConfigOutput15 | UINT | | | | • |
| 7432 | ConfigOutput16 | UINT | | | | • |
| 7172 | ConfigAdvanced01 | UDINT | | | | • |
| 7428 | ConfigAdvanced02 | UDINT | | | | • |
| Communication | | | | | | |
| 7184 | Encode01 | UDINT | • | | | |
| 7440 | Encoder02 | UDINT | • | | | |
| 264 | Input state of digital inputs 1 to 2 | USINT | • | | | |
| | DigitalInput01 | Bit 3 | | | | |
| | DigitalInput02 | Bit 7 | | | | |
| 40 | Status of encoder power supply | USINT | • | | | |
| | PowerSupply01 | Bit 0 | | | | |

9.11.16.9.3 Function model 254 - Bus controller

| Register | Offset ¹⁾ | Name | Data type | Read | | Write | |
|----------------------|----------------------|--|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| Configuration | | | | | | | |
| 7176 | - | ConfigOutput15 | UINT | | | | • |
| 7432 | - | ConfigOutput16 | UINT | | | | • |
| 7172 | - | ConfigAdvanced01 | UDINT | | | | • |
| 7428 | - | ConfigAdvanced02 | UDINT | | | | • |
| Communication | | | | | | | |
| 7184 | 0 | Encode01 | UDINT | • | | | |
| 7440 | 8 | Encoder02 | UDINT | • | | | |
| 264 | 4 | Input state of digital inputs 1 to 2 | USINT | • | | | |
| | | DigitalInput01 | Bit 3 | | | | |
| | | DigitalInput02 | Bit 7 | | | | |
| 40 | 5 | Status of encoder power supply | USINT | • | | | |
| | | PowerSupply01 | Bit 0 | | | | |

1) The offset specifies the position of the register within the CAN object.

9.11.16.9.3.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see ["Using I/O modules on the bus controller" on page 3789](#).

9.11.16.9.3.2 CAN I/O bus controller

The module occupies 2 analog logical slots on CAN I/O.

9.11.16.9.4 SSI encoder configuration registers**9.11.16.9.4.1 Standard configuration**

Name:

ConfigOutput15 to ConfigOutput16

This configuration register sets the encoding, clock rate and number of bits. Default = 0. This must be set once using an acyclic write command.

"ConfigOutput15": Configuration register for SSI encoder 01 and

"ConfigOutput16": Configuration register for SSI encoder 02

| Data type | Values | Bus controller default setting |
|-----------|------------------------|--------------------------------|
| UINT | See the bit structure. | 0 |

Bit structure:

| Bit | Description | Value | Information |
|--------|----------------------|-------|--|
| 0 - 5 | SSI value valid bits | x | Bus controller default setting: 0 |
| 6 - 7 | Clock rate | 11 | 125 kHz. Bus controller default setting: 0 |
| 8 - 13 | SSI number of bits | x | Number of bits including leading zeros. Bus controller default setting: 0 |
| 14 | Reserved | 0 | |
| 15 | Keying | 0 | Binary encoding (bus controller default setting) |
| | | 1 | Gray encoding |

9.11.16.9.4.2 Extended configuration

Name:

ConfigAdvanced01 to ConfigAdvanced02

This configuration register is used to set the encoding, clock rate, number of bits and monostable multivibrator settings. This must be set once using an acyclic write command.

It only differs from register "ConfigOutput15 + 16" on page 1272 by data length and additional monostable multivibrator testing.

"ConfigAdvanced01": Configuration register for SSI encoder 01 and

"ConfigAdvanced02": Configuration register for SSI encoder 02

| Data type | Values | Bus controller default setting |
|-----------|------------------------|--------------------------------|
| UDINT | See the bit structure. | 65536 |

Bit structure:

| Bit | Description | Value | Information |
|---------|--------------------------|-------|--|
| 0 - 5 | SSI value valid bits | x | Bus controller default setting: 0 |
| 6 - 7 | Clock rate | 11 | 125 kHz. Bus controller default setting: 0 |
| 8 - 13 | SSI number of bits | x | Number of bits including leading zeros. Bus controller default setting: 0 |
| 14 | Reserved | 0 | |
| 15 | Keying | 0 | Binary encoding (bus controller default setting) |
| | | 1 | Gray encoding |
| 16 - 17 | Monostable multivibrator | 00 | Check OFF, no additional clock bit |
| | | 01 | Check set to high level (bus controller default setting) |
| | | 10 | Check set to low level |
| | | 11 | Level is clocked but ignored. |
| 18 - 31 | Reserved | 0 | |

Transferring using Synchronous Serial Interface

Processing the measured value

- 1) Start bit ... The measured value is saved.
- 2) Output of the first data bit
- 3) All data bits are transferred; the monostable multivibrator time starts to run.
- 4) The monostable multivibrator returns to its initial state; a new transfer can be started.

9.11.16.9.5 SSI encoder communication registers

9.11.16.9.5.1 SSI position values

Name:

Encoder01 to Encoder02

The two SSI encoder values are displayed as 32-bit position values. The SSI position values are calculated synchronously with the X2X cycle.

| Data type | Values | Filter |
|-----------|--------------------|--------------|
| UDINT | 0 to 4,294,967,729 | SSI position |

9.11.16.9.5.2 Input state of digital inputs 1 to 2

Name:

DigitalInput01 to DigitalInput02

This register contains the input state of digital inputs 1 to 2.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-----|----------------|--------|-------------------------------|
| 3 | DigitalInput01 | 0 or 1 | Input state - Digital input 1 |
| 7 | DigitalInput02 | 0 or 1 | Input state - Digital input 2 |

9.11.16.9.5.3 Status of encoder power supply

Name:

PowerSupply01

This register indicates the state of the integrated encoder power supply. A faulty encoder power supply is output as a warning.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|---------------|-------|------------------------------------|
| 0 | PowerSupply01 | 0 | 24 VDC encoder power supply OK |
| | | 1 | 24 VDC encoder power supply faulty |
| 1 - 7 | Reserved | - | |

9.11.16.9.6 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time |
|--------------------|
| 128 μ s |

9.11.16.9.7 Maximum cycle time

The maximum cycle time specifies the time up to which the bus cycle can be increased without internal counter overflows causing module malfunctions.

| Minimum cycle time |
|--------------------|
| 16 ms |

9.11.16.9.8 Minimum I/O update time

The minimum I/O update time specifies how far the bus cycle can be reduced so that an I/O update is performed in each cycle.

| Minimum I/O update time |
|-------------------------|
| 128 μ s |

9.11.17 X20DC4395

Data sheet version: 3.22

9.11.17.1 General information

This module is a multifunctional counter module. It can be connected to two SSI encoders, two ABR encoders, four AB encoders or eight event counters. Four outputs are available for pulse width modulation. The functions can also be mixed.

- 24 VDC encoder inputs
- SSI, ABR, AB or event counters for inputs
- Pulse width modulation for outputs
- 24 VDC and GND for encoder supply

Information:

This module is a multifunctional module. Some bus controllers only support the default function model.

Default function model:

- **1x ABR incremental encoder (24 V)**
- **1x SSI absolute encoder (24 V)**
- **1x event counter (24 V)**
- **2x PWM output (24 V)**

9.11.17.2 Order data

1) Dead time when switching between push and pull: Max. 1.5 µs.

9.11.17.4 LED status indicators

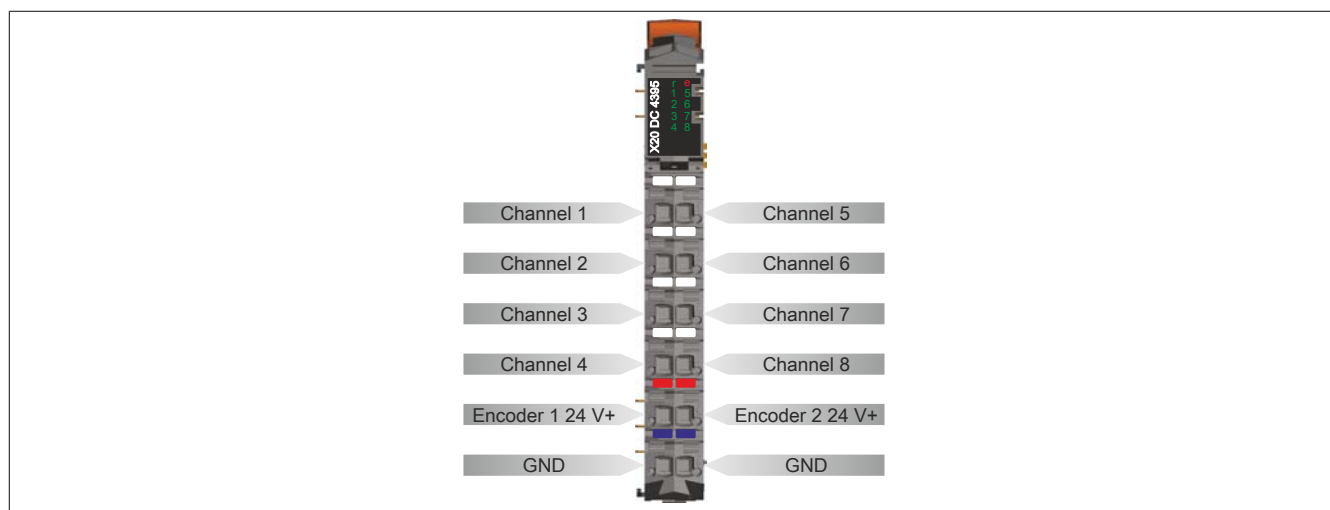

For a description of the various operating modes, see "Diagnostic LEDs" on page 3787.

| Figure | LED | Color | Status | Description |
|---|-------|-------|--------------|--|
|  | r | Green | Off | No power to module |
| | | | Single flash | RESET mode |
| | | | Double flash | BOOT mode (during firmware update) ¹⁾ |
| | | | Blinking | PREOPERATIONAL mode |
| | e | Red | On | RUN mode |
| | | | Off | No power to module or everything OK |
| | 1 - 8 | Green | On | Error or reset status |
| | | | Off | Status of the corresponding digital signal |

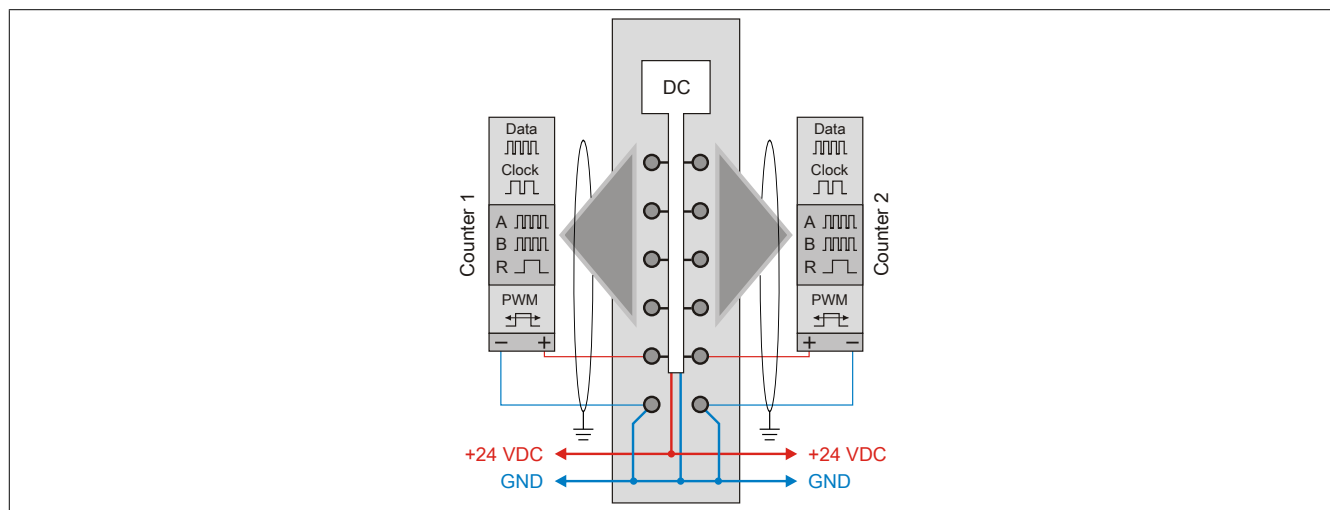

1) Depending on the configuration, a firmware update can take up to several minutes.

9.11.17.5 Pinout

Shielded cables must be used for all signal lines.

9.11.17.6 Connection example

9.11.17.7 Function overview

The following functions can be configured on the module. They cannot all be used at the same time due to the multiple use of the hardware channels and the limited cyclic data length.

- 8 digital channels, 4 of which can be configured as outputs
- 8 event counters with configurable counting direction and optional referencing via digital input
- 4 PWM outputs
- 4 up/down counters, each with optional latch inputs and comparator output
- 4 AB counters, each with optional latch inputs and comparator output
- 2 ABR encoder with configurable reference pulse edge and reference position, optional reference enable input, latch input and comparator output
- 2 SSI counter with optional latch input and comparator output
- 2 edge-triggered time measurement functions with configurable start edge based on current configuration settings

9.11.17.7.1 Description of channel assignments

The functions listed here are directly assigned to the respective hardware channels and cannot be changed:

| Channel | Signal connections |
|---------|--|
| 1 | <ul style="list-style-type: none"> • Digital input 1 • Event counter 1 • AB encoder 1 - signal line A • Up/down counter 1 - frequency • SSI encoder 1 - data line • ABR encoder 1 - signal line A |
| 2 | <ul style="list-style-type: none"> • Digital input 2 • Digital output 2 • Event counter 2 • PWM output 2 • AB encoder 1 - signal line B • Up/down counter 1 - direction • SSI encoder 1 - clock line • ABR encoder 1 - signal line B |
| 3 | <ul style="list-style-type: none"> • Digital input 3 • Event counter 3 • AB encoder 2 - signal line A • Up/down counter 2 - frequency • ABR encoder 1 - signal line R |
| 4 | <ul style="list-style-type: none"> • Digital input 4 • Digital output 4 • Event counter 4 • PWM output 4 • AB encoder 2 - signal line B • Up/down counter 2 - direction • ABR encoder 1 - reference enable input |
| 5 | <ul style="list-style-type: none"> • Digital input 5 • Event counter 5 • AB encoder 3 - signal line A • Up/down counter 3 - frequency • SSI encoder 2 - data line • ABR encoder 2 - signal line A |
| 6 | <ul style="list-style-type: none"> • Digital input 6 • Digital output 6 • Event counter 6 • PWM output 6 • AB encoder 3 - signal line B • Up/down counter 3 - direction • SSI encoder 2 - clock line • ABR encoder 2 - signal line B |
| 7 | <ul style="list-style-type: none"> • Digital input 7 • Event counter 7 • AB encoder 4 - signal line A • Up/down counter 4 - frequency • ABR encoder 2 - signal line R |
| 8 | <ul style="list-style-type: none"> • Digital input 8 • Digital output 8 • Event counter 8 • PWM output 8 • AB encoder 4 - signal line B • Up/down counter 4 - direction • ABR encoder 2 - reference enable input |

Options available in addition to these basic functions, such as comparator outputs or latch inputs, can be configured freely to unused input/output channels.

9.11.17.7.2 Connection options

Channels 1 to 8 can be connected as follows:

| Channel | Function | | | | | |
|---------|----------|---------------|---|------------------|-----------|-----|
| 1 | I | Event counter | A | A | SSI data | |
| 2 | I/O | Event counter | B | B | SSI cycle | PWM |
| 3 | I | Event counter | A | R | | |
| 4 | I/O | Event counter | B | Enable reference | | PWM |
| 5 | I | Event counter | A | A | SSI data | |
| 6 | I/O | Event counter | B | B | SSI cycle | PWM |
| 7 | I | Event counter | A | R | | |
| 8 | I/O | Event counter | B | Enable reference | | PWM |

The functions can also be mixed. For example:

| Example 1 | |
|-----------|---------------|
| Channel | Function |
| 1 | SSI data |
| 2 | SSI cycle |
| 3 | Event counter |
| 4 | PWM |
| 5 | A |
| 6 | B |
| 7 | Event counter |
| 8 | PWM |

| Example 2 | |
|-----------|---------------|
| Channel | Function |
| 1 | SSI data |
| 2 | SSI cycle |
| 3 | A |
| 4 | B |
| 5 | Event counter |
| 6 | Event counter |
| 7 | Event counter |
| 8 | Event counter |

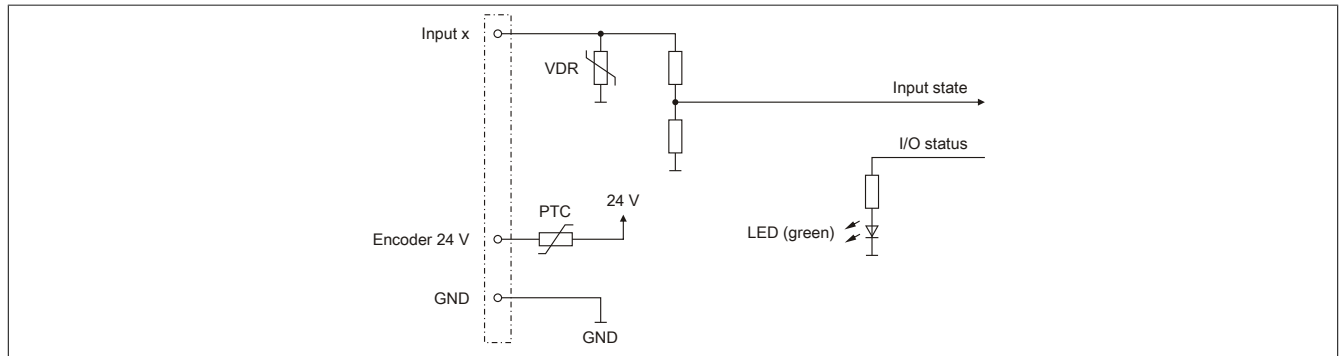

| Example 3 | |
|-----------|---------------|
| Channel | Function |
| 1 | Event counter |
| 2 | PWM |
| 3 | Event counter |
| 4 | PWM |
| 5 | SSI data |
| 6 | SSI cycle |
| 7 | A |
| 8 | B |

| Example 4 | |
|-----------|------------------|
| Channel | Function |
| 1 | A |
| 2 | B |
| 3 | R |
| 4 | Enable reference |
| 5 | A |
| 6 | B |

9.11.17.8 Input circuit diagram

9.11.17.9 Output circuit diagram

9.11.17.10 Switching inductive loads

9.11.17.11 Calculating the period duration

The outputs of the module can be operated as PWM outputs. The period duration is calculated using the following formula:

$$\text{Period duration} = \frac{n}{48000} \text{ s}$$

A value of 2 to 65535 can be defined for n.

Example

| n | Period duration | Frequency |
|-------|-----------------|-----------|
| 2 | 416 μs | 24 kHz |
| 24000 | 500 ms | 2 Hz |
| 48000 | 1 s | 1 Hz |
| 65535 | 1.36 s | 0.73 Hz |

9.11.17.12 Register description

9.11.17.12.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section "General data points" on page 3790.

9.11.17.12.2 Function model 0 - Standard and Function model 1 - 32-bit counter

The following 2 models can be selected:

- 16-bit counter, Function model 0
- 32-bit counter, Function model 1 (identified in the table with a "(D)" in the data type and "(_32Bit)" in the name.)

The only difference between these two models is that they use either 16-bit or 32-bit registers for incremental counter functions. These include:

- ABR encoders
- AB encoders
- Up/down counters
- Event counters

All other module functions e.g. SSI, PWM and time measurement, as well as their data types, are identical for the two models.

| Register | Name | Data type | Read | | Write | |

9.11.17.12.3 Function model 254 - Bus controller

Unlike the function models 0 and 1, this model only offers a selection of functions with a limited scope of configuration on the module.

The following functions are provided and can be run at the same time:

- SSI encoders
- ABR encoder with configurable reference pulse edge and reference position
- 1 event counter with configurable counting direction
- 2 PWM outputs

| Register | Offset ¹⁾ | Name | Data type | Read | | Write | |

1) The offset specifies the position of the register within the CAN object.

9.11.17.12.3.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see "Using I/O modules on the bus controller" on page 3789.

9.11.17.12.3.2 CAN I/O bus controller

The module occupies 2 analog logical slots on CAN I/O.

9.11.17.12.4 General module registers

9.11.17.12.4.1 Configuring LED status indicators

Name:

CfO_LED0source to CfO_LED7source

These registers can be used to define how the module's LED status indicators are used. Blinking patterns can be generated from the application, and the status of the physical inputs and outputs can be indicated.

| Data type | Values | Bus controller default setting |
|-----------|------------------------|---|
| USINT | See the bit structure. | CfO_LED0source = 0x20 ... CfO_LED7source = 0x27 |

Bit structure:

| Bit | Description | Values | Information |
|----------|--|---------------------------------------|--|
| 0 - 3 | MODE = 0 | 0 | LED off |
| | | 1 | Blinking quickly |
| | | 2 | Blinking |
| | | 3 | Blinking slowly |
| | | 4 | Single flash |
| | | 5 | Double flash |
| | | 6 to 15 | Reserved |
| | MODE = 1 (inverted) | 0 | LED on |
| | | 1 | Blinking quickly |
| | | 2 | Blinking |
| | | 3 | Blinking slowly |
| | | 4 | Single flash |
| | | 5 | Double flash |
| | | 6 to 15 | Reserved |
| | MODE = 2 | 0 to 7 | Number of the physical input channel (bus controller default setting) |
| | | 8 to 15 | Reserved |
| MODE = 3 | 0 to 7 | Number of the physical output channel | |
| | 8 to 15 | Reserved | |
| 4 - 7 | Selection of the mode for the status LED | 0 | LED blinking pattern |
| | | 1 | Inverted LED blinking pattern |
| | | 2 | Indicates the physical input state of a channel (bus controller default setting) |
| | | 3 | Indicates the physical output states of a channel |
| | | 4 to 15 | Reserved |

9.11.17.12.4.2 Status of encoder power supply

Name:

PowerSupply01

This register indicates the state of the integrated encoder power supply. A faulty encoder power supply is output as a warning.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|---------------|-------|------------------------------------|
| 0 | PowerSupply01 | 0 | 24 VDC encoder power supply OK |
| | | 1 | 24 VDC encoder power supply faulty |
| 1 - 7 | Reserved | - | |

9.11.17.12.5 Digital inputs and outputs

9.11.17.12.5.1 Configuring physical channels

Name:

CfO_CFGchannel01 to CfO_CFGchannel08

This register can be used to configure physical I/O channels 1 to 8.

Information:

Except for bit 2 (inverted input), all other bits are only available for channels 2, 4, 6 and 8.

| Data type | Values | Bus controller default setting |
|-----------|------------------------|--|
| USINT | See the bit structure. | CfO_CFGchannel01 = 0x00 CfO_CFGchannel02 = 0x73 CfO_CFGchannel03 = 0x00 CfO_CFGchannel04 = 0x63 CfO_CFGchannel05 to 07 = 0x00 CfO_CFGchannel08 = 0x63 |

Bit structure:

| Bit | Description | Value | Information |
|-------|--------------------|--------|------------------------------|
| 0 | Push ¹⁾ | 0 | Disabled |
| | | 1 | Enabled |
| 1 | Pull ¹⁾ | 0 | Disabled |
| | | 1 | Enabled |
| 2 | Inverted input | 0 | Disabled |
| | | 1 | Enabled |
| 3 | Inverted output | 0 | Disabled |
| | | 1 | Enabled |
| 4 - 7 | Output type | 0 | Direct I/O |
| | | 1 to 5 | Reserved |
| | | 6 | PWM (channel-specific) |
| | | 7 | SSI clock (channel-specific) |

1) To configure a channel as an output, Push and/or Pull must be enabled.

9.11.17.12.5.2 Reset mask of the digital channels

Name:

CfO_OutClearMask

The settings in this register only affect the values written to registers "DigitalOutput02 to 08" on page 1290.

- 0 allows manual reset of digital outputs using registers DigitalOutput02 to 08
- 1 prevents manual reset of digital outputs using registers DigitalOutput02 to 08

When "1" is used, the [output event function](#) can be used to reset the outputs.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-----|-----------------|-------|---|
| 0 | Reserved | - | |
| 1 | DigitalOutput02 | 0 | Writing 0 to the DigitalOutput02 register resets the output |
| | | 1 | Writing 0 from the DigitalOutput02 register does not reset the output |
| 2 | Reserved | - | |
| 3 | DigitalOutput04 | 0 | Writing 0 to the DigitalOutput04 register resets the output |
| | | 1 | Writing 0 from the DigitalOutput04 register does not reset the output |
| 4 | Reserved | - | |
| 5 | DigitalOutput06 | 0 | Writing 0 to the DigitalOutput06 register resets the output |
| | | 1 | Writing 0 from the DigitalOutput06 register does not reset the output |
| 6 | Reserved | - | |
| 7 | DigitalOutput08 | 0 | Writing 0 to the DigitalOutput08 register resets the output |
| | | 1 | Writing 0 from the DigitalOutput08 register does not reset the output |

9.11.17.12.5.3 Set mask of the digital channels

Name:

CfO_OutSetMask

The settings in this register only affect the values written to registers "DigitalOutput02 to 08" on page 1290.

- 0 allows manual setting of digital outputs using registers DigitalOutput02 to 04
- 1 prevents manual setting of digital outputs using registers DigitalOutput02 to 04

When "1" is used, the [output event function](#) can be used to reset the outputs.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Values | Information |
|-----|-----------------|--------|--|
| 0 | Reserved | - | |
| 1 | DigitalOutput02 | 0 | Writing 1 to register DigitalOutput02 sets the output. |
| | | 1 | Writing 1 from register DigitalOutput02 does not set the output. |
| 2 | Reserved | - | |
| 3 | DigitalOutput04 | 0 | Writing 1 to register DigitalOutput04 sets the output. |
| | | 1 | Writing 1 from register DigitalOutput04 does not set the output. |
| 4 | Reserved | - | |
| 5 | DigitalOutput06 | 0 | Writing 1 to register DigitalOutput06 sets the output. |
| | | 1 | Writing 1 from register DigitalOutput06 does not set the output. |
| 6 | Reserved | - | |
| 7 | DigitalOutput08 | 0 | Writing 1 to register DigitalOutput08 sets the output. |
| | | 1 | Writing 1 from register DigitalOutput08 does not set the output. |

9.11.17.12.5.4 Input states of the channels

Name:

see "Name in the Automation Studio I/O configuration"

This register reads the input status of a physical channel. The polarity settings are accounted for in the value (bit 2 in "CfO_CFGchannel[x]" on page 1288 register).

The bits in this register are shown in the Automation Studio I/O mapping table under different names based on the function used in order to improve readability.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Physical input channel | Value | Name in the Automation Studio I/O configuration |
|-----|------------------------|--------|---|
| 0 | Channel 1 | 0 or 1 | DigitalInput01 |
| 1 | Channel 2 | 0 or 1 | DigitalInput02 StatusDigitalOutput02 ComparatorActualValue02 ComparatorActualValue03 |

9.11.17.12.5.5 Output states of the channels

Name:

DigitalOutput02 to DigitalOutput08

The output status of a physical channel can be written using this register. In order to configure a channel as an output:

- 1) Bit 0 "Push" and/or bit 1 "Pull" must be enabled in the "CfO_CFGchannel[x]" on page 1288 register.
- 2) Bits 4 to 7 in the "CfO_CFGchannel[x]" on page 1288 register must be set to Direct I/O.
- 3) 0 must be set for the respective channel in the "CfO_OutClearMask" on page 1288 and "CfO_OutSetMask" on page 1289 registers.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-----|-----------------|--------|----------------------------|
| 0 | Reserved | - | |
| 1 | DigitalOutput02 | 0 or 1 | Output status of channel 2 |
| 2 | Reserved | - | |
| 3 | DigitalOutput04 | 0 or 1 | Output status of channel 4 |
| 4 | Reserved | - | |
| 5 | DigitalOutput06 | 0 or 1 | Output status of channel 6 |
| 6 | Reserved | - | |
| 7 | DigitalOutput08 | 0 or 1 | Output status of channel 8 |

9.11.17.12.6 Event functions

The module provides configurable event functions. An event function can be connected to physical I/O and the values derived from them (e.g. counters) or be purely used for internal processing.

Every event function has event inputs and outputs. Event functions can also have only inputs or only outputs. Each event output has a unique event ID. It is possible to configure when an event is generated on an event output. The effect of an event is determined by the respective event function.

Event functions can also be linked to one another. The link takes place using the event input. Every event input has a 16-bit register to which the event number of the linked event output is written.

Information:

The module functions that can be configured in the Automation Studio I/O configuration are primarily based on these event functions and their links. Changes in the Automation Studio I/O configuration have multiple effects on event functions and their links.

9.11.17.12.6.1 List of event IDs

Various hardware and software functions send event IDs or require event IDs in order to start. The following table shows all of the IDs available to configure the module.

| Event ID | Description | |
|------------------------------------|---|----------------------------------|
| Direct event inputs | | |
| 512 | Comparator condition 1 | FALSE |
| 513 | | TRUE |
| 544 | Comparator condition 2 | FALSE |
| 545 | | TRUE |
| 576 | Comparator condition 3 | FALSE |
| 577 | | TRUE |
| 608 | Comparator condition 4 | FALSE |
| 609 | | TRUE |
| Counter comparator function | | |

| 208 | Timer1 | 50 µs |
| 209 | Timer2 | 100 µs |
| 210 | Timer3 | 200 µs |
| 211 | Timer4 | 400 µs |
| 212 | Timer5 | 800 µs |
| 213 | Timer6 | 1600 µs |
| 214 | Timer7 | 3200 µs |
| 215 | Timer8 | 3200 µs (time offset to timer 7) |
| Network functions | | |
| 224 | SOAISOP (synchronous out asynchronous in start of protocol) | |
| 225 | AOSISOP (asynchronous out synchronous in start of protocol) | |
| 226 | SOAIEOP (synchronous out asynchronous in end of protocol) | |
| 227 | AOSIEOP (asynchronous out synchronous in end of protocol) | |
| Idle event | | |
| 192 | No-load operation | |

Timer

There are 8 timer events that the module can generate.

Information:

The timers have the highest event priority. All other system functions are interrupted when a timer event occurs, and jitter for the amount of time it takes to process the event.

Idle event

Idle time is the time that remains after the system has processed all higher priority events and operations. The module performs the following functions during idle time:

- Handling of the asynchronous protocol
- Mechanism for (re-)linking events
- Operation of LEDs
- Execution of event event functions linked to the idle function

9.11.17.12.6.2 Edge events

For each physical channel there are 3 event functions

- Falling edge
- Rising edge
- Falling and rising edge

The respective event is triggered when an edge is detected on the hardware input and the "[CfO_EdgeDetectRising](#)" on page 1294 and/or "[CfO_EdgeDetectFalling](#)" on page 1293 register has been configured for the respective channel.

Edges are detected by the hardware and processed for each interrupt. The interrupt handler uses an event distributor, which requires a specific amount of time for each edge to operate the hardware and execute linked event functions. To reduce this time, edge detection can be enabled/disabled individually for each channel. To optimize system load and I/O jitter, it is important to only enable edge detection where it is actually needed.

Information:

Edge detection can also be used for channels that are configured as outputs.

Event frequency limitation

To stabilize the system, there is a mechanism that limits the number of events created through edge recognition. At least one idle event must occur between two edge events for the same edge.

The "[CfO_FallingDisProtection](#)" on page 1294 and "[CfO_RisingDisProtection](#)" on page 1294 registers can be used to disable this limitation for each edge, and then an event will be generated for every edge. However, this can cause a system overload, i.e. I/O operation can fail for up to 100 ms before the module changes to the reset state.

Generate event on falling edge

Name:

CfO_EdgeDetectFalling

This register defines whether an event is generated on a falling edge.

| Data typ | Value | Bus controller default setting |
|----------|--------------------|--------------------------------|
| USINT | See bit structure. | 64 |

Bit structure:

| Bit | Description | Value | Information |
|-----|-------------|-------|--|
| 0 | Channel 1 | 0 | No event is generated on a falling edge (bus controller default setting). |
| | | 1 | Events 4096 and 4128 are generated on falling edge. |
| ... | ... | ... | ... |
| 6 | Channel 7 | 0 | No event is generated on a falling edge. |
| | | 1 | Events 4103 and 4135 are generated on a falling edge. (Bus controller default setting) |
| 7 | Channel 8 | 0 | No event is generated on a falling edge. (Bus controller default setting) |
| | | 1 | Events 4103 and 4135 are generated on a falling edge. |

Generate event on rising edge

Name:

CfO_EdgeDetectRising

This register defines whether an event is generated on a rising edge.

| Data type | Value | Bus controller default setting |
|-----------|--------------------|--------------------------------|
| USINT | See bit structure. | 64 |

Bit structure:

| Bit | Description | Value | Information |
|-----|-------------|-------|---|
| 0 | Channel 1 | 0 | No event is generated on a rising edge. (Bus controller default setting) |
| | | 1 | Events 4112 and 4128 are generated on rising edge. |
| ... | | ... | |
| 6 | Channel 7 | 0 | No event is generated on a rising edge. |
| | | 1 | Events 4119 and 4135 are generated on a rising edge. (Bus controller default setting) |
| 7 | Channel 8 | 0 | No event is generated on a rising edge. (Bus controller default setting) |
| | | 1 | Events 4119 and 4135 are generated on a rising edge. |

Enable limit for falling edges

Name:

CfO_FallingDisProtection

This register can be used to enable/disable the [event frequency limit](#) for falling edges on the respective channel.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-----|-------------|-------|---------------------------------|
| 0 | Channel 1 | 0 | Event frequency limit enabled. |
| | | 1 | Event frequency limit disabled. |
| ... | | ... | |
| 7 | Channel 7 | 0 | Event frequency limit enabled. |
| | | 1 | Event frequency limit disabled. |

Enable limit for rising edges

Name:

CfO_RisingDisProtection

This register can be used to enable/disable the [event frequency limit](#) for rising edges on the respective channel.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-----|-------------|-------|---------------------------------|
| 0 | Channel 1 | 0 | Event frequency limit enabled. |
| | | 1 | Event frequency limit disabled. |
| ... | | ... | |
| 7 | Channel 8 | 0 | Event frequency limit enabled. |
| | | 1 | Event frequency limit disabled. |

9.11.17.12.6.3 Direct input functions

The module has 2 "direct input functions"

These event functions are based on comparator functionality. If the event configured in the "CfO_DIREKTIOevent0IDwr" on page 1295 register occurs, the event function compares the status of all Direct I/O channels enabled in the "CfO_EvCompMask" on page 1295 register to a status defined in the "CfO_DIREKTIOeventcompState" on page 1295 register. The event that is generated depends on the results of this comparison.

- If the respective bits are the same, then event number 513 or 545 is generated
- If the respective bits are different, then event number 512 or 544 is generated

Configure event ID for input function

Name:

CfO_DIREKTIOevent0IDwr to CfO_DIREKTIOevent1IDwr

This register holds the event ID generated by the direct input function. For a list of all possible event IDs, see ["List of event IDs" on page 1292](#)

| Data type | Value | Information |
|-----------|--------------|--|
| INT | 192 to 7,289 | ID of the event function. <u>Bus controller default setting:</u> CfO_DIREKTIOevent0IDwr: 0 CfO_DIREKTIOevent1IDwr: 4102 |

Configure the mode of the input function

Name:

CfO_DIREKTIOevent0mode to CfO_DIREKTIOevent1mode

The mode in which the direct input function operates can be set in this register.

Comparator functions can be operated in 4 different modes. For a description, see ["Comparator modes" on page 1306](#).

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|-----------------|-------|--------------|
| 0 - 1 | Comparator mode | 0 | Off |
| | | 1 | Individual |
| | | 2 | State change |
| | | 3 | Continuous |
| 2 - 7 | Reserved | - | |

Comparator status for comparator mask

Name:

CfO_DIREKTIOevent0compState to CfO_DIREKTIOevent1compState

This register contains the status bits that are compared with the bits specified in the ["CfO_Ev0CompMask" on page 1295](#) register, which contain the I/O input status, when an event is received.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-----|--------------------------------|--------|-------------|
| 0 | Comparator status of channel 1 | 0 or 1 | |
| ... | | ... | |
| 7 | Comparator status of channel 8 | 0 or 1 | |

Configure the comparator mask for the input function

Name:

CfO_Ev0CompMask to CfO_Ev1CompMask

If a bit is set, then the input status of the respective channel is compared with that bit in the ["CfO_DIREKTIOevent-compState" on page 1295](#) register.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-----|-------------|-------|-------------------------|
| 0 | Channel 1 | 0 | Do not compare bit |
| | | 1 | Compare bit in register |
| ... | | ... | |
| 7 | Channel 8 | 0 | Do not compare bit |
| | | 1 | Compare bit in register |

9.11.17.12.6.4 Direct output functions

The module has 4 of these event functions

The effect of executing this event function is similar to writing to the ["DigitalOutput02 to 08" on page 1290](#) registers. When this event function is triggered, however, the changed output states are passed on to the hardware immediately, regardless of the X2X cycle.

When this event function is used, the masks of the respective outputs (see ["CfO_OutClearMask" on page 1288](#) and ["CfO_OutSetMask" on page 1289](#) registers) must be set to 1. Otherwise the output status would constantly be overwritten by the values in the ["DigitalOutput02 to 08" on page 1290](#) registers.

Configure event ID for output function

Name:

CfO_DIREKTIOevent0IDwr to CfO_DIREKTIOevent3IDwr

These registers hold the event IDs that trigger the direct output function. For a list of all possible event IDs, see ["List of event IDs" on page 1292](#)

| Data type | Value | Information |
|-----------|--------------|----------------------|
| INT | 192 to 7,489 | ID of event function |

Configure channels for resetting

Name:

CfO_DIREKTIOoutclearmask0 to CfO_DIREKTIOoutclearmask3

Writing "1" to the bit position that corresponds to a channel resets the output if the [output event function](#) is being executed. This corresponds to writing "0" to the ["DigitalOutput 02 to 08" on page 1290](#) registers.

The bit that corresponds to channels that should be reset should be set to "1" in the ["CfO_OutClearMask" on page 1288](#) register.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-----|-------------|-------|------------------------|
| 0 | Reserved | - | |
| 1 | Channel 2 | 0 | Reset channel 2 |
| | | 1 | Do not reset channel 2 |
| 2 | Reserved | - | |
| 3 | Channel 4 | 0 | Reset channel 4 |
| | | 1 | Do not reset channel 4 |
| 4 | Reserved | - | |
| 5 | Channel 6 | 0 | Reset channel 6 |
| | | 1 | Do not reset channel 6 |
| 6 | Reserved | - | |
| 7 | Channel 8 | 0 | Reset channel 8 |
| | | 1 | Do not reset channel 8 |

Configure channels for setting

Name:

CfO_DIREKTIOoutsetmask0 to CfO_DIREKTIOoutsetmask3

Writing "1" to the bit position that corresponds to a channel sets the output if the [output event function](#) is being executed. This corresponds to writing "1" to the ["DigitalOutput 02 to 08"](#) on page 1290 registers.

The bit that corresponds to channels that should be reset should be set to "1" in the ["CfO_OutSetMask"](#) on page 1289 register.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-----|-------------|-------|----------------------|
| 0 | Reserved | - | |
| 1 | Channel 2 | 0 | Set channel 2 |
| | | 1 | Do not set channel 2 |
| 2 | Reserved | - | |
| 3 | Channel 4 | 0 | Set channel 4 |
| | | 1 | Do not set channel 4 |
| 4 | Reserved | - | |
| 5 | Channel 6 | 0 | Set channel 6 |
| | | 1 | Do not set channel 6 |
| 6 | Reserved | - | |
| 7 | Channel 8 | 0 | Set channel 8 |
| | | 1 | Do not set channel 8 |

9.11.17.12.7 Counters and encoders

The module has 4 internal counter functions, each with 2 event counter registers. Each of these 4 counters is permanently assigned to 2 physical inputs. This assignment cannot be changed.

The counter registers perform different functions based on how the event functions are connected. The counter registers can be configured in the following ways:

- ABR counter
- AB counter
- Up/down counters
- Event counters

Different names are used for them in Automation Studio and in the register description to improve clarity.

| Channel | Counter function | Counter register | Name in Automation Studio |
|---------|------------------|------------------|--|
| 1 | 1 | 1 | ABEncoder01 ABREncoder01 Counter01 EventCounter01 |
| 2 | | 2 | EventCounter02 |
| 3 | 2 | 1 | ABEncoder02 Counter02 EventCounter03 |
| 4 | | 2 | EventCounter04 |
| 5 | 3 | 1 | ABEncoder03 ABREncoder02 Counter03 EventCounter05 |
| 6 | | 2 | EventCounter06 |
| 7 | 4 | 1 | ABEncoder04 Counter04 EventCounter07 |
| 8 | | 2 | EventCounter08 |

9.11.17.12.7.1 Counter value calculation

There are 3 steps for calculating the state of any counter function

1. The counter value is based on the 2 absolute value counters "abs1" and "abs2". These are only used internally in the module and cannot be read. Depending on the [mode](#), these registers show the respective physical input signals.

| | Mode | | |
|------|----------------------------|----------------------------------|---|
| | Edge counters | AB encoders | Up/down counter |
| abs1 | Edges of counter channel 1 | Increments in positive direction | Counter channel 2 = 0: Edges of counter channel 1 in up direction |
| abs2 | Edges of counter channel 2 | Increments in negative direction | Counter channel 2 = 1: Edges of counter channel 1 in down direction |

2. From the absolute value registers "abs1" and "abs2", 2 more counters are formed: "counter 1" and "counter 2". They are only used internally in the module and cannot be read. The following values are used for the calculation:

- Absolute value registers "abs1" and "abs2"
- SW_reference_counter 1 and 2: This reference value can be defined by the "[CfO_CounterPresetValue](#)" on [page 1304](#) register to allow referencing $\neq 0$.
- HW_reference_counter 1 and 2: In the "[CfO_CounterEventMode](#)" on [page 1308](#) register, you can configure whether latched values should be copied to these registers when [counter events](#) occur.

$$\begin{aligned} \text{counter1} &= \text{abs1} + \text{SW_reference_counter1} - \text{HW_reference_counter1} \\ \text{counter2} &= \text{abs2} + \text{SW_reference_counter2} - \text{HW_reference_counter2} \end{aligned}$$

3. The counter registers contain the sum of the two internal counters "counter 1" and "counter 2". The "[CfO_CounterConfigReg](#)" on [page 1303](#) register allows you to define a sign for each "counter" register and define whether or not it should be used.

$$\text{Counter register} = \text{counter1} + \text{counter2}$$

9.11.17.12.7.2 Sample configurations

All of the settings available in Automation Studio for ABR encoders, AB counters, up/down counters and event counters are based on the 2 counter functions.

The following configuration examples show the values with which Automation Studio initializes the module registers in order to implement these functions.

I/O configuration - AB encoder

The following table shows how the module's various event functions can be linked in order to configure an AB encoder.

[x] stands for the respective counter function, from 1 to 4

| Register | Value | Comment |
|--|--------------------------------------|--|
| For the function | | |
| CfO_Counter[x]config | 0x01 | Mode = Up/down counter |
| CfO_Counter[x]configReg0 | 0x0D | Configure the calculation of the internal "counter1" and "counter2" registers (see "Counter value calculation" on page 1298 and "Examples of calculation configurations" on page 1303) |
| For the latch | | |
| CfO_Counter[x]event0config | 0x000D | Configuration of the calculation of the first value used for the latch |
| CfO_Counter[x]event0mode | 0x03 | Mode of the first counter event function - Continuous |
| CfO_Counter[x]event0IDwr | (any) | Number of the event that should trigger Latch 1 ("Latch 01 - Channel" in the Automation Studio I/O configuration). |
| CfO_Counter[x]event1config | 0x0D | Configuration of the calculation of the second value used for the latch |
| CfO_Counter[x]event1mode | 0x03 | Mode of the second counter event function - Continuous |
| CfO_Counter[x]event1IDwr | (any) | Number of the event that should trigger Latch 2 |
| For the comparator | | |
| CfO_Counter1event1IDwr CfO_Counter3event1IDwr | 0x00D0 | Event number of Timer 1 (50 µs) Information: The latch and comparator must not have the same event number! |
| CfO_Counter1event1config CfO_Counter3event1config | 0x900D or 0xA00D | Configuration of the comparator for the second counter event |
| CfO_Counter1event1mode CfO_Counter3event1mode | 0x03 | Mode of the second counter event function - Continuous |
| CfO_DIREKTIOoutevent0IDwr CfO_DIREKTIOoutevent2IDwr | 0x0861 0x0A61 | TRUE event output of the second counter to trigger the direct output function (set outputs). |
| CfO_DIREKTIOoutsetmask0 CfO_DIREKTIOoutsetmask2 | 0x08, 0x20, 0x80 0x02, 0x08, 0x80 | Outputs that should be set when comparator condition = TRUE |
| CfO_DIREKTIOoutevent1IDwr CfO_DIREKTIOoutevent3IDwr | 0x0860 0x0A60 | FALSE event output of the second counter to trigger the direct output function (reset outputs). |
| CfO_DIREKTIOoutclearmask1 CfO_DIREKTIOoutclearmask3 | 0x08, 0x20, 0x80 0x02, 0x08, 0x80 | Outputs that should be reset when comparator condition = FALSE |

I/O configuration - ABR encoder

The following table shows how the module's various event functions can be linked in order to configure an ABR encoder.

| Register | Value | Comment |
|--|--------------------------------------|--|
| For the function | | |
| CfO_Counter1PresetValue1 CfO_Counter3PresetValue1 | (any) | Desired offset value for referencing |
| CfO_Counter1event0IDwr CfO_Counter3event0IDwr | 0x0201 | Link between the first counter event and the direct input comparator condition TRUE |
| CfO_Counter1config CfO_Counter3config | 0x01 | Mode = AB encoder |
| CfO_Counter1configReg0 CfO_Counter3configReg0 | 0x0D | Configure the calculation of the internal "counter1" and "counter2" registers (see "Counter value calculation" on page 1298 and "Examples of calculation configurations" on page 1303) |
| CfO_DIREKTIOevent0IDwr CfO_DIREKTIOevent1IDwr | 0x1002 or 0x1012 | Selection of the desired input edge as trigger for the ABR encoder function |
| CfO_Counter1event0config CfO_Counter3event0config | 0x0000 | Configuration of the first counter event (for referencing) |
| CfO_DIREKTIOevent0mode CfO_DIREKTIOevent1mode | 0x03 | Mode of the "direct input function" - Continuous |
| CfO_DIREKTIOevent0compState CfO_DIREKTIOevent1compState | 0x00 or 0x08 | Comparator status for the "direct input function" |
| CfO_Ev0CompMask CfO_Ev1CompMask | 0x08 | Comparator mask for the "direct input function" |
| For the latch | | |
| CfO_Counter1event0config CfO_Counter3event1config | 0x000D | Configuration of the calculation of the value used for the latch |
| CfO_Counter1event0mode CfO_Counter3event1mode | 0x03 | Mode of the first counter event function - Continuous |
| CfO_Counter1event0IDwr CfO_Counter3event1IDwr | (any) | Number of the event that should trigger the latch |
| For the comparator | | |
| CfO_Counter1event1IDwr CfO_Counter3event1IDwr | 0x00D0 | Event number of Timer 1 (50 µs) Information: The latch and comparator must not have the same event number! |
| CfO_Counter1event1config CfO_Counter3event1config | 0x900D or 0xA00D | Configuration of the comparator for the second counter event |
| CfO_DIREKTIOoutevent0IDwr CfO_DIREKTIOoutevent2IDwr | 0x0861 0x0A61 | TRUE event output of the second counter to trigger the direct output function (set outputs). |
| CfO_DIREKTIOoutsetmask0 CfO_DIREKTIOoutsetmask2 | 0x08, 0x20, 0x80 0x02, 0x08, 0x80 | Outputs that should be set when comparator condition = TRUE |
| CfO_DIREKTIOoutevent1IDwr CfO_DIREKTIOoutevent3IDwr | 0x0860 0x0A60 | FALSE event output of the second counter to trigger the direct output function (reset outputs). |
| CfO_DIREKTIOoutclearmask1 CfO_DIREKTIOoutclearmask3 | 0x08, 0x20, 0x80 0x02, 0x08, 0x80 | Outputs that should be reset when comparator condition = FALSE |

I/O configuration - Up/down counter

The following table shows how the module's various event functions can be linked in order to configure an up/down counter.

[x] stands for the respective counter function, from 1 to 4

| Register | Value | Comment |
|--|--------------------------------------|--|
| For the function | | |
| CfO_Counter[x]config | 0x03 | Counter mode = Up/down counter |
| CfO_Counter[x]configReg0 | 0x0D, 0x07 | Configure the calculation of the internal "counter1" and "counter2" registers (see "Counter value calculation" on page 1298 and "Examples of calculation configurations" on page 1303) |
| For the latch | | |
| CfO_Counter[x]event0config | 0x0D, 0x07 | Configuration of the calculation of the first value used for the latch |
| CfO_Counter[x]event0mode | 0x03 | Mode of the first counter function - Continuous |
| CfO_Counter[x]event0IDwr | (any) | Number of the event that should trigger Latch 1 |
| CfO_Counter[x]event1config | 0x0D, 0x07 | Configuration of the calculation of the second value used for the latch |
| CfO_Counter[x]event1mode | 0x03 | Mode of the second counter function - Continuous |
| CfO_Counter[x]event1IDwr | (any) | Number of the event that should trigger Latch 2 |
| For the comparator | | |
| CfO_Counter1event1IDwr CfO_Counter3event1IDwr | 0x00D0 | Event number of Timer 1 (50 µs) Information: The latch and comparator must not have the same event number! |
| CfO_Counter1event1config CfO_Counter3event1config | 0x900D, 0xA00d or 0x9007, 0xA007 | Configuration of the comparator for the second counter event |
| CfO_Counter1event1mode CfO_Counter3event1mode | 0x03 | Mode of the second counter event function - Continuous |
| CfO_DIREKTIOoutevent0IDwr CfO_DIREKTIOoutevent2IDwr | 0x0861 | TRUE event output of the second counter to trigger the direct output function (set outputs). |
| CfO_DIREKTIOoutsetmask0 CfO_DIREKTIOoutsetmask2 | 0x08, 0x20, 0x80 0x02, 0x08, 0x80 | Outputs that should be set when comparator condition = TRUE |
| CfO_DIREKTIOoutevent1IDwr CfO_DIREKTIOoutevent3IDwr | 0x0860 0x0A60 | FALSE event output of the second counter to trigger the direct output function (reset outputs). |
| CfO_DIREKTIOoutclearmask1 CfO_DIREKTIOoutclearmask3 | 0x08, 0x20, 0x80 0x02, 0x08, 0x80 | Outputs that should be reset when comparator condition = FALSE |

I/O configuration - Event counter

The following table shows how the module's various event functions can be linked in order to configure an event counter.

[x] stands for the respective counter function, from 1 to 4

| Register | Value | Comment |
|---|--------------|--|
| For event counters on channels 1, 3, 5 and 7 | | |
| CfO_Counter[x]configReg0 | 0x01 or 0x03 | Configure the calculation of the internal "counter1" and "counter2" registers (see "Counter value calculation" on page 1298 and "Examples of calculation configurations" on page 1303) |
| CfO_Counter[x]event0mode | 0x43 | Mode of the first counter event function and referencing configuration |
| CfO_Counter[x]event0IDwr | (any) | Number of the event that should trigger referencing |
| For event counters on channels 2, 4, 6 and 8 | | |
| CfO_Counter[x]configReg1 | 0x04 or 0x08 | Configure the calculation of the internal "counter1" and "counter2" registers (see "Counter value calculation" on page 1298 and "Examples of calculation configurations" on page 1303) |
| CfO_Counter[x]event1mode | 0x83 | Mode of the second counter event function and referencing configuration |
| CfO_Counter[x]event1IDwr | (any) | Number of the event that should trigger referencing |

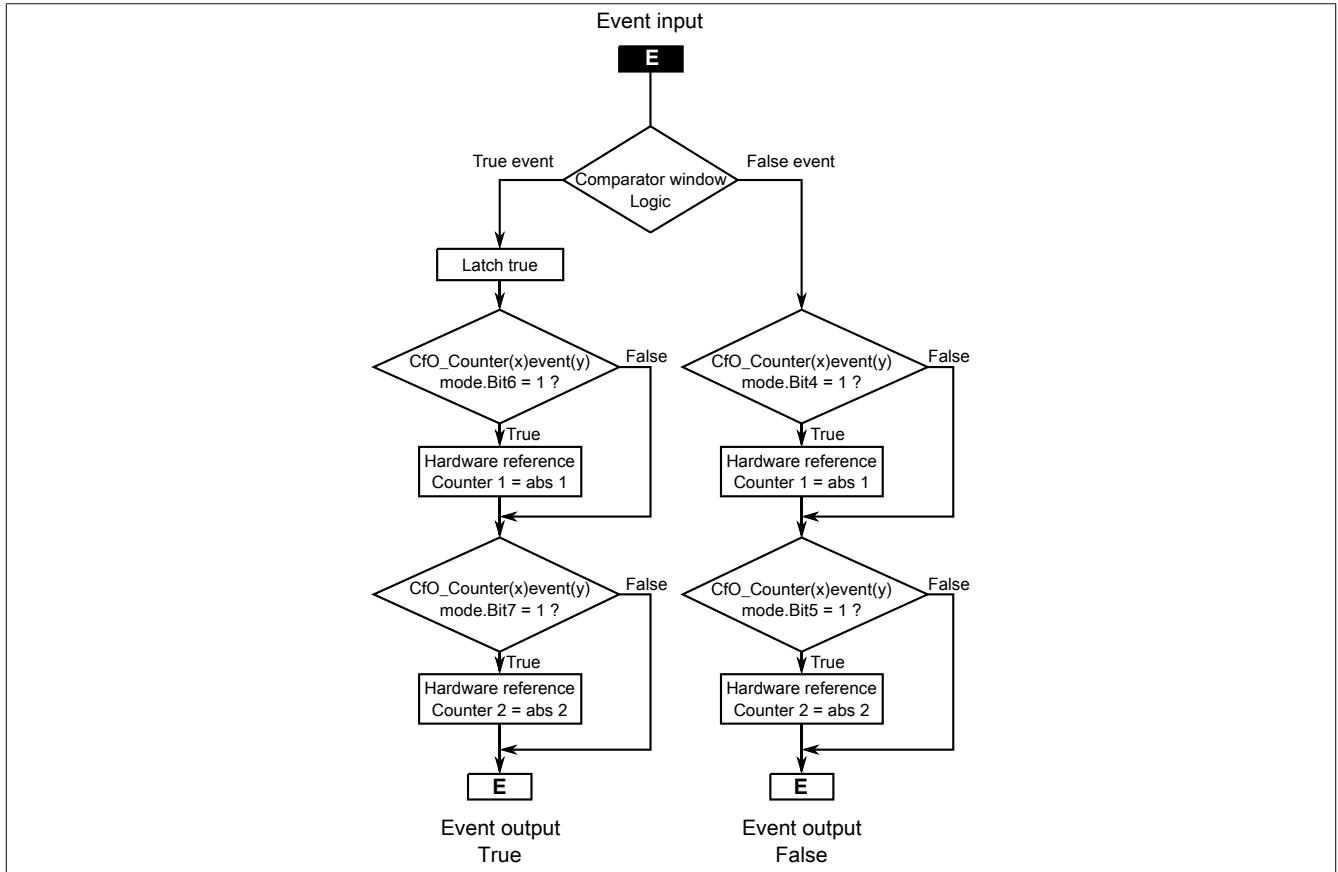

9.11.17.12.7.3 General event functions

Each of the 4 counter functions has 2 counter event functions. These consist of:

- Event ID that triggers the counter event function
- A window comparator
- Latch register for saving the counter value

When the counter event function is complete, a combined event ID in the range 2112 to 2913 (see "List of event IDs" on page 1292) is sent.

Each counter event function also has the option to copy the current counter value to the "HW reference counter" when an event occurs (see "Counter value calculation" on page 1298).

Configure counter mode

Name:

CfO_Counter1config to CfO_Counter4config

The counting mode for the counter function can be configured in these registers. Each counter function can be operated in 3 different modes.

| | Counter function mode | | |
|---------------------------------|-----------------------------------|------------|---|
| | Edge counter | AB encoder | Up/Down counter |
| Counter channel 1 ¹⁾ | Counting pulses of edge counter 1 | A | Metering pulses |
| Counter channel 2 ¹⁾ | Counting pulses of edge counter 2 | B | Counting direction (0 = Positive, 1 = Negative) |
| Counter register 1 | Counter value 1 | Position | Counter value |
| Counter register 2 | Counter value 2 | | |

1) Corresponds to the physical channels of the counter functions. See "Description of channel assignments" on page 1280.

| Data type | Values | Bus controller default setting ¹⁾ |
|-----------|------------------------|--|
| USINT | See the bit structure. | CfO_CounterNconfig N(2): 0 N(3): 1 |

1) The bus controller default value applies only to the register numbers specified in function model 254.

Bit structure:

| Bit | Description | Value | Information |
|-------|--------------|-------|---|
| 0 - 1 | Counter mode | 00 | Edge counter |
| | | 01 | Encoder AB (bus controller default setting) |
| | | 11 | Up/Down counter |
| 2 - 7 | Reserved | - | |

Configuring the calculation of internal counters

Name:

CfO_Counter1configReg0 to CfO_Counter4configReg0 ("counter1")

CfO_Counter1configReg1 to CfO_Counter4configReg1 ("counter2")

The calculation of internal registers "counter1" and "counter2" can be configured in these registers. For information about using these internal registers, see "Counter value calculation" on page 1298.

| Data type | Values | Bus controller default setting |
|-----------|------------------------|--|
| USINT | See the bit structure. | CfO_CounterNconfigReg0 N(2): 1 N(3): 13 CfO_CounterNconfigReg1 N(2,3): 0 |

1) The bus controller default value applies only to the register numbers specified in function model 254.

Bit structure:

| Bit | Description | Value | Information |
|-------|------------------|-------|--|
| 0 | counter 1 - use | 0 | 0 is added instead of "counter 1" |
| | | 1 | "counter 1" is used for addition |
| 1 | counter 1 - sign | 0 | The sign of the "counter 1" register is not changed for addition |
| | | 1 | The sign of the "counter 1" register is reversed for addition |
| 2 | counter 2 - use | 0 | 0 is added instead of "counter 2" |
| | | 1 | "counter 2" is used for addition |
| 3 | counter 2 - sign | 0 | The sign of the "counter 2" register is not changed for addition |
| | | 1 | The sign of the "counter 2" register is reversed for addition |
| 4 - 7 | Reserved | - | |

Examples of calculation configurations

| | | |
|------------|--------|--|
| 0b00000001 | = 0x01 | Only the "counter1 - use" bit is set, entering the contents of the "counter" (edge of counter event channel 1) directly in the counter register. |
| 0b00000011 | = 0x03 | "counter 1 - use" and "counter1 - sign" bits are set. The sign is changed so that the counter register counts in the negative direction. |
| 0b00001101 | = 0x0d | Edges on counter input channel 1 increase the value in the counter register. Edges on counter input channel 2 decrease the value in the counter register. This value is the best setting for modes "AB counter" and "Up/Down counter". |

Offset value for referencing

Name:

CfO_Counter1PresetValue1 to CfO_Counter4PresetValue1

CfO_Counter1PresetValue1_32Bit to CfO_Counter4PresetValue1_32Bit (SW_reference_counter1)

CfO_Counter1PresetValue2 to CfO_Counter4PresetValue2

CfO_Counter1PresetValue2_32Bit to CfO_Counter4PresetValue2_32Bit (SW_reference_counter2)

These registers can be used to define an offset value for referencing. This value is copied to the internal "SW_reference_counter" on page 1298 register of the respective counter register.

| Data type | Value | Information |
|-----------|---------------------------------|---|
| INT | -32768 to 32767 | Bus controller default setting: 0 ¹⁾ |
| DINT | -2,147,483,648 to 2,147,483,647 | |

1) The bus controller default value applies only to the register numbers specified in function model 254.

Counter register

Name:

Different names are used for these 8 registers depending on their function.

These 8 registers show the results of the [counter value calculation](#) for the respective register. Depending on the function, this corresponds to either the encoder position or the counter value.

For information on the relationship between physical channels and counter registers, see ["Counters and encoders" on page 1298](#) and ["Description of channel assignments" on page 1280](#)

| Counter 1 - Counter channel 1 | | |
|-------------------------------|------------------|----------------|
| Counter register | Function | Name |
| 1 | AB encoders | ABEncoder01 |
| | ABR encoders | ABREncoder01 |
| | Up/down counters | Counter01 |
| | Event counters | EventCounter01 |
| 2 | Event counters | EventCounter02 |

| Counter 1 - Counter channel 2 | | |
|-------------------------------|------------------|----------------|
| Counter register | Function | Name |
| 1 | AB encoders | ABEncoder02 |
| | Up/down counters | Counter02 |
| | Event counters | EventCounter03 |
| 2 | Event counters | EventCounter04 |

| Counter 2 - Counter channel 1 | | |
|-------------------------------|------------------|----------------|
| Counter register | Function | Name |
| 1 | AB encoders | ABEncoder03 |
| | ABR encoders | ABREncoder02 |
| | Up/down counters | Counter03 |
| | Event counters | EventCounter05 |
| 2 | Event counters | EventCounter06 |

| Counter 2 - Counter channel 2 | | |
|-------------------------------|------------------|----------------|
| Counter register | Function | Name |
| 1 | AB encoders | ABEncoder04 |
| | Up/down counters | Counter04 |
| | Event counters | EventCounter07 |
| | Event counters | EventCounter08 |
| 2 | Event counters | EventCounter08 |

| Data type | Value | Information |
|--------------------|---------------------------------|-----------------------------------|
| INT | -32,768 to 32,767 | Encoder position or counter value |
| DINT ¹⁾ | -2,147,483,648 to 2,147,483,647 | Encoder position or counter value |

1) Only in function model 1

Status of the ABR encoder

Name:

StatusABR01 to StatusABR02

The referencing status of the ABR encoder is shown in this register.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|--|--------|---|
| 0 - 1 | Reserved | 0 | |
| 2 | Bit is always 1 after the first reference pulse. | 0 | No reference pulses have occurred since the start of referencing. |
| | | 1 | The first reference pulse has occurred. |
| 3 | State change when referencing is complete | 0 or 1 | State change when referencing is complete |
| 4 | Bit is always 1 after the first reference pulse. | 0 | No reference pulses have occurred since the start of referencing. |
| | | 1 | The first reference pulse has occurred. |
| 5 - 7 | Continuous counter | xxx | Increased with each reference pulse |

Examples of possible values

| | | |
|------------|--------|--|
| 0b00000000 | = 0x00 | Referencing OFF or homing procedure already active |
| 0b00111100 | = 0x3C | First reference complete, reference value applied in the "ABREncoder0" on page 1304 register |
| 0bxxx11100 | = 0xxB | Bits 5 to 7 are changed with each reference pulse |
| 0bxxx1x100 | = 0xxx | Bits changed continuously with the setting continuous referencing. With every reference pulse, the reference value is applied to the "ABREncoder0" on page 1304 register |

Configure ABR referencing mode

Name:

ReferenceModeABR01 to ReferenceModeABR02

The bits in this register are used to configure the reaction to the configured reference pulse.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|---------------------------|-------|-------------------------|
| 0 - 1 | Sets the referencing mode | 00 | Referencing OFF |
| | | 01 | Single shot referencing |
| | | 10 | Reserved |
| | | 11 | Continuous referencing |
| 2 - 5 | Reserved | - | |
| 6 - 7 | Reserved | 11 | Must always be 11! |

This results in the following values:

| | | |
|------------|--------|---|
| 0b00000000 | = 0x00 | Referencing OFF |
| 0b11000001 | = 0xC1 | Single shot referencing → When starting over after the referencing process is complete, the value 0x00 must be written to start again. Wait until the "StatusABR" on page 1305 register also takes on the value 0x00, then the value 0xC1 can be written again. |
| 0b11000011 | = 0xC3 | Continuous referencing → Referencing takes place automatically with every reference pulse |

9.11.17.12.7.4 Comparator functions

The ABR and AB counters and the up/down counter have a comparator function. It always works the same and is described here globally for all three.

The comparators are implemented in software form. They do not work actively but rather passively, i.e. the comparison is only carried out when an event is received. The event received is forwarded along the TRUE or FALSE branch depending on the status of the comparator condition. An event function like this generally also offers a latch for the TRUE and FALSE branch to save the value used for the comparator at the time of the event.

Comparator modes

Comparator functions can be operated in 4 different modes.

- **Off**
Events are ignored.
- **Individual**
The event function is executed once and then disables itself automatically. To re-enable it, the "event function mode" must be changed, preferably to "off" and then to the desired mode. This setting allows a hardware latch to be simulated.
- **State change**
The event function only responds when the comparator status has changed, i.e. from false to true (or vice versa). Only the first event for each status is processed, e.g. the first "true" of a sequence of events with the comparator condition "true". After the event function is enabled, the first incoming event is used to determine the starting status and therefore not forwarded. This setting allows a hardware comparator to be simulated.
- **Continuous**
Each incoming event is forwarded to the true or false branch depending on the comparator condition. This setting allows event filters to be created.

Configure event ID for comparator

Name:

CfO_Counter1event0IDwr to CfO_Counter4event0IDwr (event function 1)

CfO_Counter1event1IDwr to CfO_Counter4event1IDwr (event function 2)

This register holds the event ID that should trigger the counter event function. For a list of all possible event IDs, see "[List of event IDs](#)" on page 1292

| Data type | Value | Information |
|-----------|--------------|---|
| INT | 192 to 7,489 | ID of counter event function Bus controller default setting: ¹⁾ CfO_Counter3event0IDwr: 545 All others: 0 |

1) The bus controller default value applies only to the register numbers specified in function model 254.

Configure calculation of comparator

Name:

CfO_Counter1event0config to CfO_Counter4event0config (event function 1)

CfO_Counter1event1config to CfO_Counter4event1config (event function 2)

The counter event function of the respective counter function can be configured in these registers.

Bits 0 to 3 configure the calculation of the comparison or latch the value used. This calculation is similar to the calculation of the counter registers (see "Counter value calculation" on page 1298)

Bits 8 to 13 can be used to limit the number of bits used for the comparison. A mask is created from $2^n - 1$ in which an AND operation is performed before the comparison. This makes it possible to generate a comparator pulse every 2^n increments.

| Data type | Values | Bus controller default setting ¹⁾ |
|-----------|------------------------|--|
| UINT | See the bit structure. | 0 |

1) The bus controller default value applies only to the register numbers specified in function model 254.

Bit structure:

| Bit | Description | Value | Information |
|--------|-------------------------------------|-------|---|
| 0 | counter1 - Use | 0 | 0 is added instead of register "counter1" (bus controller default setting). |
| | | 1 | "counter1" is used for addition. |
| 1 | counter1 - Sign | 0 | The sign of register "counter1" is not changed for addition (bus controller default setting). |
| | | 1 | The sign of register "counter1" is reversed for addition. |
| 2 | counter2 - Use | 0 | 0 is added instead of register "counter2" (bus controller default setting). |
| | | 1 | "counter2" is used for addition. |
| 3 | counter2 - Sign | 0 | The sign of register "counter2" is not changed for addition (bus controller default setting). |
| | | 1 | The sign of register "counter2" is reversed for addition. |
| 4 - 7 | Reserved | - | |
| 8 - 13 | Number of bits for comparator mask | x | The mask value is calculated as $2^n - 1$, where n is value set in these bits. (Bus controller default setting: 0) |
| 14 | Reserved | - | |
| 15 | Comparison mode of the window width | 0 | $\text{MarginComparator} \geq (\text{Current position} - \text{OriginComparator})$ (bus controller default setting) |
| | | 1 | $\text{MarginComparator} > (\text{Current position} - \text{OriginComparator})$ |

Configure mode and latching of comparator function

Name:

CfO_Counter1event0mode to CfO_Counter4event0mode (event function 1)

CfO_Counter1event1mode to CfO_Counter4event1mode (event function 2)

In these registers you can set the mode for the comparator function and optional copying of the latched registers.

Comparator functions can be operated in 4 different modes. For a description, see "Comparator modes" on page 1306.

Bits 4 to 7 can be used to define hardware referencing actions.

Based on these bits, the values of the internal absolute value counters "abs1" and "abs2" can be copied to the respective "HW_reference_counter" register at every counter event (see "Counter value calculation" on page 1298). This function can be used to reference the counter values directly in the hardware.

| Data type | Values | Bus controller default setting ¹⁾ |
|-----------|------------------------|--|
| USINT | See the bit structure. | 0 |

1) The bus controller default value applies only to the register numbers specified in function model 254.

Bit structure:

| Bit | Description | Value | Information |
|-------|-------------------------|-------|---|
| 0 - 1 | Comparator mode | 0 | Off |
| | | 1 | Individual |
| | | 2 | State change |
| | | 3 | Continuous |
| 2 - 3 | Reserved | - | |
| 4 | Copy abs1 counter value | 0 | No action |
| | | 1 | When event is FALSE → hardware reference counter 1 = abs1 |
| 5 | Copy abs2 counter value | 0 | No action |
| | | 1 | When event is FALSE → hardware reference counter 2 = abs2 |
| 6 | Copy abs1 counter value | 0 | No action |
| | | 1 | When event is TRUE → hardware reference counter 1 = abs1 |
| 7 | Copy abs2 counter value | 0 | No action |
| | | 1 | When event is TRUE → hardware reference counter 2 = abs2 |

Comparator origin

Name:

OriginComparator01 to OriginComparator02 (ABR encoder)

OriginComparator01 and OriginComparator03 (AB encoder and up/down counter)

This register is available for the comparator function of the ABR encoder, AB counter and up/down counter.

It defines the position value at which the respective configured comparator output channel is set.

| Data type | Value | Information |
|-----------|---------------------------------|----------------------------------|
| INT | -32,768 to 32,767 | Comparator window origin, 16-bit |
| DINT | -2,147,483,648 to 2,147,483,647 | Comparator window origin, 32-bit |

Width of the comparator

Name:

MarginComparator01 to MarginComparator02 (ABR encoder)

MarginComparator01 and MarginComparator03 (AB encoder and up/down counter)

This register is available for the AB and ABR encoders and the up/down counters.

It defines the width of the comparator window in the positive direction.

| Data type | Value | Information |
|-----------|---------------------------------|------------------------------------|
| INT | -32768 to 32767 | Width of comparator window, 16-bit |
| DINT | -2,147,483,648 to 2,147,483,647 | Width of comparator window, 32-bit |

Read latch position or counter value

Name:

Different names are used for these 4 registers depending on their function.

If the comparator returns "TRUE", then the current counter value is latched and copied to these registers. The calculation of the comparator value used for the latch can be configured in the "[CfO_Counter\[x\]event\[y\]config](#)" on [page 1307](#) register.

| Counter 1 - Latch 1 | | |
|---------------------|------------------|------------------|
| Event function | Function | Name |
| 1 | AB encoders | Latch01AB01 |
| | Up/down counters | Latch01Counter01 |
| 2 | AB encoders | Latch02AB01 |
| | ABR encoders | Latch01ABR01 |
| | Up/down counters | Latch02Counter01 |

| Counter 1 - Latch 2 | | |
|---------------------|------------------|------------------|
| Event function | Function | Name |
| 1 | AB encoders | Latch01AB02 |
| | Up/down counters | Latch01Counter02 |
| 2 | AB encoders | Latch02AB02 |
| | Up/down counters | Latch02Counter02 |

| Counter 2 - Latch 1 | | |
|---------------------|------------------|------------------|
| Event function | Function | Name |
| 1 | AB encoders | Latch01AB03 |
| | Up/down counters | Latch01Counter03 |
| 2 | AB encoders | Latch02AB03 |
| | ABR encoders | Latch01ABR02 |
| | Up/down counters | Latch02Counter03 |

| Counter 2 - Latch 2 | | |
|---------------------|------------------|------------------|
| Event function | Function | Name |
| 1 | AB encoders | Latch01AB04 |
| | Up/down counters | Latch01Counter04 |
| 2 | AB encoders | Latch02AB04 |
| | Up/down counters | Latch02Counter04 |

| Data type | Value | Information |
|--------------------|---------------------------------|---|
| INT | -32,768 to 32,767 | Latched encoder position or counter value |
| DINT ¹⁾ | -2,147,483,648 to 2,147,483,647 | Latched encoder position or counter value |

1) Only in function model 1

9.11.17.12.8 SSI encoder interface

The module has 2 SSI encoders available, supported directly in the hardware. Two 24 V output channels are set for each SSI encoder and cannot be changed. (See also ["Description of channel assignments" on page 1280](#))

When using the SSI encoder, the corresponding clock channel can be configured in the ["CfO_CFGchannel" on page 1288](#) register as "Channel-specific" and "Push/Pull".

| Encoder | Data channel | Clock channel |
|---------|--------------|---------------|
| SSI1 | 1 | 2 |
| SSI2 | 5 | 6 |

9.11.17.12.8.1 SSI event functions

Each of the 2 SSI encoders consists of an event function and an event input. The SSI cycle is started when an event is received on this input.

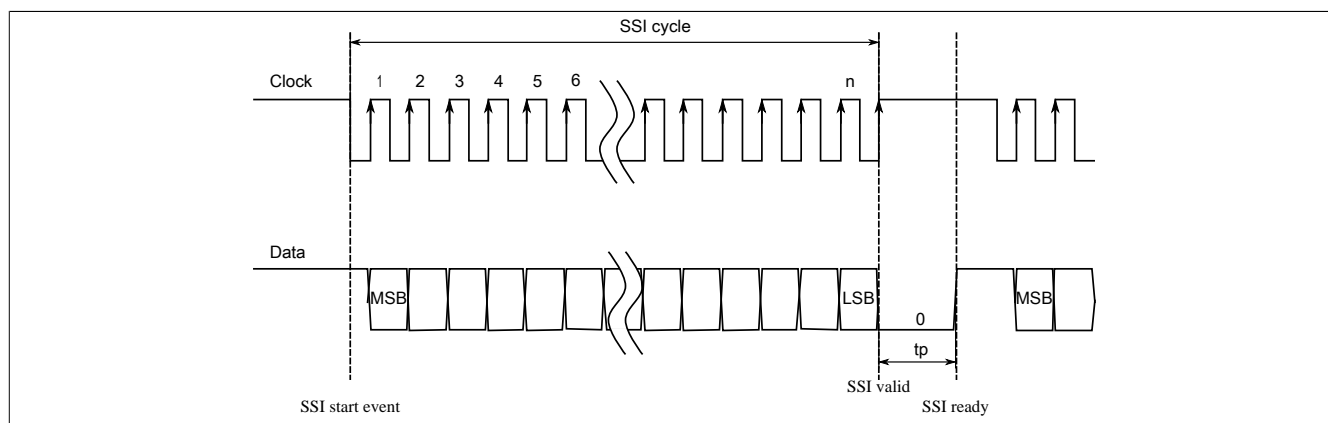

Information:

The SSI event function is not linked to an event by default, i.e. SSI functions are disabled.

2 events are transmitted from the SSI encoder interface.

- An "SSI valid" event is triggered immediately after the end of the SSI cycle if a new counter value is available.
- The "SSI ready" event then shows when the monoflop time has expired (t_p in SSI encoder timing diagram). This is the earliest that the next SSI cycle can be started.

SSI encoder - Timing diagram

Configure event ID for SSI

Name:

CfO_SSI1eventIDwr to CfO_SSI2eventIDwr

This register holds the event ID that should start the SSI cycle. For a list of all possible event IDs, see ["List of event IDs" on page 1292](#)

Normally this register is set to network event 225 "AOSISOP"- This ensures that the new encoder position is available at the next "I/O → Synchronous Frame" transfer. Check the SSI transfer time and the X2X cycle time, because the SSI cycle must be completed within this time.

| Data type | Value | Information |
|-----------|--------------|--|
| INT | 192 to 7,233 | ID of event function Bus controller default setting: 225¹⁾ |

1) The bus controller default value applies only to the register numbers specified in function model 254.

Configure SSI

Name:

CfO_SSI1cfg to CfO_SSI2cfg

This configuration register sets the encoding, clock rate and number of bits.

| Data type | Values | Bus controller default setting ¹⁾ |
|-----------|------------------------|--|
| UINT | See the bit structure. | 0 |

1) The bus controller default value applies only to the register numbers specified in function model 254.

Bit structure:

| Bit | Description | Value | Information |
|--------|----------------------|-------|--|
| 0 - 5 | SSI value valid bits | x | |
| 6 - 7 | Clock rate | 00 | 1 MHz (bus controller default setting) |
| | | 01 | 500 kHz |
| | | 10 | 250 kHz |
| | | 11 | 125 kHz |
| 8 - 13 | SSI number of bits | x | Number of bits including leading zeros |
| 14 | Reserved | 0 | |
| 15 | Keying | 0 | Binary encoding (bus controller default setting) |
| | | 1 | Gray encoding |

SSI advanced configuration

Name:

ConfigAdvanced01 to ConfigAdvanced02

This configuration register is used to set the coding, the clock rate, the number of bits and the monostable multi-vibrator settings.

It only differs from "[CfO_SSI1cfg](#)" on page 1311 by data length and additional monostable multivibrator testing.

| Data type | Value | Bus controller default setting ¹⁾ |
|-----------|--------------------|--|
| UDINT | See bit structure. | 0x10000 |

1) The bus controller default value applies only to the register number specified in function model 254.

Bit structure:

| Bit | Name | Value | Information |
|---------|--------------------------------|-------|--|
| 0 - 5 | SSI value valid bits | x | Bus controller default setting: 0 |
| 6 - 7 | Clock rate | 00 | 1 MHz (bus controller default setting) |
| | | 01 | 500 kHz |
| | | 10 | 250 kHz |
| | | 11 | 125 kHz |
| 8 - 13 | SSI number of bits | x | Number of bits including leading zeros. Bus controller default setting: 0 |
| 14 | Reserved | 0 | |
| 15 | Encoding | 0 | Binary encoding (bus controller default setting) |
| | | 1 | Gray encoding |
| 16 - 17 | Monostable multivibrator check | 00 | Check OFF, no additional clock bit |
| | | 01 | Check set to high level (bus controller default setting) |
| | | 10 | Check set to low level |
| | | 11 | Level is clocked but ignored |
| 18 - 31 | Reserved | 0 | |

Enable SSI event function

Name:

CfO_SSI1control to CfO_SSI2control

The 2 "[SSI encoder events](#)" on page 1310 can be enabled/disabled using this register.

| Data type | Values | Bus controller default setting ¹⁾ |
|-----------|------------------------|--|
| USINT | See the bit structure. | 0 |

1) The bus controller default value applies only to the register numbers specified in function model 254.

Bit structure:

| Bit | Description | Value | Information |
|-------|--------------------|-------|--|
| 0 | Event: "SSI valid" | 0 | Not transmitted (bus controller default setting) |
| | | 1 | Sent |
| 1 | Event: "SSI ready" | 0 | Not sent |
| | | 1 | Sent |
| 2 - 7 | Reserved | - | |

Read SSI position

Name:

SSIEncoder01 to SSIEncoder02

The last transferred SSI position can be read out from this register. The SSI encoder value is displayed as a 32-bit position value. This position value is generated synchronously with the X2X cycle.

| Data type | Value | Information |
|-----------|--------------------|-------------------------------|
| UDINT | 0 to 4,294,967,295 | Last SSI position transferred |

9.11.17.12.8.2 SSI comparator condition

The module has an assigned comparator function for the SSI function. These consist of:

- Event ID that triggers the comparator function
- The window comparator
- Latch register for saving the counter value

When the comparator function is complete, event ID 7232 to 7489 (see "[List of event IDs](#)" on page 1292) is sent.

Configure event ID for SSI comparator

Name:

CfO_SSI1event0IDwr to CfO_SSI2event0IDwr

This register holds the event ID that should start the SSI comparator function. For a list of all possible event IDs, see "[List of event IDs](#)" on page 1292

| Data type | Value | Information |
|-----------|--------------|--|
| INT | 192 to 7,233 | ID of comparator function Bus controller default setting: 0 ¹⁾ |

1) The bus controller default value applies only to the register numbers specified in function model 254.

Configure the mode of the SSI comparator function

Name:

CfO_SSI1event0mode to CfO_SSI2event0mode

This register can be used to configure the mode of the comparator function.

Comparator functions can be operated in 4 different modes. For a description, see "[Comparator modes](#)" on page 1306.

| Data type | Values | Bus controller default setting ¹⁾ |
|-----------|------------------------|--|
| USINT | See the bit structure. | 0 |

1) The bus controller default value applies only to the register numbers specified in function model 254.

Bit structure:

| Bit | Description | Value | Information |
|-------|-----------------|-------|--------------|
| 0 - 1 | Comparator mode | 0 | Off |
| | | 1 | Individual |
| | | 2 | State change |
| | | 3 | Continuous |
| 2 - 7 | Reserved | - | |

Configure calculation of SSI comparator

Name:

CfO_SSI1event0config and CfO_SSI2event0config

The calculation of the position value used for the comparator can be configured in this register.

The window comparator condition is calculated as follows:

```

counter_window_value = ssi_counter & (2^ssi_data_bits - 1)
diff = counter_window_value - origin_comparator
if ((diff & (2^(comparator_mask)-1)) <= margin_comparator)
condition = True;
else
condition = False;

```

| Data type | Values | Bus controller default setting ¹⁾ |
|-----------|------------------------|--|
| USINT | See the bit structure. | 0 |

1) The bus controller default value applies only to the register numbers specified in function model 254.

Bit structure:

| Bit | Description | Value | Information |
|--------|-----------------|-------|--|
| 0 - 5 | SSI data bits | x | Number of data bits used for masking |
| 6 - 7 | Reserved | - | |
| 8 - 13 | Comparator mask | x | The mask value is calculated from $2^n - 1$, where n is the value configured in SSI data bits. Default: 0 |
| 14 | Comparator mode | 0 | $\text{MarginComparator} \geq \text{SSI position} - \text{OriginComparator}$ |
| | | 1 | $\text{MarginComparator} > \text{SSI position} - \text{OriginComparator}$ |

Origin of the SSI comparator

Name:

OriginComparator01_SSI to OriginComparator02_SSI

This register contains the origin of the window comparator.

| Data type | Value | Information |
|-----------|--------------------|----------------------------------|
| UDINT | 0 to 4,294,967,295 | Origin of the window comparator. |

Width of the SSI comparator

Name:

MarginComparator01_SSI to MarginComparator02_SSI

This register provides the width of the window comparator.

| Data type | Value | Information |
|-----------|--------------------|------------------------------------|
| UDINT | 0 to 4,294,967,295 | Width of the SSI window comparator |

Read SSI latch position

Name:

Latch01SSI01 to Latch01SSI02

If the SSI window comparator returns "True", then the current SSI position is latched and saved in this register.

| Data type | Value | Information |
|-----------|--------------------|----------------------|
| UDINT | 0 to 4,294,967,295 | Latched SSI position |

9.11.17.12.9 PWM - Pulse width modulation

The module has 4 PWM functions available, supported directly by the hardware. A 24 V output channel is set for each PWM encoder and cannot be changed. (See also "[Description of channel assignments](#)" on page 1280)

When using the PWM function, the corresponding channel can be configured in the "[CfO_CFGchannel](#)" on page 1288 register as "Channel-specific".

| PWM function | Channel |
|--------------|---------|
| PWM1 | 2 |
| PWM2 | 4 |
| PWM3 | 6 |
| PWM4 | 8 |

9.11.17.12.9.1 Configure PWM prescaler

Name:

CfO_PWM0prescaler to CfO_PWM3prescaler

The length of the PWM cycle is configured using this register. The base is a 48 MHz clock, which can be changed (divided) using the setting in this register. One PWM cycle consists of 1000 of the resulting clocks after they have been divided. The period duration of the PWM cycle is calculated as follows:

$$\text{PWM_cycle} = 1000 \frac{\text{prescale}}{48000000} \text{ [s]}$$

| Data type | Value | Information |
|-----------|------------|--|
| UINT | 2 to 65535 | Prescaler for PWM cycle Bus controller default setting: 480 ¹⁾ |

1) The bus controller default value applies only to the register numbers specified in function model 254.

9.11.17.12.9.2 Output PWM values

Name:

PWMOutput02, PWMOutput04, PWMOutput06, PWMOutput08

In this register, a configuration is made for the percentage of the PWM cycle (in 1/10% steps) that the PWM output is logical 1, i.e. ON.

| Data type | Value | Information |
|-----------|----------|-----------------------------|
| UINT | 0 | PWM output always off |
| | 1 to 999 | Turn on time in 1/10% steps |
| | 1000 | PWM output always on |

9.11.17.12.10 Time measurement function

The module has a time measurement function for each I/O channel. It can be configured separately for rising and falling edges on each channel.

A starting edge can be configured for each time measurement function. When a configured starting edge occurs, the value of the internal timer is saved in a FIFO. This FIFO holds up to 16 elements. When the actual trigger edge occurs, the difference in time between the starting edge and the triggered edge is copied to the respective register. Bits 8 to 11 "Previous start edge" of the "CfO_EdgeTimeFallingMode" on page 1315 and "CfO_EdgeTimeRisingMode" on page 1316 registers can be used to define which detected starting edge from the FIFO should be used to calculate the difference. Additionally, when the trigger edge occurs, the counter clocked internally using bits 12 to 15 "Time measurement resolution" are copied to the "TimeStampFallingCH" on page 1317 and "TimeStampRisingCH" on page 1318 registers.

Information:

The time measurement function is an extension of edge detection, so all of the channels used must be configured there.

9.11.17.12.10.1 Enable time measurement function

Name:

CfO_EdgeTimeglobalenable

This register enables/disables the time measurement function for the entire module.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|---------------------------|-------|----------------------------|
| 0 | Time measurement function | 0 | Disabled for entire module |
| | | 1 | Enabled for entire module |
| 1 - 7 | Reserved | - | |

9.11.17.12.10.2 Configure time measurement function for the falling edge

Name:

CfO_EdgeTimeFallingMode01 to CfO_EdgeTimeFallingMode08

These registers can be used to configure the time measurement function for the falling edge of the respective channel.

| Data type | Values |
|-----------|------------------------|
| UINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|---------|---|---------|---|
| 0 - 3 | Selects the channel for the starting edge | 0 | Channel 1 |
| | | ... | |
| | | 7 | Channel 8 |
| 4 | Selects the edge for the starting edge | 0 | The falling edge of the channel configured in bits 0 to 3 serves as the starting edge. |
| | | 1 | The rising edge of the channel configured in bits 0 to 3 serves as the starting edge. |
| 5 - 6 | Reserved | - | |
| 7 | Trigger | 0 | Triggered ¹⁾ |
| | | 1 | Continuous ²⁾ |
| 8 - 11 | Previous start edge | 0 to 15 | The value determines which entry in the starting edge FIFO should be used to calculate the time difference. |
| 12 - 15 | Time measurement resolution | 0 | 8 Mhz |
| | | 1 | 4 Mhz |
| | | 2 | 2 Mhz |
| | | 3 | 1 Mhz |
| | | 4 | 500 kHz |
| | | 5 | 250 kHz |
| | | 6 | 125 kHz |
| | | 7 | 625 kHz |

1) The time measurement is triggered by the corresponding bit in the "TriggerRisingCH" on page 1316 register.

2) Time measurement runs continuously and is triggered at every edge.

9.11.17.12.10.3 Configure time measurement function for the rising edge

Name:

CfO_EdgeTimeRisingMode01 to CfO_EdgeTimeRisingMode08

These registers can be used to configure the time measurement function for the rising edge of the respective channel.

| Data type | Values |
|-----------|------------------------|
| UINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|---------|---|---------|---|
| 0 - 3 | Selects the channel for the starting edge | 0 | Channel 1 |
| | | ... | |
| | | 7 | Channel 8 |
| 4 | Selects the edge for the starting edge | 0 | The falling edge of the channel configured in bits 0 to 3 serves as the starting edge. |
| | | 1 | The rising edge of the channel configured in bits 0 to 3 serves as the starting edge. |
| 5 - 6 | Reserved | - | |
| 7 | Trigger | 0 | Triggered ¹⁾ |
| | | 1 | Continuous ²⁾ |
| 8 - 11 | Previous start edge | 0 to 15 | The value determines which entry in the starting edge FIFO should be used to calculate the time difference. |
| 12 - 15 | Time measurement resolution | 0 | 8 Mhz |
| | | 1 | 4 Mhz |
| | | 2 | 2 Mhz |
| | | 3 | 1 Mhz |
| | | 4 | 500 kHz |
| | | 5 | 250 kHz |
| | | 6 | 125 kHz |
| | | 7 | 625 kHz |

1) The time measurement is triggered by the corresponding bit in the "TriggerRisingCH" on page 1316 register.

2) Time measurement runs continuously and is triggered at every edge.

9.11.17.12.10.4 Trigger falling edge detection

Name:

TriggerFallingCH01 to TriggerFallingCH08

If bit 7 "Trigger" is cleared in the "CfO_EdgeTimeFallingMode" on page 1315 register, then detection of a falling edge on the respective input can be triggered using the respective bit in this register. After a bit has been set, the next falling edge on the corresponding channel is detected.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-----|--------------------|-------|---|
| 0 | TriggerFallingCH01 | 0 | Falling edges on channel 1 are not detected |
| | | 1 | The next falling edge on channel 1 will be detected |
| ... | | ... | |
| 7 | TriggerFallingCH08 | 0 | Falling edges on channel 8 are not detected |
| | | 1 | The next falling edge on channel 8 will be detected |

9.11.17.12.10.5 Trigger rising edge detection

Name:

TriggerRisingCH01 to TriggerRisingCH08

If the "Continued/triggered" bit is cleared in the "CfO_EdgeTimeRisingMode" on page 1316 register, then detection of a rising edge on the respective input can be triggered using the respective bit in this register. After a bit has been set, the next rising edge on the corresponding channel is detected.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-----|---------------------------------|-------|--|
| 0 | Trigger rising edge - Channel 1 | 0 | Rising edges on channel 1 are not detected |
| | | 1 | The next rising edge on channel 1 will be detected |
| ... | | - | |
| 7 | Trigger rising edge - Channel 8 | 0 | Rising edges on channel 8 are not detected |
| | | 1 | The next rising edge on channel 8 will be detected |

9.11.17.12.10.6 Show first falling trigger edge

Name:

BusyTriggerFallingCH01 to BusyTriggerFallingCH08

If edges are triggered via the bits in the "TriggerFallingCH" on page 1316 register, then a set bit in this register indicates that no falling edges have been detected on the respective channel since the corresponding bit was set in the "TriggerFallingCH" register. If a falling edge occurs on the respective channel, then the corresponding BusyTriggerFalling bit is cleared.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-----|------------------------|-------|--|
| 0 | BusyTriggerFallingCH01 | 0 | Falling edge detected on channel 1 |
| | | 1 | Module waiting for a falling edge on channel 1 |
| ... | | ... | |
| 7 | BusyTriggerFallingCH08 | 0 | Falling edge detected on channel 8 |
| | | 1 | Module waiting for a falling edge on channel 8 |

9.11.17.12.10.7 Show first rising trigger edge

Name:

BusyTriggerRisingCH01 to BusyTriggerRisingCH08

If edges are triggered via the bits in the "TriggerRisingCH" on page 1316 register, then a set bit in this register indicates that no rising edges have been detected on the respective channel since the corresponding bit was set in the "TriggerRisingCH" register. If a rising edge occurs on the respective channel, then the corresponding BusyTriggerRising bit is cleared.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-----|-----------------------|-------|---|
| 0 | BusyTriggerRisingCH01 | 0 | Rising edge detected on channel 1 |
| | | 1 | Module waiting for a rising edge on channel 1 |
| ... | | ... | |
| 7 | BusyTriggerRisingCH08 | 0 | Rising edge detected on channel 8 |
| | | 1 | Module waiting for a rising edge on channel 8 |

9.11.17.12.10.8 Count falling trigger edges

Name:

CountFallingCH01 to CountFallingCH08

These registers contain cyclic counters that are incremented with every detected falling edge on the respective channel.

| Data type | Value | Information |
|-----------|----------|---------------------------|
| USINT | 0 to 255 | Counter for falling edges |

9.11.17.12.10.9 Count rising trigger edges

Name:

CountRisingCH01 to CountRisingCH08

These registers contain cyclic counters that are incremented with every detected rising edge on the respective channel.

| Data type | Value | Information |
|-----------|----------|--------------------------|
| USINT | 0 to 255 | Counter for rising edges |

9.11.17.12.10.10 Time stamp of falling edge

Name:

TimeStampFallingCH01 to TimeStampFallingCH08

When a falling edge occurs on the respective channel, the current counter value of the module timer is copied to these registers.

| Data type | Value | Information |
|-----------|------------|----------------------------|
| UINT | 0 to 65535 | Timestamp for rising edges |

9.11.17.12.10.11 Time stamp of the rising edge

Name:

TimeStampRisingCH01 to TimeStampRisingCH08

When a rising edge occurs on the respective channel, the current counter value of the module timer is copied to these registers.

| Data type | Value | Information |
|-----------|------------|----------------------------|
| UINT | 0 to 65535 | Timestamp for rising edges |

9.11.17.12.10.12 Time difference of falling edge

Name:

TimeDiffFallingCH01 to TimeDiffFallingCH08

When a falling edge occurs on the respective channel, the time difference compared to the starting edge configured in bit 4 of the "[CfO_EdgeTimeFallingMode](#)" on [page 1315](#) register is copied to this register.

| Data type | Value | Information |
|-----------|-------------|------------------------------------|
| UINT | 0 to 65,535 | Time difference from starting edge |

9.11.17.12.10.13 Time difference of rising edge

Name:

TimeDiffRisingCH01 to TimeDiffRisingCH08

When a rising edge occurs on the respective channel, the time difference compared to the starting edge configured in bit 4 of the "[CfO_EdgeTimeRisingMode](#)" on [page 1316](#) register is copied to this register.

| Data type | Value | Information |
|-----------|-------------|------------------------------------|
| UINT | 0 to 65,535 | Time difference from starting edge |

9.11.17.12.11 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time |
|--------------------|
| 128 μ s |

9.11.17.12.12 Maximum cycle time

The maximum cycle time specifies the time up to which the bus cycle can be increased without internal counter overflows causing module malfunctions.

| Minimum cycle time |
|--------------------|
| 16 ms |

9.11.17.12.13 Minimum I/O update time

The minimum I/O update time specifies how far the bus cycle can be reduced so that an I/O update is performed in each cycle.

| Minimum I/O update time |
|-------------------------|
| 128 μ s |

9.12 CPUs

X20 CPUs are powerful components within the X20 system landscape. The CPUs are based on Intel processors and available in a wide range of performance classes and designs.

- Standard CPU
- CPU with integrated I/O

Available interfaces

In addition to onboard CompactFlash, 2x USB and RS232, there are also 2 independent Ethernet interfaces:

- 1 standard Gigabit Ethernet interface for TCP/IP data transfer
- 1 Fast Ethernet interface (100 Mbit/s) used as a POWERLINK interface

An additional 1 or 3 slots are also available for interface expansion.

Easy maintenance

All CPU modules are fanless. The CPU can be used across the full temperature range specified for the X20 system landscape. Derating may be required over 55°C depending on the model, however.

The built-in battery for retaining SRAM data can be exchanged during operation as long as this is permitted by local regulations. If the battery is exchanged with the power off, SRAM data will be retained for approximately 1 minute.

9.12.1 Summary

| Model number | Short description | Page |
|--------------|---|------|
| X20CP1301 | X20 CPU, with integrated I/O, x86-200, 128 MB DDR3 RAM, 16 kB FRAM, 1 GB onboard flash drive, 1 insert slot for X20 interface modules, 1 USB interface, 1 RS232 interface, 1 Ethernet interface 10/100BASE-T, 14 digital inputs, 24 VDC, sink, 4 digital outputs, 24 VDC, 0.5 A, source, 4 digital outputs, 2 μs, 24 VDC, 0.2 A, 4 digital inputs/outputs, 24 VDC, 0.5 A, 2 analog inputs ±10 V or 0 to 20 mA / 4 to 20 mA, 1 PT1000 instead of an analog input, includes power supply module, 3x terminal block X20TB1F, slot cover and X20 end cover plate X20AC0SR1 (right) included | 1324 |
| X20CP1381 | X20 CPU, with integrated I/O, x86-200, 128 MB DDR3 RAM, 16 kB FRAM, 1 GB onboard flash drive, 1 insert slot for X20 interface modules, 2 USB interfaces, 1 RS232 interface, 1 CAN bus interface, 1 POWERLINK interface, 1 Ethernet interface 10/100BASE-T, 14 digital inputs, 24 VDC, sink, 4 digital outputs, 2 μs, 24 VDC, sink, 4 digital outputs, 24 VDC, 0.5 A, source, 4 digital outputs, 2 μs, 24 VDC, 0.2 A, 4 digital inputs/outputs, 24 VDC, 0.5 A, 2 analog inputs ±10 V or 0 to 20 mA / 4 to 20 mA, 1 PT1000 instead of an analog input, includes power supply module, 3x terminal block X20TB1F, slot cover and X20 end cover plate X20AC0SR1 (right) included | 1324 |
| X20CP1382 | X20 CPU, with integrated I/O, x86-400, 256 MB DDR3 RAM, 32 kB FRAM, 2 GB onboard flash drive, 1 insert slot for X20 interface modules, 2 USB interfaces, 1 RS232 interface, 1 CAN bus interface, 1 POWERLINK interface, 1 Ethernet interface 10/100BASE-T, 14 digital inputs, 24 VDC, sink, 4 digital outputs, 2 μs, 24 VDC, sink, 4 digital outputs, 24 VDC, 0.5 A, source, 4 digital outputs, 2 μs, 24 VDC, 0.2 A, 4 digital inputs/outputs, 24 VDC, 0.5 A, 2 analog inputs ±10 V or 0 to 20 mA / 4 to 20 mA, 1 PT1000 instead of an analog input, includes power supply module, 3x terminal block X20TB1F, slot cover and X20 end cover plate X20AC0SR1 (right) included | 1324 |
| X20CP1483 | X20 CPU, x86 100 MHz Intel compatible, 32 MB DRAM, 128 kB SRAM, removable application memory: CompactFlash, 1 insert slot for X20 interface modules, 2 USB interfaces, 1 RS232 interface, 1 Ethernet interface 10/100BASE-T, 1 POWERLINK interface, including power supply module, 1x terminal block X20TB12, slot cover and X20 end cover plate X20AC0SR1 (right) included, order application memory separately! | 1380 |
| X20CP1483-1 | X20 CPU, x86 100 MHz Intel compatible, 64 MB DRAM, 128 kB SRAM, removable application memory: CompactFlash, 1 insert slot for X20 interface modules, 2 USB interfaces, 1 RS232 interface, 1 Ethernet interface 10/100BASE-T, 1 POWERLINK interface, including power supply module, 1x terminal block X20TB12, slot cover and X20 end cover plate X20AC0SR1 (right) included, order application memory separately! | 1380 |

| Model number | Short description | Page |
|--------------|---|------|
| X20CP1583 | X20 CPU, Atom 333 MHz Intel compatible, 128 MB DDR2 RAM, 1 MB SRAM, removable application memory: CompactFlash, 1 insert slot for X20 interface modules, 2 USB interfaces, 1 RS232 interface, 1 Ethernet interface 10/100/1000BASE-T, 1 POWERLINK interface, including power supply module, 1x terminal block X20TB12, slot cover and X20 end cover plate X20AC0SR1 (right) included, order application memory separately! | 1397 |
| X20CP1584 | X20 CPU, Atom 0.6 GHz, 256 MB DDR2 RAM, 1 MB SRAM, removable application memory: CompactFlash, 1 insert slot for X20 interface modules, 2 USB interfaces, 1 RS232 interface, 1 Ethernet interface 10/100/1000BASE-T, 1 POWERLINK interface, including power supply module, 1x terminal block X20TB12, slot cover and X20 end cover plate X20AC0SR1 (right) included, order application memory separately! | 1397 |
| X20CP1585 | X20 CPU, Atom 1.0 GHz, 256 MB DDR2 RAM, 1 MB SRAM, removable application memory: CompactFlash, 1 insert slot for X20 interface modules, 2 USB interfaces, 1 RS232 interface, 1 Ethernet interface 10/100/1000BASE-T, 1 POWERLINK interface, including power supply module, 1x terminal block X20TB12, slot cover and X20 end cover plate X20AC0SR1 (right) included, order application memory separately! | 1397 |
| X20CP1586 | X20 CPU, Atom 1.6 GHz, 512 MB DDR2 RAM, 1 MB SRAM, removable application memory: CompactFlash, 1 insert slot for X20 interface modules, 2 USB interfaces, 1 RS232 interface, 1 Ethernet interface 10/100/1000BASE-T, 1 POWERLINK interface, including power supply module, 1x terminal block X20TB12, slot cover and X20 end cover plate X20AC0SR1 (right) included, order application memory separately! | 1397 |
| X20CP1684 | X20 CPU, Atom 0.4 GHz (compatible), 512 MB DDR4 RAM, 1 MB SRAM, 1 GB onboard flash drive, removable application memory: CompactFlash, 1 insert slot for X20 interface modules, 2 USB interfaces, 1 RS232 interface, 1 Ethernet interface (TSN) 10/100/1000BASE-T, 1 POWERLINK interface module, including supply module. 1x terminal block X20TB12, slot cover and X20 end cover plate X20AC0SR1 (right) included. Order CompactFlash separately! | 1418 |
| X20CP1685 | X20 CPU, Atom 0.8 GHz, 512 MB DDR4 RAM, 1 MB SRAM, 1 GB onboard flash drive, removable application memory: CompactFlash, 1 insert slot for X20 interface modules, 2 USB interfaces, 1 RS232 interface, 1 Ethernet interface (TSN) 10/100/1000BASE-T, 1 POWERLINK interface module, including supply module. 1x terminal block X20TB12, slot cover and X20 end cover plate X20AC0SR1 (right) included. Order CompactFlash separately! | 1418 |
| X20CP1686X | X20 CPU, Atom 1.3 GHz, 1 GB DDR4 RAM, 1 MB SRAM, 2 GB onboard flash drive, removable application memory: CompactFlash, 1 insert slot for X20 interface modules, 2 USB interfaces, 1 RS232 interface, 1 Ethernet interface (TSN) 10/100/1000BASE-T, 1 POWERLINK interface module, including supply module. 1x terminal block X20TB12, slot cover and X20 end cover plate X20AC0SR1 (right) included. Order CompactFlash separately! | 1418 |
| X20CP3583 | X20 CPU, Atom 333 MHz Intel compatible, 128 MB DDR2 RAM, 1 MB SRAM, removable application memory: CompactFlash, 3 insert slots for X20 interface modules, 2 USB interfaces, 1 RS232 interface, 1 Ethernet interface 10/100/1000BASE-T, 1 POWERLINK interface, including power supply module, 1x terminal block X20TB12, slot covers and X20 end cover plate X20AC0SR1 (right) included, order application memory separately! | 1401 |
| X20CP3584 | X20 CPU, Atom 0.6 GHz, 256 MB DDR2 RAM, 1 MB SRAM, removable application memory: CompactFlash, 3 insert slots for X20 interface modules, 2 USB interfaces, 1 RS232 interface, 1 Ethernet interface 10/100/1000BASE-T, 1 POWERLINK interface, including power supply module, 1x terminal block X20TB12, slot covers and X20 end cover plate X20AC0SR1 (right) included, order application memory separately! | 1401 |
| X20CP3585 | X20 CPU, Atom 1.0 GHz, 256 MB DDR2 RAM, 1 MB SRAM, removable application memory: CompactFlash, 3 insert slots for X20 interface modules, 2 USB interfaces, 1 RS232 interface, 1 Ethernet interface 10/100/1000BASE-T, 1 POWERLINK interface, including power supply module, 1x terminal block X20TB12, slot covers and X20 end cover plate X20AC0SR1 (right) included, order application memory separately! | 1401 |
| X20CP3586 | X20 CPU, Atom 1.6 GHz, 512 MB DDR2 RAM, 1 MB SRAM, removable application memory: CompactFlash, 3 insert slots for X20 interface modules, 2 USB interfaces, 1 RS232 interface, 1 Ethernet interface 10/100/1000BASE-T, 1 POWERLINK interface, including power supply module, 1x terminal block X20TB12, slot covers and X20 end cover plate X20AC0SR1 (right) included, order application memory separately! | 1401 |
| X20CP3684 | X20 CPU, Atom 0.4 GHz (compatible), 512 MB DDR4 RAM, 1 MB SRAM, 1 GB onboard flash drive, removable application memory: CompactFlash, 3 insert slots for X20 interface modules, 2 USB interfaces, 1 RS232 interface, 1 Ethernet interface (TSN) 10/100/1000BASE-T, 1 POWERLINK interface module, including supply module. 1x terminal block X20TB12, slot covers and X20 end cover plate X20AC0SR1 (right) included. Order CompactFlash separately! | 1422 |
| X20CP3685 | X20 CPU, Atom 0.8 GHz, 512 MB DDR4 RAM, 1 MB SRAM, 1 GB onboard flash drive, removable application memory: CompactFlash, 3 insert slots for X20 interface modules, 2 USB interfaces, 1 RS232 interface, 1 Ethernet interface (TSN) 10/100/1000BASE-T, 1 POWERLINK interface module, including supply module. 1x terminal block X20TB12, slot covers and X20 end cover plate X20AC0SR1 (right) included. Order CompactFlash separately! | 1422 |
| X20CP3686X | X20 CPU, Atom 1.3 GHz, 1 GB DDR4 RAM, 1 MB SRAM, 2 GB onboard flash drive, removable application memory: CompactFlash, 3 insert slots for X20 interface modules, 2 USB interfaces, 1 RS232 interface, 1 Ethernet interface (TSN) 10/100/1000BASE-T, 1 POWERLINK interface module, including supply module. 1x terminal block X20TB12, slot covers and X20 end cover plate X20AC0SR1 (right) included. Order CompactFlash separately! | 1422 |
| X20CP3687X | X20 CPU, Atom 1.6 GHz, 2 GB DDR4 RAM, 1 MB SRAM, 2 GB onboard flash drive, removable application memory: CompactFlash, 3 insert slots for X20 interface modules, 2 USB interfaces, 1 RS232 interface, 1 Ethernet interface (TSN) 10/100/1000BASE-T, 1 POWERLINK interface module, including supply module. 1x terminal block X20TB12, slot covers and X20 end cover plate X20AC0SR1 (right) included. Order CompactFlash separately! | 1422 |
| X20cCP1301 | X20 CPU coated, with integrated I/O, x86-200, 128 MB DDR3 RAM, 16 kB FRAM, 1 GB onboard flash drive, 1 insert slot for X20 interface modules, 1 USB interface, 1 RS232 interface, 1 Ethernet interface 10/100BASE-T, 14 digital inputs, 24 VDC, sink, 4 digital inputs, 2 μ s, 24 VDC, sink, 4 digital outputs, 24 VDC, 0.5 A, source, 4 digital outputs, 2 μ s, 24 VDC, 0.2 A, 4 digital inputs/outputs, 24 VDC, 0.5 A, 2 analog inputs \pm 10 V or 0 to 20 mA / 4 to 20 mA, 1 PT1000 instead of an analog input, includes power supply module, 3x terminal block X20TB1F, slot cover and X20 end cover plate X20AC0SR1 (right) included | 1324 |
| X20cCP1584 | X20 CPU, coated, Atom 0.6 GHz, 256 MB DDR2 RAM, 1 MB SRAM, removable application memory: CompactFlash, 1 insert slot for X20 interface modules, 2 USB interfaces, 1 RS232 interface, 1 Ethernet interface 10/100/1000BASE-T, 1 POWERLINK interface, including power supply module, 1x terminal block X20TB12, slot cover and X20 end cover plate X20AC0SR1 (right) included, order application memory separately! | 1397 |
| X20cCP1586 | X20 CPU, coated, Atom 1.6 GHz, 512 MB DDR2 RAM, 1 MB SRAM, removable application memory: CompactFlash, 1 insert slot for X20 interface modules, 2 USB interfaces, 1 RS232 interface, 1 Ethernet interface 10/100/1000BASE-T, 1 POWERLINK interface, including power supply module, 1x terminal block X20TB12, slot cover and X20 end cover plate X20AC0SR1 (right) included, order application memory separately! | 1397 |

| X20cCP3584 | X20 CPU, coated, ATOM 0.6 GHz, 256 MB DDR2 RAM, 1 MB SRAM, removable application memory: CompactFlash, 3 insert slots for X20 interface modules, 2 USB interfaces, 1 RS232 interface, 1 Ethernet interface 10/100/1000 Base-T, 1 POWERLINK interface, incl. supply module, 1 X20TB12 terminal block, slot covers and X20 end cover plate (right) X20AC0SR1 included, order application memory separately. | 1401 |
| X20cCP3586 | X20 CPU, coated, ATOM 1.6 GHz, 512 MB DDR2 RAM, 1 MB SRAM, removable application memory: CompactFlash, 3 insert slots for X20 interface modules, 2 USB interfaces, 1 RS232 interface, 1 Ethernet interface 10/100/1000 Base-T, 1 POWERLINK interface, incl. supply module, 1 X20TB12 terminal block, slot covers and X20 end cover plate (right) X20AC0SR1 included, order application memory separately. | 1401 |

9.12.2 X20(c)CP1301, X20CP1381 and X20CP1382

Data sheet version: 1.23

9.12.2.1 General information

Compact CPUs are available with processor speeds of 200 MHz and 400 MHz. Depending on the variant, up to 256 MB RAM and up to 32 kB nonvolatile onboard RAM is available. A built-in flash drive is available to store up to 2 GB of application and other data.

All CPUs come equipped with Ethernet, USB and one RS232 interface. In both performance classes, integrated POWERLINK and CAN bus interfaces are also available. If additional fieldbus connections are needed, the CPU can be upgraded with an interface module from the standard X20 product range. These CPUs do not require fans or batteries and are therefore maintenance-free. 30 different digital inputs and outputs and 2 analog inputs are integrated in the devices. 1 analog input can be used for PT1000 resistance temperature measurement.

- CPU is Intel x86 200/400 MHz compatible with integrated I/O processor
- Ethernet, POWERLINK with poll-response chaining and USB onboard
- 1 slot for modular interface expansion
- 30 digital inputs/outputs and 2 analog inputs integrated in the device
- 1/2 GB flash drive onboard
- 128/256 MB DDR3 SDRAM
- Fanless
- No battery
- Battery-backed real-time clock

9.12.2.2 Coated modules

Coated modules are X20 modules with a protective coating for the electronics component. This coating protects X20c modules from condensation and corrosive gases.

The modules' electronics are fully compatible with the corresponding X20 modules.

For simplification purposes, only images and module IDs of uncoated modules are used in this data sheet.

The coating has been certified according to the following standards:

- Condensation: BMW GS 95011-4, 2x 1 cycle
- Corrosive gas: EN 60068-2-60, method 4, exposure 21 days

Table 225: Technical data

- 1) The specified values are maximum values. For examples of the exact calculation, see section "Mechanical and electrical configuration" of the X20 system user's manual.
- 2) When operated in parallel, the nominal power of 2 W is not permitted to be added to the total power.
- 3) Up to 2 W bus load.
- 4) The size of the memory used for remanent variables is configurable in Automation Studio.
- 5) The memory size for remanent variables is configurable in Automation Studio.
- 6) See Automation Help under "Communication / POWERLINK / General information / Hardware - IF/LS" for more information.
- 7) Based on the current measured value.
- 8) Based on the 20 V measurement range.
- 9) Based on the 20 mA measurement range.
- 10) Based on the current resistance value.
- 11) Based on the current measured resistance value.
- 12) Based on the entire resistance measurement range.
- 13) For the high-speed digital outputs, derating must be taken into account at a switching frequency >50 kHz (see section "Derating for switching frequency of high-speed digital outputs"). Overtemperature protection is not provided.
- 14) The high-speed digital outputs can be used for pulse width modulation.
- 15) Only for standard outputs and mixed channels.
- 16) Standard outputs and mixed channels: At loads $\leq 1 \text{ k}\Omega$

9.12.2.5 LED status indicators

9.12.2.5.1 Slot X1

| Figure | LED | Color | Status | Description |
|---|---------|-----------|--|---|
|  | E | Red | On | Operating mode SERVICE ¹⁾ or BOOT ¹⁾ |
| | | | Blinking | The "E" LED blinks red and the "RF" LED blinks yellow when there is a license violation. |
| | | | Double flash | Firmware update ²⁾ |
| | R | Green | On | Application running |
| | | | Blinking | System startup: The CPU is initializing the application, all bus systems and I/O modules. ²⁾ |
| | RF | Yellow | On | Operating mode SERVICE ¹⁾ or BOOT ¹⁾ |
| | | | Blinking | The "RF" LED blinks yellow and the "E" LED blinks red when there is a license violation. |
| | SE | Green/Red | | Status/Error LED. LED states are described in section "LED "S/E" (LED "Status/Error")" on page 1331. |
| | ET | Green | On | A link to the Ethernet remote station has been established. |
| | | | Blinking | A link to the Ethernet remote station has been established. The LED blinks when Ethernet activity is taking place on the bus. |
| | PL | Green | On | A link to the POWERLINK peer station has been established. |
| | | | Blinking | A link to the POWERLINK peer station has been established. The LED blinks when Ethernet activity is taking place on the bus. |
| | A1 - A2 | Green | Off | Open circuit or disconnected sensor |
| | | | Blinking | Input signal overflow or underflow |
| | | | On | Analog/digital converter running, value OK |
| | 1 - 4 | Green | | Input state of the corresponding digital input |
| | C | Yellow | On | CPU transmitting or receiving data via the CAN bus interface |
| S | Yellow | On | CPU transmitting or receiving data via the RS232 interface | |
| T | Yellow | On | The terminating resistor integrated in the CPU is switched on. | |
| DC | Yellow | On | CPU power supply OK | |

Table 226: LED status indicators on the integrated X1 I/O slot

- 1) The operating states are described in Automation Help under "Real-time operating system - Method of operation - Operating states".
- 2) The process can take several minutes depending on the configuration.

9.12.2.5.1.1 LED "S/E" (LED "Status/Error")

This LED is a green/red dual LED and indicates the state of the POWERLINK interface. The LED states have a different meaning depending on the operating mode of the POWERLINK interface.

Ethernet mode

In this mode, the interface is operated as an Ethernet interface.

| LED "S/E" | | Description |
|-----------|-----|---|
| Green | Red | |
| On | Off | The interface is operated as an Ethernet interface. |

Table: LED "S/E": Interface in Ethernet mode

POWERLINK V2 mode

Error message

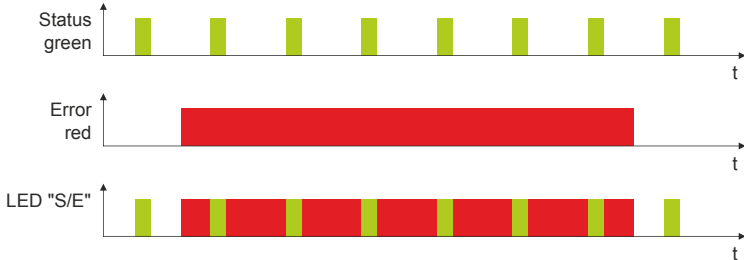

| LED "S/E" | | Description |
|-----------|-----|---|
| Green | Red | |
| Off | On | The interface is in error mode (failed Ethernet frames, increased number of collisions on the network, etc.). Note: Several red blinking signals are displayed immediately after the device is switched on. These are not errors, however. |
| Blinking | On | If an error occurs in the following modes, then the green LED blinks over the red LED: <ul style="list-style-type: none"> PRE_OPERATIONAL_1 PRE_OPERATIONAL_2 READY_TO_OPERATE  |

Table: LED "S/E" - Error message (interface in POWERLINK mode)

Interface status

| LED "S/E" | | Description |
|----------------------------|-----|--|
| Green | Red | |
| Off | Off | Mode: NOT_ACTIVE The interface is either in mode NOT_ACTIVE or one of the following modes or errors is present: <ul style="list-style-type: none"> The device is switched off. The device is in the startup phase. The interface or device is not configured correctly in Automation Studio. The interface or device is defective. Managing node (MN) The network is monitored for POWERLINK frames. If a frame is not received within the configured time window (timeout), the interface immediately enters mode PRE_OPERATIONAL_1. If POWERLINK communication is detected before the time has elapsed, however, the MN is not started. |
| Flickering (approx. 10 Hz) | Off | Mode: BASIC_ETHERNET The interface is in mode BASIC_ETHERNET. The interface is operated in Ethernet mode . |
| | | Managing node (MN) This mode can only be exited by resetting the controller. |
| | | Controlled node (CN) If POWERLINK communication is detected during this mode, the interface enters mode PRE_OPERATIONAL_1. |

Table: LED "S/E" - Interface state (interface in POWERLINK mode)

| LED "S/E" | | Description |
|--------------------------------|-----|--|
| Green | Red | |
| Single flash (approx. 1 Hz) | Off | <p>Mode: PRE_OPERATIONAL_1 The interface is in mode PRE_OPERATIONAL_1.</p> <p>Managing node (MN) The MN is in "reduced cycle" operation. The CNs are configured in this mode. Cyclic communication is not yet taking place.</p> <p>Controlled node (CN) The CN can be configured by the MN in this mode. The CN waits until it receives an SoC frame and then switches to mode PRE_OPERATIONAL_2.</p> |
| | On | <p>Controlled node (CN) If the red LED lights up in this mode, this means that the MN has failed.</p> |
| Double flash (approx. 1 Hz) | Off | <p>Mode: PRE_OPERATIONAL_2 The interface is in mode PRE_OPERATIONAL_2.</p> <p>Managing node (MN) The MN starts cyclic communication (cyclic input data is not yet evaluated). The CNs are configured in this mode.</p> <p>Controlled node (CN) The CN can be configured by the MN in this mode. A command then switches the mode to READY_TO_OPERATE.</p> |
| | On | <p>Controlled node (CN) If the red LED lights up in this mode, this means that the MN has failed.</p> |
| Triple flash (approx. 1 Hz) | Off | <p>Mode: READY_TO_OPERATE The interface is in mode READY_TO_OPERATE.</p> <p>Managing node (MN) Cyclic and asynchronous communication. Received PDO data is ignored.</p> <p>Controlled node (CN) The configuration of the CN is completed. Normal cyclic and asynchronous communication. The transmitted PDO data corresponds to the PDO mapping. However, cyclic data is not yet evaluated.</p> |
| | On | <p>Controlled node (CN) If the red LED lights up in this mode, this means that the MN has failed.</p> |
| On | Off | <p>Mode: OPERATIONAL The interface is in mode OPERATIONAL. PDO mapping is active and cyclic data is evaluated.</p> |
| Blinking (approx. 2.5 Hz) | Off | <p>Mode: STOPPED The interface is in mode STOPPED.</p> <p>Managing node (MN) This mode does not occur for the MN.</p> <p>Controlled node (CN) Output data is not being output, and no input data is being provided. This mode can only be reached and exited by a corresponding command from the MN.</p> |

Table: LED "S/E" - Interface state (interface in POWERLINK mode)

Blink times

9.12.2.5.1.2 System stop error codes

A system stop error can occur due to incorrect configuration or defective hardware.

The error code is indicated by LED "S/E" blinking red. The blinking signal of the error code consists of 4 switch-on phases with short (150 ms) or long (600 ms) duration. The error code is repeated every 2 seconds.

| Error | Error description |
|----------------|---|
| RAM error | The device is defective and must be replaced. |
| Hardware error | The device or a system component is defective and must be replaced. |

9.12.2.5.2 Slot X2

| Figure | LED | Color | Status | Description |
|---|--------|-------|--------|--|
|  | 1 - 14 | Green | | Input state of the corresponding digital input |

Table 227: LED status indicators on the integrated X2 I/O slot

9.12.2.5.3 Slot X3

| Figure | LED | Color | Status | Description |
|---|--------|--------|--------------|---|
|  | DC | Yellow | On | I/O power supply OK |
| | E | Red | Off | Everything OK |
| | | | Double flash | No power to module |
| | 1 - 4 | Yellow | | Output status of the corresponding digital output |
| | 5 - 8 | Yellow | | Input or output status of the corresponding digital input or output |
| | 9 - 12 | Yellow | | Output status of the corresponding high-speed digital output |

Table 228: LED status indicators on the integrated X3 I/O slot

9.12.2.6 Operating and connection elements

X20CP1301

X20CP1381 and X20CP1382

9.12.2.6.1 Button for reset and operating mode

9.12.2.6.1.1 Reset

The button must be pressed for less than 2 seconds to trigger a reset. This triggers a hardware reset on the CPU, which means that:

- All application programs are stopped.
- All outputs are set to zero.

The controller then boots into service mode by default. The startup mode that follows after pressing the reset button can be set in Automation Studio.

- Service mode (default)
- Warm restart
- Cold restart
- Diagnostic mode

9.12.2.6.1.2 Operating mode

3 operating modes can be configured using different button sequences:

| Operating mode | Button sequence | Description |
|---------------------------|---|---|
| BOOT ¹⁾ | Boot mode is enabled by the following button sequence: <ul style="list-style-type: none"> • Press the button for less than 2 seconds. As soon as the "R" LED on the X1 I/O slot is lit RED, the button can be released. • Then press the button within 2 seconds for longer than 2 seconds. As soon as the "R" LED is no longer lit, the button can be released. | The default Automation Runtime system is started and the runtime system can be installed via the online interface (Automation Studio). User flash memory is deleted only after the download begins. |
| SERVICE/RUN ¹⁾ | Press the button for less than 2 seconds. As soon as the "R" LED on the X1 I/O slot is lit RED , the button can be released. | Mode SERVICE/RUN: Triggering and startup behavior correspond to triggering a hardware reset (see "Reset" on page 1335). |
| DIAGNOSE ¹⁾ | Press the button for more than 2 seconds. The "R" LED on the X1 I/O slot lights up RED and then goes out. As soon as the "R" LED is no longer lit, the button can be released. | Boots the CPU in diagnostic mode. Program sections in User RAM and User FlashPROM are not initialized. After diagnostic mode, the CPU always boots with a cold restart. |

1) The operating states are described in Automation Help under "Real-time operating system - Method of operation - Operating states".

9.12.2.6.2 Flash drive

This application memory is implemented as an integrated flash drive.

9.12.2.6.3 Project installation

Project installation is described in Automation Help under "Project management / Project installation".

9.12.2.6.4 RS232 interface (IF1)

The non-electrically isolated RS232 interface is primarily intended to serve as an online interface for communication with the programming device. It is located on the X1 I/O slot.

Figure 123: RS232 interface (IF1) on the X1 I/O slot - Pinout

9.12.2.6.5 Ethernet interface (IF2)

The IF2 interface is designed for 10BASE-T / 100BASE-TX transmission.

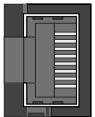

The INA2000 station number can be set using the Automation Studio software.

Information about cabling X20 modules with an Ethernet interface can be found in the module's download section at (www.br-automation.com).

Information:

The Ethernet interface (IF2) is not suitable for POWERLINK (see "POWERLINK interface (IF3)" on page 1337).

Pinout

| Interface | Pinout | | |
|--|--------|-------------|----------------|
| | Pin | Ethernet | |
|  Shielded RJ45 | 1 | TXD | Transmit data |
| | 2 | TXD\ | Transmit data\ |
| | 3 | RXD | Receive data |
| | 4 | Termination | |
| | 5 | Termination | |
| | 6 | RXD\ | Receive data\ |
| | 7 | Termination | |
| | 8 | Termination | |

9.12.2.6.6 POWERLINK interface (IF3)

Compact CPUs X20CP1381 and X20CP1382 are equipped with a POWERLINK V2 interface.

POWERLINK

By default, the POWERLINK interface is operated as a managing node (MN). In the managing node, the node number is set to a fixed value of 240.

If the POWERLINK node is operated as a controlled node (CN), a node number from 1 to 239 can be set in the POWERLINK configuration in Automation Studio.

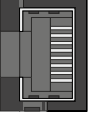

Ethernet mode

In this mode, the interface is operated as an Ethernet interface. The INA2000 station number is set using the B&R Automation Studio software.

Pinout

For information about wiring X20 modules with an Ethernet interface, see ["Cabling guidelines for X20 modules with an Ethernet cable"](#) on page 58.

| Interface | Pinout | | |
|--|--------|-------------|----------------|
| | Pin | Ethernet | |
|  Shielded RJ45 | 1 | RXD | Receive data |
| | 2 | RXD\ | Receive data\ |
| | 3 | TXD | Transmit data |
| | 4 | Termination | |
| | 5 | Termination | |
| | 6 | TXD\ | Transmit data\ |
| | 7 | Termination | |
| | 8 | Termination | |

9.12.2.6.7 USB interfaces (IF4 and IF5)

IF4 and IF5 are non-galvanically isolated USB interfaces. The abbreviation USB stands for "Universal Serial Bus". Both USB interfaces support the USB 1.1 and 2.0 standards.

Information:

USB peripheral devices can be connected to the USB interfaces. Due to the variety of USB devices available on the market, B&R cannot guarantee their functionality. The functionality of USB devices available from B&R is guaranteed.

Information:

- The USB interfaces cannot be used as online communication interfaces.
- Only devices isolated from GND are permitted to be connected to the USB interfaces.
- Current-carrying capacity is listed in the technical data.

Only interface IF4 is available on the entry level CPU.

9.12.2.6.8 CAN bus interface (IF7)

With the exception of the entry level CPU, all compact CPUs are equipped with a non-electrically isolated CAN bus interface. It is located on the X1 I/O slot.

9.12.2.6.8.1 Pinout

Figure 124: CAN bus interface (IF7) on the X1 I/O slot - Pinout

9.12.2.6.8.2 Terminating resistor

Figure 125: Switch positions for the CAN bus terminating resistor

A terminating resistor is already installed on the X1 I/O slot. It can be turned on and off with a switch on top of the housing. An active terminating resistor is indicated by the "T" LED.

9.12.2.6.9 Slot for interface modules

These CPUs are equipped with one slot for interface modules.

Various bus and network systems can easily be integrated into the X20 system by selecting the corresponding interface module.

9.12.2.6.10 Data and real-time clock retention

The CPUs do not use a battery. This makes them completely maintenance-free. The following measures make operation without a backup battery possible.

| Data and real-time clock retention | Backup type | Note |
|------------------------------------|---------------------|---|
| Remanent variables | FRAM | This FRAM stores its contents ferroelectrically. Unlike normal SRAM, this does not require a battery. |
| Real-time clock | Gold foil capacitor | The real-time clock is backed up for approx. 1000 hours @ 25°C by a gold foil capacitor. The gold foil capacitor is completely charged after 3 continuous hours of operation. |

9.12.2.7 CPU supply

A power supply is integrated in these compact CPUs. It has a feed for the CPU, X2X Link and the internal I/O power supply. The supply for the CPU and X2X Link is electrically isolated.

The connections are located on the X3 I/O slot.

Power supply concept of Compact CPUs

To ensure proper operation of compact CPUs, the following items must be taken into consideration:

| The supply concept | Description |
|-------------------------|--|
| CPU and I/O GND | The GND contact is provided 5 times on the terminal blocks of the integrated I/O slots. All GND contacts are connected to one another. The GND contacts of the CPU and I/O power supply therefore use the same voltage. |
| Plug-in X20 I/O modules | Supply of X20 I/O modules that can be connected to the compact CPU: <ul style="list-style-type: none"> X2X Link: Supplied by the CPU supply I/O channels: Supplied by the I/O power supply |
| Integrated X1 I/O slot | All digital and analog signals as well as the RS232 and CAN bus interface are supplied by the CPU supply. Their operation is therefore guaranteed even if there is no I/O power supply. |
| Integrated X2 I/O slot | <ul style="list-style-type: none"> All digital signals are supplied by the CPU supply. Their operation is therefore guaranteed even if there is no I/O power supply. The encoder supply is supplied by the I/O power supply. If the encoder is not to be connected to the E-stop chain, then it must be connected to an external power supply or it will be supplied by the CPU supply. |
| Integrated X3 I/O slot | <ul style="list-style-type: none"> All 12 digital signals are supplied by the I/O power supply. The status messages for each channel also work without an I/O power supply. This guarantees that status messages will continue to be transferred during an E-stop. The status of the I/O power supply is indicated by a separate status message. <p>Caution!</p> <p>Channels 5 to 8 are designed as mixed channels. If one of these channels is being used, it is absolutely essential to ensure that there is no external voltage present on the I/O channel when the I/O power supply is cut off. Otherwise, power will be regenerated back to the plus terminal of the I/O power supply via the I/O channel. This will result in defective components.</p> <p>The following solutions are available for preventing power regeneration from occurring:</p> <ul style="list-style-type: none"> The I/O power supply of the CPU is not permitted to be switched off, which allows the reference potential to be maintained. If the I/O power supply is switched off anyway (e.g. as part of the E-stop chain), then the sensor/actuator supplies must also be switched off. This prevents potential power regeneration and protects components from being destroyed. |

Pinout

Figure 126: Integrated power supply - Pinout

Connection example

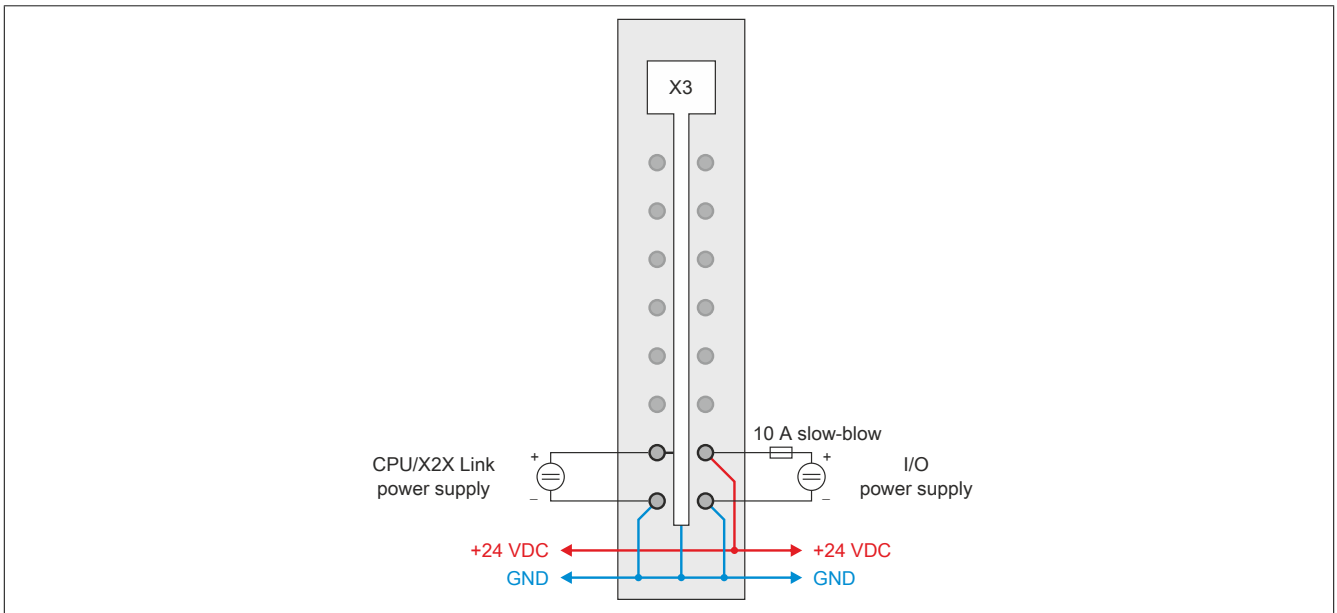

Figure 127: CPU supply - Connection example

9.12.2.8 Overtemperature cutoff

To prevent damage, a shutdown/reset is triggered on the CPU when the processor reaches 95°C.

The following errors are entered in the logbook in the event of shutdown:

| Error number | Short error text |
|--------------|--|
| 9204 | PLC restart triggered by the PLC CPU's temperature monitoring. |
| 9210 | Warning: Halt/Service after watchdog or manual reset. |

9.12.2.9 Local I/O channels

Compact CPUs are equipped with 3 integrated I/O slots. These devices have 30 digital inputs/outputs and 2 analog inputs.

Information about the functions of the high-speed digital inputs and outputs can be found in the section "[Functions of the high-speed digital inputs/outputs](#)" on page 1348.

The following table provides an overview of the connections to the I/O channels and their properties.

Digital inputs/outputs

| Connection | Terminal connection | Channel | Description |
|------------|---------------------|-------------|---|
| X1 | 14 | DI 1 | 24 VDC, sink, $\leq 200 \mu\text{s}$, configurable software filter |
| | 24 | DI 2 | 24 VDC, sink, $\leq 200 \mu\text{s}$, configurable software filter |
| | 15 | DI 3 | 24 VDC, sink, $\leq 200 \mu\text{s}$, configurable software filter |
| | 25 | DI 4 | 24 VDC, sink, $\leq 200 \mu\text{s}$, configurable software filter |
| X2 | 11 | DI 1 | 24 VDC, sink, $\leq 200 \mu\text{s}$, configurable software filter |
| | 21 | DI 2 | 24 VDC, sink, $\leq 200 \mu\text{s}$, configurable software filter |
| | ... | ... | ... |
| | 25 | DI 10 | 24 VDC, sink, $\leq 200 \mu\text{s}$, configurable software filter |
| | 16 | DI 11 | 24 VDC, sink, $\leq 2 \mu\text{s}$, configurable software filter |
| | 26 | DI 12 | 24 VDC, sink, $\leq 2 \mu\text{s}$, configurable software filter |
| | 17 | DI 13 | 24 VDC, sink, $\leq 2 \mu\text{s}$, configurable software filter |
| | 27 | DI 14 | 24 VDC, sink, $\leq 2 \mu\text{s}$, configurable software filter |
| X3 | 11 | DO 1 | 24 VDC, 0.5 A, source, $< 300 \mu\text{s}$ |
| | 21 | DO 2 | 24 VDC, 0.5 A, source, $< 300 \mu\text{s}$ |
| | 12 | DO 3 | 24 VDC, 0.5 A, source, $< 300 \mu\text{s}$ |
| | 22 | DO 4 | 24 VDC, 0.5 A, source, $< 300 \mu\text{s}$ |
| | 13 | DI 5 / DO 5 | DI: 24 VDC, sink, $\leq 200 \mu\text{s}$, configurable software filter DO: 24 VDC, 0.5 A, source, $< 300 \mu\text{s}$ |
| | 23 | DI 6 / DO 6 | DI: 24 VDC, sink, $\leq 200 \mu\text{s}$, configurable software filter DO: 24 VDC, 0.5 A, source, $< 300 \mu\text{s}$ |
| | 14 | DI 7 / DO 7 | DI: 24 VDC, sink, $\leq 200 \mu\text{s}$, configurable software filter DO: 24 VDC, 0.5 A, source, $< 300 \mu\text{s}$ |
| | 24 | DI 8 / DO 8 | DI: 24 VDC, sink, $\leq 200 \mu\text{s}$, configurable software filter DO: 24 VDC, 0.5 A, source, $< 300 \mu\text{s}$ |
| | 15 | DO 9 | 24 VDC, 0.2 A, push-pull, $< 3 \mu\text{s}$ |
| | 25 | DO 10 | 24 VDC, 0.2 A, push-pull, $< 3 \mu\text{s}$ |
| | 16 | DO 11 | 24 VDC, 0.2 A, push-pull, $< 3 \mu\text{s}$ |
| | 26 | DO 12 | 24 VDC, 0.2 A, push-pull, $< 3 \mu\text{s}$ |

Analog inputs

| Connection | Terminal connection | Channel | Description |
|------------|---------------------|---------|---|
| X1 | 11, 12, 13 | AI 1 | $\pm 10 \text{ V} / 0$ to 20 mA or 4 to 20 mA, 12-bit, 1 ms |
| | 21, 22, 23 | AI 2 | $\pm 10 \text{ V} / 0$ to 20 mA or 4 to 20 mA, 12-bit, 1 ms |

Analog input 1 can also be used for PT1000 resistance temperature measurement.

| Connection | Terminal connection | Channel | Description |
|------------|---------------------|---------|---|
| X1 | 11, 12, 13 | AI 1 | PT1000 resistance temperature measurement Measurement takes place using analog input A1. |

9.12.2.10 Pinouts

Slot X1

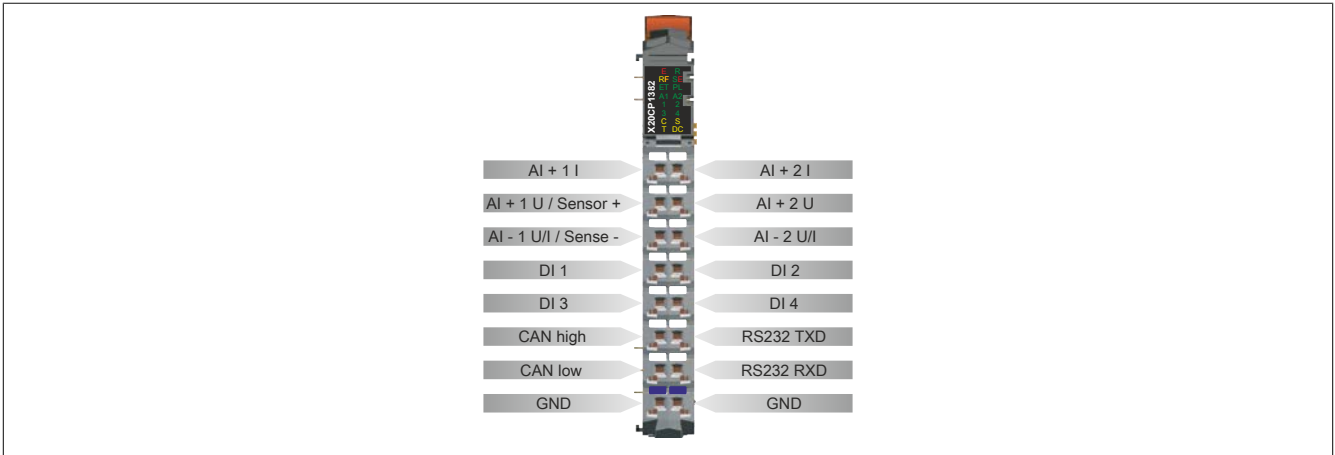

Figure 128: Pinout of the integrated X1 I/O slot

Slot X2

To prevent crosstalk, each signal line of the high-speed digital inputs should be shielded individually. The maximum cable length is 20 m.

Figure 129: Pinout of the integrated X2 I/O slot

Slot X3

To ensure proper operation of the digital mixed channels (DI 5 / DO 5 to DI 8 / DO 8), it is important to observe the notes in section "Power supply concept of Compact CPUs" on page 1340.

To prevent crosstalk, each signal line of the high-speed digital outputs should be shielded individually. The maximum cable length is 20 m.

9.12.2.12 Functions of the high-speed digital inputs/outputs

9.12.2.12.1 Functions of the high-speed digital inputs

Possible functions

The high-speed digital inputs DI 11 to DI 14 can be configured for the following functions: It is important to note that maximum 2 functions of the same type are possible with edge detection.

| Channel | Counter function | | | Edge detection ¹⁾ |
|---------|------------------|---|----------------------|--|
| DI 11 | Event counter 1 | A | A | D - Direction • Period measurement • Gate measurement • Differential time measurement • Edge counters • Edge times |
| DI 12 | | B | B | F - Frequency • Period measurement • Gate measurement • Differential time measurement • Edge counters • Edge times |
| DI 13 | Event counter 2 | A | R | R • Period measurement • Gate measurement • Differential time measurement • Edge counters • Edge times |
| DI 14 | | B | E - Reference enable | E - Reference enable • Period measurement • Gate measurement • Differential time measurement • Edge counters • Edge times |

Table 229: Possible functions of the high-speed digital inputs DI 11 to DI 14

1) Maximum 2 functions of the same type can be configured.

Please note

The following points must be taken into account to correctly configure the high-speed digital inputs:

- The counter functions are mutually exclusive. Only one type of counter function can be selected at a time. It is not possible to select 2 event counters (DI 11 and DI 13) at the same time together with an AB or DF counter (each on DI 13 and DI 14)!
- It is possible to select a counter function and edge detection at the same time.
- A position or counter latch is possible when configuring the high-speed inputs as a 2x event counter, ABR incremental encoder or DF function.

Examples of possible configurations

| Channel | Configuration 1 | Configuration 2 | Configuration 3 | Configuration 4 |
|---------|---|---------------------------------|----------------------|----------------------|
| DI 11 | Event counter 1 | • Edge counters • Edge times | A | D |
| DI 12 | • Period measurement • Gate measurement • Differential time measurement | • Edge counters • Edge times | B | F |
| DI 13 | Event counter 2 | A | R | R |
| DI 14 | • Period measurement • Gate measurement • Differential time measurement | B | E - Reference enable | E - Reference enable |

| Channel | Configuration 5 | Configuration 6 | Configuration 7 | Configuration 8 |
|---------|---|---|---|---|
| DI 11 | Event counter 1 | A | • Period measurement • Gate measurement • Differential time measurement | D - Direction |
| DI 12 | • Edge counters • Edge times | B | • Period measurement • Gate measurement • Differential time measurement | F - Frequency |
| DI 13 | Event counter 2 | • Period measurement • Gate measurement • Differential time measurement | • Edge counters • Edge times | • Edge counters • Edge times |
| DI 14 | • Period measurement • Gate measurement • Differential time measurement | • Edge counters • Edge times | • Edge counters • Edge times | • Period measurement • Gate measurement • Differential time measurement |

9.12.2.12.2 Functions of the high-speed digital outputs

Possible functions

The high-speed digital outputs DO 9 to DO 12 can be configured for the following functions:

| Channel | Function | |
|---------|------------------------------|---------------|
| DO 9 | PWM - Pulse width modulation | D - Direction |
| DO 10 | PWM - Pulse width modulation | F - Frequency |
| DO 11 | PWM - Pulse width modulation | D - Direction |
| DO 12 | PWM - Pulse width modulation | F - Frequency |

Table 230: Possible functions of the high-speed digital inputs DO 9 to DO 12

Examples of possible configurations

| Channel | Configuration 1 | Configuration 2 | Configuration 3 | Configuration 4 |
|---------|------------------------------|------------------------------|------------------------------|-----------------|
| DO 9 | PWM - Pulse width modulation | D - Direction | PWM - Pulse width modulation | D - Direction |
| DO 10 | PWM - Pulse width modulation | F - Frequency | PWM - Pulse width modulation | F - Frequency |
| DO 11 | D - Direction | PWM - Pulse width modulation | PWM - Pulse width modulation | D - Direction |
| DO 12 | F - Frequency | PWM - Pulse width modulation | PWM - Pulse width modulation | F - Frequency |

9.12.2.14 Switching frequency derating for high-speed digital outputs

The high-speed digital outputs can be switched with a frequency of max. 200 kHz. Derating may be necessary depending on the mounting orientation and operating temperature.

Switching frequency derating for horizontal mounting orientations

Figure 144: Switching frequency derating for high-speed digital outputs with horizontal mounting orientations

Switching frequency derating for vertical mounting orientations

Figure 145: Switching frequency derating for high-speed digital outputs with vertical mounting orientations

9.12.2.15 Switching inductive loads

Information:

If the maximum number of operating cycles per second is exceeded, an external inverse diode must be used.

Operating conditions outside of the area in the diagram are not permitted!

9.12.2.16 Register description

9.12.2.16.1 System requirements

The following minimum versions are recommended to generally be able to use all functions:

- Automation Studio 4.1.4.96
- Automation Runtime M4.10 for X20cCP1301
- Automation Runtime D4.09 for all other variants

9.12.2.16.2 General data points

This CPU is equipped with general data points. These are not CPU-specific; instead, they contain general information such as system time and heat sink temperature.

General data points are described in section "[General CPU data points](#)" on page 3792.

9.12.2.16.3 Register overview of the I/O data points on the integrated X1 I/O slot

| Register | Name | Data type | Read | | Write | |
|---------------------------|--------------------|-----------|--------|---------|--------|---------|
| | | | Cyclic | Acyclic | Cyclic | Acyclic |
| X1 - Configuration | | | | | | |
| 2048 | X1CfO_DI_Filter | USINT | | | | • |
| 2128 | X1CfO_AI_Mode | USINT | | | | • |
| 2112 | X1CfO_AI1_Filter | USINT | | | | • |
| 2116 | X1CfO_AI1_LowerLim | INT | | | | • |

| 0 | Digital inputs | USINT | • | | | |
| | DigitalInput01 | Bit 0 | | | | |
| | DigitalInput02 | Bit 1 | | | | |
| | DigitalInput03 | Bit 2 | | | | |
| | DigitalInput04 | Bit 3 | | | | |
| 64 | AnalogInput01 | INT | • | | | |
| | | UINT | • | | | |
| 66 | AnalogInput02 | INT | • | | | |
| 80 | StatusInput01 | USINT | • | | | |

9.12.2.16.3.1 Digital inputs

Unfiltered

The input status is recorded in a 100 µs cycle.

Filtered

The filtered status is transferred in a 100 µs cycle.

Filtering takes place asynchronously in an interval of 100 µs.

Digital input filter

Name:

X1CfO_DI_Filter

This register can be used to specify the filter value for all digital inputs.

The filter value can be configured in steps of 100 µs.

| Data type | Value | Filter |
|-----------|-------|---|
| USINT | 0 | No SW filter |
| | 1 | 0.1 ms |
| | ... | ... |
| | 250 | 25 ms - Higher values are limited to this value |

Input state of digital inputs 1 to 4

Name:

DigitalInput01 to DigitalInput04

This register indicates the input state of digital inputs 1 to 4.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|-----|----------------|--------|---------------------------------|
| 0 | DigitalInput01 | 0 or 1 | Input status of digital input 1 |
| ... | | ... | |
| 3 | DigitalInput04 | 0 or 1 | Input status of digital input 4 |

9.12.2.16.3.2 Analog inputs

Analog input values are recorded in a fixed interval. The time required for conversion/updating depends on the number of analog inputs and on the input signal:

| Input signal | Time required for conversion/updating |
|--|---------------------------------------|
| 1 current/voltage input | 100 µs |
| 1 temperature/resistance input | 200 µs |
| 2 current/voltage inputs | 200 µs |
| 1 current/voltage input and 1 temperature/resistance input | 400 µs |

Input values of analog inputs

Name:

AnalogInput01

The analog input value is mapped in this register depending on the configured operating mode.

| Data type | Value | Input signal |
|-----------|-----------------|---|
| INT | -32768 to 32767 | Voltage signal -10 to 10 VDC |
| | 0 to 32767 | Current signal 0 to 20 mA (with 0 to 20 mA configuration) |
| | -8192 to 32767 | Current signal 0 to 20 mA (with 4 to 20 mA configuration) |
| | -2000 to 8500 | PT1000 signal -200.0 to 850.0°C |
| UINT | 0 to 40000 | Resistance signal 0 to 4000.0 Ω |

Name:

AnalogInput02

The analog input value is mapped in this register depending on the configured operating mode.

| Data type | Value | Input signal |
|-----------|-----------------|---|
| INT | -32768 to 32767 | Voltage signal -10 to 10 VDC |
| | 0 to 32767 | Current signal 0 to 20 mA (with 0 to 20 mA configuration) |
| | -8192 to 32767 | Current signal 0 to 20 mA (with 4 to 20 mA configuration) |

Status of the inputs

Name:

StatusInput01

This register holds the status of the analog inputs. A change in the monitoring status generates an error message. The following states are monitored depending on the settings:

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|-------------|-------|-------------------------|
| 0 - 1 | Channel 1 | 00 | No error |
| | | 01 | Below lower limit value |
| | | 10 | Above upper limit value |
| | | 11 | Open circuit |
| 2 - 3 | Channel 2 | 00 | No error |
| | | 01 | Below lower limit value |
| | | 10 | Above upper limit value |
| | | 11 | Open circuit |
| 4 - 7 | Reserved | 0 | |

Limiting the analog value

In addition to the status information, the analog value is set to the limit values listed below by default when an error occurs (see "Limit values" on page 1362). The analog value is limited to the new values if the limit values were changed.

Input filter

The analog inputs are equipped with a configurable input filter.

Input ramp limiting

Input ramp limiting can only be performed in conjunction with filtering. Input ramp limiting is performed before filtering.

The difference of the input value change is checked for exceeding the specified limit. In the event of overshoot, the tracked input value is equal to the old value \pm the limit value.

Configurable limit values:

| Value | Limit value |
|-------|---|
| 0 | The input value is used without limitation. |
| 1 | 0x3FFF = 16383 |
| 2 | 0x1FFF = 8191 |
| 3 | 0x0FFF = 4095 |
| 4 | 0x07FF = 2047 |
| 5 | 0x03FF = 1023 |
| 6 | 0x01FF = 511 |
| 7 | 0x00FF = 255 |

Input ramp limiting is well suited for suppressing disturbances (spikes). The following examples show the functionality of input ramp limiting based on an input step and a disturbance.

Example 1

The input value jumps from 8000 to 17000. The diagram shows the tracked input value with the following settings:

Input ramp limiting = 4 = 0x07FF = 2047

Filter level = 2

Figure 146: Tracked input value for input step

Example 2

A disturbance interferes with the input value. The diagram shows the tracked input value with the following settings:

Input ramp limiting = 4 = 0x07FF = 2047

Filter level = 2

Figure 147: Tracked input value for disturbance

Filter level

A filter can be defined to prevent large input jumps. This filter is used to bring the input value closer to the actual analog value over a period of several bus cycles.

Filtering takes place after input ramp limitation.

Formula for calculating the input value:

$$\text{Value}_{\text{New}} = \text{Value}_{\text{Old}} - \frac{\text{Value}_{\text{Old}}}{\text{Filter level}} + \frac{\text{Input value}}{\text{Filter level}}$$

Adjustable filter levels:

| Value | Filter level |
|-------|---------------------|
| 0 | Filter switched off |
| 1 | Filter level 2 |
| 2 | Filter level 4 |
| 3 | Filter level 8 |
| 4 | Filter level 16 |
| 5 | Filter level 32 |
| 6 | Filter level 64 |
| 7 | Filter level 128 |

The following examples show how filtering works in the event of an input jump or disturbance.

Example 1

The input value jumps from 8000 to 16000. The diagram shows the calculated value with the following settings:

Input ramp limiting = 0

Filter level = 2 or 4

Figure 148: Calculated value during input step

Example 2

A disturbance interferes with the input value. The diagram shows the calculated value with the following settings:

Input ramp limiting = 0

Filter level = 2 or 4

Figure 149: Calculated value during disturbance

Configuring the input filter

Name:

X1CfO_AI1_Filter

X1CfO_AI2_Filter

This register is used to define the filter level and input ramp limitation of the input filter.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|-----------------------------|-------|--|
| 0 - 2 | Defines the filter level | 000 | Filter disabled (bus controller default setting) |
| | | 001 | Filter level 2 |
| | | 010 | Filter level 4 |
| | | 011 | Filter level 8 |
| | | 100 | Filter level 16 |
| | | 101 | Filter level 32 |
| | | 110 | Filter level 64 |
| | | 111 | Filter level 128 |
| 3 | Reserved | 0 | |
| 4 - 6 | Defines input ramp limiting | 000 | The input value is applied without limitation (bus controller default setting) |
| | | 001 | Limit value = 0x3FFF (16383) |
| | | 010 | Limit value = 0x1FFF (8191) |
| | | 011 | Limit value = 0x0FFF (4095) |
| | | 100 | Limit value = 0x07FF (2047) |
| | | 101 | Limit value = 0x03FF (1023) |
| | | 110 | Limit value = 0x01FF (511) |
| | | 111 | Limit value = 0x00FF (255) |
| 7 | Reserved | 0 | |

Channel type

Name:

X1CfO_AI_Mode

This register defines the type and range of signal measurement.

Each channel is capable of handling current, voltage or resistance signals. This differentiation is made using different terminal connections and an integrated switch. The switch is automatically activated depending on the specified configuration. The following input signals can be set:

| Input signal | On channel |
|--------------------------------|------------|
| ±10 V voltage signal (default) | 1 and 2 |
| 0 to 20 mA current signal | 1 and 2 |
| 4 to 20 mA current signal | 1 and 2 |
| PT1000 measurement | 1 |
| Resistance measurement | 1 |

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|--------------------------|-------|---------------------------|
| 0 - 2 | Analog input - Channel 1 | 000 | Channel switched off |
| | | 001 | ±10 V voltage signal |
| | | 010 | 0 to 20 mA current signal |
| | | 011 | 4 to 20 mA current signal |
| | | 100 | PT1000 measurement |
| | | 101 | Resistance measurement |
| 3 | Reserved | 0 | |
| 4 - 5 | Analog input - Channel 2 | 00 | Channel switched off |
| | | 01 | ±10 V voltage signal |
| | | 10 | 0 to 20 mA current signal |
| | | 11 | 4 to 20 mA current signal |
| 6 - 7 | Reserved | 0 | |

Limit values

The input signal is monitored at the upper and lower limit values. By default the following limits are set for each mode:

| Limit value (default) | Voltage signal ± 10 V | | Current signal 0 to 20 mA | | Current signal 4 to 20 mA | |
|---------------------------|---------------------------|-----------------|---------------------------|-----------------|---------------------------|-----------------|
| Upper maximum limit value | 10 V | 32767 (0x7FFF) | 20 mA | 32767 (0x7FFF) | 20 mA | 32767 (0x7FFF) |
| Lower minimum limit value | -10 V | -32767 (0x8001) | 0 mA | 0 ¹⁾ | 4 mA | 0 ²⁾ |

Table 231: Limit values for voltage and current signals

- 1) The analog value is limited down to 0.
- 2) Due to the default limit value, the analog value is limited to a minimum of 0 at currents <4 mA.

| Limit value (default) | Temperature measurement | | Resistance measurement | |
|---------------------------|-------------------------|----------------|------------------------|----------------|
| Upper maximum limit value | 800.0°C | 8000 (0x1F40) | 4000.0 Ω | 32767 (0x7FFF) |
| Lower minimum limit value | -200.0°C | -2000 (0xF830) | 0 Ω | 0 |

Table 232: Limit values for temperature and resistance measurement

Other limit values can be defined if necessary. These are activated automatically by writing the limit value register (see "[Lower limit value](#)" on page 1362 and "[Upper limit value](#)" on page 1362). From this point on, the analog values will be monitored and limited according to the new limits. The results of monitoring are displayed in the status register (see "[Status of the inputs](#)" on page 1357).

Application example of setting limit values

A negative limit value must be configured in order to measure values <4 mA with a current signal of 4 to 20 mA: 0 mA corresponds to the value -8192 (0xE000).

Lower limit value

Name:

X1CfO_AI1_LowerLim

X1CfO_AI2_LowerLim

These registers can be used to configure the lower limit value for analog values. If the analog value goes below the limit value, it is frozen at this value and the corresponding error status bit is set (see "[Status of the inputs](#)" on page 1357).

| Data type | Value |
|-----------|-----------------|
| INT | -32768 to 32767 |
| UINT | 0 to 65535 |

Information:

When configured as 4 to 20 mA, this value can be set to -8192 (corresponds to 0 mA) in order to display values <4 mA.

Upper limit value

Name:

X1CfO_AI1_UpperLim

X1CfO_AI2_UpperLim

These registers can be used to configure the upper limit value for analog values. If the analog value goes above the limit value, it is frozen at this value and the corresponding error status bit is set (see "[Status of the inputs](#)" on page 1357).

| Data type | Value |
|-----------|------------|
| INT | 0 to 32767 |
| UINT | 0 to 65535 |

9.12.2.16.4 Register overview of the I/O data points on the integrated X2 I/O slot

9.12.2.16.4.1 Digital inputs**Unfiltered**

The input status is recorded in a 100 µs cycle.

Filtered

The filtered status is transferred in a 100 µs cycle.

Filtering takes place asynchronously in an interval of 100 µs.

Digital input filter

Name:

X2CfO_DI_Filter

This register can be used to specify the filter value for all digital inputs.

The filter value can be configured in steps of 100 µs.

| Data type | Value | Filter |
|-----------|-------|---|
| USINT | 0 | No SW filter |
| | 1 | 0.1 ms |
| | ... | ... |
| | 250 | 25 ms - Higher values are limited to this value |

Input state of digital inputs 1 to 14

Name:

DigitalInput01 to DigitalInput14

These registers are used to indicate the input state of digital inputs 1 to 14.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure of register 4096:

| Bit | Name | Value | Information |
|-----|----------------|--------|---------------------------------|
| 0 | DigitalInput01 | 0 or 1 | Input status of digital input 1 |
| ... | ... | ... | ... |
| 7 | DigitalInput08 | 0 or 1 | Input status of digital input 8 |

Bit structure of register 4097:

| Bit | Name | Value | Information |
|-----|----------------|--------|----------------------------------|
| 0 | DigitalInput09 | 0 or 1 | Input status of digital input 9 |
| ... | ... | ... | ... |
| 5 | DigitalInput14 | 0 or 1 | Input status of digital input 14 |

9.12.2.16.4.2 Edge detection

Digital inputs 11 to 14 can be used for high-speed edge detection. This runs parallel to all other functions such as counters, etc. This function does not use the digital input filter.

The edge detection function measures edges with μs precision. 2 units are available. A master and a slave edge can be configured for each unit. At each master edge, the timestamp of the master edge and the differential time to the previous slave edge (if present) are logged. A "Master count" can always be utilized to determine how many edges have been detected since the last task class cycle. The timestamp is based on the system time of the CPU.

The combination of rising/falling edges of each channel can be used to configure the following functions for each unit:

| Function | Description |
|-----------------|---|
| Edge time | Measure an edge time |
| Period duration | Measure the master and differential time |
| Gate time | Measure the master and differential time |
| Time offset | Measure the master and differential time of edges on different channels |

Edge detection unit - Mode settings

The edge detection unit needs to be configured according to the desired function.

| Function | Description |
|--|---|
| Basic timestamp, master edge mode | The current system time is saved as the master time at the time of the edge. |
| Timestamp and/or differential time, master and slave edge mode | The slave edge starts the measurement and the system time is saved temporarily. When the master edge occurs, the current system time is saved as the master time and the difference between the master and slave edges is calculated. |

Name:

X2CfO_EdgeDetectUnit01Mode

X2CfO_EdgeDetectUnit02Mode

These registers are used to configure the mode of the basic function for either just the master edge or both master and slave edges.

| Data type | Value | Information |
|-----------|-------|---|
| USINT | 0x00 | Edge detection disabled on Unit0x: Time measurement not possible |
| | 0x80 | Edge detection enabled on Unit0x: Reaction only possible for master edge, no differential measurement possible |
| | 0xC0 | Edge detection enabled on Unit0x: Reaction possible for configured master and slave edges |

Edge detection unit - Selection of master edge

Name:

X2CfO_EdgeDetectUnit01Master

X2CfO_EdgeDetectUnit02Master

These registers are used to select the source of the master edge for the respective unit. Either the rising or falling edge of one of the 4 high-speed digital input channels can be selected. Only one edge can be selected for each unit.

| Data type | Value | Information |
|-----------|-------|--|
| USINT | 0 | Digital input channel 11: Rising edge |
| | 2 | Digital input channel 12: Rising edge |
| | 4 | Digital input channel 13: Rising edge |
| | 6 | Digital input channel 14: Rising edge |
| | 1 | Digital input channel 11: Falling edge |
| | 3 | Digital input channel 12: Falling edge |
| | 5 | Digital input channel 13: Falling edge |
| | 7 | Digital input channel 14: Falling edge |

Edge detection unit - Selection of slave edge

Name:

X2CfO_EdgeDetectUnit01Slave

X2CfO_EdgeDetectUnit02Slave

These registers are used to select the source of the slave edge for the respective unit. Either the rising or falling edge of one of the 4 high-speed digital input channels can be selected. Only one edge can be selected for each unit.

| Data type | Value | Information |
|-----------|-------|--|
| USINT | 0 | Digital input channel 11: Rising edge |
| | 2 | Digital input channel 12: Rising edge |
| | 4 | Digital input channel 13: Rising edge |
| | 6 | Digital input channel 14: Rising edge |
| | 1 | Digital input channel 11: Falling edge |
| | 3 | Digital input channel 12: Falling edge |
| | 5 | Digital input channel 13: Falling edge |
| | 7 | Digital input channel 14: Falling edge |

Edge detection unit - Master edge counter

Name:

EdgeDetect01Mastercount

EdgeDetect02Mastercount

These registers hold the counter values of the detected master edges. The counter value is used to detect new measurements.

| Data type | Value | Information |
|-----------|-----------------|--|
| INT | -32768 to 32767 | Running counter: Number of detected master edges |

Edge detection unit - Master edge timestamp

Name:

EdgeDetect01Mastertime

EdgeDetect02Mastertime

The exact CPU system time of the respective unit is saved to these registers when a master edge occurs. If multiple master edges occur within a single cycle (task class), then the time of the last edge is shown.

| Data type | Value | Information |
|-----------|---------------------------------|---|
| DINT | -2,147,483,648 to 2,147,483,647 | CPU system time of master edge [μ s] |

Edge detection unit - Time difference

Name:

EdgeDetect01Difference

EdgeDetect02Difference

The difference between the master edge and the slave edge of the respective unit is saved to these registers. If multiple measurement periods are completed within a single cycle (task class), then the time difference from the last period is shown.

| Data type | Value | Information |
|-----------|---------------------------------|---|
| DINT | -2,147,483,648 to 2,147,483,647 | Time difference between master edge and slave edge [μ s] |

9.12.2.16.4.3 Counter functions

High-speed digital inputs 11 to 14 can be used for counter functions. This function does not use the digital input filter. The following functions are available. Only one of these basic configurations can be enabled at a time:

- 2x event counter with latch function
- 2x AB incremental counter without latch function
- DF counter function
- ABR counter function

Configuring the counter function

The following counter functions can be configured:

| Counter function | Description |
|--|--|
| 2x event counter with latch function | Input 11 for event counter 1 and input 13 for event counter 2 can be used simultaneously as event counters. Both rising and falling edges are counted. The latch function of all 4 inputs can be used. |
| 2x AB incremental counter without latch function | Inputs 11 and 12 as AB counter 1 and inputs 13 and 14 as AB counter 2. Since no more high-speed inputs are available, the latch function is not available. |
| DF counter: Direction/Frequency with latch function | The D, F and R signals are linked to inputs 11, 12 and 13. Signal D defines the positive (Level = 0) or negative (Level = 1) counting direction. The latch function of all 4 inputs can be used. |
| ABR counter with latch function | The A, B and R signals are linked to inputs 11, 12 and 13. The latch function of all 4 inputs can be used. |

Name:

X2CfO_CounterMode

This register configures the counter function:

| Data type | Value | Information |
|-----------|-------|--|
| USINT | 0 | 2x event counter with latch function |
| | 1 | 2x AB incremental counter without latch function |
| | 2 | DF counter with latch function |
| | 3 | ABR counter with latch function |

Configuring the mode of the latch function

Name:

X2CfO_Latch01Mode

X2CfO_Latch02Mode

This register sets the mode of the latch function. The following latch functions can be configured:

| Latch function | Description |
|------------------------|--|
| Single shot latch mode | The latch function must be enabled/set. After a successful latch procedure the function must first be reset. Then it can be enabled again. |
| Continuous latch mode | The latch function only has to be enabled/set as long as latching is desired. |

A changed counter value on "LatchCount" indicates that the latch procedure has been performed (see "[Counter value of latch events](#)" on page 1369). The counter value is stored in the latch register (see "[Latched counter value](#)" on page 1369).

| Data type | Value | Information |
|-----------|-------|------------------------|
| USINT | 0 | Single shot latch mode |
| | 1 | Continuous latch mode |

Configuring the latch signals

Name:

X2CfO_Latch01Comparator

X2CfO_Latch02Comparator

This register defines the inputs and their level for triggering the latch procedure.

- This defines which inputs are linked to generate the latch event. All 4 digital input signals can be used for an "AND" connection.
- The "active voltage level" needed for the latch procedure can be defined to adjust for the physical signals. It is not possible to configure a high and low level at the same time.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Value | Information |
|-----|-------|--|
| 0 | 0 | Input 11 high level disabled |
| | 1 | Input 11 high level enabled for comparator |
| 1 | 0 | Input 12 high level disabled |
| | 1 | Input 12 high level enabled for comparator |
| 2 | 0 | Input 13 high level disabled |
| | 1 | Input 13 high level enabled for comparator |
| 3 | 0 | Input 14 high level disabled |
| | 1 | Input 14 high level enabled for comparator |
| 4 | 0 | Input 11 low level disabled |
| | 1 | Input 11 low level enabled for comparator |
| 5 | 0 | Input 12 low level disabled |
| | 1 | Input 12 low level enabled for comparator |
| 6 | 0 | Input 13 low level disabled |
| | 1 | Input 13 low level enabled for comparator |
| 7 | 0 | Input 14 low level disabled |
| | 1 | Input 14 low level enabled for comparator |

Clear counter value and enable/disable latch function

Name:

Counter01Reset

Counter02Reset

Latch01Enable

Latch02Enable

The respective bits in these registers clear the counter value or start the latch procedure.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|----------------|-------|--------------------------|
| 0 | Counter0xReset | 0 | Do not reset the counter |
| | | 1 | Reset the counter |
| 1 | Latch0xEnable | 0 | Do not latch the counter |
| | | 1 | Latch the counter |
| 2 - 7 | Reserved | 0 | |

Counter value

Name:

Counter01Value

Counter02Value

The current counter values are saved in these registers.

| Data type | Value | Information |
|-----------|---------------------------------|-----------------------|
| DINT | -2,147,483,648 to 2,147,483,647 | Current counter value |

Latched counter value

Name:

Counter01Latch

Counter02Latch

As soon as the latch conditions have been met, the value of the respective counter is copied to these registers.

| Data type | Value | Information |
|-----------|---------------------------------|-----------------------|
| DINT | -2,147,483,648 to 2,147,483,647 | Latched counter value |

Counter value of latch events

Name:

Latch01Count

Latch02Count

These registers hold the counter values of the latch events. This allows detection of whether a new latched counter value has been saved.

| Data type | Value | Information |
|-----------|-------------|--|
| SINT | -128 to 127 | Running counter: Number of detected latch events |

Timestamp of last counter change

Name:

Counter01TimeChanged

Counter02TimeChanged

The CPU system time at the time of the last change to the counter value is saved in these registers.

| Data type | Value | Information |
|-----------|---------------------------------|---|
| DINT | -2,147,483,648 to 2,147,483,647 | The CPU system time at the time of the last change to the counter value |

Timestamp of last valid counter value

Name:

Counter01TimeValid

Counter02TimeValid

The CPU system time at the time of the last valid counter value is saved in these registers.

| Data type | Value | Information |
|-----------|---------------------------------|--|
| DINT | -2,147,483,648 to 2,147,483,647 | CPU system time of current counter value |

9.12.2.16.5 Register overview of the I/O data points on the integrated X3 I/O slot

| Register | Name | Data type | Read | | Write | |

9.12.2.16.5.1 Physical configuration of I/O channels

These registers are used to define the functionality of the channels. Depending on the desired configuration, the following assignments can be made with respect to the existing software and hardware:

- A physical configuration as input or output for mixed channels
- An explicit assignment as direct I/O channel: i.e. digital input or digital output
- An explicit assignment as PWM output
- An explicit assignment as D or F movement output

Physical configuration

Name:

X3CfO_PhyIOConfigCh01 to X3CfO_PhyIOConfigCh12

These registers are used to configure the functionality of the channels.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

Name:

X3CfO_PhyIOConfigCh01 to X3CfO_PhyIOConfigCh04

Channels 1 to 4 are digital outputs and can only be used as direct I/O channel.

| Bit | Description | Value | Information |
|-------|-------------|-------|--------------------------------|
| 0 - 7 | | 0 | Direct I/O operation of output |

Name:

X3CfO_PhyIOConfigCh05 to X3CfO_PhyIOConfigCh08

Channels 5 to 8 are digital mixed channels and can be configured as either input or output.

| Bit | Description | Value | Information |
|-------|-------------|-------|--------------------------------|
| 0 - 1 | | 00 | Configured as digital output |
| | | 01 | Reserved |
| | | 10 | Reserved |
| | | 11 | Configured as digital input |
| 2 - 7 | | 0 | Direct I/O operation of output |

Name:

X3CfO_PhyIOConfigCh09 to X3CfO_PhyIOConfigCh12

Channels 9 to 12 are high-speed digital outputs and can be configured as direct I/O, PWM or movement channels.

| Bit | Description | Value | Information |
|-------|-------------|-------|---------------------------------|
| 0 - 3 | Reserved | 0 | |
| 4 - 5 | | 00 | Direct I/O operation of output |
| | | 01 | Output operated as PWM |
| | | 10 | Reserved |
| | | 11 | Output operated as D/F movement |
| 6 - 7 | Reserved | 0 | |

9.12.2.16.5.2 Monitoring of the I/O power supply voltage

Name:

StatusInput01

The state of the I/O supply voltage is indicated in this register.

| Data type | Values | Information |
|-----------|--------|--|
| USINT | 0 | I/O power supply voltage within permissible range |
| | 1 | I/O power supply voltage not connected or outside of the permissible range |

9.12.2.16.5.3 Digital inputs**Unfiltered**

The input status is recorded in a 100 µs cycle.

Filtered

The filtered status is transferred in a 100 µs cycle.

Filtering takes place asynchronously in an interval of 100 µs.

Digital input filter

Name:

X3CfO_DI_Filter

This register can be used to specify the filter value for all digital inputs.

The filter value can be configured in steps of 100 µs.

| Data type | Value | Filter |
|-----------|-------|---|
| USINT | 0 | No SW filter |
| | 1 | 0.1 ms |
| | ... | ... |
| | 250 | 25 ms - Higher values are limited to this value |

Input state of digital inputs 5 to 8

Name:

DigitalInput05 to DigitalInput08

This register indicates the input state of digital inputs 5 to 8.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|-----|----------------|--------|---------------------------------|
| 0 | DigitalInput05 | 0 or 1 | Input status of digital input 5 |
| ... | | ... | |
| 3 | DigitalInput08 | 0 or 1 | Input status of digital input 8 |

9.12.2.16.5.4 Digital outputs

The output status is processed in a 100 µs cycle.

Switching state of digital outputs 1 to 12

Name:

DigitalOutput01 to DigitalOutput12

These registers are used to store the switching state of digital outputs 1 to 12.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

Register 8208:

| Bit | Description | Value | Information |
|-----|-----------------|-------|------------------------|
| 0 | DigitalOutput01 | 0 | Digital output 1 reset |
| | | 1 | Digital output 1 set |
| ... | | ... | |
| 7 | DigitalOutput08 | 0 | Digital output 8 reset |
| | | 1 | Digital output 8 set |

Register 8209:

| Bit | Description | Value | Information |
|-----|-----------------|-------|-------------------------|
| 0 | DigitalOutput09 | 0 | Digital output 9 reset |
| | | 1 | Digital output 9 set |
| ... | | ... | |
| 3 | DigitalOutput12 | 0 | Digital output 12 reset |
| | | 1 | Digital output 12 set |

9.12.2.16.5.5 Monitoring status of the digital outputs

The error states of the outputs must be programmed in the application. The status information that is read is the actual voltage state on the channel (set or reset). The error state is therefore determined by a difference between the data points "DigitalOutputxx" and the corresponding "StatusDigitalOutputxx".

At least 3 system ticks are needed internally to read the output status. This is the reason for the delay after which the earliest possible comparison can be made after a change in the status of the output.

The digital input filter is not applied to this status information.

Status of digital outputs 1 to 12

Name:

StatusDigitalOutput01 to StatusDigitalOutput12

These registers are used to indicate the status of digital outputs 1 to 12.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

Register 8193:

| Bit | Description | Value | Information |
|-----|-----------------------|-------|---|
| 0 | StatusDigitalOutput01 | 0 | Channel 1: Digital output reset or short circuit |
| | | 1 | Channel 1: Digital output set or voltage feedback |
| ... | | ... | |
| 7 | StatusDigitalOutput08 | 0 | Channel 8: Digital output reset or short circuit |
| | | 1 | Channel 8: Digital output set or voltage feedback |

Register 8194:

| Bit | Description | Value | Information |
|-----|-----------------------|-------|--|
| 0 | StatusDigitalOutput09 | 0 | Channel 9: Digital output reset or short circuit |
| | | 1 | Channel 9: Digital output set or voltage feedback |
| ... | | ... | |
| 3 | StatusDigitalOutput12 | 0 | Channel 12: Digital output reset or short circuit |
| | | 1 | Channel 12: Digital output set or voltage feedback |

9.12.2.16.5.6 Pulse width modulation (PWM) function

Digital inputs 9 to 12 can be configured as PWM outputs. 2 data points are available per channel for controlling the PWM signal.

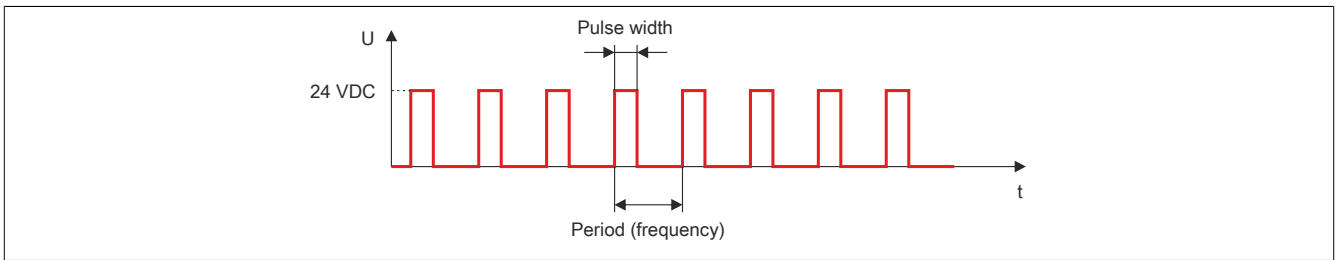

Figure 150: The PWM signal is controlled by setting the pulse width and period duration

Period duration of the PWM outputs

Name:

PWMPeriod09 to PWMPeriod12

These registers are used to define the duration of the period duration, i.e. the time base for the respective PWM output. This time represents the 100% value, which can be resolved to 0.1% through the duty cycle.

| Data type | Value | Information |
|-----------|------------|--|
| UINT | 5 to 65535 | Period duration, between 5 and 65535 μ s: Corresponds to a frequency of 200 kHz to \approx 15 Hz |

Duty cycle of the PWM outputs

Name:

PWMOutput09 to PWMOutput12

These registers output the duty cycle of the respective PWM output in a resolution of 0.1% of the period duration.

| Data type | Value | Information |
|-----------|-----------|---|
| INT | 0 to 1000 | Duty cycle of the output in 0 to 100.0% |

Example: Period duration T [μ s] with a duty cycle of 25% equals a duty time of t_1 [μ s].

Figure 151: Switch-on time depending on the period duration and duty cycle

9.12.2.16.5.7 DF movement generator function

Digital output channels 9 to 12 can be configured as 2 independently functioning movement generators (Direction/Frequency) for stepper motor control. The movement generators are assigned to the following channels:

| Movement generator | Channel | Function |
|--------------------|---------|--------------|
| 1 | DO 9 | D: Direction |
| | DO 10 | F: Frequency |
| 2 | DO 11 | D: Direction |
| | DO 12 | F: Frequency |

The frequency is output via the respective F channel, and the direction is output via the respective D channel. The switchover between directions (movement/counter) takes place via the sign of the speed setpoint.

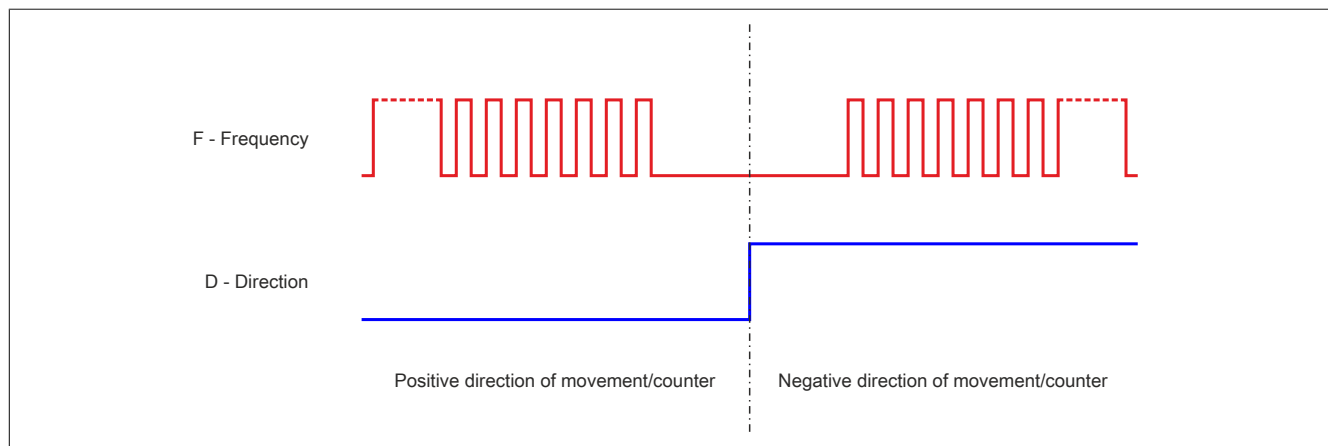

Figure 152: Frequency output via F channel, direction output via D channel

The respective output must be configured correctly in order to completely process the motion function (see ["Physical configuration" on page 1371](#)).

The data points described below are available for configuring and controlling the respective movements.

Configuring the movement mode

Name:

X3Cfo_Mov01Mode

X3Cfo_Mov02Mode

These registers are used to configure how the speed setpoint is interpreted. The difference between the two modes is whether edges or periods are output for each increment of the setpoint.

| Data type | Value | Information |
|-----------|-------|---|
| USINT | 0 | Edge mode: Each increment generates an edge on the output |
| | 1 | Pulse mode: Each increment generates a period on the output |

Edge mode

4 increments of the speed setpoint correspond to 2 periods on the output:

Figure 153: Interpretation of the speed setpoint with edge output for each increment

Pulse mode

2 increments of the speed setpoint correspond to 2 periods on the output:

Figure 154: Interpretation of the speed setpoint with period output for each increment

Configuring the maximum speed of the movement

The maximum speed or output frequency of the movement is configured in order to protect the digital output, the actuator/drive being controlled and/or the mechanical system.

Name:

X3Cfo_Mov01SpeedLimit

X3Cfo_Mov02SpeedLimit

These registers are used to configure the maximum speed / output frequency permitted in the system. It is important that the limit values for edge and pulse mode are different.

Edge mode

| Data type | Value | Information |
|-----------|--------------|-------------------------------|
| UDINT | 10 to 400000 | Speed [increments per second] |

Pulse mode

| Data type | Value | Information |
|-----------|-------------|-------------------------------|
| UDINT | 5 to 200000 | Speed [increments per second] |

Activates the movement

When a movement is active, the two channels are operated according to the preset values.

Name:

Mov01Enable

Mov02Enable

These registers are used to enable or disable the motion function.

Mov01Enable

| Data type | Value | Information |
|-----------|-------|---|
| USINT | 0 | Movement 1 disabled |
| | 2 | Movement 1 enabled: The speed setpoint is evaluated |

Mov02Enable

| Data type | Value | Information |
|-----------|-------|---|
| USINT | 0 | Movement 2 disabled |
| | 4 | Movement 2 enabled: The speed setpoint is evaluated |

Speed and direction control of the movement

The following parameters are important for speed and direction control of the movement:

| Characteristic value | Description |
|----------------------------------|---|
| Speed control | The predefined speed is specified as a percentage of the configured maximum speed. 0 to ± 32767 correspond to 0 to $\pm 100\%$ of the configured maximum speed |
| Direction control | The direction of movement is defined by the sign of the speed setpoint: 0 to +32767 correspond to 0 to the maximum speed in the positive direction of movement 0 to -32767 correspond to 0 to the maximum speed in the negative direction of movement |
| Resolution of the speed setpoint | The resolution of the speed setpoint is: $\text{Maximum speed} / 32767$ |
| Relationship: Speed / Frequency | The relationship between speed and output frequency is: $(\text{Speed setpoint} / \text{Maximum speed}) * 32767$ |

Table 233: Parameters for speed and direction control of the movement

Name:

Mov01Speed

Mov02Speed

These registers are used to set the speed of the movement.

| Data type | Value | Information |
|-----------|-------------|--|
| INT | 0 to 32767 | Speed setpoint 0 to 100%: Movement output F = 0 to maximum speed Positive direction of movement: Movement output D = 0 |
| | 0 to -32767 | Speed setpoint 0 to 100%: Movement output F = 0 to maximum speed Negative direction of movement: Movement output D = 1 |

Position feedback for movement

The position feedback is represented by a fixed point value [16.16]:

- HighWord = whole number increments
- LowWord = positions after the decimal of the increments

Name:

Mov01Position

Mov02Position

These registers show the current position of the movement.

| Data type | Value | Information |
|-----------|---------------------------------|--|
| DINT | -2,147,483,648 to 2,147,483,647 | Position value in fixed point format [16.16] |

9.12.3 X20CP1483 and X20CP1483-1

Data sheet version: 2.37

9.12.3.1 General information

The x86 100 MHz-compatible X20CP1483 is the entry-level X20 CPU. With an optimal price/performance ratio, it has the same basic features as the larger CPUs and offers sufficient performance for most standard applications.

USB and Ethernet are included in every CPU. In addition, every CPU has a POWERLINK connection for real-time communication.

In addition, a multi-purpose slot is provided for an additional interface module.

- Intel x86 100 MHz-compatible with additional I/O processor
- Onboard Ethernet, POWERLINK V1/V2 and USB
- Modular expansion of interfaces
- CompactFlash as removable application memory
- Fanless

9.12.3.2 Order data - X20CP148x

|  | |
|--|---|
| Model number | Short description |
| | X20 CPUs |
| X20CP1483 | X20 CPU, x86 100 MHz Intel compatible, 32 MB DRAM, 128 kB SRAM, removable application memory: CompactFlash, 1 insert slot for X20 interface modules, 2 USB interfaces, 1 RS232 interface, 1 Ethernet interface 10/100BASE-T, 1 POWERLINK interface, including power supply module, 1x terminal block X20TB12, slot cover and X20 end cover plate X20AC0SR1 (right) included, order application memory separately! |
| X20CP1483-1 | X20 CPU, x86 100 MHz Intel compatible, 64 MB DRAM, 128 kB SRAM, removable application memory: CompactFlash, 1 insert slot for X20 interface modules, 2 USB interfaces, 1 RS232 interface, 1 Ethernet interface 10/100BASE-T, 1 POWERLINK interface, including power supply module, 1x terminal block X20TB12, slot cover and X20 end cover plate X20AC0SR1 (right) included, order application memory separately! |

Table 236: X20CP1483, X20CP1483-1 - Technical data

- 1) The specified values are maximum values. For examples of the exact calculation, see section "Mechanical and electrical configuration" of the X20 system user's manual.
- 2) When operated at temperatures above 55°C, a derating of the nominal output power to 5 W for the X2X Link supply must be taken into consideration.
- 3) In parallel operation, only 75% of the rated power can be assumed. It is important to make sure that all power supplies operated in parallel are switched on and off at the same time.
- 4) The size of the memory used for remanent variables is adjustable in Automation Studio.
- 5) Minus configured remanent variables.
- 6) See Automation Help under "Communication / POWERLINK / General information / Hardware - IF/LS" for more information.

9.12.3.4 X20 CPUs - Status LEDs

| Figure | LED | Color | Status | Description |
|---|--------|-----------|----------------------|--|
|  | R/E | Green | On | Application running |
| | | | Blinking | Boot mode system start: CPU initializing the application, all bus systems and I/O modules ¹⁾ |
| | | | Double flash | Mode BOOT (during firmware update) ¹⁾ |
| | RDY/F | Yellow | On | SERVICE mode |
| | | | Blinking | The "R/E" LED blinks red and the "RDY/F" LED blinks yellow when there is a license violation. |
| | S/E | Green/Red | On | SERVICE or BOOT mode |
| | | | Blinking | The "RDY/F" LED blinks yellow and the "R/E" LED blinks red when there is a license violation. |
| | PLK | Green | On | A link to the POWERLINK peer station has been established. |
| | | | Blinking | A link to the POWERLINK peer station has been established. The LED blinks when Ethernet activity is taking place on the bus. |
| | ETH | Green | On | A link to the peer station has been established. |
| | | | Blinking | A link to the peer station has been established. Indicates Ethernet activity is taking place on the bus. |
| | CF | Green | On | CompactFlash inserted and detected |
| | | | Yellow | CompactFlash read/write access |
| DC | Yellow | On | CPU power supply OK | |
| | | Red | Backup battery empty | |

1) The process can take several minutes depending on the configuration.

9.12.3.4.1 LED "S/E" (LED "Status/Error")

This LED is a green/red dual LED and indicates the state of the POWERLINK interface. The LED states have a different meaning depending on the operating mode of the POWERLINK interface.

9.12.3.4.1.1 Ethernet mode

In this mode, the interface is operated as an Ethernet interface.

| LED "S/E" | | Description |
|-----------|-----|---|
| Green | Red | |
| On | Off | The interface is operated as an Ethernet interface. |

Table: LED "S/E": Interface in Ethernet mode

9.12.3.4.1.2 POWERLINK V1 mode

| LED "S/E" | | Current state of the POWERLINK node |
|----------------------|----------|--|
| Green | Red | |
| On | Off | The POWERLINK node is running with no errors. |
| Off | On | A system error occurred. The type of error can be read using the PLC logbook. An irreparable problem has occurred. The system can no longer properly carry out its tasks. This state can only be changed by resetting the module. |
| Blinking alternately | | The POWERLINK managing node has failed. This error code can only occur when operated as a controlled node. This means that the set node number lies within the range 0x01 - 0xFD. |
| Off | Blinking | System stop. The red blinking LED indicates an error code (see "System stop error codes" on page 1386). |
| Off | Off | The interface is either not active or one of the following states or errors is present: <ul style="list-style-type: none"> The device is switched off. The device is in the startup phase. The interface or device is not configured correctly in Automation Studio. The interface or device is defective. |

Table 237: LED "S/E": POWERLINK V1 mode

9.12.3.4.1.3 POWERLINK V2

| LED "S/E" | | Description |
|-----------|-----|--|
| Green | Red | |
| Off | On | The interface is in error mode (failed Ethernet frames, increased number of collisions on the network, etc.). Note: Several red blinking signals are displayed immediately after the device is switched on. These are not errors, however. |
| Blinking | On | <p>If an error occurs in the following modes, then the green LED blinks over the red LED:</p> <ul style="list-style-type: none"> PRE_OPERATIONAL_1 PRE_OPERATIONAL_2 READY_TO_OPERATE |

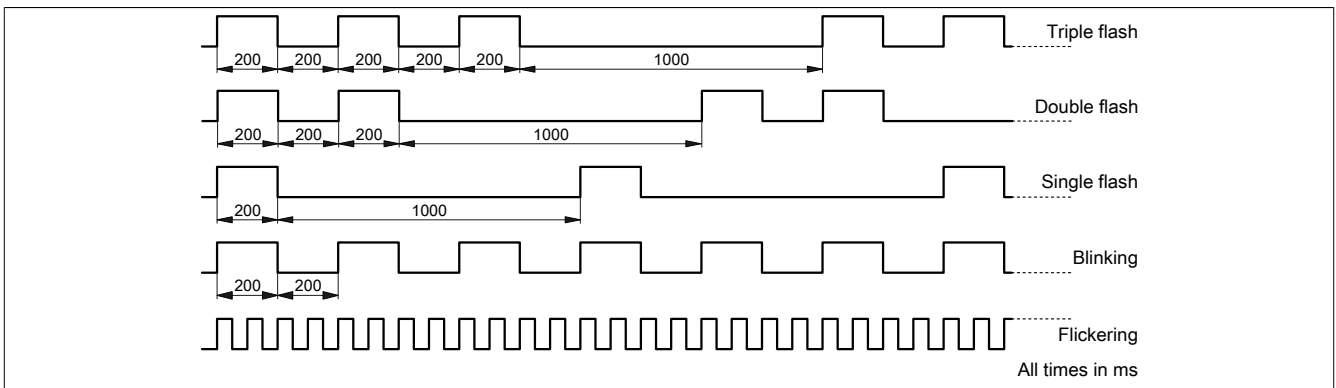

Table: LED "S/E" - Error message (interface in POWERLINK mode)

| LED "S/E" | | Description |
|----------------------------------|-----|--|
| Green | Red | |
| Off | Off | <p>Mode: NOT_ACTIVE The interface is either in mode NOT_ACTIVE or one of the following modes or errors is present:</p> <ul style="list-style-type: none"> The device is switched off. The device is in the startup phase. The interface or device is not configured correctly in Automation Studio. The interface or device is defective. <p>Managing node (MN) The network is monitored for POWERLINK frames. If a frame is not received within the configured time window (timeout), the interface immediately enters mode PRE_OPERATIONAL_1. If POWERLINK communication is detected before the time has elapsed, however, the MN is not started.</p> <p>Controlled node (CN) The network is monitored for POWERLINK frames. If a frame is not received within the configured time window (timeout), the interface immediately enters mode BASIC_ETHERNET. If POWERLINK communication is detected before this time expires, however, the interface immediately enters mode PRE_OPERATIONAL_1.</p> |
| Flickering (approx. 10 Hz) | Off | <p>Mode: BASIC_ETHERNET The interface is in mode BASIC_ETHERNET. The interface is operated in Ethernet mode.</p> <p>Managing node (MN) This mode can only be exited by resetting the controller.</p> <p>Controlled node (CN) If POWERLINK communication is detected during this mode, the interface enters mode PRE_OPERATIONAL_1.</p> |
| Single flash (approx. 1 Hz) | Off | <p>Mode: PRE_OPERATIONAL_1 The interface is in mode PRE_OPERATIONAL_1.</p> <p>Managing node (MN) The MN is in "reduced cycle" operation. The CNs are configured in this mode. Cyclic communication is not yet taking place.</p> <p>Controlled node (CN) The CN can be configured by the MN in this mode. The CN waits until it receives an SoC frame and then switches to mode PRE_OPERATIONAL_2.</p> |
| | On | <p>Controlled node (CN) If the red LED lights up in this mode, this means that the MN has failed.</p> |
| Double flash (approx. 1 Hz) | Off | <p>Mode: PRE_OPERATIONAL_2 The interface is in mode PRE_OPERATIONAL_2.</p> <p>Managing node (MN) The MN starts cyclic communication (cyclic input data is not yet evaluated). The CNs are configured in this mode.</p> <p>Controlled node (CN) The CN can be configured by the MN in this mode. A command then switches the mode to READY_TO_OPERATE.</p> |
| | On | <p>Controlled node (CN) If the red LED lights up in this mode, this means that the MN has failed.</p> |

Table: LED "S/E" - Interface state (interface in POWERLINK mode)

| LED "S/E" | | Description |
|--------------------------------|-----|--|
| Green | Red | |
| Triple flash (approx. 1 Hz) | Off | Mode: READY_TO_OPERATE The interface is in mode READY_TO_OPERATE. Managing node (MN) Cyclic and asynchronous communication. Received PDO data is ignored. Controlled node (CN) The configuration of the CN is completed. Normal cyclic and asynchronous communication. The transmitted PDO data corresponds to the PDO mapping. However, cyclic data is not yet evaluated. |
| | On | Controlled node (CN) If the red LED lights up in this mode, this means that the MN has failed. |
| On | Off | Mode: OPERATIONAL The interface is in mode OPERATIONAL. PDO mapping is active and cyclic data is evaluated. |
| Blinking (approx. 2.5 Hz) | Off | Mode: STOPPED The interface is in mode STOPPED. Managing node (MN) This mode does not occur for the MN. Controlled node (CN) Output data is not being output, and no input data is being provided. This mode can only be reached and exited by a corresponding command from the MN. |

Table: LED "S/E" - Interface state (interface in POWERLINK mode)

9.12.3.4.2 System stop error codes

A system stop error can occur due to incorrect configuration or defective hardware.

The error code is indicated by LED "S/E" blinking red. The blinking signal of the error code consists of 4 switch-on phases with short (150 ms) or long (600 ms) duration. The error code is repeated every 2 seconds.

| Error | Error description |
|----------------|---|
| RAM error | The device is defective and must be replaced. |
| Hardware error | The device or a system component is defective and must be replaced. |

9.12.3.5 LED status indicators for the integrated power supply

For a description of the various operating modes, see "Diagnostic LEDs" on page 3787.

| Figure | LED | Color | Status | Description |
|---|-------|--------------------------------|--|--|
|  | r | Green | Off | No power to module |
| | | | Single flash | Mode RESET |
| | | | Blinking | Mode PREOPERATIONAL |
| | | | On | Mode RUN |
| | e | Red | Off | Module not supplied with power or everything OK |
| | | | Double flash | The LED indicates one of the following states: <ul style="list-style-type: none"> The X2X Link power supply of the power supply is overloaded. I/O power supply too low The input voltage for the X2X Link power supply is too low. |
| | e + r | Solid red / Single green flash | | Invalid firmware |
| | S | Yellow | Off | No RS232 activity |
| | | | On | The LED lights up when data is being transmitted or received via the RS232 interface. |
| | l | Red | Off | The X2X Link power supply is within the valid range. |
| On | | | The X2X Link power supply of the power supply is overloaded. | |

9.12.3.6 Operating and connection elements

9.12.3.7 Slot for application memory

Program memory is required to operate the CPUs. The application memory is provided in the form of a CompactFlash card. It is not included with the CPUs, but must be ordered separately as an accessory.

Information:

The CompactFlash card must not be removed during operation.

9.12.3.8 Operating mode switch

The operating mode switch is used to set the operating mode.

| Switch position | Operating mode | Description |
|-----------------|----------------|--|
| BOOT | BOOT | In this switch position, Boot AR is started and the runtime system can be installed via the online interface (B&R Automation Studio). User flash memory is erased only when the download begins. |
| RUN | RUN | Mode RUN |
| DIAG | DIAGNOSE | The CPU boots in diagnostic mode. Program sections in User RAM and User FlashPROM are not initialized. After diagnostic mode, the CPU always boots with a warm restart. |

Table 238: X20 CPUs - Operating mode

9.12.3.9 Reset button

The reset button is located below the USB interfaces on the bottom of the housing. It can be pressed with any small pointed object (e.g. paper clip). Pressing the reset button triggers a hardware reset, which means:

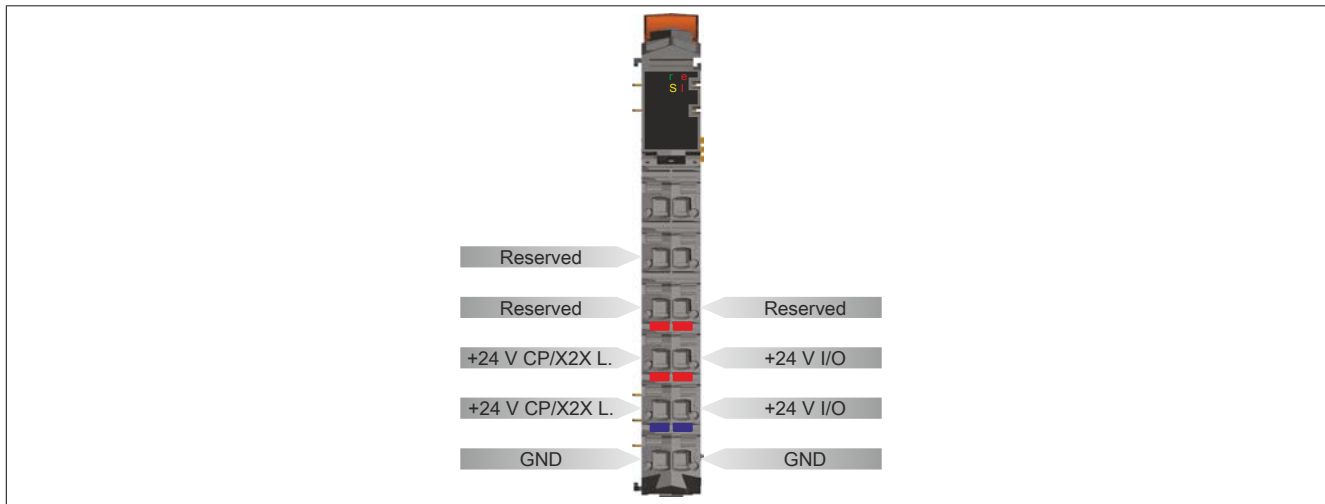

- All application programs are stopped.
- All outputs are set to zero.

The PLC then starts up in service mode by default. The startup mode that follows after pressing the reset button can be set in Automation Studio.

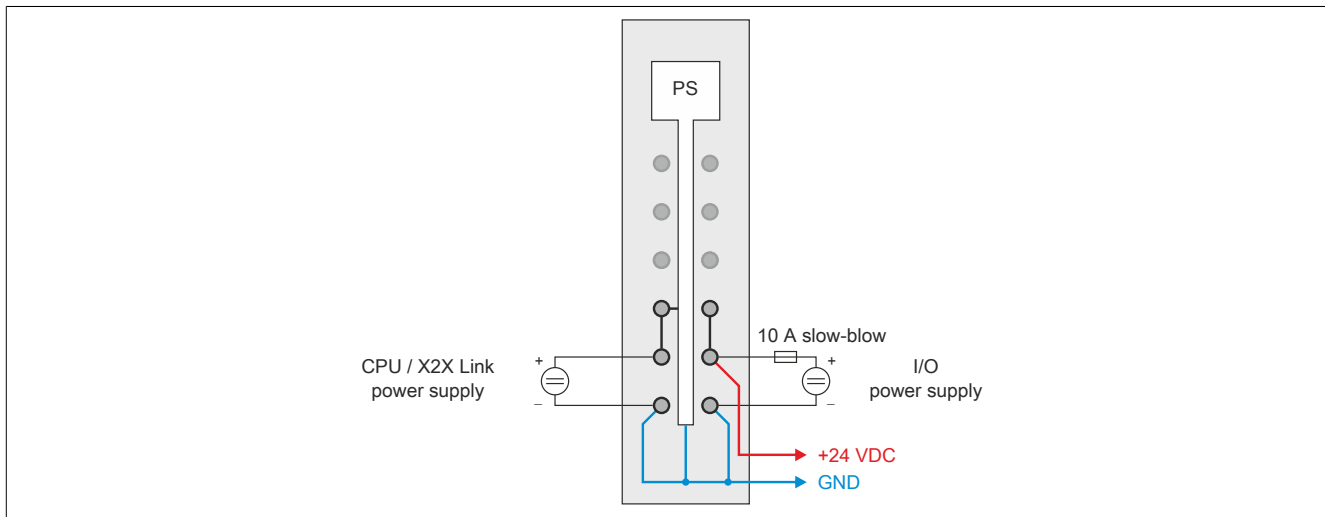

9.12.3.10 CPU power supply

A power supply is integrated in the X20 CPUs. It is equipped with a supply for the CPU, X2X Link and the internal I/O power supply. The bus power supply and internal I/O power supply are galvanically isolated from each other.

Integrated power supply - Pinout

Connection example with 2 separate supplies

Connection example with power supply and jumper

9.12.3.11 RS232 interface (IF1)

The non-electrically isolated RS232 interface is designed as an online interface for communication with the programming device.

9.12.3.12 Ethernet interface (IF2)

IF2 is designed as a 10BASE-T/100BASE-TX interface.

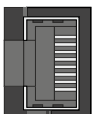

The INA2000 station number of the Ethernet interface is set using the two hex switches.

For information about wiring X20 modules with an Ethernet interface, see ["Cabling guidelines for X20 modules with an Ethernet cable"](#) on page 58.

Information:

The Ethernet interface (IF2) is not suitable for POWERLINK (see ["POWERLINK interface \(IF3\)"](#) on page 1391).

Pinout

| Interface | Pinout | | |
|--|--------|-------------|----------------|
| | Pin | Ethernet | |
|  Shielded RJ45 | 1 | TXD | Transmit data |
| | 2 | TXD\ | Transmit data\ |
| | 3 | RXD | Receive data |
| | 4 | Termination | |
| | 5 | Termination | |
| | 6 | RXD\ | Receive data\ |
| | 7 | Termination | |
| | 8 | Termination | |

9.12.3.13 POWERLINK interface (IF3)

POWERLINK V1

| Switch position | Description |
|-----------------|--|
| 0x00 | Operation as managing node. |
| 0x01 - 0xFD | Node number of the POWERLINK node. Operation as controlled node. |
| 0xFE - 0xFF | Reserved, switch position not permitted |

POWERLINK V2

| Switch position | Description |
|-----------------|---|
| 0x00 | Reserved, switch position not permitted. |
| 0x01 - 0xEF | Node number of the POWERLINK node. Operation as a controlled node (CN). |
| 0xF0 | Operation as a managing node (MN). |
| 0xF1 - 0xFF | Reserved, switch position not permitted. |

Ethernet mode

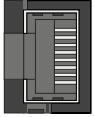

Starting with Automation Studio Version V2.5.3 and with Automation Runtime V2.90, the interface can be operated as an Ethernet interface.

The INA2000 station number can be set using the B&R Automation Studio software.

Pinout

For information about wiring X20 modules with an Ethernet interface, see ["Cabling guidelines for X20 modules with an Ethernet cable"](#) on page 58.

| Interface | Pinout | | |
|--|--------|-------------|----------------|
| | Pin | Ethernet | |
|  Shielded RJ45 | 1 | RXD | Receive data |
| | 2 | RXD\ | Receive data\ |
| | 3 | TXD | Transmit data |
| | 4 | Termination | |
| | 5 | Termination | |
| | 6 | TXD\ | Transmit data\ |
| | 7 | Termination | |
| | 8 | Termination | |

9.12.3.14 USB interfaces (IF4 and IF5)

IF4 and IF5 are non-electrically isolated USB interfaces. The connection is made using a USB 1.1 interface.

The USB interfaces can only be used for devices approved by B&R (e.g. floppy disk drive, DiskOnKey or dongle).

Information:

- **USB interfaces cannot be used for online communication with a programming device.**
- **Only devices isolated from GND can be connected to the USB interfaces.**
- **Current-carrying capacity is listed in the technical data.**

9.12.3.15 Slots for interface modules

The CPUs have one or three slots for interface modules.

Different bus or network systems can be flexibly integrated into the X20 system by selecting the appropriate interface module.

9.12.3.16 Overtemperature cutoff

To prevent damage, a shut-off/reset is triggered on the CPU when the processor reaches 100°C.

The following errors are entered in the logbook:

| Error number | Error description |
|--------------|---|
| 9204 | WARNING: System halted because of temperature check |
| 9210 | WARNING: Boot by watchdog or manual reset |

Table 239: X20 CPUs - Logbook entries after overtemperature cutoff

9.12.3.17 Derating

There is no derating when operated below 55°C. Above 55°C, the nominal output power for the X2X Link power supply must be reduced to 5 W.

9.12.3.18 Battery

X20 CPUs are equipped with a lithium battery. The lithium battery is located in a separate compartment and protected by a cover.

Backup battery data

| | |
|--|---|
| Order number 4A0006.00-000 0AC201.91 | 1 pcs. 4 pcs. |
| Short description | Lithium battery, 3 V / 950 mAh, button cell |
| Storage temperature | -40 to 85°C |
| Storage time | Max. 3 years at 30°C |
| Relative humidity | 0 to 95% (non-condensing) |

The following areas are buffered:

- Remanent variables
- User RAM
- System RAM
- Real-time clock

Battery monitoring

The battery voltage is checked cyclically. The cyclic load test of the battery does not considerably shorten its service life; instead, it gives an early warning of weakened buffer capacity.

Status information "Battery OK" is available from system library function "BatteryInfo" and the CPU's I/O mapping.

Replacement interval for battery

The battery should be replaced every 4 years. The replacement intervals recommended by B&R reflect the batteries' average service life and operating conditions. They do not correspond to the maximum buffer duration!

Important information about the battery exchange

The product design allows the battery to be changed when the power to the PLC is switched off as well as when the power to the PLC is switched on. In some countries, safety regulations do not allow batteries to be changed while the module is switched on. To prevent data loss, the battery must be changed within 1 min when the power is switched off.

Warning!

The battery is only permitted to be replaced by a Renata CR2477N battery. The use of another battery may present a fire or explosion hazard.

The battery can explode if handled improperly. Do not recharge, disassemble or dispose of the battery in fire.

Procedure for replacing the battery

1. Perform electrostatic discharge at the top-hat rail or at the ground connection (do not reach into the power supply!)
2. Remove the cover for the lithium battery. Do this by sliding it down and away from the CPU.

Figure 155: X20 CPUs - Remove lithium battery cover

3. Push the empty battery out of the holder.

4. It is important to ensure that the new battery is not handled with moist or greasy fingers. Plastic tweezers can also be used. Do not touch the battery with pliers or metal tweezers → short circuit!
5. To insert the battery into the holder, place it with the "+" side up on the right part of the battery holder. Then press the battery into the battery holder.
6. Replace the cover.

Information:

Lithium batteries are hazardous waste. Used batteries should be disposed of in accordance with applicable local regulations.

9.12.3.19 Programming the system flash memory

General information

In order for the application project to be executed on the CPU, the Automation Runtime operating system, the system components and the application project must be installed on the CompactFlash card.

Creating a CompactFlash using a USB card reader

The easiest way to perform an initial installation is by creating a fully programmed CompactFlash card using a USB card reader.

1. Creating and configuring a project in Automation Studio
2. In Automation Studio, select **Tools / Create CompactFlash**
3. In the dialog box that opens, select a CompactFlash card and then generate it
4. Insert the finished CompactFlash into the CPU and turn on the CPU's supply voltage
5. CPU booting

For details about commissioning: See help system under "Automation Software / Getting Started"

Installation over an online connection

The CPUs are delivered with a default B&R Automation Runtime system (with limited functions) already installed. This runtime system is started in Boot mode (operating mode switch in the BOOT position or no CompactFlash / invalid CompactFlash inserted). It initializes the Ethernet interface and onboard serial RS232 interface, making it possible to download a new runtime system.

1. Insert the CompactFlash card and switch on the power to the CPU. When the switch is in the BOOT position, a new or invalid CompactFlash card starts the CPU with the default B&R Automation Runtime system.
2. Establish a physical online connection between the programming device (PC or industrial PC) and the CPU (e.g. over an Ethernet network or the RS232 interface).
3. Before you can establish an online connection via Ethernet, the CPU must be assigned an IP address. In Automation Studio, select **Settings** from the Online menu and then click on the **Browse targets** button to search for B&R target systems on the local network. The CPU should appear in the list. If the CPU has not already received an IP address from a DHCP server, right-click on it and select **Set IP parameters** from the shortcut menu. All necessary network configurations can be made on a temporary basis in this dialog box (should be identical to the settings defined in the project).
4. Configure online connection in B&R Automation Studio. For details about the configuration: See help system under "Automation Software / Communication / Online communication"
5. Start the download procedure by selecting the **Services** command from the **Project** menu. Then select **Transfer Automation Runtime** from the pop-up menu. Now follow the instructions provided by B&R Automation Studio.

9.12.3.20 General data points

This CPU is equipped with general data points. These are not CPU-specific; instead, they contain general information such as system time and heat sink temperature.

General data points are described in section ["General CPU data points" on page 3792](#).

9.12.4 X20(c)CP158x and X20(c)CP358x

Data sheet version: 1.52

9.12.4.1 General information

Based on Intel ATOM processor technology, X20 CPUs cover a wide spectrum of requirements. They can be implemented in solutions ranging from standard applications to those requiring the high levels of performance.

The series starts with Intel ATOM processor 333 MHz compatible models – X20CP1583 and X20CP3583. With an optimum price/performance ratio, it has the same basic features as all of the larger CPUs.

The basic model includes USB, Ethernet, POWERLINK V1/V2 and replaceable CompactFlash card. The standard Ethernet interface is capable of handling communication in the gigabit range. For even more real-time network performance, the onboard POWERLINK interface supports poll response chaining mode (PRC).

Up to 3 more slots are available for additional interface modules to increase flexibility.

- Intel ATOM 1600/1000/600 Performance with integrated I/O processor
- Entry-level CPU is Intel ATOM 333 MHz-compatible with integrated I/O processor
- Onboard Ethernet, POWERLINK V1/V2 with poll response chaining and USB
- 1 or 3 slots for modular interface expansion
- CompactFlash as removable application memory
- Up to 512 MB DDR2-SRAM according to performance requirements
- CPU redundancy possible
- Fanless

9.12.4.2 Coated modules

Coated modules are X20 modules with a protective coating for the electronics component. This coating protects X20c modules from condensation and corrosive gases.

The modules' electronics are fully compatible with the corresponding X20 modules.

For simplification purposes, only images and module IDs of uncoated modules are used in this data sheet.

The coating has been certified according to the following standards:

- Condensation: BMW GS 95011-4, 2x 1 cycle
- Corrosive gas: EN 60068-2-60, method 4, exposure 21 days

9.12.4.3 Order data - X20CP158x

|  | |
|---|--|
| Model number | Short description |
| X20 CPUs | |
| X20CP1583 | X20 CPU, Atom 333 MHz Intel compatible, 128 MB DDR2 RAM, 1 MB SRAM, removable application memory: CompactFlash, 1 insert slot for X20 interface modules, 2 USB interfaces, 1 RS232 interface, 1 Ethernet interface 10/100/1000BASE-T, 1 POWERLINK interface, including power supply module, 1x terminal block X20TB12, slot cover and X20 end cover plate X20AC0SR1 (right) included, order application memory separately! |

Table 242: X20CP1583, X20CP1584, X20cCP1584, X20CP1585, X20CP1586, X20cCP1586 - Technical data

- 1) The specified values are maximum values. For examples of the exact calculation, see section "Mechanical and electrical configuration" of the X20 system user's manual.
- 2) When operated at temperatures above 55°C, a derating of the nominal output power to 5 W for the X2X Link power supply must be taken into consideration.
- 3) In parallel operation, only 75% of the rated power can be assumed. It is important to make sure that all power supplies operated in parallel are switched on and off at the same time.
- 4) The size of the memory used for remanent variables is adjustable in Automation Studio.
- 5) 1 MB SRAM minus the configured remanent variables.
- 6) See Automation Help under "Communication / POWERLINK / General information / Hardware - IF/LS" for more information.

9.12.4.5 Order data - X20CP358x

|  | |
|---|--|
| Model number | Short description |
| X20 CPUs | |
| X20CP3583 | X20 CPU, Atom 333 MHz Intel compatible, 128 MB DDR2 RAM, 1 MB SRAM, removable application memory: CompactFlash, 3 insert slots for X20 interface modules, 2 USB interfaces, 1 RS232 interface, 1 Ethernet interface 10/100/1000BASE-T, 1 POWERLINK interface, including power supply module, 1x terminal block X20TB12, slot covers and X20 end cover plate X20AC0SR1 (right) included, order application memory separately! |
| X20CP3584 | X20 CPU, Atom 0.6 GHz, 256 MB DDR2 RAM, 1 MB SRAM, removable application memory: CompactFlash, 3 insert slots for X20 interface modules, 2 USB interfaces, 1 RS232 interface, 1 Ethernet interface 10/100/1000BASE-T, 1 POWERLINK interface, including power supply module, 1x terminal block X20TB12, slot covers and X20 end cover plate X20AC0SR1 (right) included, order application memory separately! |
| X20cCP3584 | X20 CPU, coated, ATOM 0.6 GHz, 256 MB DDR2 RAM, 1 MB SRAM, removable application memory: CompactFlash, 3 insert slots for X20 interface modules, 2 USB interfaces, 1 RS232 interface, 1 Ethernet interface 10/100/1000 Base-T, 1 POWERLINK interface, incl. supply module, 1 X20TB12 terminal block, slot covers and X20 end cover plate (right) X20AC0SR1 included, order application memory separately. |
| X20CP3585 | X20 CPU, Atom 1.0 GHz, 256 MB DDR2 RAM, 1 MB SRAM, removable application memory: CompactFlash, 3 insert slots for X20 interface modules, 2 USB interfaces, 1 RS232 interface, 1 Ethernet interface 10/100/1000BASE-T, 1 POWERLINK interface, including power supply module, 1x terminal block X20TB12, slot covers and X20 end cover plate X20AC0SR1 (right) included, order application memory separately! |
| X20CP3586 | X20 CPU, Atom 1.6 GHz, 512 MB DDR2 RAM, 1 MB SRAM, removable application memory: CompactFlash, 3 insert slots for X20 interface modules, 2 USB interfaces, 1 RS232 interface, 1 Ethernet interface 10/100/1000BASE-T, 1 POWERLINK interface, including power supply module, 1x terminal block X20TB12, slot covers and X20 end cover plate X20AC0SR1 (right) included, order application memory separately! |
| X20cCP3586 | X20 CPU, coated, ATOM 1.6 GHz, 512 MB DDR2 RAM, 1 MB SRAM, removable application memory: CompactFlash, 3 insert slots for X20 interface modules, 2 USB interfaces, 1 RS232 interface, 1 Ethernet interface 10/100/1000 Base-T, 1 POWERLINK interface, incl. supply module, 1 X20TB12 terminal block, slot covers and X20 end cover plate (right) X20AC0SR1 included, order application memory separately. |
| Required accessories | |
| CompactFlash cards | |
| 0CFCRD.0512E.01 | CompactFlash 512 MB extended temp. |

Table 245: X20CP3583, X20CP3584, X20cCP3584, X20CP3585, X20CP3586, X20cCP3586 - Technical data

- 1) The specified values are maximum values. For examples of the exact calculation, see section "Mechanical and electrical configuration" of the X20 system user's manual.
- 2) When operated at temperatures above 55°C, a derating of the nominal output power to 5 W for the X2X Link power supply must be taken into consideration.
- 3) In parallel operation, only 75% of the rated power can be assumed. It is important to make sure that all power supplies operated in parallel are switched on and off at the same time.
- 4) The size of the memory used for remanent variables is adjustable in Automation Studio.
- 5) 1 MB SRAM minus the configured remanent variables.
- 6) See Automation Help under "Communication / POWERLINK / General information / Hardware - IF/LS" for more information.

9.12.4.7 LED status indicators

9.12.4.7.1 X20 CPUs - LED status indicators

| Figure | LED | Color | Status | Description |
|---|--------|-----------|----------------------|--|
|  | R/E | Green | On | Application running |
| | | | Blinking | System startup boot mode: The CPU is initializing the application, all bus systems and I/O modules. ¹⁾ |
| | | | Double flash | Mode BOOT (during firmware update) ¹⁾ |
| | RDY/F | Red | On | Mode SERVICE |
| | | | Blinking | If LED "R/E" blinks red and LED "RDY/F" blinks yellow, a license violation has occurred. |
| | RDY/F | Yellow | On | Mode SERVICE or BOOT |
| | | | Blinking | If LED "RDY/F" blinks yellow and LED "R/E" blinks red, a license violation has occurred. |
| | S/E | Green/Red | | Status/Error LED. LED states are described in section " LED "S/E" (LED "Status/Error") " on page 1405. |
| | PLK | Green | On | The link to the POWERLINK remote station is established. |
| | | | Blinking | The link to the POWERLINK remote station is established. The LED blinks if Ethernet activity is taking place on the bus. |
| | ETH | Green | On | The link to the Ethernet remote station is established. |
| | | | Blinking | The link to the Ethernet remote station is established. The LED blinks if Ethernet activity is taking place on the bus. |
| | CF | Green | On | CompactFlash inserted and detected |
| | | Yellow | On | CompactFlash read/write access |
| DC | Yellow | On | CPU power supply OK | |
| | Red | On | Backup battery empty | |

- 1) This process can take several minutes depending on the configuration.

9.12.4.7.1.1 LED "S/E" (LED "Status/Error")

This LED is a green/red dual LED and indicates the state of the POWERLINK interface. The LED states have a different meaning depending on the operating mode of the POWERLINK interface.

Ethernet mode

In this mode, the interface is operated as an Ethernet interface.

| LED "S/E" | | Description |
|-----------|-----|---|
| Green | Red | |
| On | Off | The interface is operated as an Ethernet interface. |

Table: LED "S/E": Interface in Ethernet mode

POWERLINK V1 mode

| LED "S/E" | | Current state of the POWERLINK node |
|----------------------|----------|--|
| Green | Red | |
| On | Off | The POWERLINK node is running with no errors. |
| Off | On | A system error occurred. The type of error can be read using the PLC logbook. An irreparable problem has occurred. The system can no longer properly carry out its tasks. This state can only be changed by resetting the module. |
| Blinking alternately | | The POWERLINK managing node has failed. This error code can only occur when operated as a controlled node. This means that the set node number lies within the range 0x01 - 0xFD. |
| Off | Blinking | System stop. The red blinking LED indicates an error code (see "System stop error codes" on page 1407). |
| Off | Off | The interface is either not active or one of the following states or errors is present: <ul style="list-style-type: none"> • The device is switched off. • The device is in the startup phase. • The interface or device is not configured correctly in Automation Studio. • The interface or device is defective. |

Table 246: LED "S/E": POWERLINK V1 mode

POWERLINK V2 mode

Error message

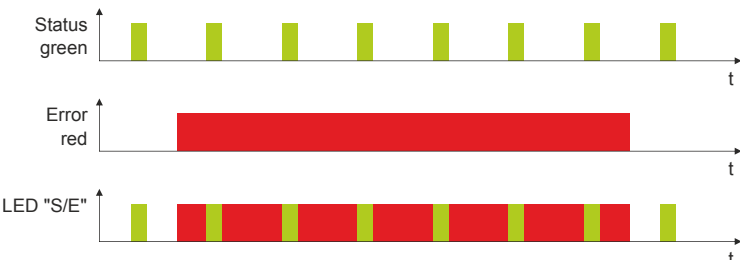

| LED "S/E" | | Description |
|-----------|-----|--|
| Green | Red | |
| Off | On | The interface is in error mode (failed Ethernet frames, increased number of collisions on the network, etc.). Note: Several red blinking signals are displayed immediately after the device is switched on. These are not errors, however. |
| Blinking | On | If an error occurs in the following modes, then the green LED blinks over the red LED: <ul style="list-style-type: none"> • PRE_OPERATIONAL_1 • PRE_OPERATIONAL_2 • READY_TO_OPERATE  |

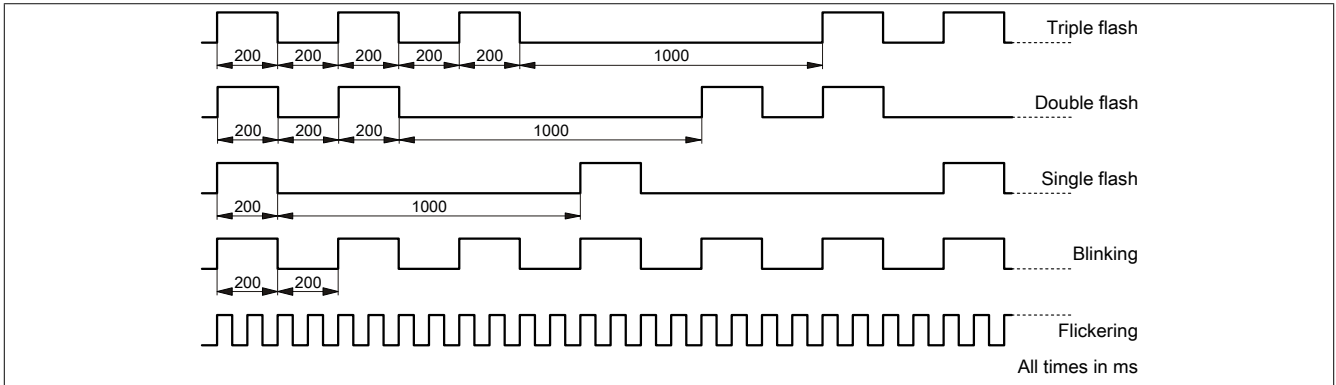

Table: LED "S/E" - Error message (interface in POWERLINK mode)

Interface status

| LED "S/E" | | Description |
|-----------------------------|-----|--|
| Green | Red | |
| Off | Off | <p>Mode: NOT_ACTIVE The interface is either in mode NOT_ACTIVE or one of the following modes or errors is present:</p> <ul style="list-style-type: none"> The device is switched off. The device is in the startup phase. The interface or device is not configured correctly in Automation Studio. The interface or device is defective. <p>Managing node (MN) The network is monitored for POWERLINK frames. If a frame is not received within the configured time window (timeout), the interface immediately enters mode PRE_OPERATIONAL_1. If POWERLINK communication is detected before the time has elapsed, however, the MN is not started.</p> <p>Controlled node (CN) The network is monitored for POWERLINK frames. If a frame is not received within the configured time window (timeout), the interface immediately enters mode BASIC_ETHERNET. If POWERLINK communication is detected before this time expires, however, the interface immediately enters mode PRE_OPERATIONAL_1.</p> |
| Flickering (approx. 10 Hz) | Off | <p>Mode: BASIC_ETHERNET The interface is in mode BASIC_ETHERNET. The interface is operated in Ethernet mode.</p> <p>Managing node (MN) This mode can only be exited by resetting the controller.</p> <p>Controlled node (CN) If POWERLINK communication is detected during this mode, the interface enters mode PRE_OPERATIONAL_1.</p> |
| Single flash (approx. 1 Hz) | Off | <p>Mode: PRE_OPERATIONAL_1 The interface is in mode PRE_OPERATIONAL_1.</p> <p>Managing node (MN) The MN is in "reduced cycle" operation. The CNs are configured in this mode. Cyclic communication is not yet taking place.</p> <p>Controlled node (CN) The CN can be configured by the MN in this mode. The CN waits until it receives an SoC frame and then switches to mode PRE_OPERATIONAL_2.</p> |
| | On | <p>Controlled node (CN) If the red LED lights up in this mode, this means that the MN has failed.</p> |
| Double flash (approx. 1 Hz) | Off | <p>Mode: PRE_OPERATIONAL_2 The interface is in mode PRE_OPERATIONAL_2.</p> <p>Managing node (MN) The MN starts cyclic communication (cyclic input data is not yet evaluated). The CNs are configured in this mode.</p> <p>Controlled node (CN) The CN can be configured by the MN in this mode. A command then switches the mode to READY_TO_OPERATE.</p> |
| | On | <p>Controlled node (CN) If the red LED lights up in this mode, this means that the MN has failed.</p> |
| Triple flash (approx. 1 Hz) | Off | <p>Mode: READY_TO_OPERATE The interface is in mode READY_TO_OPERATE.</p> <p>Managing node (MN) Cyclic and asynchronous communication. Received PDO data is ignored.</p> <p>Controlled node (CN) The configuration of the CN is completed. Normal cyclic and asynchronous communication. The transmitted PDO data corresponds to the PDO mapping. However, cyclic data is not yet evaluated.</p> |
| | On | <p>Controlled node (CN) If the red LED lights up in this mode, this means that the MN has failed.</p> |
| On | Off | <p>Mode: OPERATIONAL The interface is in mode OPERATIONAL. PDO mapping is active and cyclic data is evaluated.</p> |
| Blinking (approx. 2.5 Hz) | Off | <p>Mode: STOPPED The interface is in mode STOPPED.</p> <p>Managing node (MN) This mode does not occur for the MN.</p> <p>Controlled node (CN) Output data is not being output, and no input data is being provided. This mode can only be reached and exited by a corresponding command from the MN.</p> |

Table: LED "S/E" - Interface state (interface in POWERLINK mode)

Blink times

9.12.4.7.1.2 System stop error codes

A system stop error can occur due to incorrect configuration or defective hardware.

The error code is indicated by LED "S/E" blinking red. The blinking signal of the error code consists of 4 switch-on phases with short (150 ms) or long (600 ms) duration. The error code is repeated every 2 seconds.

| Error | Error description |
|----------------|---|
| RAM error | The device is defective and must be replaced. |
| Hardware error | The device or a system component is defective and must be replaced. |

9.12.4.7.2 LED status indicators for the integrated power supply

For a description of the various operating modes, see "[Diagnostic LEDs](#)" on page 3787.

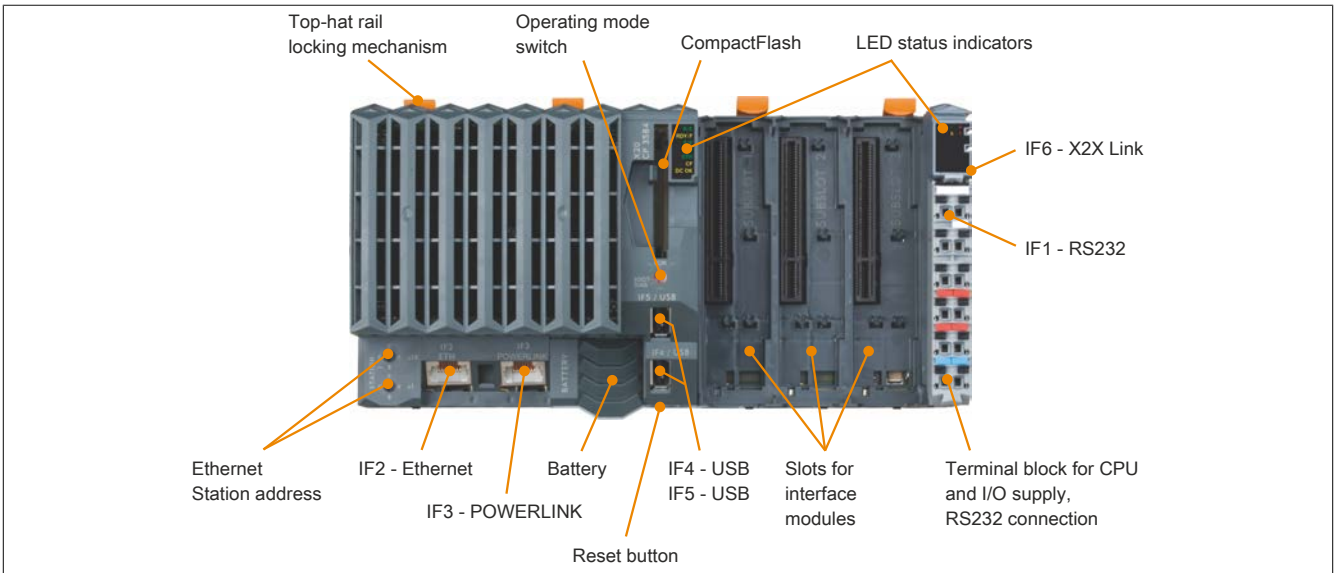

| Figure | LED | Color | Status | Description |
|--------|-------|--------------------------------|--|--|
| | r | Green | Off | No power to module |
| | | | Single flash | Mode RESET |
| | | | Blinking | Mode PREOPERATIONAL |
| | | | On | Mode RUN |
| | e | Red | Off | Module not supplied with power or everything OK |
| | | | Double flash | The LED indicates one of the following states: <ul style="list-style-type: none"> The X2X Link power supply of the power supply is overloaded. I/O power supply too low The input voltage for the X2X Link power supply is too low. |
| | e + r | Solid red / Single green flash | Invalid firmware | |
| | S | Yellow | Off | No RS232 activity |
| | | | On | The LED lights up when data is being transmitted or received via the RS232 interface. |
| | l | Red | Off | The X2X Link power supply is within the valid range. |
| On | | | The X2X Link power supply of the power supply is overloaded. | |

9.12.4.8 Operating and connection elements

X20CP158x

X20CP358x

9.12.4.8.1 Operating mode switch

The operating mode switch is used to set the operating mode.

| Switch position | Operating mode | Description |
|-----------------|----------------|--|
| BOOT | BOOT | In this switch position, Boot AR is started and the runtime system can be installed via the online interface (B&R Automation Studio). User flash memory is erased only when the download begins. |
| RUN | RUN | Mode RUN |
| DIAG | DIAGNOSE | The CPU boots in diagnostic mode. Program sections in User RAM and User FlashPROM are not initialized. After diagnostic mode, the CPU always boots with a warm restart. |

Table 247: X20 CPUs - Operating mode

9.12.4.8.2 Reset button

The reset button is located below the USB interfaces on the bottom of the housing. It can be pressed with any small pointed object (e.g. paper clip). Pressing the reset button triggers a hardware reset, which means:

- All application programs are stopped.
- All outputs are set to zero.

The PLC then starts up in service mode by default. The startup mode that follows after pressing the reset button can be set in Automation Studio.

9.12.4.8.3 Slot for application memory

Program memory is required to operate the CPUs. The application memory is provided in the form of a CompactFlash card. It is not included with the CPUs, but must be ordered separately as an accessory.

Information:

The CompactFlash card must not be removed during operation.

9.12.4.8.4 Project installation

Project installation is described in Automation Help under "Project management / Project installation".

9.12.4.8.5 RS232 interface (IF1)

The non-electrically isolated RS232 interface is designed as an online interface for communication with the programming device.

9.12.4.8.6 Ethernet interface (IF2)

The IF2 is executed as the 10 BASE-T / 100 BASE-TX / 1000 BASE-T gigabit Ethernet interface.

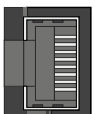

The INA2000 station number of the Ethernet interface is set using the two hex switches.

For information about wiring X20 modules with an Ethernet interface, see ["Cabling guidelines for X20 modules with an Ethernet cable"](#) on page 58.

Information:

The Ethernet interface (IF2) is not suitable for POWERLINK (see ["POWERLINK interface \(IF3\)"](#) on page 1411).

Pinout

| Interface | Pinout | | |
|---|--------|----------|---------|
| | Pin | Ethernet | |
|  Shielded RJ45 port | 1 | D1+ | Data 1+ |
| | 2 | D1- | Data 1- |
| | 3 | D2+ | Data 2+ |
| | 4 | D3+ | Data 3+ |
| | 5 | D3- | Data 3- |
| | 6 | D2- | Data 2- |
| | 7 | D4+ | Data 4+ |
| | 8 | D4- | Data 4- |

9.12.4.8.7 POWERLINK interface (IF3)

The CPUs are equipped with a POWERLINK V1/V2 interface.

POWERLINK V1

By default, the POWERLINK interface is operated as a managing node (MN). In the managing node, the node number is set to a fixed value of 0.

If the POWERLINK node is operated as a controlled node (CN), a node number from 1 to 253 can be set in the POWERLINK configuration in Automation Studio.

POWERLINK V2

Setting in Automation Studio

By default, the POWERLINK interface is operated as a managing node (MN). In the managing node, the node number is set to a fixed value of 240.

If the POWERLINK node is operated as a controlled node (CN), a node number from 1 to 239 can be set in the POWERLINK configuration in Automation Studio.

Setting with hex switches

The POWERLINK node number can also be set with the two onboard hex switches. These are normally used to set the INA2000 station number of the Ethernet interface. Switching takes place in the POWERLINK configuration in Automation Studio.

Node numbers from 0x01 to 0xF0 are permitted.

| Switch position | Description |
|-----------------|---|
| 0x00 | Reserved, switch position not permitted. |
| 0x01 - 0xEF | Node number of the POWERLINK node. Operation as a controlled node (CN). |
| 0xF0 | Operation as a managing node (MN). |
| 0xF1 - 0xFF | Reserved, switch position not permitted. |

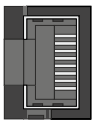

Ethernet mode

In this mode, the interface is operated as an Ethernet interface. The INA2000 station number is set using the B&R Automation Studio software.

Pinout

For information about wiring X20 modules with an Ethernet interface, see ["Cabling guidelines for X20 modules with an Ethernet cable" on page 58](#).

| Interface | Pinout | | |
|--|--------|-------------|----------------|
| | Pin | Ethernet | |
|  Shielded RJ45 | 1 | RXD | Receive data |
| | 2 | RXD\ | Receive data\ |
| | 3 | TXD | Transmit data |
| | 4 | Termination | |
| | 5 | Termination | |
| | 6 | TXD\ | Transmit data\ |
| | 7 | Termination | |
| | 8 | Termination | |

9.12.4.8.8 USB interfaces (IF4 and IF5)

IF4 and IF5 are non-galvanically isolated USB interfaces. The connection is made via a USB interface (1.1/2.0). The USB interfaces can only be used for devices approved by B&R (e.g. floppy disk drive, DiskOnKey or dongle).

Information:

- The USB interfaces cannot be used as online communication interfaces.
- Only devices isolated from GND are permitted to be connected to the USB interfaces.
- Current-carrying capacity is listed in the technical data.

9.12.4.8.9 Slots for interface modules

The CPUs have one or three slots for interface modules.

Different bus or network systems can be flexibly integrated into the X20 system by selecting the appropriate interface module.

9.12.4.8.10 Battery

The CPUs are equipped with a lithium battery. The lithium battery is located in a separate compartment and protected by a cover.

Backup battery data

| | |
|---------------------|---|
| Model number | |
| 4A0006.00-000 | 1 pcs. |
| 0AC201.91 | 4 pcs. |
| Short description | Lithium battery, 3 V / 950 mAh, button cell |
| Storage temperature | -40 to 85°C |
| Storage time | Max. 3 years at 30°C |
| Relative humidity | 0 to 95% (non-condensing) |

The following areas are buffered:

- Remanent variables
- User RAM
- System RAM
- Real-time clock

Battery monitoring

The battery voltage is checked cyclically. The cyclic load test of the battery does not considerably shorten its service life; instead, it gives an early warning of weakened buffer capacity.

Status information "Battery OK" is available from system library function "BatteryInfo" and the CPU's I/O mapping.

Replacement interval for battery

The battery should be replaced every 4 years. The replacement intervals recommended by B&R reflect the batteries' average service life and operating conditions. They do not correspond to the maximum buffer duration!

Important information about the battery exchange

The product design allows the battery to be changed with the PLC switched either on or off. In some countries, safety regulations do not allow batteries to be changed while the module is switched on. To prevent data loss, the battery must be changed within 1 min. with the power off.

Warning!

The battery is only permitted to be replaced by a Renata CR2477N battery. The use of another battery may present a fire or explosion hazard.

The battery can explode if handled improperly. Do not recharge, disassemble or dispose of the battery in fire.

Procedure for replacing the battery

1. Perform electrostatic discharge at the top-hat rail or at the ground connection (do not reach into the power supply!)
2. Remove the cover for the lithium battery. Do this by sliding it down and away from the CPU.

Figure 156: X20 CPUs - Remove lithium battery cover

3. Push the empty battery out of the holder.
4. It is important to ensure that the new battery is not handled with moist or greasy fingers. Plastic tweezers can also be used. Do not touch the battery with pliers or metal tweezers → short circuit!
5. To insert the battery into the holder, place it with the "+" side up on the right part of the battery holder. Then press the battery into the battery holder.
6. Replace the cover.

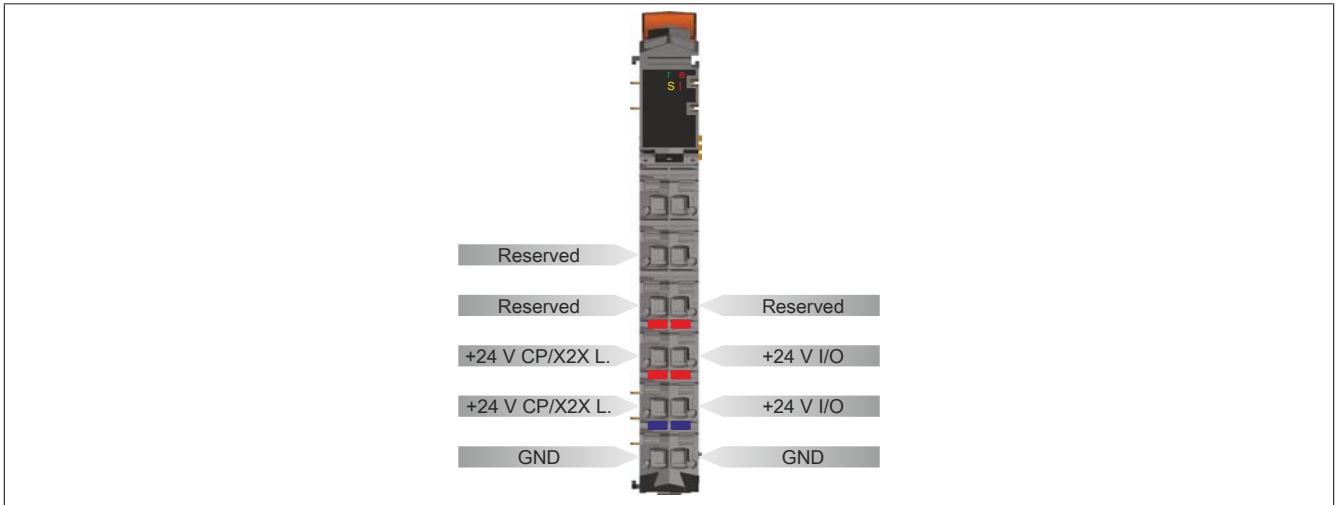

Information:

Lithium batteries are hazardous waste. Used batteries should be disposed of in accordance with applicable local regulations.

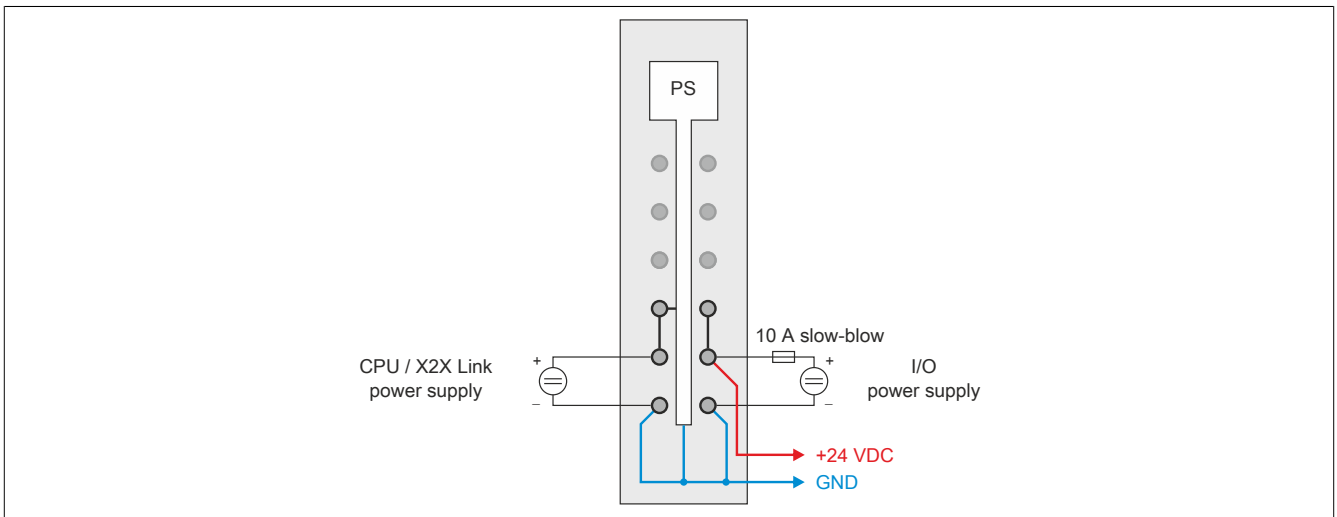

9.12.4.9 CPU power supply

A power supply is integrated in the X20 CPUs. It is equipped with a supply for the CPU, X2X Link and the internal I/O power supply. The bus power supply and internal I/O power supply are galvanically isolated from each other.

Integrated power supply - Pinout

Connection example with 2 separate supplies

Connection example with power supply and jumper

9.12.4.10 Derating

There is no derating when operated below 55°C. Above 55°C, the nominal output power for the X2X Link power supply must be reduced to 5 W.

9.12.4.11 Overtemperature shutdown

To prevent damage, the CPU is switched off - reset state - at 110°C processor temperature or 95°C board temperature.

The following errors are entered in the logbook in the event of shutdown:

| Error number | Short error text |
|--------------|--|
| 9204 | PLC restart triggered by the PLC CPU's temperature monitoring. |
| 9210 | Warning: Halt/Service after watchdog or manual reset. |

9.12.4.12 Information about migrating from the X20CPx48x to the X20CPx58x

- A hardware upgrade is required for some X20 IFxxxx interface modules. This can be installed from Automation Studio by selecting **Tools / Upgrades** from the menu. In addition, a certain hardware revision is required for some modules. The following table provides an overview:

| Order number | Minimum upgrade version | Minimum hardware revision |
|--------------|-------------------------|---------------------------|
| X20IF1020 | 1.1.5.1 | H0 |
| X20IF1030 | 1.1.5.1 | I0 |
| X20IF1041-1 | - | - |
| X20IF1043-1 | - | - |
| X20IF1051-1 | - | - |
| X20IF1053-1 | - | - |
| X20IF1061 | - | E0 |
| X20IF1061-1 | - | - |
| X20IF1063 | 1.1.5.0 | - |
| X20IF1063-1 | - | - |
| X20IF1065 | - | - |
| X20IF1072 | 1.0.5.1 | - |
| X20IF1082 | 1.2.2.0 | - |
| X20IF1082-2 | 1.2.1.0 | - |
| X20IF1086-2 | 1.1.1.0 | - |
| X20IF1091 | 1.0.5.1 | - |
| X20IF10A1-1 | - | - |
| X20IF10D1-1 | - | - |
| X20IF10D3-1 | - | - |
| X20IF10E1-1 | - | - |
| X20IF10E3-1 | - | - |
| X20IF10G3-1 | - | - |
| X20IF10H3-1 | - | - |
| X20IF2772 | 1.0.6.1 | - |
| X20IF2792 | 1.0.5.1 | - |

Table 248: X20 CPUs - Minimum upgrade version and minimum hardware revision for X20 IFxxxx interface modules

- X20CPx58x CPUs are supported starting with B&R Automation Studio V3.0.90.20.
- If an X20CPx48x should be replaced by an X20CPx58x in an existing Automation Studio configuration, the X20CPx58x may not be listed as one of the available options even though the upgrade for the CPU has already been installed. In such a case, an upgrade of the X20CPx48x is required.
- Starting with Automation Runtime 4.x, USB devices are integrated in Automation Runtime dynamically so that they no longer must be configured in Automation Studio. In order to use a USB device, its internal device name must be obtained at runtime. For an example, see Automation Help for the library "AsUSB / Examples".

9.12.4.13 General data points

This CPU is equipped with general data points. These are not CPU-specific; instead, they contain general information such as system time and heat sink temperature.

General data points are described in section ["General CPU data points" on page 3792](#).

9.12.5 X20CP168x(X) and X20CP368x(X)

Data sheet version: 1.00

9.12.5.1 General information

This CPU is based on Intel Atom processor technology and used for applications with the highest performance requirements. It rounds off the top end of the X20 CPU product family.

Base equipment includes USB, Ethernet, POWERLINK V2, flash drive and removable CompactFlash. The standard Ethernet interface is capable of handling gigabit communication. For even more real-time network performance, the onboard POWERLINK interface supports poll-response chaining mode (PRC).

Up to 3 more slots are available for additional interface modules to increase flexibility.

- Intel Atom processor with 400 MHz (compatible) to 1.6 GHz with integrated I/O processor
- Ethernet, POWERLINK V2 with poll-response chaining and onboard USB
- 1 or 3 slots for modular interface expansion
- CompactFlash as removable application memory
- 512 MB to 2 GB LPDDR4 SDRAM
- 1 to 2 GB onboard flash drive
- Controller redundancy possible
- Fanless

9.12.5.2 X20CP168x(X) - Order data

| Model number | Short description |
|-----------------------------|---|
| X20 CPUs | |
| X20CP1684 | X20 CPU, Atom 0.4 GHz (compatible), 512 MB DDR4 RAM, 1 MB SRAM, 1 GB onboard flash drive, removable application memory: CompactFlash, 1 insert slot for X20 interface modules, 2 USB interfaces, 1 RS232 interface, 1 Ethernet interface (TSN) 10/100/1000BASE-T, 1 POWERLINK interface module, including supply module. 1x terminal block X20TB12, slot cover and X20 end cover plate X20AC0SR1 (right) included. Order CompactFlash separately! |
| X20CP1685 | X20 CPU, Atom 0.8 GHz, 512 MB DDR4 RAM, 1 MB SRAM, 1 GB onboard flash drive, removable application memory: CompactFlash, 1 insert slot for X20 interface modules, 2 USB interfaces, 1 RS232 interface, 1 Ethernet interface (TSN) 10/100/1000BASE-T, 1 POWERLINK interface module, including supply module. 1x terminal block X20TB12, slot cover and X20 end cover plate X20AC0SR1 (right) included. Order CompactFlash separately! |
| X20CP1686X | X20 CPU, Atom 1.3 GHz, 1 GB DDR4 RAM, 1 MB SRAM, 2 GB onboard flash drive, removable application memory: CompactFlash, 1 insert slot for X20 interface modules, 2 USB interfaces, 1 RS232 interface, 1 Ethernet interface (TSN) 10/100/1000BASE-T, 1 POWERLINK interface module, including supply module. 1x terminal block X20TB12, slot cover and X20 end cover plate X20AC0SR1 (right) included. Order CompactFlash separately! |

Table 251: X20CP168x(X) - Technical data

- 1) The specified values are maximum values. For examples of the exact calculation, see section "Mechanical and electrical configuration" of the X20 system user's manual.
- 2) When operated at temperatures above 55°C, a derating of the nominal output power to 5 W for the X2X Link power supply must be taken into account.
- 3) In parallel operation, it is only permitted to expect 75% of the nominal power. It is important to make sure that all power supplies operated in parallel are switched on and off at the same time.
- 4) The memory size for remanent variables is configurable in Automation Studio.
- 5) 1 MB SRAM minus the configured remanent variables.
- 6) See Automation Help under "Communication / POWERLINK / General information / Hardware - IF/LS" for more information.
- 7) The CPU was weighed with the battery and terminal block X20TB12. The CompactFlash card, cover for the interface module slot and the X20 end cover plate (right) were not included in the weighing.

9.12.5.4 X20CP368x(X) - Order data

| Height | 99 mm | | | |
| Depth | 85 mm | | | |
| Weight | 530 g ⁷⁾ | | | |

Table 254: X20CP368x(X) - Technical data

- 1) The specified values are maximum values. For examples of the exact calculation, see section "Mechanical and electrical configuration" of the X20 system user's manual.
- 2) When operated at temperatures above 55°C, a derating of the nominal output power to 5 W for the X2X Link power supply must be taken into account.
- 3) In parallel operation, it is only permitted to expect 75% of the nominal power. It is important to make sure that all power supplies operated in parallel are switched on and off at the same time.
- 4) The memory size for remanent variables is configurable in Automation Studio.
- 5) 1 MB SRAM minus the configured remanent variables.
- 6) See Automation Help under "Communication / POWERLINK / General information / Hardware - IF/LS" for more information.
- 7) The CPU was weighed with the battery and terminal block X20TB12. The CompactFlash card, covers for interface module slots and the X20 end cover plate (right) were not included in the weighing.

9.12.5.6 Operating and connection elements

X20CP168x(X)

X20CP368x(X)

9.12.5.6.1 LED status indicators

9.12.5.6.1.1 X20 CPUs - LED status indicators

| Figure | LED | Color | Status | Description |
|---|---------|-----------|----------------------|--|
|  | R/E | Green | On | Application running |
| | | | Blinking | System startup: The CPU is initializing the application, all bus systems and I/O modules. ¹⁾ |
| | | | Double flash | System startup during firmware update ¹⁾ |
| | RDY/F | Red | On | Mode SERVICE ²⁾ |
| | | | Blinking | If LED "R/E" blinks red and LED "RDY/F" blinks yellow, a license violation has occurred. |
| | RDY/F | Yellow | On | Mode SERVICE ²⁾ or BOOT ²⁾ |
| | | | Blinking | If LED "RDY/F" blinks yellow and LED "R/E" blinks red, a license violation has occurred. |
| | S/E | Green/Red | | Status/Error LED. LED states are described in section "LED "S/E" (LED "Status/Error")" on page 1427. |
| | IF3/PLK | Green | On | The link to the POWERLINK remote station is established. |
| | | | Blinking | The link to the POWERLINK remote station is established. The LED blinks if Ethernet activity is taking place on the bus. |
| | IF2/ETH | Green | On | The link to the Ethernet remote station is established. |
| | | | Blinking | The link to the Ethernet remote station is established. The LED blinks if Ethernet activity is taking place on the bus. |
| | CF | Green | On | CompactFlash inserted and detected |
| | | Yellow | On | CompactFlash read/write access |
| DC | Yellow | On | CPU power supply OK | |
| | Red | On | Backup battery empty | |

1) This process can take several minutes depending on the configuration.

2) The operating states are described in Automation Help under "Real-time operating system - Method of operation - Operating states".

LED "S/E" (LED "Status/Error")

This LED is a green/red dual LED and indicates the state of the POWERLINK interface. The LED states have a different meaning depending on the operating mode of the POWERLINK interface.

Ethernet mode

In this mode, the interface is operated as an Ethernet interface.

| LED "S/E" | | Description |
|-----------|-----|---|
| Green | Red | |
| On | Off | The interface is operated as an Ethernet interface. |

Table: LED "S/E": Interface in Ethernet mode

POWERLINK V2 mode

Error message

| LED "S/E" | | Description |
|-----------|-----|--|
| Green | Red | |
| Off | On | The interface is in error mode (failed Ethernet frames, increased number of collisions on the network, etc.). Note: Several red blinking signals are displayed immediately after the device is switched on. These are not errors, however. |
| Blinking | On | If an error occurs in the following modes, then the green LED blinks over the red LED: <ul style="list-style-type: none"> PRE_OPERATIONAL_1 PRE_OPERATIONAL_2 READY_TO_OPERATE |

Table: LED "S/E" - Error message (interface in POWERLINK mode)

Interface status

| LED "S/E" | | Description |
|--------------------------------|-----|---|
| Green | Red | |
| Off | Off | <p>Mode: NOT_ACTIVE The interface is either in mode NOT_ACTIVE or one of the following modes or errors is present:</p> <ul style="list-style-type: none"> The device is switched off. The LED status indicator is disabled. The device is in the startup phase. The interface or device is not configured correctly in Automation Studio. The interface or device is defective. <p>Managing node (MN) The network is monitored for POWERLINK frames. If a frame is not received within the configured time window (timeout), the interface immediately enters mode PRE_OPERATIONAL_1. If POWERLINK communication is detected before the time has elapsed, however, the MN is not started.</p> <p>Controlled node (CN) The network is monitored for POWERLINK frames. If a frame is not received within the configured time window (timeout), the interface immediately enters mode BASIC_ETHERNET. If POWERLINK communication is detected before this time expires, however, the interface immediately enters mode PRE_OPERATIONAL_1.</p> |
| Flickering (approx. 10 Hz) | Off | <p>Mode: BASIC_ETHERNET The interface is in mode BASIC_ETHERNET. The interface is operated in Ethernet mode.</p> <p>Managing node (MN) This mode can only be exited by resetting the controller.</p> <p>Controlled node (CN) If POWERLINK communication is detected during this mode, the interface enters mode PRE_OPERATIONAL_1.</p> |
| Single flash (approx. 1 Hz) | Off | <p>Mode: PRE_OPERATIONAL_1 The interface is in mode PRE_OPERATIONAL_1.</p> <p>Managing node (MN) The MN is in "reduced cycle" operation. The CNs are configured in this mode. Cyclic communication is not yet taking place.</p> <p>Controlled node (CN) The CN can be configured by the MN in this mode. The CN waits until it receives an SoC frame and then switches to mode PRE_OPERATIONAL_2.</p> |
| | On | <p>Controlled node (CN) If the red LED lights up in this mode, this means that the MN has failed.</p> |
| Double flash (approx. 1 Hz) | Off | <p>Mode: PRE_OPERATIONAL_2 The interface is in mode PRE_OPERATIONAL_2.</p> <p>Managing node (MN) The MN starts cyclic communication (cyclic input data is not yet evaluated). The CNs are configured in this mode.</p> <p>Controlled node (CN) The CN can be configured by the MN in this mode. A command then switches the mode to READY_TO_OPERATE.</p> |
| | On | <p>Controlled node (CN) If the red LED lights up in this mode, this means that the MN has failed.</p> |
| Triple flash (approx. 1 Hz) | Off | <p>Mode: READY_TO_OPERATE The interface is in mode READY_TO_OPERATE.</p> <p>Managing node (MN) Cyclic and asynchronous communication. Received PDO data is ignored.</p> <p>Controlled node (CN) The configuration of the CN is completed. Normal cyclic and asynchronous communication. The transmitted PDO data corresponds to the PDO mapping. However, cyclic data is not yet evaluated.</p> |
| | On | <p>Controlled node (CN) If the red LED lights up in this mode, this means that the MN has failed.</p> |
| On | Off | <p>Mode: OPERATIONAL The interface is in mode OPERATIONAL. PDO mapping is active and cyclic data is evaluated.</p> |
| Blinking (approx. 2.5 Hz) | Off | <p>Mode: STOPPED The interface is in mode STOPPED.</p> <p>Managing node (MN) This mode does not occur for the MN.</p> <p>Controlled node (CN) Output data is not being output, and no input data is being provided. This mode can only be reached and exited by a corresponding command from the MN.</p> |

Table: LED "S/E" - Interface state (interface in POWERLINK mode)

Blink times

System stop error codes

A system stop error can occur due to incorrect configuration or defective hardware.

The error code is indicated by LED "S/E" blinking red. The blinking signal of the error code consists of 4 switch-on phases with short (150 ms) or long (600 ms) duration. The error code is repeated every 2 seconds.

| Error | Error description |
|----------------|---|
| RAM error | The device is defective and must be replaced. |
| Hardware error | The device or a system component is defective and must be replaced. |

9.12.5.6.1.2 LED status indicators for the integrated power supply

For a description of the various operating modes, see "Diagnostic LEDs" on page 3787.

| Figure | LED | Color | Status | Description |
|--------|-------|--------------------------------|--|--|
| | r | Green | Off | No power to module |
| | | | Single flash | Mode RESET |
| | | | Blinking | Mode PREOPERATIONAL |
| | | | On | Mode RUN |
| | e | Red | Off | Module not supplied with power or everything OK |
| | | | Double flash | The LED indicates one of the following states: <ul style="list-style-type: none"> The X2X Link power supply of the power supply is overloaded. I/O power supply too low The input voltage for the X2X Link power supply is too low. |
| | e + r | Solid red / Single green flash | Invalid firmware | |
| | S | Yellow | Off | No RS232 activity |
| | | | On | The LED lights up when data is being transmitted or received via the RS232 interface. |
| | l | Red | Off | The X2X Link power supply is within the valid range. |
| On | | | The X2X Link power supply of the power supply is overloaded. | |

9.12.5.6.2 Application memory

In order for the application project to be processed on the CPU, the Automation Runtime operating system, system components and application project must be installed on application memory. Either an integrated flash drive or removable CompactFlash card can be selected as the application memory.

9.12.5.6.2.1 Flash drive

This application memory is implemented as an integrated flash drive.

9.12.5.6.2.2 Removable CompactFlash card

The CompactFlash card is not included in delivery with the CPUs; it must be ordered separately as an accessory!

Information:

Removing the CompactFlash card during operation is not permitted.

9.12.5.6.2.3 Project installation

Project installation is described in Automation Help under "Project management / Project installation".

9.12.5.6.2.4 Selecting application memory

The application memory is selected via a switch on the CPU front.

| Application memory | Description |
|--------------------|--|
| ONBOARD | The flash drive integrated in the CPU is used as the application memory. |
| CF | The connected CompactFlash card is used as the application memory. |

9.12.5.6.3 Button for reset and operating mode

The reset button is located below the USB interfaces on the bottom of the housing. It can be pressed with any small pointed object (e.g. paper clip).

9.12.5.6.3.1 Reset

The button must be pressed for less than 2 seconds to trigger a reset. This triggers a hardware reset on the CPU, which means that:

- All application programs are stopped.
- All outputs are set to zero.

The controller then boots into service mode by default. The startup mode that follows after pressing the reset button can be set in Automation Studio.

- Service mode (default)
- Warm restart
- Cold restart
- Diagnostic mode

9.12.5.6.3.2 Operating mode

3 operating modes can be set using different button sequences:

| Operating mode | Button sequence | Description |
|---------------------------|---|---|
| BOOT ¹⁾ | Boot mode is enabled by the following button sequence: <ul style="list-style-type: none"> • Press the button for less than 2 s. As soon as LED "Error" lights RED, the button can be released. • Then press the button within 2 s for longer than 2 s. As soon as LED "Error" goes dark, the button can be released. | Boot AR is started, and the runtime system can be installed via the online interface (Automation Studio). User flash memory is erased only when the download begins. |
| SERVICE/RUN ¹⁾ | Press the button for less than 2 s. As soon as LED "Error" lights RED , the button can be released. | Mode SERVICE/RUN: Triggering and startup behavior correspond to triggering a hardware reset (see "Reset" on page 1431). |
| DIAGNOSE ¹⁾ | Press the button for more than 2 s. LED "Error" lights RED and then goes dark. As soon as LED "Error" goes dark, the button can be released. | The CPU boots in diagnostic mode. Program sections in User RAM and User FlashPROM are not initialized. After diagnostic mode, the CPU always boots with a warm restart. |

1) The operating states are described in Automation Help under "Real-time operating system - Method of operation - Operating states".

9.12.5.6.4 RS232 interface (IF1)

The non-electrically isolated RS232 interface is designed as an online interface for communication with the programming device.

9.12.5.6.5 Ethernet interface (IF2)

IF2 is designed as a 10BASE-T/100BASE-TX/1000BASE-T gigabit-capable Ethernet interface.

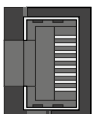

The INA2000 station number of the Ethernet interface is set using the two hex switches.

For information about wiring X20 modules with an Ethernet interface, see ["Cabling guidelines for X20 modules with an Ethernet cable"](#) on page 58.

Information:

The Ethernet interface (IF2) is not suitable for POWERLINK (see ["POWERLINK interface \(IF3\)"](#) on page 1433).

Pinout

| Interface | Pinout | | |
|---|--------|----------|---------|
| | Pin | Ethernet | |
|  Shielded RJ45 port | 1 | D1+ | Data 1+ |
| | 2 | D1- | Data 1- |
| | 3 | D2+ | Data 2+ |
| | 4 | D3+ | Data 3+ |
| | 5 | D3- | Data 3- |
| | 6 | D2- | Data 2- |
| | 7 | D4+ | Data 4+ |
| | 8 | D4- | Data 4- |

9.12.5.6.6 POWERLINK interface (IF3)

The CPUs are equipped with a POWERLINK V2 interface.

POWERLINK

Setting in Automation Studio

By default, the POWERLINK interface is operated as a managing node (MN). In the managing node, the node number is set to a fixed value of 240.

If the POWERLINK node is operated as a controlled node (CN), a node number from 1 to 239 can be set in the POWERLINK configuration in Automation Studio.

Setting with hex switches

The POWERLINK node number can also be set with the two onboard hex switches. These are normally used to set the INA2000 station number of the Ethernet interface. Switching takes place in the POWERLINK configuration in Automation Studio.

Node numbers from 0x01 to 0xF0 are permitted.

| Switch position | Description |
|-----------------|---|
| 0x00 | Reserved, switch position not permitted. |
| 0x01 - 0xEF | Node number of the POWERLINK node. Operation as a controlled node (CN). |
| 0xF0 | Operation as a managing node (MN). |
| 0xF1 - 0xFF | Reserved, switch position not permitted. |

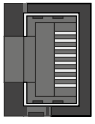

Ethernet mode

In this mode, the interface is operated as an Ethernet interface. The INA2000 station number is set using the B&R Automation Studio software.

Pinout

For information about wiring X20 modules with an Ethernet interface, see ["Cabling guidelines for X20 modules with an Ethernet cable"](#) on page 58.

| Interface | Pinout | | |
|--|--------|-------------|----------------|
| | Pin | Ethernet | |
|  Shielded RJ45 | 1 | RXD | Receive data |
| | 2 | RXD\ | Receive data\ |
| | 3 | TXD | Transmit data |
| | 4 | Termination | |
| | 5 | Termination | |
| | 6 | TXD\ | Transmit data\ |
| | 7 | Termination | |
| | 8 | Termination | |

9.12.5.6.7 USB interfaces (IF4 and IF5)

IF4 and IF5 are non-galvanically isolated USB interfaces. The abbreviation USB stands for "Universal Serial Bus". Both USB interfaces support the USB 1.1 and 2.0 standards.

Information:

USB peripheral devices can be connected to the USB interfaces. Due to the variety of USB devices available on the market, B&R cannot guarantee their functionality. The functionality of USB devices available from B&R is guaranteed.

Information:

- The USB interfaces cannot be used as online communication interfaces.
- Only devices isolated from GND are permitted to be connected to the USB interfaces.
- Current-carrying capacity is listed in the technical data.

9.12.5.6.8 Slots for interface modules

The CPUs have one or three slots for interface modules.

Different bus or network systems can be flexibly integrated into the X20 system by selecting the appropriate interface module.

9.12.5.6.9 Battery

X20 CPUs are equipped with a lithium battery. The lithium battery is located in a separate compartment and protected by a cover.

Backup battery data

| | |
|---------------------|---|
| Order number | |
| 4A0006.00-000 | 1 pcs. |
| 0AC201.91 | 4 pcs. |
| Short description | Lithium battery, 3 V / 950 mAh, button cell |
| Storage temperature | -40 to 85°C |
| Storage time | Max. 3 years at 30°C |
| Relative humidity | 0 to 95% (non-condensing) |

The following areas are buffered:

- Remanent variables
- User RAM
- System RAM
- Real-time clock

Battery monitoring

The battery voltage is checked cyclically. The cyclic load test of the battery does not considerably shorten its service life; instead, it gives an early warning of weakened buffer capacity.

Status information "Battery OK" is available from system library function "BatteryInfo" and the CPU's I/O mapping.

Replacement interval for battery

The battery should be replaced every 4 years. The replacement intervals recommended by B&R reflect the batteries' average service life and operating conditions. They do not correspond to the maximum buffer duration!

Important information about the battery exchange

The product design allows the battery to be changed when the power to the PLC is switched off as well as when the power to the PLC is switched on. In some countries, safety regulations do not allow batteries to be changed while the module is switched on. To prevent data loss, the battery must be changed within 1 min when the power is switched off.

Warning!

The battery is only permitted to be replaced by a Renata CR2477N battery. The use of another battery may present a fire or explosion hazard.

The battery can explode if handled improperly. Do not recharge, disassemble or dispose of the battery in fire.

Procedure for replacing the battery

1. Perform electrostatic discharge at the top-hat rail or at the ground connection (do not reach into the power supply!)
2. Remove the cover for the lithium battery. Do this by sliding it down and away from the CPU.

Figure 157: X20 CPUs - Remove lithium battery cover

3. Push the empty battery out of the holder.
4. It is important to ensure that the new battery is not handled with moist or greasy fingers. Plastic tweezers can also be used. Do not touch the battery with pliers or metal tweezers → short circuit!
5. To insert the battery into the holder, place it with the "+" side up on the right part of the battery holder. Then press the battery into the battery holder.
6. Replace the cover.

Information:

Lithium batteries are hazardous waste. Used batteries should be disposed of in accordance with applicable local regulations.

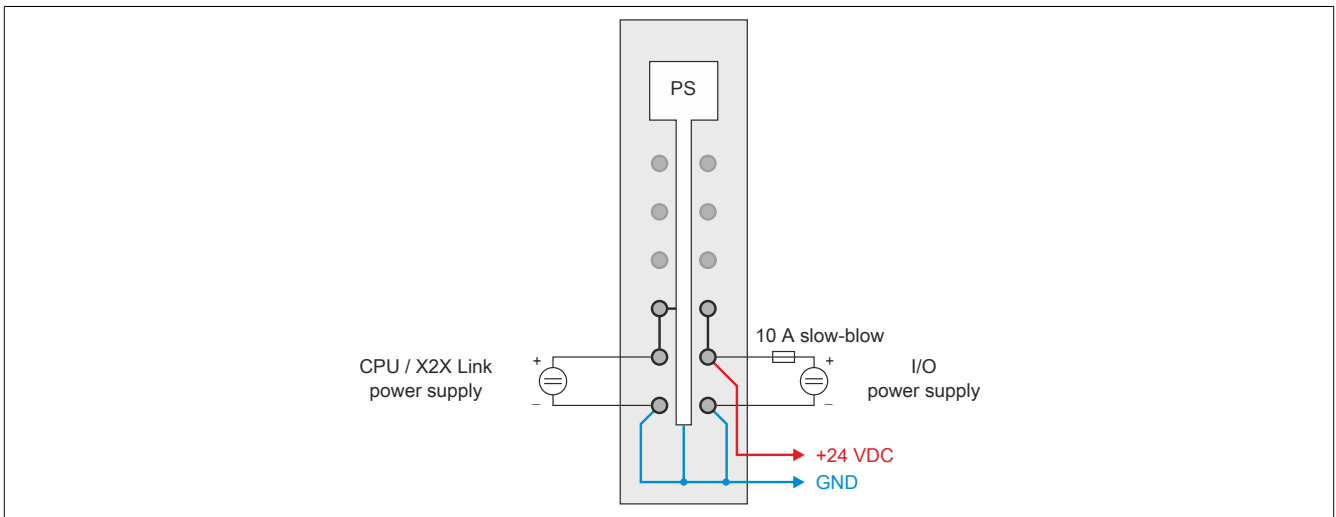

9.12.5.7 CPU power supply

A power supply is integrated in the X20 CPUs. It is equipped with a supply for the CPU, X2X Link and the internal I/O power supply. The bus power supply and internal I/O power supply are galvanically isolated from each other.

Integrated power supply - Pinout

Connection example with 2 separate supplies

Connection example with power supply and jumper

9.12.5.8 Derating

There is no derating when operated below 55°C. Above 55°C, the nominal output power for the X2X Link power supply must be reduced to 5 W.

9.12.5.9 Overtemperature shutdown

To prevent damage, the CPU is switched off - reset state - at 110°C processor temperature or 95°C board temperature.

The following errors are entered in the logbook in the event of shutdown:

| Error number | Short error text |
|--------------|--|
| 9204 | PLC restart triggered by the PLC CPU's temperature monitoring. |
| 9210 | Warning: Halt/Service after watchdog or manual reset. |

9.12.5.10 System requirements

The following minimum versions are recommended to generally be able to use all functions:

- Automation Studio 4.7
- Automation Runtime A4.73

9.12.5.11 Information about migrating from the X20CPx58x to X20CPx68x(X)

The minimum hardware upgrade versions listed in the table are required to operate the following modules with X20CPx68x(X) CPUs. The upgrade can be installed from Automation Studio by selecting **Tools / Upgrades** from the menu.

| Order number | Minimum hardware upgrade version |
|--------------|----------------------------------|
| X20IF10X0 | 1.2.2.0 |
| X20SLXyyy | 1.10.10.4 |

9.12.5.12 General data points

This CPU is equipped with general data points. These are not CPU-specific; instead, they contain general information such as system time and heat sink temperature.

General data points are described in section ["General CPU data points" on page 3792](#).

9.13 Digital input modules

Digital input modules convert binary process signals into the internal signal level required by the PLC. The states of the digital inputs are indicated with status LEDs.

9.13.1 Summary

| Model number | Short description | Page |
|--------------|---|------|
| X20DI0471 | X20 digital input module, 10 inputs, 5-48 VDC, sink, configurable input filter, 1-wire connections | 1439 |

9.13.2 X20DI0471

Data sheet version: 1.05

9.13.2.1 General information

The module is equipped with 10 inputs for 1-wire connections. It is designed for a nominal voltage of 5 to 48 VDC.

- 10 digital inputs
- Sink circuit
- 1-wire connections
- Configurable software input filter for entire module

9.13.2.2 Order data

| Model number | Short description | Figure |

Table 256: X20DI0471 - Technical data

9.13.2.4 LED status indicators

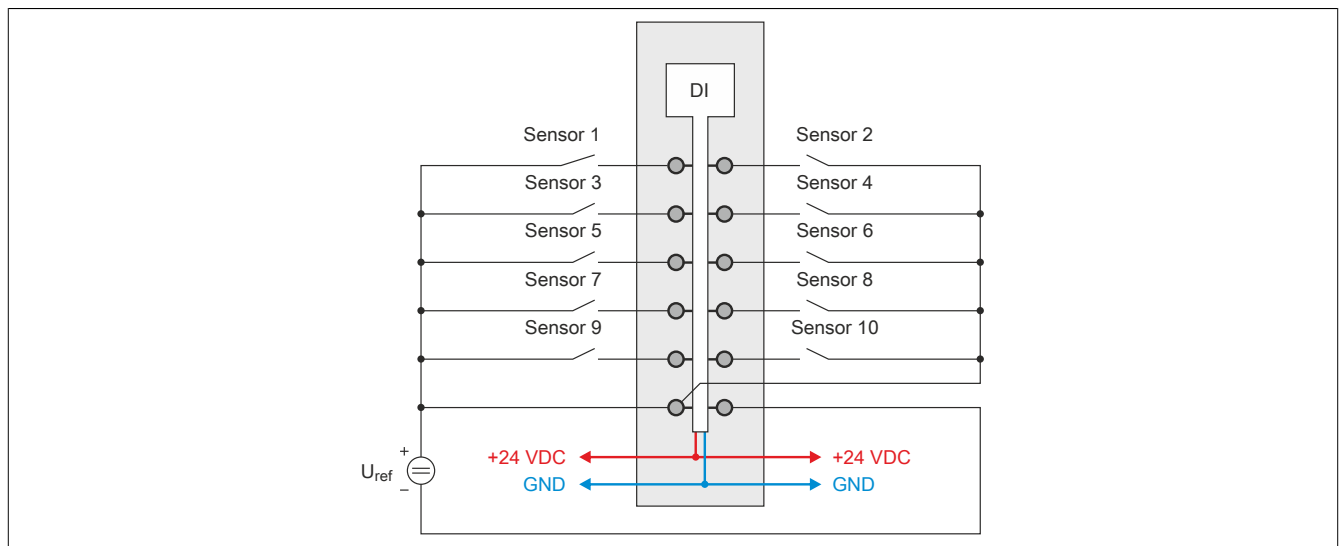

For a description of the various operating modes, see "[Diagnostic LEDs](#)" on page 3787.

| Figure | LED | Color | Status | Description | |
|---|--------|-------|-----------------------------|-------------------------------------|--|
|  | r | Green | Off | No power to module | |
| | | | Single flash | RESET mode | |
| | | | Blinking | PREOPERATIONAL mode | |
| | | | On | RUN mode | |
| | e | Red | Off | No power to module or everything OK | |
| | | | On | Error or reset status | |
| | e + r | | Red on / Green single flash | Invalid firmware | |
| | 1 - 10 | | Green | | Input state of the corresponding digital input |

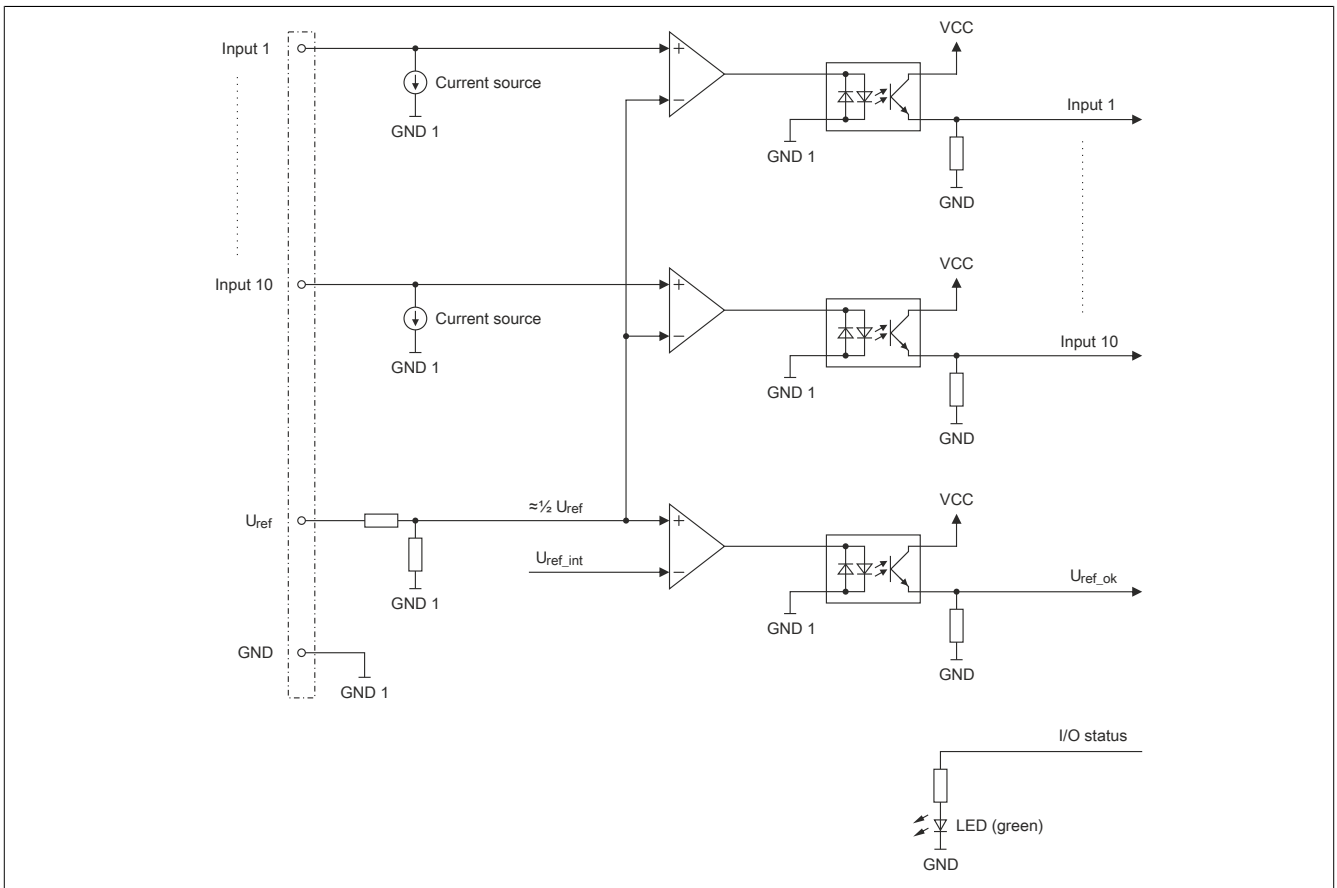

9.13.2.5 Pinout

9.13.2.6 Connection example

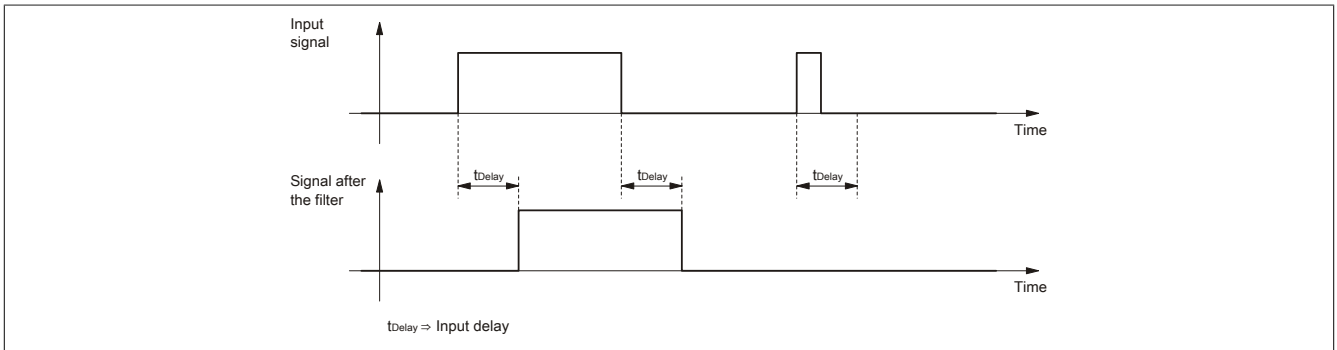

9.13.2.7 Input circuit diagram

9.13.2.8 Input filter

An input filter is available for each input. The input delay can be set using register "ConfigOutput01" on page 1444. Disturbance pulses which are shorter than the input delay are suppressed by the input filter.

9.13.2.9 Register description

9.13.2.9.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section "[General data points](#)" on page 3790.

9.13.2.9.2 Function model 0 - default

| Register | Fixed offset | Register name | Data type | Read | | Write | |
|----------------------|--------------|---------------------------------------|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| Configuration | | | | | | | |
| 18 | - | ConfigOutput01 (input filter) | USINT | | | | • |
| Communication | | | | | | | |
| - | 1 | DigitalInput | UINT | • | | | |
| 0 | 1 | Input state of digital inputs 1 to 8 | USINT | | | | |
| | | DigitalInput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| 1 | 2 | DigitalInput08 | Bit 7 | | | | |
| | | Input state of digital inputs 9 to 10 | USINT | • | | | |
| | | DigitalInput09 | Bit 0 | | | | |
| | | DigitalInput10 | Bit 1 | | | | |
| | | ReferenceStatus | Bit 7 | | | | |

Fixed modules require their data points to be in a specific order in the X2X frame. Cyclic access occurs according to a predefined offset, not based on the register address.

Acyclic access continues to be based on the register numbers.

9.13.2.9.3 Function model 254 - Bus controller

| Register | Offset ¹⁾ | Register name | Data type | Read | | Write | |
|----------------------|----------------------|---------------------------------------|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| Configuration | | | | | | | |
| 18 | - | ConfigOutput01 (input filter) | USINT | | | | • |
| Communication | | | | | | | |
| 0 | 0 | Input state of digital inputs 1 to 8 | USINT | • | | | |
| | | DigitalInput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | DigitalInput08 | Bit 7 | | | | |
| 1 | 1 | Input state of digital inputs 9 to 10 | USINT | • | | | |
| | | DigitalInput09 | Bit 0 | | | | |
| | | DigitalInput10 | Bit 1 | | | | |
| | | ReferenceStatus | Bit 7 | | | | |

1) The offset specifies the position of the register within the CAN object.

9.13.2.9.3.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see "[Using I/O modules on the bus controller](#)" on page 3789.

9.13.2.9.3.2 CAN I/O bus controller

The module occupies 2 digital logical slots on CAN I/O.

9.13.2.9.4 Digital inputs

Unfiltered

The input state is collected with a fixed offset to the network cycle and transferred in the same cycle.

Filtered

The filtered status is collected with a fixed offset to the network cycle and transferred in the same cycle. Filtering takes place asynchronously to the network in multiples of 200 µs with a network-related jitter of up to 50 µs.

9.13.2.9.5 Digital input filter

Name:

ConfigOutput01

This register can be used to specify the filter value for all digital inputs.

The filter value can be configured in steps of 100 μ s. It makes sense to enter values in steps of 2, however, since the input signals are sampled every 200 μ s.

| Data type | Value | Filter |
|-----------|-------|---|
| USINT | 0 | No software filter (bus controller default setting) |
| | 2 | 0.2 ms |
| | ... | ... |
| | 250 | 25 ms - Higher values are limited to this value |

9.13.2.9.5.1 Details related to use

The table shows how the register must be defined in relation to the function model and which parameter is available for this in the Automation Studio configuration.

| Function model | Value or path for the configuration parameter |
|----------------|---|
| All | General / Input filter [0.1 ms] |

9.13.2.9.6 Input state of digital inputs 1 to 10

Register name:

DigitalInput or

DigitalInput01 to DigitalInput10

This register indicates the input state of digital inputs 1 to 10 and the status of the reference voltage.

The reference voltage is monitored. The status is output in bit 7.

| Reference voltage | Status of the digital inputs in relation to the input voltage | |
|-----------------------|--|---|
| $U_{ref} < 4.75$ V | All digital inputs are in a low state regardless of the voltage on the inputs. | |
| $U_{ref} \geq 4.75$ V | $U_{in} \leq 0.2 * U_{ref}$ | The digital input is low |
| | $U_{in} \geq 0.6 * U_{ref}$ | The digital input is high |
| | $0.2 * U_{ref} < U_{in} < 0.6 * U_{ref}$ | This area is inconclusive. The digital input is either low or high. |

Example

The reference voltage $U_{ref} = 48$ VDC

Calculation of the switching threshold:

Switching threshold low = $48 * 0.2 = 9.6$ VDC

Switching threshold high = $48 * 0.6 = 28.8$ VDC

Status of the digital inputs in relation to the input voltage:

| Input voltage | State of the digital input |
|---------------------------------|---|
| $U_{in} \leq 9.6$ VDC | The digital input is low |
| 9.6 VDC $< U_{in} < 28.8$ VDC | The digital input is either low or high (inconclusive). |
| $U_{in} \geq 28.8$ VDC | The digital input is high |

Only function model 0 - Standard

The "Packed inputs" setting in the Automation Studio I/O configuration is used to determine whether all of the bits from this register should be set up individually as data points in the Automation Studio I/O mapping ("DigitalInput01" to "DigitalInput10") or whether this register should be displayed as an individual UINT data point ("DigitalInput").

| Data type | Value | Information | |
|-----------|--------------------|---|--|
| UINT | 0x0000 to 0x83FF | Packed inputs = On | |
| | | 0xy000 to 0xy3FF | Status of digital inputs 1 to 10 |
| | | 0x0yyy | Reference voltage $U_{ref} < 4.75\text{ V}$ |
| | | 0x8yyy | Reference voltage $U_{ref} \geq 4.75\text{ V}$ |
| USINT | See bit structure. | Packed inputs = Off or Function model $\neq 0$ - Standard | |

Bit structure:

Register 0

| Bit | Name | Value | Information |
|-----|----------------|--------|-------------------------------|
| 0 | DigitalInput01 | 0 or 1 | Input state - Digital input 1 |
| ... | | ... | |
| 7 | DigitalInput08 | 0 or 1 | Input state - Digital input 8 |

Register 1

| Bit | Name | Value | Information |
|-------|-----------------|--------|--|
| 0 | DigitalInput09 | 0 or 1 | Input state - Digital input 9 |
| 1 | DigitalInput10 | 0 or 1 | Input state - Digital input 10 |
| 2 - 6 | Reserved | | |
| 7 | ReferenceStatus | 0 | Reference voltage $U_{ref} < 4.75\text{ V}$ |
| | | 1 | Reference voltage $U_{ref} \geq 4.75\text{ V}$ |

9.13.2.9.7 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time | |
|--------------------|-------------------|
| Without filtering | 100 μs |
| With filtering | 150 μs |

9.13.2.9.8 Minimum I/O update time

The minimum I/O update time specifies how far the bus cycle can be reduced so that an I/O update is performed in each cycle.

| Minimum I/O update time | |
|-------------------------|-------------------|
| Without filtering | 100 μs |
| With filtering | 200 μs |

9.13.3 X20DI2371

Data sheet version: 3.07

9.13.3.1 General Information

The module is equipped with 2 inputs for 3-wire connections.

This module is designed for X20 6-pin terminal blocks. If needed (e.g. for logistical reasons), the 12-pin terminal block can also be used.

- 2 digital inputs
- Sink connection
- 3-wire connections
- 24 VDC and GND for sensor supply
- Software input filter can be configured for entire module

1) The power consumption of the sensors connected to the module is not permitted to exceed 12 W.

9.13.3.4 Status LEDs

For a description of the various operating modes, see "Diagnostic LEDs" on page 3787.

| Image | LED | Color | Status | Description |
|---|-------|-----------------------------|---|--|
|  | r | Green | Off | No power to module |
| | | | Single flash | RESET mode |
| | | | Blinking | PREOPERATIONAL mode |
| | | | On | RUN mode |
| | e | Red | Off | Module supply not connected or everything OK |
| | e + r | Red on / Green single flash | Invalid firmware | |
| 1 - 2 | Green | | Input status of the corresponding digital input | |

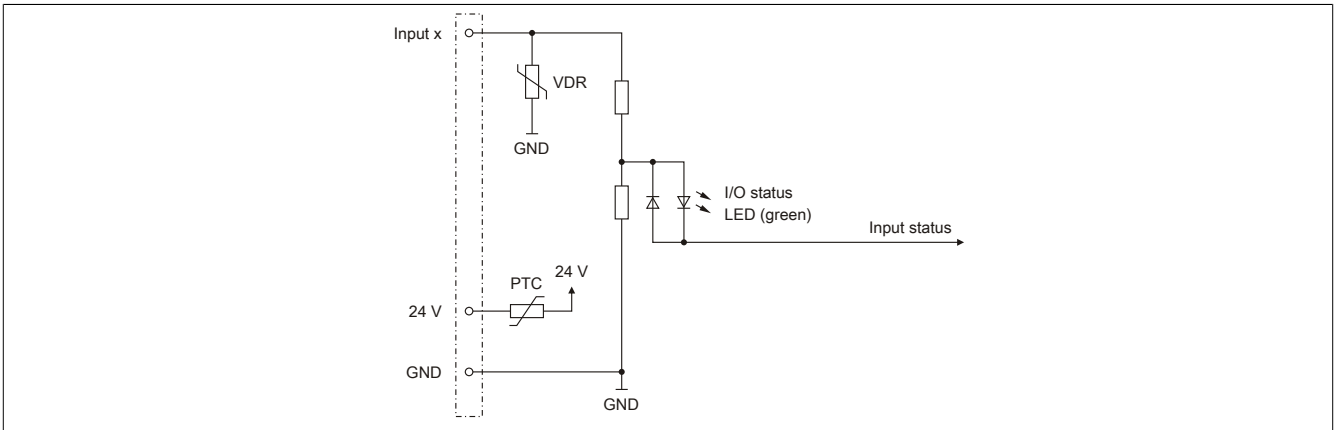

9.13.3.5 Pinout

9.13.3.6 Connection example

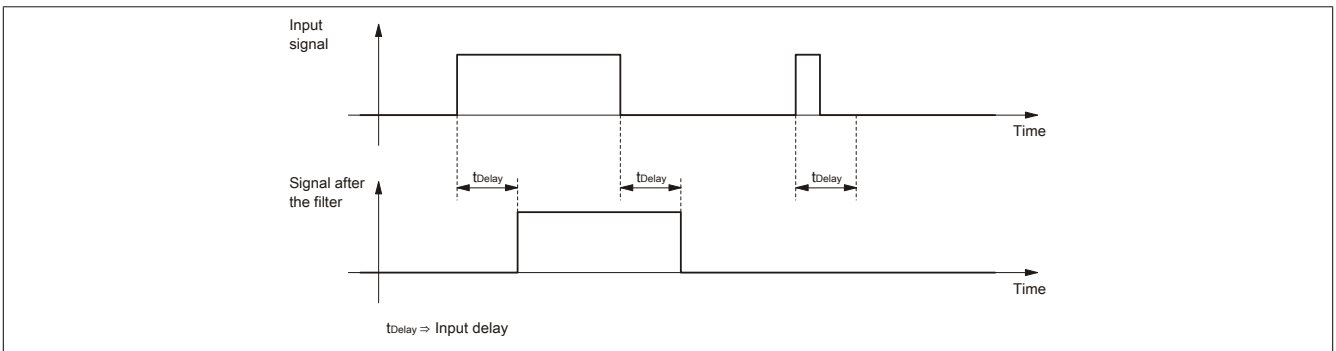

9.13.3.7 Input circuit diagram

9.13.3.8 Input filter

An input filter is available for each input. The input delay can be set using register "[ConfigOutput01](#)" on page 1451. Disturbance pulses which are shorter than the input delay are suppressed by the input filter.

9.13.3.9 Register description

9.13.3.9.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section ["General data points" on page 3790](#).

9.13.3.9.2 Function model 0 - Standard

| Register | Fixed offset | Name | Data type | Read | | Write | |
|----------------------|--------------|---|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| Configuration | | | | | | | |
| 18 | - | ConfigOutput01 (input filter) | USINT | | | | • |
| Communication | | | | | | | |
| 0 | 1 | DigitalInput | USINT | • | | | |
| | | DigitalInput01 | Bit 0 | | | | |
| | | DigitalInput02 | Bit 1 | | | | |

Fixed modules require their data points to be in a specific order in the X2X frame. Cyclic access occurs according to a predefined offset, not based on the register address.

Acyclic access continues to be based on the register numbers.

9.13.3.9.3 Function model 254 - Bus Controller

| Register | Offset ¹⁾ | Name | Data type | Read | | Write | |
|----------------------|----------------------|---|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| Configuration | | | | | | | |
| 18 | - | ConfigOutput01 (input filter) | USINT | | | | • |
| Communication | | | | | | | |
| 0 | 1 | Input status of digital inputs 1 to 2 | USINT | • | | | |
| | | DigitalInput01 | Bit 0 | | | | |
| | | DigitalInput02 | Bit 1 | | | | |

1) The offset specifies where the register is within the CAN object.

9.13.3.9.3.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see ["Using I/O modules on the bus controller" on page 3789](#).

9.13.3.9.3.2 CAN I/O bus controller

The module occupies 1 digital logical slot on CAN I/O.

9.13.3.9.4 Digital inputs

Unfiltered

The input state is collected with a fixed offset to the network cycle and transferred in the same cycle.

Filtered

The filtered status is collected with a fixed offset to the network cycle and transferred in the same cycle. Filtering takes place asynchronously to the network in multiples of 200 µs with a network-related jitter of up to 50 µs.

9.13.3.9.4.1 Digital input filter

Name:

ConfigOutput01

This register can be used to specify the filter value for all digital inputs.

The filter value can be configured in steps of 100 µs. It makes sense to enter values in steps of 2, however, since the input signals are sampled every 200 µs.

| Data type | Value | Filter |
|-----------|-------|---|
| USINT | 0 | No software filter (bus controller default setting) |
| | 2 | 0.2 ms |
| | ... | ... |
| | 250 | 25 ms - Higher values are limited to this value |

9.13.3.9.4.2 Input status of digital inputs 1 to 2

Name:

DigitalInput or

DigitalInput01 to DigitalInput02

The input status of digital inputs 1 to 2 is mapped in this register.

Only function model 0 - Standard:

The "packed inputs" setting in the Automation Studio I/O configuration is used to determine whether all of this register's bits should be set up individually as data points in the Automation Studio I/O mapping ("DigitalInput01" through "DigitalInput02") or whether this register should be displayed as an individual USINT data point ("DigitalInput").

| Data type | Value | Information |
|-----------|------------------------|--|
| USINT | 0 to 3 | Packed inputs = On |
| | See the bit structure. | Packed inputs = Off or function model ≠ 0 - Standard |

Bit structure:

| Bit | Name | Value | Information |
|-----|----------------|--------|--------------------------------|
| 0 | DigitalInput01 | 0 or 1 | Input status - Digital input 1 |
| 1 | DigitalInput02 | 0 or 1 | Input state - Digital input 2 |

9.13.3.9.5 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time | |
|--------------------|--------|
| Without filtering | 100 µs |
| With filtering | 150 µs |

9.13.3.9.6 Minimum I/O update time

The minimum I/O update time specifies how far the bus cycle can be reduced so that an I/O update is performed in each cycle.

| Minimum I/O update time | |
|-------------------------|--------|
| Without filtering | 100 µs |
| With filtering | 200 µs |

9.13.4 X20DI2372

Data sheet version: 3.07

9.13.4.1 General Information

The module is equipped with 2 inputs for 3-wire connections.

This module is designed for X20 6-pin terminal blocks. If needed (e.g. for logistical reasons), the 12-pin terminal block can also be used.

- 2 digital inputs
- Source connection
- 3-wire connections
- 24 VDC and GND for sensor supply
- Software input filter can be configured for entire module

9.13.4.2 Order data

| Model number | Short description | Figure |
|--------------|---|--|
| | Digital inputs |  |

9.13.4.5 Pinout

9.13.4.6 Connection example

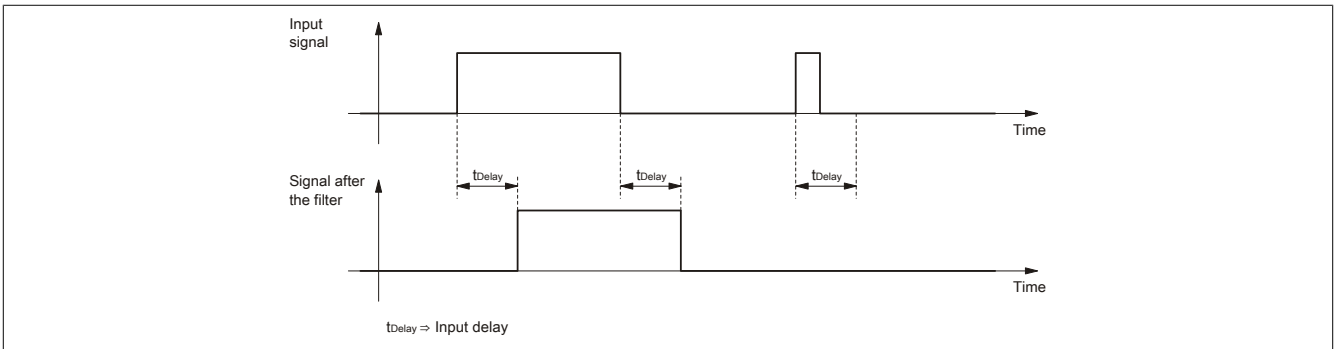

9.13.4.7 Input circuit diagram

9.13.4.8 Input filter

An input filter is available for each input. The input delay can be set using register "ConfigOutput01" on page 1457. Disturbance pulses which are shorter than the input delay are suppressed by the input filter.

9.13.4.9 Register description

9.13.4.9.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section ["General data points" on page 3790](#).

9.13.4.9.2 Function model 0 - Standard

| Register | Fixed offset | Name | Data type | Read | | Write | |
|----------------------|--------------|---|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| Configuration | | | | | | | |
| 18 | - | ConfigOutput01 (input filter) | USINT | | | | • |
| Communication | | | | | | | |
| 0 | 1 | DigitalInput | USINT | • | | | |
| | | DigitalInput01 | Bit 0 | | | | |
| | | DigitalInput02 | Bit 1 | | | | |

Fixed modules require their data points to be in a specific order in the X2X frame. Cyclic access occurs according to a predefined offset, not based on the register address.

Acyclic access continues to be based on the register numbers.

9.13.4.9.3 Function model 254 - Bus Controller

| Register | Offset ¹⁾ | Name | Data type | Read | | Write | |
|----------------------|----------------------|---|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| Configuration | | | | | | | |
| 18 | - | ConfigOutput01 (input filter) | USINT | | | | • |
| Communication | | | | | | | |
| 0 | 1 | Input status of digital inputs 1 to 2 | USINT | • | | | |
| | | DigitalInput01 | Bit 0 | | | | |
| | | DigitalInput02 | Bit 1 | | | | |

1) The offset specifies where the register is within the CAN object.

9.13.4.9.3.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see ["Using I/O modules on the bus controller" on page 3789](#).

9.13.4.9.3.2 CAN I/O bus controller

The module occupies 1 digital logical slot on CAN I/O.

9.13.4.9.4 Digital inputs

Unfiltered

The input state is collected with a fixed offset to the network cycle and transferred in the same cycle.

Filtered

The filtered status is collected with a fixed offset to the network cycle and transferred in the same cycle. Filtering takes place asynchronously to the network in multiples of 200 µs with a network-related jitter of up to 50 µs.

9.13.4.9.4.1 Digital input filter

Name:

ConfigOutput01

This register can be used to specify the filter value for all digital inputs.

The filter value can be configured in steps of 100 µs. It makes sense to enter values in steps of 2, however, since the input signals are sampled every 200 µs.

| Data type | Value | Filter |
|-----------|-------|---|
| USINT | 0 | No software filter (bus controller default setting) |
| | 2 | 0.2 ms |
| | ... | ... |
| | 250 | 25 ms - Higher values are limited to this value |

9.13.4.9.4.2 Input status of digital inputs 1 to 2

Name:

DigitalInput or

DigitalInput01 to DigitalInput02

The input status of digital inputs 1 to 2 is mapped in this register.

Only function model 0 - Standard:

The "packed inputs" setting in the Automation Studio I/O configuration is used to determine whether all of this register's bits should be set up individually as data points in the Automation Studio I/O mapping ("DigitalInput01" through "DigitalInput02") or whether this register should be displayed as an individual USINT data point ("DigitalInput").

| Data type | Value | Information |
|-----------|------------------------|--|
| USINT | 0 to 3 | Packed inputs = On |
| | See the bit structure. | Packed inputs = Off or function model ≠ 0 - Standard |

Bit structure:

| Bit | Name | Value | Information |
|-----|----------------|--------|--------------------------------|
| 0 | DigitalInput01 | 0 or 1 | Input status - Digital input 1 |
| 1 | DigitalInput02 | 0 or 1 | Input state - Digital input 2 |

9.13.4.9.5 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time | |
|--------------------|--------|
| Without filtering | 100 µs |
| With filtering | 150 µs |

9.13.4.9.6 Minimum I/O update time

The minimum I/O update time specifies how far the bus cycle can be reduced so that an I/O update is performed in each cycle.

| Minimum I/O update time | |
|-------------------------|--------|
| Without filtering | 100 µs |
| With filtering | 200 µs |

9.13.5 X20DI2377

Data sheet version: 3.12

9.13.5.1 General Information

The module is equipped with two inputs for 3-wire connections. Both inputs can be configured as event counters. Gate measurement is only ever possible on one channel.

This module is designed for X20 6-pin terminal blocks. If needed (e.g. for logistical reasons), the 12-pin terminal block can also be used.

- 2 digital inputs
- Sink connection
- 3-wire connections
- 2 counter inputs with 50 kHz counter frequency
- Gate measurement
- 24 VDC and GND for sensor supply
- Software input filter can be configured for entire module

9.13.5.2 Order data

| 20 | - | Counter configuration | USINT | | | | • |
| | | ResetCounter01 | Bit 5 | | | | |
| 22 | - | Counter configuration | USINT | | | | • |
| | | ResetCounter02 | Bit 5 | | | | |

1) The offset specifies where the register is within the CAN object.

9.13.5.9.4.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see ["Using I/O modules on the bus controller" on page 3789](#).

9.13.5.9.4.2 CAN I/O bus controller

The module occupies 1 analog logical slot on CAN I/O.

9.13.5.9.5 Digital inputs

Unfiltered

The input state is collected with a fixed offset to the network cycle and transferred in the same cycle.

Filtered

The filtered status is collected with a fixed offset to the network cycle and transferred in the same cycle. Filtering takes place asynchronously to the network in multiples of 200 μ s with a network-related jitter of up to 50 μ s.

9.13.5.9.5.1 Digital input filter

Name:

ConfigOutput01

This register can be used to specify the filter value for all digital inputs.

The filter value can be configured in steps of 100 μ s. It makes sense to enter values in steps of 2, however, since the input signals are sampled every 200 μ s.

| Data type | Value | Filter |
|-----------|-------|---|
| USINT | 0 | No software filter (bus controller default setting) |
| | 2 | 0.2 ms |
| | ... | ... |
| | 250 | 25 ms - Higher values are limited to this value |

9.13.5.9.5.2 Input status of digital inputs 1 to 2

Name:

DigitalInput or

DigitalInput01 to DigitalInput02

The input status of digital inputs 1 to 2 is mapped in this register.

Only function model 0 - Standard:

The "packed inputs" setting in the Automation Studio I/O configuration is used to determine whether all of this register's bits should be set up individually as data points in the Automation Studio I/O mapping ("DigitalInput01" through "DigitalInput02") or whether this register should be displayed as an individual USINT data point ("DigitalInput").

| Data type | Value | Information |
|-----------|------------------------|---|
| USINT | 0 to 3 | Packed inputs = On |
| | See the bit structure. | Packed inputs = Off or function model \neq 0 - Standard |

Bit structure:

| Bit | Name | Value | Information |
|-----|----------------|--------|--------------------------------|
| 0 | DigitalInput01 | 0 or 1 | Input status - Digital input 1 |
| 1 | DigitalInput02 | 0 or 1 | Input state - Digital input 2 |

9.13.5.9.5.3 Input status of digital latch inputs 1 - 2

Name:

DigitalInputLatch01 to DigitalInputLatch02

The input status of digital inputs 1 to 2 after expiration of the input filter time is mapped in this register.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|-----|---------------------|--------|--|
| 0 | DigitalInputLatch01 | 0 or 1 | Input status of digital input 1 after expiration of the delay time |
| 1 | DigitalInputLatch02 | 0 or 1 | Input status of digital input 2 after expiration of the delay time |

9.13.5.9.6 Counter operation

The following operation modes can be selected:

- Event counter mode
- Event counter mode with software (processed after the input filter)
- Gate measurement

Event counter mode

The rising (positive) edges are registered on the counter input.

The counter state is registered with a fixed offset with respect to the network cycle and transferred in the same cycle.

Event counter mode with software

The rising (positive) edges are registered on the counter input. But the edges are first processed through the configured software filter.

The counter state is registered with a fixed offset with respect to the network cycle and transferred in the same cycle.

Gate measurement

The time of rising to falling edges for the gate input is registered using an internal frequency. The result is checked for overflow (0xFFFF) and corrected with the adjustable prescaler.

The recovery time between measurements must be >100 µs.

The measurement result is transferred with the falling edge to the result memory.

Information:

Only one of the counter channels at a time can be used for gate measurement.

9.13.5.9.6.1 Event or gate counter

Name:

Counter01 to Counter02

This register displays the results of the individual counters.

Event counter or gate measurement (16-bit counter value) depending on operating mode.

- **Configuration as an event counter**
This register contains the counter value of all positive edges on the input channel.
- **Configuration as gate measurement**
This register contains the counter value between positive and negative edges on the input channel. The absolute time duration depends on the set frequency.

| Data type | Value | Information |
|-----------|---------------|-------------------|
| UINT | Counter value | Default value = 0 |

Calculating the gate measurement

The measuring frequency can be set between 48 Mhz and 375 kHz (see "[Counter configuration](#)" on page 1465). The maximum time to be measured depends on the height of the measuring frequency. The higher the measuring frequency, the shorter the measurable time period.

Formula for converting the counter value into time

$$\text{Time}_{\text{ms}} = \text{Counter value} * \frac{1}{\text{Measuring frequency}_{\text{Hz}}}$$

Examples

$$3485 * (1 / 375000 \text{ Hz}) = 9.2933 \text{ ms}$$

$$10345 * (1 / 750000 \text{ Hz}) = 13.7933 \text{ ms}$$

$$33719 * (1 / 187500 \text{ Hz}) = 179.834 \text{ ms}$$

$$55760 * (1 / 6000000 \text{ Hz}) = 9.2933 \text{ ms}$$

9.13.5.9.6.2 Counter configuration

Name:

ConfigOutput02 to ConfigOutput03

This register can be used to configure the individual counters.

| Data type | Value | Bus controller default setting |
|-----------|--------------------|--------------------------------|
| USINT | See bit structure. | 0 |

Bit structure:

| Bit | Name | Value | Information |
|-------|----------------------------------|-------|---|
| 0 - 3 | Counter frequency | 0 | 48 MHz (only for gate measurement) (bus controller default setting) |
| | | 1 | 3 MHz (only with gate measurement) |
| | | 1 | Event counter via software (only in event counter operation) |
| | | 2 | 187.5 kHz (only with gate measurement) |
| | | 3 | 24 MHz (only with gate measurement) |
| | | 4 | 12 MHz (only with gate measurement) |
| | | 5 | 6 MHz (only with gate measurement) |
| | | 6 | 1.5 MHz (only with gate measurement) |
| | | 7 | 750 kHz (only with gate measurement) |
| 4 | Reserved | 0 | |
| | | 8 | 375 kHz (only with gate measurement) |
| 5 | ResetCounter01 or ResetCounter02 | 0 | No influence on the counter |
| | | 1 | Clear counter (at rising edge) |
| 6 - 7 | | 0 | Event counter measurement (bus controller default setting) |
| | | 1 | Gate measurement |

9.13.5.9.7 Rising edge input latch

Using this function, the rising edges of the input signal can be latched with a resolution of 200 μ s. With the "Acknowledge - input latch" function, the input latch is either reset or prevented from latching.

It works in the same way as a dominant reset RS flip-flop.

9.13.5.9.7.1 Acknowledge digital inputs

Name:

DigitalInput01LatchQuitt to DigitalInput02LatchQuitt

This register is used to reset the input latches channel by channel.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|-------|--------------------------|-------|----------------------------------|
| 0 | DigitalInput01LatchQuitt | 0 | No influence on the latch status |
| | | 1 | Resets the latch status |
| 1 | DigitalInput02LatchQuitt | 0 | No influence on the latch status |
| | | 1 | Resets the latch status |
| 2 - 7 | Reserved | - | |

9.13.5.9.8 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time | |
|--------------------|--------|
| Without filtering | 100 µs |
| With filtering | 150 µs |

9.13.5.9.9 Minimum I/O update time

The minimum I/O update time specifies how far the bus cycle can be reduced so that an I/O update is performed in each cycle.

| Minimum I/O update time | |
|-------------------------|--------|
| Without filtering | 100 µs |
| With filtering | 200 µs |

9.13.6 X20DI2653

Data sheet version: 3.08

9.13.6.1 General Information

The module is equipped with 2 inputs for 3-wire connections. It is designed for an input voltage of 100 to 240 VAC.

- 2 digital inputs
- 100 to 240 VAC inputs
- 50 Hz or 60 Hz
- 3-wire connections
- 240 V coded

Danger!

Risk of electric shock!

The terminal block is only permitted to conduct voltage when it is connected. It is not permitted to be disconnected or connected while voltage is applied or have voltage applied to it while it is removed under any circumstances.

This module is not permitted to be the last module connected on the X2X Link network. At least one subsequent X20ZF dummy module must provide protection against contact.

9.13.6.2 Order data

| Model number | Short description | Figure |
|--------------|---|--|
| | Digital inputs |  |
| X20DI2653 | X20 digital input module, 2 inputs, 100 to 240 VAC, 240 V keyed, 3-wire connections | |
| | Required accessories | |
| | Bus modules | |
| X20BM12 | X20 bus module, 240 VAC keyed, internal I/O power supply connected through | |

9.13.6.4 Status LEDs

For a description of the various operating modes, see "[Diagnostic LEDs](#)" on page 3787.

| Image | LED | Color | Status | Description |
|---|-------|-----------------------------|--------------|---|
|  | r | Green | Off | No power to module |
| | | | Single flash | RESET mode |
| | | | Blinking | PREOPERATIONAL mode |
| | | | On | RUN mode |
| | e | Red | Off | Module supply not connected or everything OK |
| | | | Double flash | External supply is too low or not connected |
| | e + r | Red on / Green single flash | | Invalid firmware |
| | 1 - 2 | Green | | Input status of the corresponding digital input |

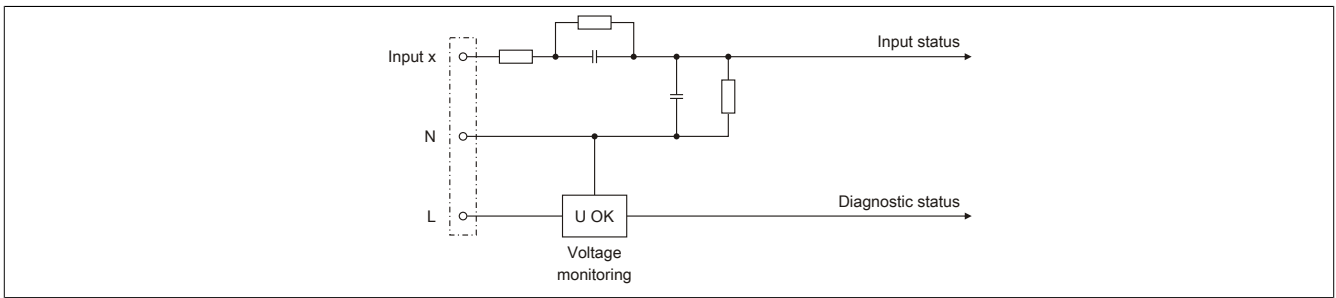

9.13.6.5 Pinout

9.13.6.6 Connection example

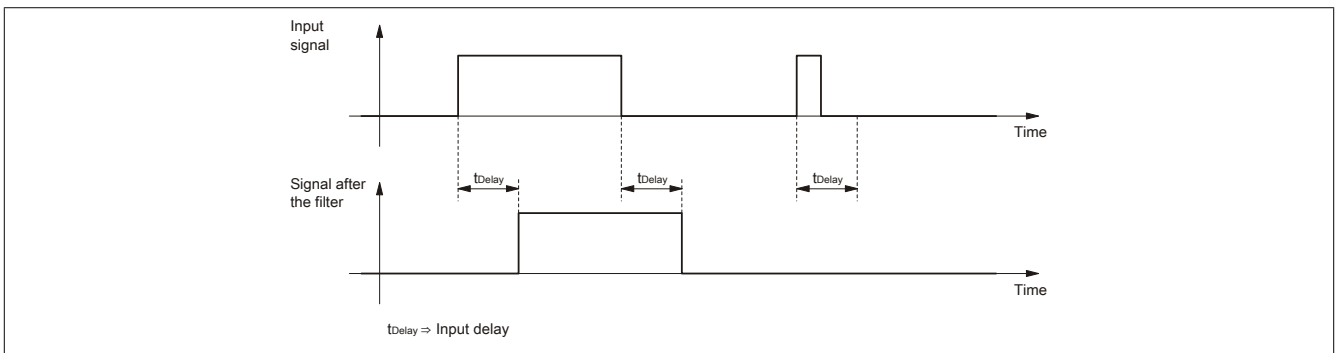

9.13.6.7 Input circuit diagram

9.13.6.8 Input filter

An input filter is available for each input. The input delay can be set using register "ConfigOutput01" on page 1472. Disturbance pulses which are shorter than the input delay are suppressed by the input filter.

9.13.6.9 Register description

9.13.6.9.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section ["General data points" on page 3790](#).

9.13.6.9.2 Function model 0 - Standard

| Register | Fixed offset | Name | Data type | Read | | Write | |
|----------------------|--------------|-------------------------------|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| Configuration | | | | | | | |
| 18 | - | ConfigOutput01 (input filter) | USINT | | | | • |
| Communication | | | | | | | |
| 0 | 1 | DigitalInput | USINT | • | | | |
| | | DigitalInput01 | Bit 0 | | | | |
| | | DigitalInput02 | Bit 1 | | | | |
| | | PowerSupply | Bit 7 | | | | |

Fixed modules require their data points to be in a specific order in the X2X frame. Cyclic access occurs according to a predefined offset, not based on the register address.

Acyclic access continues to be based on the register numbers.

9.13.6.9.3 Function model 254 - Bus Controller

| Register | Offset ¹⁾ | Name | Data type | Read | | Write | |
|----------------------|----------------------|---------------------------------------|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| Configuration | | | | | | | |
| 18 | - | ConfigOutput01 (input filter) | USINT | | | | • |
| Communication | | | | | | | |
| 0 | 0 | Input status of digital inputs 1 to 2 | USINT | • | | | |
| | | DigitalInput01 | Bit 0 | | | | |
| | | DigitalInput02 | Bit 1 | | | | |
| | | PowerSupply | Bit 7 | | | | |

1) The offset specifies where the register is within the CAN object.

9.13.6.9.3.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see ["Using I/O modules on the bus controller" on page 3789](#).

9.13.6.9.3.2 CAN I/O bus controller

The module occupies 1 digital logical slot on CAN I/O.

9.13.6.9.4 Digital inputs

Unfiltered

The input state is collected with a fixed offset to the network cycle and transferred in the same cycle.

Filtered

The filtered status is collected with a fixed offset to the network cycle and transferred in the same cycle. Filtering takes place asynchronously to the network in multiples of 200 µs with a network-related jitter of up to 50 µs.

9.13.6.9.4.1 Digital input filter

Name:

ConfigOutput01

This register can be used to specify the filter value for all digital inputs.

The filter value can be configured in steps of 100 μ s. It makes sense to enter values in steps of 2, however, since the input signals are sampled every 200 μ s.

| Data type | Value | Filter |
|-----------|-------|---|
| USINT | 0 | No software filter (bus controller default setting) |
| | 2 | 0.2 ms |
| | ... | ... |
| | 250 | 25 ms - Higher values are limited to this value |

9.13.6.9.4.2 Input status of digital inputs 1 to 2

Name:

DigitalInput or

DigitalInput01 to DigitalInput02

PowerSupply

The input status of digital inputs 1 to 2 is mapped in this register.

Only function model 0 - Standard:

The "packed inputs" setting in the Automation Studio I/O configuration is used to determine whether all of this register's bits should be set up individually as data points in the Automation Studio I/O mapping ("DigitalInput01", "DigitalInput02" and "PowerSupply") or whether this register should be displayed as an individual USINT data point ("DigitalInput").

| Data type | Value | Information |
|-----------|------------------------|---|
| USINT | 0 to 255 | Packed inputs = On |
| | See the bit structure. | Packed inputs = Off or function model \neq 0 - Standard |

Bit structure:

| Bit | Name | Value | Information |
|-------|----------------|--------|--------------------------------|
| 0 | DigitalInput01 | 0 or 1 | Input status - Digital input 1 |
| 1 | DigitalInput02 | 0 or 1 | Input state - Digital input 2 |
| 2 - 6 | Reserved | 0 | |
| 7 | PowerSupply | 0 | Supply voltage too low |
| | | 1 | Supply voltage >80 VAC |

9.13.6.9.5 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time | |
|--------------------|-------------|
| Without filtering | 100 μ s |
| With filtering | 150 μ s |

9.13.6.9.6 Minimum I/O update time

The minimum I/O update time specifies how far the bus cycle can be reduced so that an I/O update is performed in each cycle.

| Minimum I/O update time | |
|-------------------------|-------------|
| Without filtering | 100 μ s |
| With filtering | 200 μ s |

9.13.7 X20(c)DI4371

Data sheet version: 3.19

9.13.7.1 General Information

The module is equipped with 4 inputs for 3-wire connections.

- 4 digital inputs
- Sink connection
- 3-wire connections
- 4 counter inputs with 1 kHz counter frequency
- 24 VDC and GND for sensor supply
- Software input filter can be configured for entire module

9.13.7.2 Coated modules

Coated modules are X20 modules with a protective coating for the electronics component. This coating protects X20c modules from condensation and corrosive gases.

The modules' electronics are fully compatible with the corresponding X20 modules.

For simplification purposes, only images and module IDs of uncoated modules are used in this data sheet.

The coating has been certified according to the following standards:

- Condensation: BMW GS 95011-4, 2x 1 cycle
- Corrosive gas: EN 60068-2-60, method 4, exposure 21 days

9.13.7.2.1 -40°C starting temperature

The starting temperature describes the minimum permissible ambient temperature when the power is switched off at the time the coated module is switched on. This is permitted to be as low as -40°C. During operation, the conditions as specified in the technical data continue to apply.

Information:

It is important to absolutely ensure that there is no forced cooling by air currents in a closed control cabinet, for example using a fan or ventilation slots.

9.13.7.3 Order data

9.13.7.9 Input filter

An input filter is available for each input. The input delay can be set using register "[ConfigOutput01](#)" on page 1478. Disturbance pulses which are shorter than the input delay are suppressed by the input filter.

9.13.7.10 Register description

9.13.7.10.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section ["General data points" on page 3790](#).

9.13.7.10.2 Function model 0 - Standard

| Register | Fixed offset | Name | Data type | Read | | Write | |
|----------------------|--------------|---|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| Configuration | | | | | | | |
| 18 | - | ConfigOutput01 (input filter) | USINT | | | | • |
| Communication | | | | | | | |
| 0 | 1 | DigitalInput | USINT | • | | | |
| | | DigitalInput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | DigitalInput04 | Bit 3 | | | | |

Fixed modules require their data points to be in a specific order in the X2X frame. Cyclic access occurs according to a predefined offset, not based on the register address.

Acyclic access continues to be based on the register numbers.

9.13.7.10.3 Function model 1 - Event counter

| Register | Fixed offset | Name | Data type | Read | | Write | |
|----------------------|--------------|---|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| Configuration | | | | | | | |
| 14 | - | ConfigOutput02 (edge configuration) | USINT | | | | • |
| 18 | - | ConfigOutput01 (input filter) | USINT | | | | • |
| Communication | | | | | | | |
| 0 | 1 | Input status of digital inputs 1 to 4 | USINT | • | | | |
| | | DigitalInput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | DigitalInput04 | Bit 3 | | | | |
| 4 | 2 | Counter01 | UINT | • | | | |
| 6 | 4 | Counter02 | UINT | • | | | |
| 8 | 6 | Counter03 | UINT | • | | | |
| 10 | 8 | Counter04 | UINT | • | | | |
| 12 | 0 | Resets the counter registers | USINT | | | • | |
| | | ResetCounter01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | ResetCounter04 | Bit 3 | | | | |

Fixed modules require their data points to be in a specific order in the X2X frame. Cyclic access occurs according to a predefined offset, not based on the register address.

Acyclic access continues to be based on the register numbers.

9.13.7.10.4 Function model 254 - Bus Controller

| Register | Offset ¹⁾ | Name | Data type | Read | | Write | |
|----------------------|----------------------|---|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| Configuration | | | | | | | |
| 18 | - | ConfigOutput01 (input filter) | USINT | | | | • |
| Communication | | | | | | | |
| 0 | 0 | Input status of digital inputs 1 to 4 | USINT | • | | | |
| | | DigitalInput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | DigitalInput04 | Bit 3 | | | | |

1) The offset specifies where the register is within the CAN object.

9.13.7.10.4.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see ["Using I/O modules on the bus controller" on page 3789](#).

9.13.7.10.4.2 CAN I/O bus controller

The module occupies 1 digital logical slot on CAN I/O.

9.13.7.10.5 Digital inputs

Unfiltered

The input state is collected with a fixed offset to the network cycle and transferred in the same cycle.

Filtered

The filtered status is collected with a fixed offset to the network cycle and transferred in the same cycle. Filtering takes place asynchronously to the network in multiples of 200 μ s with a network-related jitter of up to 50 μ s.

9.13.7.10.5.1 Digital input filter

Name:

ConfigOutput01

This register can be used to specify the filter value for all digital inputs.

The filter value can be configured in steps of 100 μ s. It makes sense to enter values in steps of 2, however, since the input signals are sampled every 200 μ s.

| Data type | Value | Filter |
|-----------|-------|---|
| USINT | 0 | No software filter (bus controller default setting) |
| | 2 | 0.2 ms |
| | ... | ... |
| | 250 | 25 ms - Higher values are limited to this value |

9.13.7.10.5.2 Input status of digital inputs 1 to 4

Name:

DigitalInput or

DigitalInput01 to DigitalInput04

The input status of digital inputs 1 to 4 is mapped in this register.

Only function model 0 - Standard:

The "Packed inputs" setting in the Automation Studio I/O configuration is used to determine whether all of the bits from these registers should be set up individually as data points in the Automation Studio I/O mapping ("DigitalInput01" through "DigitalInput04") or whether this register should be displayed as an individual USINT data point ("DigitalInput").

| Data type | Value | Information |
|-----------|------------------------|---|
| USINT | 0 to 15 | Packed inputs = On |
| | See the bit structure. | Packed inputs = Off or function model \neq 0 - Standard |

Bit structure:

| Bit | Name | Value | Information |
|-----|----------------|--------|--------------------------------|
| 0 | DigitalInput01 | 0 or 1 | Input status - Digital input 1 |
| ... | ... | ... | ... |
| 3 | DigitalInput04 | 0 or 1 | Input state - Digital input 4 |

9.13.7.10.6 The event counter function model

Starting with hardware variant F0 and firmware version 801, the module has four software counters for signal edges. Each counter register can be configured individually for falling, rising or both edges.

9.13.7.10.6.1 Counter register

Name:

Counter01 to Counter04

These registers provide the current counter value for the configured events.

| Data type | Value |
|-----------|------------|
| UINT | 0 to 65535 |

9.13.7.10.6.2 Resets the counter registers

Name:

ResetCounter01 to ResetCounter04

Using these data points, the corresponding counter registers can be reset to 0.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|-----|----------------|-------|-----------------------------|
| 0 | ResetCounter01 | 0 | No change |
| | | 1 | Counter register 1 is reset |
| ... | | ... | |
| 3 | ResetCounter04 | 0 | No change |
| | | 1 | Counter register 4 is reset |

Information:

A counter is only reset if a positive edge is detected on the reset bit.

A continually set reset bit does not prevent counting in the counter register.

9.13.7.10.6.3 Configuration of the edges

Name:

ConfigOutput02

This register is used to configure which event will be assessed on the channel input for the respective counter.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|-----|-------------------------|-------|----------------------------|
| 0 | Rising edge on input 1 | 0 | Event is not counted |
| | | 1 | Event increments Counter01 |
| ... | | ... | |
| 3 | Rising edge on input 4 | 0 | Event is not counted |
| | | 1 | Event increments Counter04 |
| 4 | Falling edge on input 1 | 0 | Event is not counted |
| | | 1 | Event increments Counter01 |
| ... | | ... | |
| 7 | Falling edge on input 4 | 0 | Event is not counted |
| | | 1 | Event increments Counter04 |

9.13.7.10.7 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time | |
|--------------------|--------|
| Without filtering | 100 µs |
| With filtering | 150 µs |

9.13.7.10.8 Minimum I/O update time

The minimum I/O update time specifies how far the bus cycle can be reduced so that an I/O update is performed in each cycle.

| Minimum I/O update time | |
|-------------------------|--------|
| Without filtering | 100 µs |
| With filtering | 200 µs |

9.13.8 X20DI4372

Data sheet version: 3.07

9.13.8.1 General Information

The module is equipped with 4 inputs for 3-wire connections.

- 4 digital inputs
- Source connection
- 3-wire connections
- 24 VDC and GND for sensor supply
- Software input filter can be configured for entire module

9.13.8.2 Order data

| Model number | Short description | Figure |
|--------------|---|--|
| | Digital inputs |  |
| X20DI4372 | X20 digital input module, 4 inputs, 24 VDC, source, configurable input filter, 3-wire connections | |
| | Required accessories | |
| | Bus modules | |

1) The power consumption of the sensors connected to the module is not permitted to exceed 12 W.

9.13.8.4 Status LEDs

For a description of the various operating modes, see "Diagnostic LEDs" on page 3787.

| Image | LED | Color | Status | Description |
|---|-------|-----------------------------|------------------|---|
|  | r | Green | Off | No power to module |
| | | | Single flash | RESET mode |
| | | | Blinking | PREOPERATIONAL mode |
| | | | On | RUN mode |
| | e | Red | Off | Module supply not connected or everything OK |
| | e + r | Red on / Green single flash | Invalid firmware | |
| | 1 - 4 | Green | | Input status of the corresponding digital input |

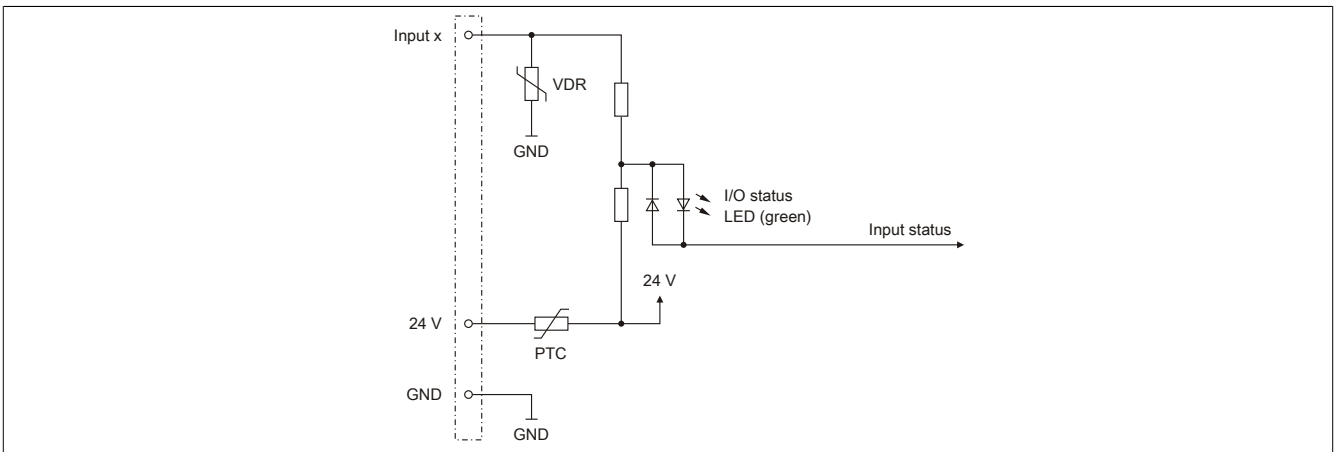

9.13.8.5 Pinout

9.13.8.6 Connection example

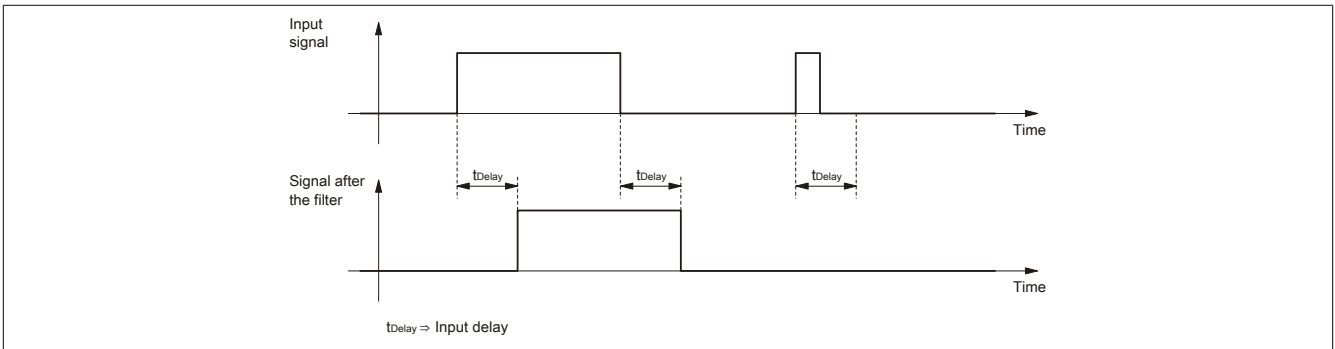

9.13.8.7 Input circuit diagram

9.13.8.8 Input filter

An input filter is available for each input. The input delay can be set using register "[ConfigOutput01](#)" on page 1485. Disturbance pulses which are shorter than the input delay are suppressed by the input filter.

9.13.8.9 Register description

9.13.8.9.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section "[General data points](#)" on page 3790.

9.13.8.9.2 Function model 0 - Standard

| Register | Fixed offset | Name | Data type | Read | | Write | |
|----------------------|--------------|-------------------------------|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| Configuration | | | | | | | |
| 18 | - | ConfigOutput01 (input filter) | USINT | | | | • |
| Communication | | | | | | | |
| 0 | 1 | DigitalInput | USINT | • | | | |
| | | DigitalInput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | DigitalInput04 | Bit 3 | | | | |

Fixed modules require their data points to be in a specific order in the X2X frame. Cyclic access occurs according to a predefined offset, not based on the register address.

Acyclic access continues to be based on the register numbers.

9.13.8.9.3 Function model 254 - Bus Controller

| Register | Offset ¹⁾ | Name | Data type | Read | | Write | |
|----------------------|----------------------|---------------------------------------|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| Configuration | | | | | | | |
| 18 | - | ConfigOutput01 (input filter) | USINT | | | | • |
| Communication | | | | | | | |
| 0 | 0 | Input status of digital inputs 1 to 4 | USINT | • | | | |
| | | DigitalInput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | DigitalInput04 | Bit 3 | | | | |

1) The offset specifies where the register is within the CAN object.

9.13.8.9.3.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see "[Using I/O modules on the bus controller](#)" on page 3789.

9.13.8.9.3.2 CAN I/O bus controller

The module occupies 1 digital logical slot on CAN I/O.

9.13.8.9.4 Digital inputs

Unfiltered

The input state is collected with a fixed offset to the network cycle and transferred in the same cycle.

Filtered

The filtered status is collected with a fixed offset to the network cycle and transferred in the same cycle. Filtering takes place asynchronously to the network in multiples of 200 µs with a network-related jitter of up to 50 µs.

9.13.8.9.4.1 Digital input filter

Name:

ConfigOutput01

This register can be used to specify the filter value for all digital inputs.

The filter value can be configured in steps of 100 μ s. It makes sense to enter values in steps of 2, however, since the input signals are sampled every 200 μ s.

| Data type | Value | Filter |
|-----------|-------|---|
| USINT | 0 | No software filter (bus controller default setting) |
| | 2 | 0.2 ms |
| | ... | ... |
| | 250 | 25 ms - Higher values are limited to this value |

9.13.8.9.4.2 Input status of digital inputs 1 to 4

Name:

DigitalInput or

DigitalInput01 to DigitalInput04

The input status of digital inputs 1 to 4 is mapped in this register.

Only function model 0 - Standard:

The "Packed inputs" setting in the Automation Studio I/O configuration is used to determine whether all of the bits from these registers should be set up individually as data points in the Automation Studio I/O mapping ("DigitalInput01" through "DigitalInput04") or whether this register should be displayed as an individual USINT data point ("DigitalInput").

| Data type | Value | Information |
|-----------|------------------------|---|
| USINT | 0 to 15 | Packed inputs = On |
| | See the bit structure. | Packed inputs = Off or function model \neq 0 - Standard |

Bit structure:

| Bit | Name | Value | Information |
|-----|----------------|--------|--------------------------------|
| 0 | DigitalInput01 | 0 or 1 | Input status - Digital input 1 |
| ... | | ... | |
| 3 | DigitalInput04 | 0 or 1 | Input state - Digital input 4 |

9.13.8.9.5 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time | |
|--------------------|-------------|
| Without filtering | 100 μ s |
| With filtering | 150 μ s |

9.13.8.9.6 Minimum I/O update time

The minimum I/O update time specifies how far the bus cycle can be reduced so that an I/O update is performed in each cycle.

| Minimum I/O update time | |
|-------------------------|-------------|
| Without filtering | 100 μ s |
| With filtering | 200 μ s |

9.13.9 X20(c)DI4375

Data sheet version: 2.20

9.13.9.1 General Information

The module is equipped with 4 inputs for 3-wire connections. It has open circuit and short circuit detection. This detection can be switched off individually for each channel.

- 4 digital inputs
- Sink connection
- 3-wire connections
- 24 VDC and GND for sensor supply
- Open circuit and short circuit detection, can be switched off individually for each channel
- Software input filter can be configured for entire module

9.13.9.2 Coated modules

Coated modules are X20 modules with a protective coating for the electronics component. This coating protects X20c modules from condensation and corrosive gases.

The modules' electronics are fully compatible with the corresponding X20 modules.

For simplification purposes, only images and module IDs of uncoated modules are used in this data sheet.

The coating has been certified according to the following standards:

- Condensation: BMW GS 95011-4, 2x 1 cycle
- Corrosive gas: EN 60068-2-60, method 4, exposure 21 days

9.13.9.2.1 Starting temperature

The starting temperature describes the minimum permissible ambient temperature when the power is switched off at the time the coated module is switched on. This is permitted to be as low as -40°C . During operation, the conditions as specified in the technical data continue to apply.

Information:

It is important to absolutely ensure that there is no forced cooling by air currents in a closed control cabinet, for example using a fan or ventilation slots.

9.13.9.3 Order data

9.13.9.5 Status LEDs

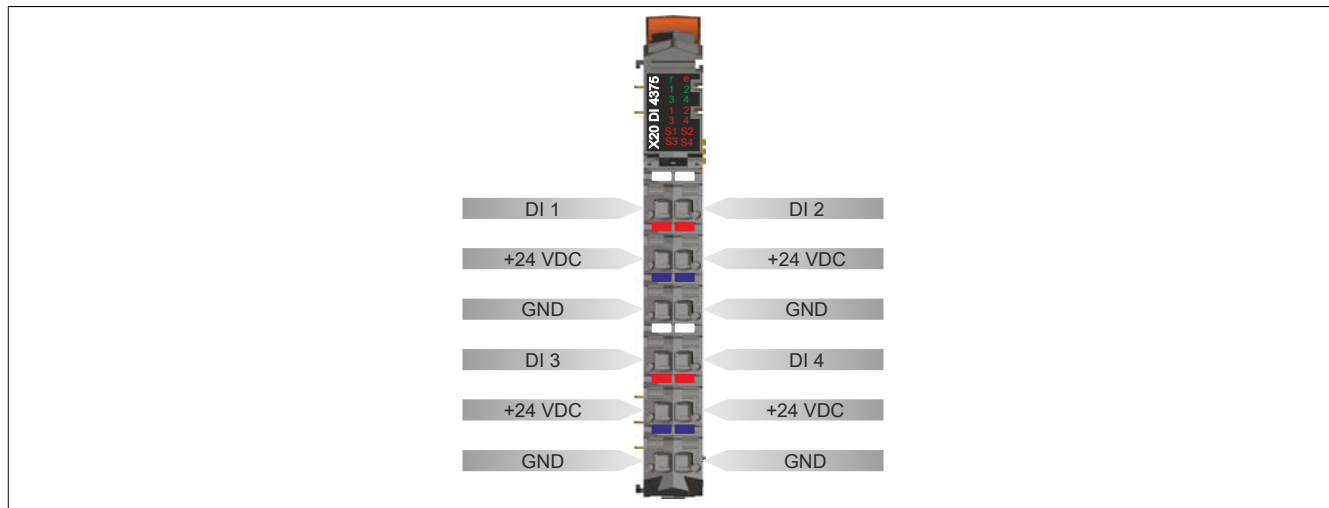

For a description of the various operating modes, see "Diagnostic LEDs" on page 3787.

| Image | LED | Color | Status | Description |
|---|-------|-------|--|--|
|  | r | Green | Off | No power to module |
| | | | Single flash | RESET mode |
| | | | Double flash | BOOT mode (during firmware update) ¹⁾ |
| | | | Blinking | PREOPERATIONAL mode |
| | | | On | RUN mode |
| | e | Red | Off | Module supply not connected or everything OK |
| | | | Single flash | Summary status for channel error → Check the red channel LEDs 1 - 4 |
| | | | Double flash | Module supply below lower limit |
| | 1 - 4 | Green | Off | Input status of the corresponding digital input |
| | | | On | Input status of the corresponding digital input |
| | 1 - 4 | Red | Off | No error detected |
| | | | Single flash | Short circuit of respective digital input with +24 VDC |
| | | | Blinking | Open circuit or the measured value is below the lower switch off threshold |
| | | | Single flash, inverse | Other channel error |
| | | | On | Other channel error |
| S1 - S4 | Red | Off | Sensor supply OK | |
| | | On | Sensor supply monitor has detected something | |

1) Depending on the configuration, a firmware update can take up to several minutes.

9.13.9.6 Pinout

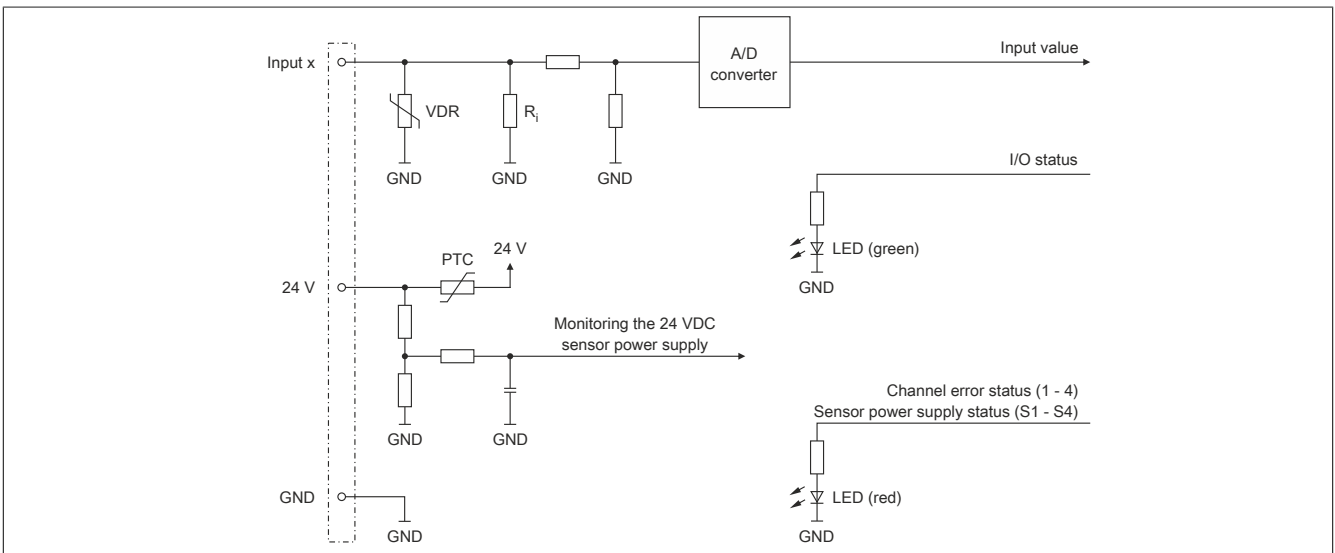

Shielded cables should be used for all connections.

9.13.9.7 Connection example

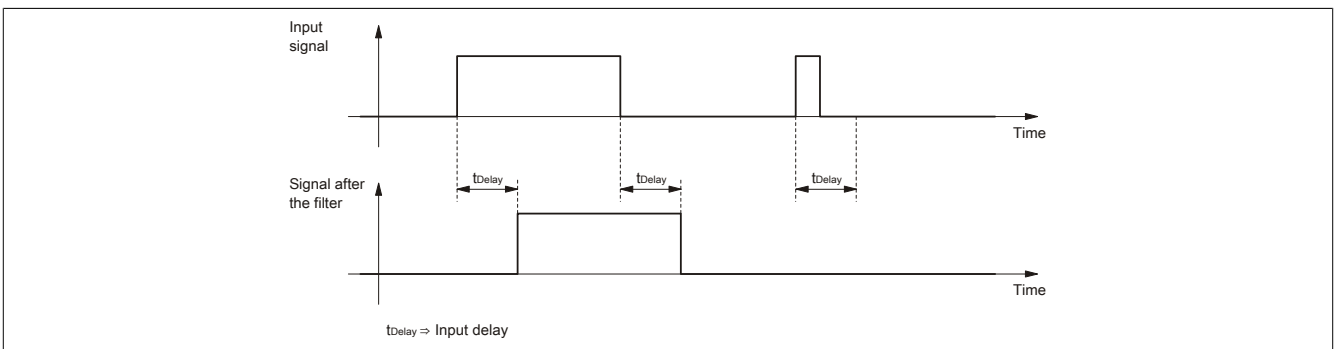

9.13.9.8 Input circuit diagram

9.13.9.9 Input filter

An input filter is available for each input. The input delay can be set using register "ConfigOutput02" on page 1494. Disturbance pulses which are shorter than the input delay are suppressed by the input filter.

9.13.9.10 Open circuit and short circuit detection

General Information

The X20DI4375 digital input module is equipped with open line and short circuit detection. To do this the sensor needs to be connected to the necessary resistances.

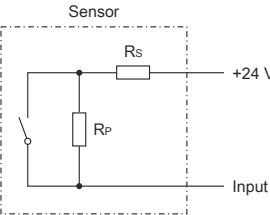

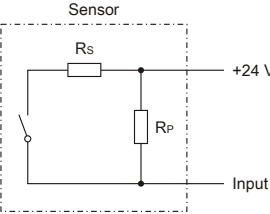

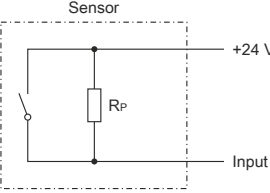

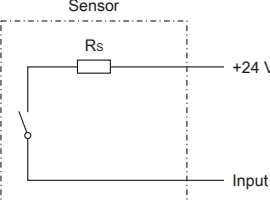

Sensor connections

The resistances are connected to the sensor parallel or in series. The following values are defined for the resistances:

| Resistance | Range |
|------------|--------------------------|
| Serial | 1 - 2 k Ω (10%) |
| Parallel | 10 - 20 k Ω (10%) |

Connection options

To guarantee error-free functionality of the open circuit and short circuit detection, the +24 VDC sensor supply from the module must absolutely be used.

| Sensor connections | Description | Detection | Setting in configuration register |
|---|--------------------------------|--------------------------------|-----------------------------------|
|  | Standard connection | - | 0 |
|  | Series and parallel resistance | Open circuit and short circuit | 1 |
|  | Parallel and series resistor | Open circuit and short circuit | 2 |
|  | Parallel resistance | Open line | 3 |
|  | Series resistor | Short circuit | 4 |

9.13.9.11 Error status

The following errors are detected by the module and can be evaluated separately for each channel:

- Sensor line short circuit
- Sensor line open circuit
- Sensor supply
- Other channel error

9.13.9.12 Timestamp

Each converted value is given a timestamp. The time of the last conversion can be read.

9.13.9.13 Configuration

The sensor connections and therefore the sensor monitoring are set in the configuration register. Sensor monitoring and the settings in the configuration register are described in section "[Open circuit and short circuit detection](#)" on [page 1490](#).

9.13.9.14 Register description

9.13.9.14.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section ["General data points" on page 3790](#).

9.13.9.14.2 Function model 0 - Standard

| Register | Name | Data type | Read | | Write | |
|----------------------|---|-----------|--------|---------|--------|---------|
| | | | Cyclic | Acyclic | Cyclic | Acyclic |
| Configuration | | | | | | |
| 2050 | ConfigOutput01 (power monitoring) | UINT | | | | • |

| IE_DigitalInput01 | Bit 3 | | | | | | |
| 2324 | - | | | SampleTimeStamp | UDINT | | • |

1) The offset specifies the position of the register within the CAN object.

9.13.9.14.3.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see ["Using I/O modules on the bus controller" on page 3789](#).

9.13.9.14.3.2 CAN I/O bus controller

The module occupies 1 digital logical slot on CAN I/O.

9.13.9.14.4 Digital inputs

Unfiltered

The input state is collected with a fixed offset to the network cycle and transferred in the same cycle.

Filtered

The filtered status is collected with a fixed offset to the network cycle and transferred in the same cycle. Filtering takes place asynchronously to the network in multiples of 200 µs with a network-related jitter of up to 50 µs.

9.13.9.14.4.1 Digital input filter

Name:

ConfigOutput02

This register can be used to specify the filter value for all digital inputs.

The filter value can be configured in steps of 100 μ s. It makes sense to enter values in steps of 2, however, since the input signals are sampled every 200 μ s.

| Data type | Value | Filter |
|-----------|-------|---|
| USINT | 0 | No software filter (bus controller default setting) |
| | 2 | 0.2 ms |
| | ... | ... |
| | 250 | 25 ms - Higher values are limited to this value |

9.13.9.14.4.2 Input status of digital inputs 1 to 4

Name:

DigitalInput or

DigitalInput01 to DigitalInput04

StateDigitalInput01 to StateDigitalInput04

The input status and status of digital inputs 1 to 4 are mapped in this register.

Only function model 0 - Standard:

The "Packed inputs" setting in the Automation Studio I/O configuration is used to determine whether all of the bits from these registers should be set up individually as data points in the Automation Studio I/O mapping ("DigitalInput01" through "DigitalInput04" and "StateDigitalInput01" through "StateDigitalInput04") or whether this register should be displayed as an individual USINT data point ("DigitalInput").

| Data type | Value | Information |
|-----------|------------------------|---|
| USINT | 0 to 255 | Packed inputs = On |
| | See the bit structure. | Packed inputs = Off or function model \neq 0 - Standard |

Bit structure:

| Bit | Name | Value | Information |
|-----|---------------------|--------|--|
| 0 | DigitalInput01 | 0 or 1 | Input status - Digital input 1 |
| ... | | ... | |
| 3 | DigitalInput04 | 0 or 1 | Input state - Digital input 4 |
| 4 | StateDigitalInput01 | 0 | No error |
| | | 1 | Short-circuit, open line, sensor monitoring error or other channel error |
| ... | | ... | |
| 7 | StateDigitalInput04 | 0 | No error |
| | | 1 | Short-circuit, open line, sensor monitoring error or other channel error |

9.13.9.14.5 Short circuit monitoring of channels 1 to 4

Name:

StatusInput01 or

SC_DigitalInput01 to SC_DigitalInput04

This register indicates whether a short circuit has occurred on the individual channels.

Function model 0 - Standard only:

The "Packed inputs" setting in the Automation Studio I/O configuration is used to determine whether all of the bits from these registers should be set up individually as data points in the Automation Studio I/O mapping ("SC_DigitalInput01" through "SC_DigitalInput04") or whether this register should be displayed as an individual USINT data point ("StatusInput01").

| Data type | Value | Information |
|-----------|------------------------|--|
| USINT | 0 to 15 | Packed inputs = On |
| | See the bit structure. | Packed inputs = Off or function model ≠ 0 - Standard |

Bit structure:

| Bit | Name | Value | Information |
|-------|-------------------|-------|----------------------------|
| 0 | SC_DigitalInput01 | 0 | No error |
| | | 1 | Short circuit on channel 1 |
| ... | | ... | |
| 3 | SC_DigitalInput04 | 0 | No error |
| | | 1 | Short circuit on channel 4 |
| 4 - 7 | Reserved | - | |

9.13.9.14.6 Open line monitoring on channels 1 to 4

Name:

StatusInput02 or

WB_DigitalInput01 to WB_DigitalInput04

This register indicates whether an open line has occurred on the individual channels.

Function model 0 - Standard only:

The "Packed inputs" setting in the Automation Studio I/O configuration is used to determine whether all of the bits from these registers should be set up individually as data points in the Automation Studio I/O mapping ("WB_DigitalInput01" through "WB_DigitalInput04") or whether this register should be displayed as an individual USINT data point ("StatusInput02").

| Data type | Value | Information |
|-----------|------------------------|--|
| USINT | 0 to 15 | Packed inputs = On |
| | See the bit structure. | Packed inputs = Off or function model ≠ 0 - Standard |

Bit structure:

| Bit | Name | Value | Information |
|-------|-------------------|-------|------------------------|
| 0 | WB_DigitalInput01 | 0 | No error |
| | | 1 | Open line on channel 1 |
| ... | | ... | |
| 3 | WB_DigitalInput04 | 0 | No error. |
| | | 1 | Open line on channel 4 |
| 4 - 7 | Reserved | - | |

9.13.9.14.7 Voltage monitoring on channels 1 to 4

Name:

StatusInput03 or
SM_DigitalInput01 to SM_DigitalInput04

This register monitors the voltage supply on the individual channels.

Function model 0 - Standard only:

The "Packed inputs" setting in the Automation Studio I/O configuration is used to determine whether all of the bits from these registers should be set up individually as data points in the Automation Studio I/O mapping ("SM_DigitalInput01" through "SM_DigitalInput04") or whether this register should be displayed as an individual USINT data point ("StatusInput03").

| Data type | Value | Information |
|-----------|------------------------|--|
| USINT | 0 to 15 | Packed inputs = On |
| | See the bit structure. | Packed inputs = Off or function model ≠ 0 - Standard |

Bit structure:

| Bit | Name | Value | Information |
|-------|-------------------|-------|----------------------------------|
| 0 | SM_DigitalInput01 | 0 | No error |
| | | 1 | Sensor supply error on channel 1 |
| ... | | ... | |
| 3 | SM_DigitalInput04 | 0 | No error |
| | | 1 | Sensor supply error on channel 4 |
| 4 - 7 | Reserved | - | |

9.13.9.14.8 Error monitoring on channels 1 to 4

Name:

StatusInput04 or
IE_DigitalInput01 to IE_DigitalInput04

This register indicates whether any other errors have occurred on the individual channels.

Function model 0 - Standard only:

The "Packed inputs" setting in the Automation Studio I/O configuration is used to determine whether all of the bits from these registers should be set up individually as data points in the Automation Studio I/O mapping ("IE_DigitalInput01" through "IE_DigitalInput04") or whether this register should be displayed as an individual USINT data point ("StatusInput04").

| Data type | Value | Information |
|-----------|------------------------|--|
| USINT | 0 to 15 | Packed inputs = On |
| | See the bit structure. | Packed inputs = Off or function model ≠ 0 - Standard |

Bit structure:

| Bit | Name | Value | Information |
|-------|-------------------|-------|--------------------------|
| 0 | IE_DigitalInput01 | 0 | No error |
| | | 1 | Other error on channel 1 |
| ... | | ... | |
| 3 | IE_DigitalInput04 | 0 | No error |
| | | 1 | Other error on channel 4 |
| 4 - 7 | Reserved | - | |

9.13.9.14.9 Timestamp of last conversion

Name:

SampleTimeStamp

This register shows the timestamp of the last conversion in μ s.

| Data type | Value |
|-----------|---|
| UDINT | Timestamp of the last conversion in μ s |

9.13.9.14.10 Configuration of line status monitoring

Name:

ConfigOutput01

This register is used to configure short circuit monitoring and line status monitoring on the inputs.

| Data type | Value | Bus controller default setting |
|-----------|-------------------|--------------------------------|
| UINT | See bit structure | 0 |

Bit structure:

| Bit | Name | Value | Information |
|---------|-----------------------------------|---------|---|
| 0 - 3 | Channel configuration - Channel 1 | 0 | Default (bus controller default setting) |
| | | 1 | Serial/Parallel: R-1k in series with (R-10k parallel to the switch) |
| | | 2 | Parallel/Serial: R-10k parallel to (R-1k in series with switch) |
| | | 3 | Parallel: R-10k parallel to switch |
| | | 4 | Serial: R-1k in series with switch |
| | | 5 to 15 | Inactive |
| 4 - 7 | Channel configuration - Channel 2 | 0 to 15 | See Channel configuration - Channel 1 |
| 8 - 11 | Channel configuration - Channel 3 | 0 to 15 | See Channel configuration - Channel 1 |
| 12 - 15 | Channel configuration - Channel 4 | 0 to 15 | See Channel configuration - Channel 1 |

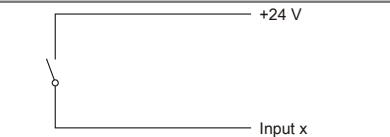

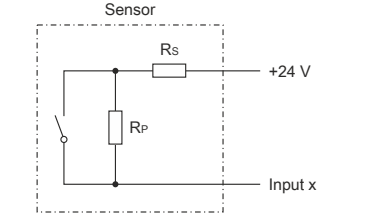

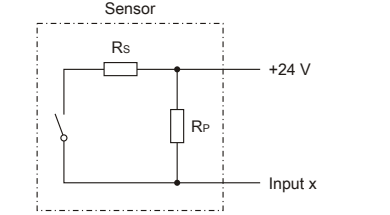

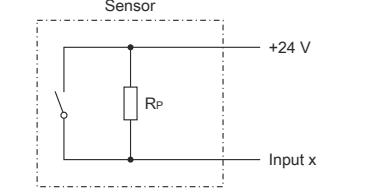

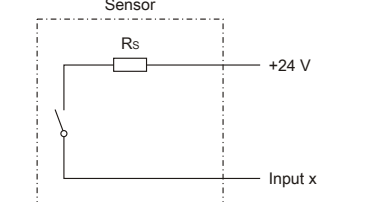

The name R-1k indicates a resistance in the permitted range of 1000 Ohm to 2000 Ohm with an accuracy of 10%.

The name R-10k indicates a resistance in the permitted range of 10000 Ohm to 20000 Ohm with an accuracy of 10%.

Information:

Inputs that are not being used should be set to the type "Standard" or "Serial" to prevent mistakes.

Configuration Possibilities:

| Value | Configuration | Diagram | Information |
|-------|-----------------|---|---|
| 0 | Standard |  | Short-circuit detection and line break monitoring is not possible when using this configuration. |
| 1 | Serial/parallel |  | Short-circuit detection and line break monitoring is possible with this configuration. |
| 2 | Parallel/serial |  | Short-circuit detection and line break monitoring is possible with this configuration. |
| 3 | Parallel |  | This configuration allows line break monitoring. Short-circuit detection is not possible when using this configuration. |
| 4 | Serial |  | This configuration allows short circuit detection. Line break monitoring is not possible when using this configuration. |

9.13.9.14.11 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time | |
|--------------------|--------|
| All channels | 150 µs |

9.13.9.14.12 Minimum I/O update time

The minimum I/O update time specifies how far the bus cycle can be reduced so that an I/O update is performed in each cycle.

| Minimum I/O update time | |
|-------------------------|--------|
| All channels | 150 µs |

9.13.10 X20DI4653

Data sheet version: 3.08

9.13.10.1 General Information

The module is equipped with 4 inputs for 2-wire connections. It is designed for an input voltage of 100 to 240 VAC.

- 4 digital inputs
- 100 to 240 VAC inputs
- 50 Hz or 60 Hz
- 2-wire connections
- 240 V coded

Danger!

Risk of electric shock!

The terminal block is only permitted to conduct voltage when it is connected. It is not permitted to be disconnected or connected while voltage is applied or have voltage applied to it while it is removed under any circumstances.

This module is not permitted to be the last module connected on the X2X Link network. At least one subsequent X20ZF dummy module must provide protection against contact.

9.13.10.2 Order data

| Model number | Short description | Figure |
|--------------|---|--|
| | Digital inputs |  |
| X20DI4653 | X20 digital input module, 4 inputs, 100 to 240 VAC, 240 V keyed, 2-wire connections | |
| | Required accessories | |
| | Bus modules | |
| X20BM12 | X20 bus module, 240 VAC keyed, internal I/O power supply connected through | |
| | Terminal blocks | |
| X20TB32 | X20 terminal block, 12-pin, 240 VAC keyed | |

Table 272: X20DI4653 - Technical data

9.13.10.4 Status LEDs

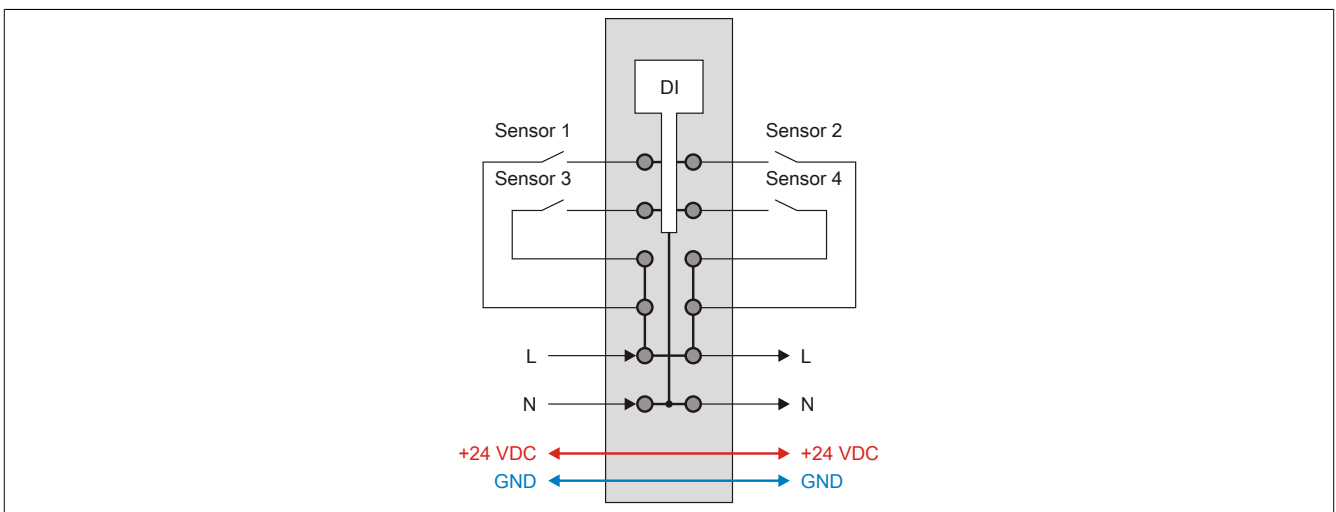

For a description of the various operating modes, see "Diagnostic LEDs" on page 3787.

| Image | LED | Color | Status | Description |
|---|-------|-----------------------------|--------------|---|
|  | r | Green | Off | No power to module |
| | | | Single flash | RESET mode |
| | | | Blinking | PREOPERATIONAL mode |
| | | | On | RUN mode |
| | e | Red | Off | Module supply not connected or everything OK |
| | | | Double flash | External supply is too low or not connected |
| | e + r | Red on / Green single flash | | Invalid firmware |
| | 1 - 4 | Green | | Input status of the corresponding digital input |

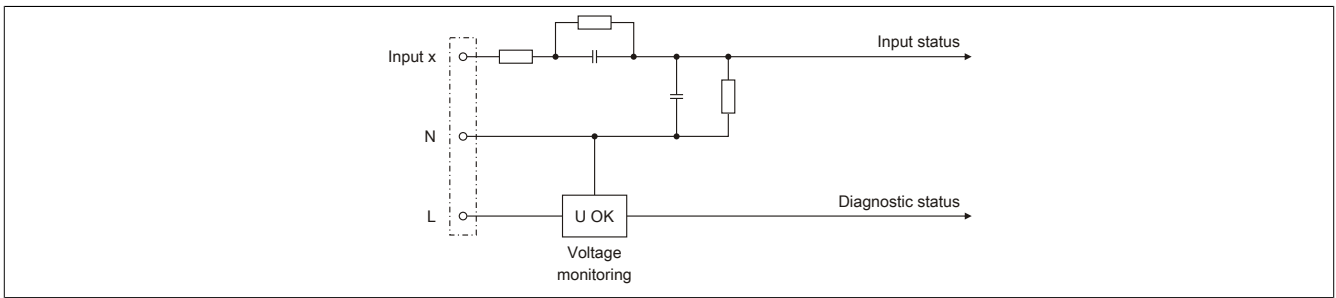

9.13.10.5 Pinout

9.13.10.6 Connection example

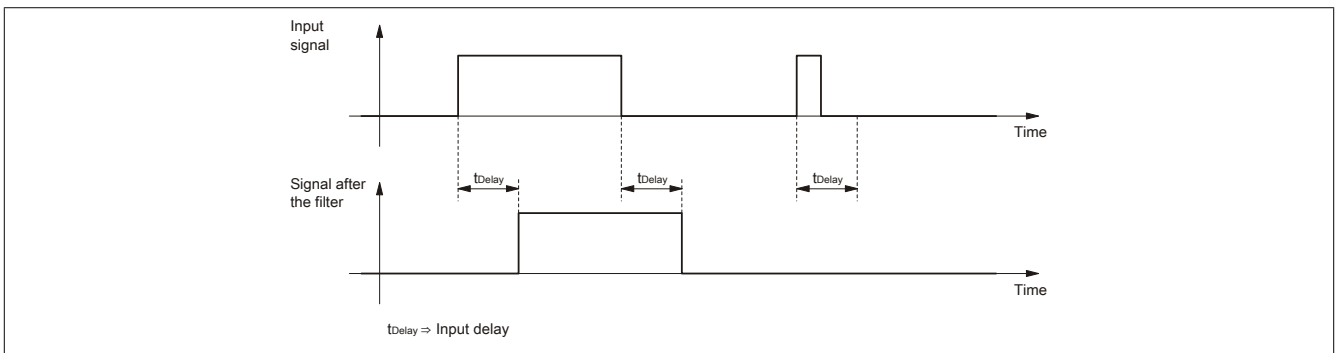

9.13.10.7 Input circuit diagram

9.13.10.8 Input filter

An input filter is available for each input. The input delay can be set using register "ConfigOutput01" on page 1504. Disturbance pulses which are shorter than the input delay are suppressed by the input filter.

9.13.10.9 Register description

9.13.10.9.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section "[General data points](#)" on page 3790.

9.13.10.9.2 Function model 0 - Standard

| Register | Fixed offset | Name | Data type | Read | | Write | |
|----------------------|--------------|-------------------------------|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| Configuration | | | | | | | |
| 18 | - | ConfigOutput01 (input filter) | USINT | | | | • |
| Communication | | | | | | | |
| 0 | 1 | DigitalInput | USINT | • | | | |
| | | DigitalInput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | DigitalInput04 | Bit 3 | | | | |
| | | PowerSupply | Bit 7 | | | | |

Fixed modules require their data points to be in a specific order in the X2X frame. Cyclic access occurs according to a predefined offset, not based on the register address.

Acyclic access continues to be based on the register numbers.

9.13.10.9.3 Function model 254 - Bus Controller

| Register | Offset ¹⁾ | Name | Data type | Read | | Write | |
|----------------------|----------------------|---------------------------------------|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| Configuration | | | | | | | |
| 18 | - | ConfigOutput01 (input filter) | USINT | | | | • |
| Communication | | | | | | | |
| 0 | 0 | Input status of digital inputs 1 to 4 | USINT | • | | | |
| | | DigitalInput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | DigitalInput04 | Bit 3 | | | | |
| | | PowerSupply | Bit 7 | | | | |

1) The offset specifies where the register is within the CAN object.

9.13.10.9.3.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see "[Using I/O modules on the bus controller](#)" on page 3789.

9.13.10.9.3.2 CAN I/O bus controller

The module occupies 1 digital logical slot on CAN I/O.

9.13.10.9.4 Digital inputs

Unfiltered

The input state is collected with a fixed offset to the network cycle and transferred in the same cycle.

Filtered

The filtered status is collected with a fixed offset to the network cycle and transferred in the same cycle. Filtering takes place asynchronously to the network in multiples of 200 µs with a network-related jitter of up to 50 µs.

9.13.10.9.4.1 Digital input filter

Name:

ConfigOutput01

This register can be used to specify the filter value for all digital inputs.

The filter value can be configured in steps of 100 μ s. It makes sense to enter values in steps of 2, however, since the input signals are sampled every 200 μ s.

| Data type | Value | Filter |
|-----------|-------|---|
| USINT | 0 | No software filter (bus controller default setting) |
| | 2 | 0.2 ms |
| | ... | ... |
| | 250 | 25 ms - Higher values are limited to this value |

9.13.10.9.4.2 Input status of digital inputs 1 to 4

Name:

DigitalInput or

DigitalInput01 to DigitalInput04

PowerSupply

The input status of digital inputs 1 to 4 is mapped in this register.

Only function model 0 - Standard:

The "Packed inputs" setting in the Automation Studio I/O configuration is used to determine whether all of the bits from these registers should be set up individually as data points in the Automation Studio I/O mapping ("DigitalInput01" through "DigitalInput04" and "PowerSupply") or whether this register should be displayed as an individual USINT data point ("DigitalInput").

| Data type | Value | Information |
|-----------|------------------------|---|
| USINT | 0 to 15 | Packed inputs = On |
| | See the bit structure. | Packed inputs = Off or function model \neq 0 - Standard |

Bit structure:

| Bit | Name | Value | Information |
|-------|----------------|--------|--------------------------------|
| 0 | DigitalInput01 | 0 or 1 | Input status - Digital input 1 |
| ... | | ... | |
| 3 | DigitalInput04 | 0 or 1 | Input state - Digital input 4 |
| 4 - 6 | Reserved | 0 | |
| 7 | PowerSupply | 0 | Supply voltage too low |
| | | 1 | Supply voltage >80 VAC |

9.13.10.9.5 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time | |
|--------------------|-------------|
| Without filtering | 100 μ s |
| With filtering | 150 μ s |

9.13.10.9.6 Minimum I/O update time

The minimum I/O update time specifies how far the bus cycle can be reduced so that an I/O update is performed in each cycle.

| Minimum I/O update time | |
|-------------------------|-------------|
| Without filtering | 100 μ s |
| With filtering | 200 μ s |

9.13.11 X20(c)DI4760

Data sheet version: 3.22

9.13.11.1 General Information

The module is used to transfer digital signals from NAMUR encoders according to EN 60947-5-6. In addition to NAMUR encoders, normal switches can also be used.

- 4 digital inputs
- Input module for NAMUR encoders
- Open line and short circuit detection
- Each input can be used as a counter input

9.13.11.2 Coated modules

Coated modules are X20 modules with a protective coating for the electronics component. This coating protects X20c modules from condensation and corrosive gases.

The modules' electronics are fully compatible with the corresponding X20 modules.

For simplification purposes, only images and module IDs of uncoated modules are used in this data sheet.

The coating has been certified according to the following standards:

- Condensation: BMW GS 95011-4, 2x 1 cycle
- Corrosive gas: EN 60068-2-60, method 4, exposure 21 days

9.13.11.2.1 Starting temperature

The starting temperature describes the minimum permissible ambient temperature when the power is switched off at the time the coated module is switched on. This is permitted to be as low as -40°C . During operation, the conditions as specified in the technical data continue to apply.

Information:

It is important to absolutely ensure that there is no forced cooling by air currents in a closed control cabinet, for example using a fan or ventilation slots.

9.13.11.3 Order data

| Model number | Short description | Figure |
|--------------|---|---|
| | Digital inputs |  |

| | | | Invalid firmware | |
| | 1 - 4 | Green | Off | Open line or input status log. 0 |
| | | | On | Short circuit or input status log. 1 |
| | 1 - 4 | Red | Off | The sensor is ready for operation |
| | | | Blinking 1Hz | Open line on corresponding channel |
| On | | | Short circuit on corresponding channel | |

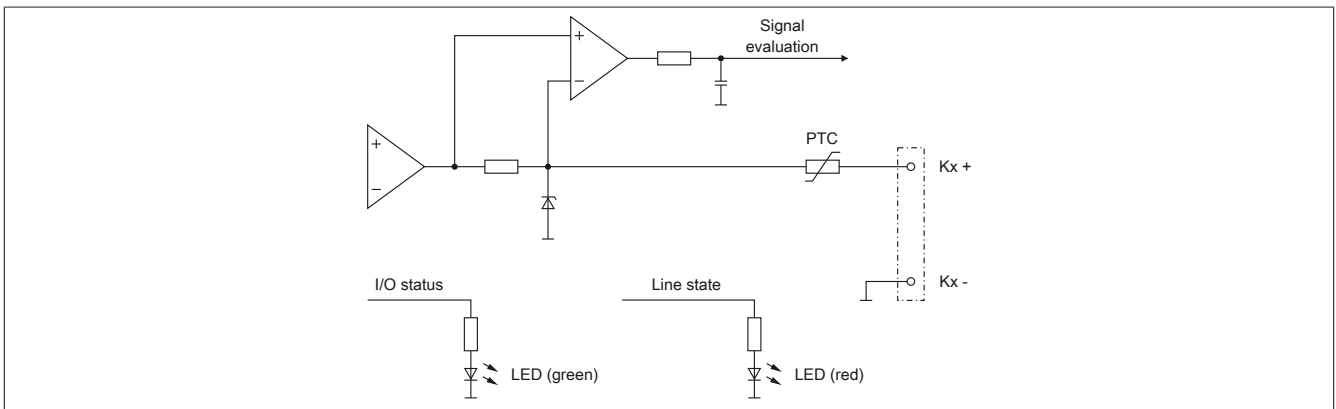

9.13.11.6 Pinout

9.13.11.7 Connection example

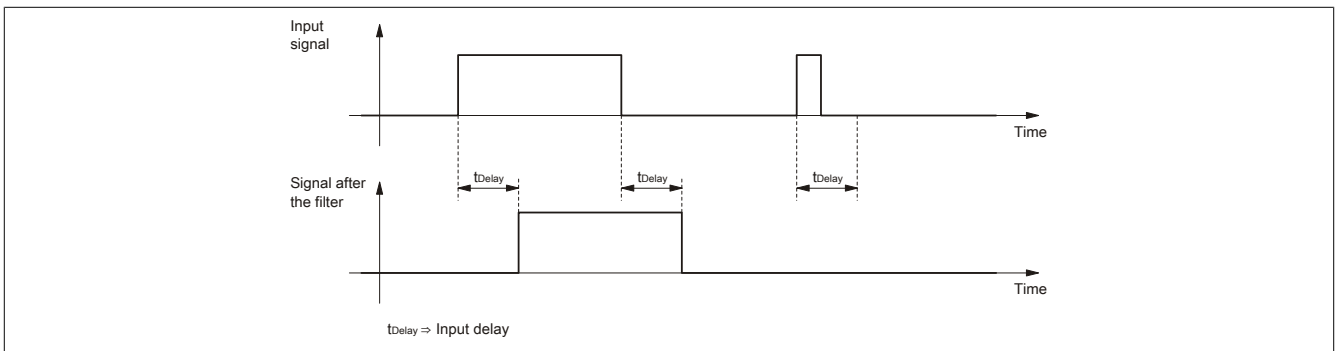

9.13.11.8 Input circuit diagram

9.13.11.9 Input filter

An input filter is available for each input. The input delay can be set using register "ConfigOutput03" on page 1511. Disturbance pulses which are shorter than the input delay are suppressed by the input filter.

9.13.11.10 Examples of possible signal generators

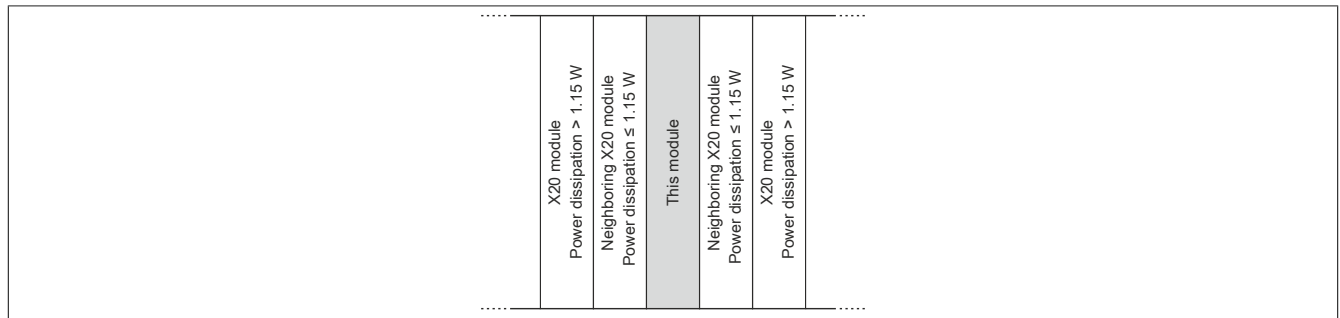

| Proximity switch | |
|---|--|
| Switch in accordance with EN 60947-5-6 (NAMUR) | |
| Mechanical contacts (instead of NAMUR encoders) | |
| Without open line detection and without short circuit detection | |
| Without open line detection and with short circuit detection | |
| With open line detection and without short circuit detection | |
| With open line detection and with short circuit detection | |

9.13.11.11 Derating

There is no derating when operated below 55°C.

During operation over 55°C, the power dissipation of the modules to the left and right of this module is not permitted to exceed 1.15 W!

For an example of calculating the power dissipation of I/O modules, see section "[Power dissipation calculation of I/O modules](#)" on page 101.

9.13.11.12 Register description

9.13.11.12.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section ["General data points" on page 3790](#).

9.13.11.12.2 Function model 0 - Standard

| Register | Name | Data type | Read | | Write | |
|----------------------|---|-----------|--------|---------|--------|---------|
| | | | Cyclic | Acyclic | Cyclic | Acyclic |
| Configuration | | | | | | |
| 16 | ConfigOutput01 (channel/status configuration) | USINT | | | | • |
| 18 | ConfigOutput02 (replacement values) | USINT | | | | • |
| 20 | ConfigOutput03 (input filter) | USINT | | | | • |
| Communication | | | | | | |
| 0 | DigitalInput | USINT | • | | | |
| | DigitalInput01 | Bit 0 | | | | |
| | ... | ... | | | | |
| | DigitalInput04 | Bit 3 | | | | |
| 4 | Counter01 | USINT | • | | | |
| 6 | Counter02 | USINT | • | | | |
| 8 | Counter03 | USINT | • | | | |
| 10 | Counter04 | USINT | • | | | |
| 30 | StatusInput | USINT | • | | | |
| | ShortCircuit01 | Bit 0 | | | | |
| | ... | ... | | | | |
| | ShortCircuit04 | Bit 3 | | | | |
| | OpenLine01 | Bit 4 | | | | |
| | ... | ... | | | | |
| | OpenLine04 | Bit 7 | | | | |

9.13.11.12.3 Function model 254 - Bus Controller

| Register | Offset ¹⁾ | Name | Data type | Read | | Write | |
|----------------------|----------------------|---|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| Configuration | | | | | | | |
| 16 | - | ConfigOutput01 (channel/status configuration) | USINT | | | | • |
| 18 | - | ConfigOutput02 (replacement values) | USINT | | | | • |
| 20 | - | ConfigOutput03 (input filter) | USINT | | | | • |
| Communication | | | | | | | |
| 0 | 0 | Input status of digital inputs 1 to 4 | USINT | • | | | |
| | | DigitalInput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | DigitalInput04 | Bit 3 | | | | |
| 4 | - | Counter01 | USINT | | • | | |
| 6 | - | Counter02 | USINT | | • | | |
| 8 | - | Counter03 | USINT | | • | | |
| 10 | - | Counter04 | USINT | | • | | |
| 30 | - | Status of channels 1 to 4 | USINT | • | | | |
| | | ShortCircuit01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | ShortCircuit04 | Bit 3 | | | | |
| | | OpenLine01 | Bit 4 | | | | |
| | | ... | ... | | | | |
| | | OpenLine04 | Bit 7 | | | | |

1) The offset specifies where the register is within the CAN object.

9.13.11.12.3.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see ["Using I/O modules on the bus controller" on page 3789](#).

9.13.11.12.3.2 CAN I/O bus controller

The module occupies 1 digital logical slot on CAN I/O.

9.13.11.12.4 Digital inputs

Unfiltered

The input state is collected with a fixed offset to the network cycle and transferred in the same cycle.

Filtered

The filtered status is collected with a fixed offset to the network cycle and transferred in the same cycle. Filtering takes place asynchronously to the network in multiples of 200 µs with a network-related jitter of up to 50 µs.

9.13.11.12.4.1 Digital input filter

Name:

ConfigOutput03

This register can be used to specify the filter value for all digital inputs.

The filter value can be configured in steps of 100 µs. It makes sense to enter values in steps of 2, however, since the input signals are sampled every 200 µs.

| Data type | Value | Filter |
|-----------|-------|---|
| USINT | 0 | No software filter (bus controller default setting) |
| | 2 | 0.2 ms |
| | ... | ... |
| | 250 | 25 ms - Higher values are limited to this value |

9.13.11.12.4.2 Input status of digital inputs 1 to 4

Name:

DigitalInput or

DigitalInput01 to DigitalInput04

PowerSupply

The input status of digital inputs 1 to 4 is mapped in this register.

Only function model 0 - Standard:

The "Packed inputs" setting in the Automation Studio I/O configuration is used to determine whether all of the bits from these registers should be set up individually as data points in the Automation Studio I/O mapping ("DigitalInput01" through "DigitalInput02" and "PowerSupply") or whether this register should be displayed as an individual USINT data point ("DigitalInput").

| Data type | Value | Information |
|-----------|------------------------|--|
| USINT | 0 to 15 | Packed inputs = On |
| | See the bit structure. | Packed inputs = Off or function model ≠ 0 - Standard |

Bit structure:

| Bit | Name | Value | Information |
|-------|----------------|--------|--------------------------------|
| 0 | DigitalInput01 | 0 or 1 | Input status - Digital input 1 |
| ... | | ... | |
| 3 | DigitalInput04 | 0 or 1 | Input state - Digital input 4 |
| 4 - 6 | Reserved | 0 | |
| 7 | PowerSupply | 0 | Supply voltage too low |
| | | 1 | Supply voltage >80 VAC |

9.13.11.12.5 Positive edge counter on digital inputs

Name:

Counter01 to Counter04

These registers cyclically count the positive edges on the individual channels.

| Data type | Value |
|-----------|--|
| USINT | Positive edge counter on channel, cyclic |

9.13.11.12.6 Status of channels 1 to 4

Name:

StatusInput01 and

ShortCircuit01 to ShortCircuit04

OpenLine01 to OpenLine04

This register indicates whether an open line or overflow has occurred on the individual channels.

Only function model 0 - Standard:

The "Packed inputs" setting in the Automation Studio I/O configuration is used to determine whether all of the bits from these registers should be set up individually as data points in the Automation Studio I/O mapping ("ShortCircuit01" to "ShortCircuit04" and "OpenLine01" to "OpenLine04") or whether this register should be displayed as an individual USINT data point ("StatusInput01").

| Data type | Values | Information |
|-----------|--------------------|---|
| USINT | 0 to 255 | Packed inputs = On |
| | See bit structure. | Packed inputs = Off or Function model <> 0 - Standard |

Bit structure:

| Bit | Name | Value | Information |
|-----|----------------|-------|------------------------|
| 0 | ShortCircuit01 | 0 | No error |
| | | 1 | Overload on channel 1 |
| ... | | ... | |
| 3 | ShortCircuit04 | 0 | No error |
| | | 1 | Overload on channel 4 |
| 4 | OpenLine01 | 0 | No error |
| | | 1 | Open line on channel 1 |
| ... | | ... | |
| 7 | OpenLine04 | 0 | No error |
| | | 1 | Open line on channel 4 |

9.13.11.12.7 Function expansion

Firmware version 802 is offered for hardware variant 7 or higher of the module. This and subsequent firmware versions provide the user with new configuration possibilities.

9.13.11.12.7.1 Disabling channels and status messages

Name:

ConfigOutput01

This register can be used to (de)activate individual channels or just their status responses.

| Data type | Values | Bus controller default setting |
|-----------|------------------------|--------------------------------|
| USINT | See the bit structure. | 0 |

Bit structure:

| Bit | Name | Value | Information |
|-----|----------------------------|-------|---|
| 0 | Channel 1 | 0 | Channel enabled (bus controller default setting) |
| | | 1 | Channel disabled |
| ... | | ... | |
| 3 | Channel 4 | 0 | Channel enabled (bus controller default setting) |
| | | 1 | Channel disabled |
| 4 | Status message - Channel 1 | 0 | Status message enabled (bus controller default setting) |
| | | 1 | Status message deactivated |
| ... | | ... | |
| 7 | Status message - Channel 4 | 0 | Status message enabled (bus controller default setting) |
| | | 1 | Status message deactivated |

9.13.11.12.7.2 Replacement values during overload

Name:

ConfigOutput02

This register can be used to specify defined replacement values for the individual channels according to the error situation.

| Data type | Values | Bus controller default setting |
|-----------|------------------------|--------------------------------|
| USINT | See the bit structure. | 15 |

Bit structure:

| Bit | Name | Value | Information |
|-----|-----------------------|-------|---|
| 0 | Overload - Channel 1 | 0 | Replacement value when overload is FALSE |
| | | 1 | Replacement value if overload TRUE (bus controller default setting) |
| ... | | ... | |
| 3 | Overload - Channel 4 | 0 | Replacement value when overload is FALSE |
| | | 1 | Replacement value if overload TRUE (bus controller default setting) |
| 4 | Open line - Channel 1 | 0 | Replacement value when open line is FALSE |
| | | 1 | Replacement value if open circuit TRUE (bus controller default setting) |
| ... | | ... | |
| 7 | Open line - Channel 4 | 0 | Replacement value when open line is FALSE |
| | | 1 | Replacement value if open circuit TRUE (bus controller default setting) |

9.13.11.12.8 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time | |
|--------------------|--------|
| Without filtering | 100 µs |
| With filtering | 150 µs |

9.13.11.12.9 Minimum I/O update time

The minimum I/O update time specifies how far the bus cycle can be reduced so that an I/O update is performed in each cycle.

| Minimum I/O update time | |
|-------------------------|--------|
| Without filtering | 100 µs |
| With filtering | 200 µs |

9.13.12 X20(c)DI6371

Data sheet version: 3.19

9.13.12.1 General Information

The module is equipped with 6 inputs for 1 or 2-wire connections. The X20 6-pin terminal block can be used for universal 1-line wiring. Two-line wiring can be implemented using the 12-pin terminal block. The inputs on the module are designed for sink connections.

- 6 digital inputs
- Sink connection
- 2-wire connections
- 24 VDC for sensor supply
- Software input filter can be configured for entire module
- 1-wire connection type with 6-pin terminal block

9.13.12.2 Coated modules

Coated modules are X20 modules with a protective coating for the electronics component. This coating protects X20c modules from condensation and corrosive gases.

The modules' electronics are fully compatible with the corresponding X20 modules.

For simplification purposes, only images and module IDs of uncoated modules are used in this data sheet.

The coating has been certified according to the following standards:

- Condensation: BMW GS 95011-4, 2x 1 cycle
- Corrosive gas: EN 60068-2-60, method 4, exposure 21 days

9.13.12.2.1 -40°C starting temperature

The starting temperature describes the minimum permissible ambient temperature when the power is switched off at the time the coated module is switched on. This is permitted to be as low as -40°C. During operation, the conditions as specified in the technical data continue to apply.

Information:

It is important to absolutely ensure that there is no forced cooling by air currents in a closed control cabinet, for example using a fan or ventilation slots.

9.13.12.3 Order data

9.13.12.6 Pinout

9.13.12.7 Connection example

9.13.12.8 Input circuit diagram

9.13.12.9 Input filter

An input filter is available for each input. The input delay can be set using register "[ConfigOutput01](#)" on page 1519. Disturbance pulses which are shorter than the input delay are suppressed by the input filter.

9.13.12.10 Register description

9.13.12.10.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section ["General data points" on page 3790](#).

9.13.12.10.2 Function model 0 - Standard

| Register | Fixed offset | Name | Data type | Read | | Write | |
|----------------------|--------------|-------------------------------|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| Configuration | | | | | | | |
| 18 | - | ConfigOutput01 (input filter) | USINT | | | | • |
| Communication | | | | | | | |
| 0 | 1 | DigitalInput | USINT | • | | | |
| | | DigitalInput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | DigitalInput06 | Bit 5 | | | | |

Fixed modules require their data points to be in a specific order in the X2X frame. Cyclic access occurs according to a predefined offset, not based on the register address.

Acyclic access continues to be based on the register numbers.

9.13.12.10.3 Function model 254 - Bus Controller

| Register | Offset ¹⁾ | Name | Data type | Read | | Write | |
|----------------------|----------------------|---------------------------------------|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| Configuration | | | | | | | |
| 18 | - | ConfigOutput01 (input filter) | USINT | | | | • |
| Communication | | | | | | | |
| 0 | 0 | Input status of digital inputs 1 to 6 | USINT | • | | | |
| | | DigitalInput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | DigitalInput06 | Bit 5 | | | | |

1) The offset specifies where the register is within the CAN object.

9.13.12.10.3.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see ["Using I/O modules on the bus controller" on page 3789](#).

9.13.12.10.3.2 CAN I/O bus controller

The module occupies 1 digital logical slot on CAN I/O.

9.13.12.10.4 Digital inputs

Unfiltered

The input state is collected with a fixed offset to the network cycle and transferred in the same cycle.

Filtered

The filtered status is collected with a fixed offset to the network cycle and transferred in the same cycle. Filtering takes place asynchronously to the network in multiples of 200 µs with a network-related jitter of up to 50 µs.

9.13.12.10.4.1 Digital input filter

Name:

ConfigOutput01

This register can be used to specify the filter value for all digital inputs.

The filter value can be configured in steps of 100 μ s. It makes sense to enter values in steps of 2, however, since the input signals are sampled every 200 μ s.

| Data type | Value | Filter |
|-----------|-------|---|
| USINT | 0 | No software filter (bus controller default setting) |
| | 2 | 0.2 ms |
| | ... | ... |
| | 250 | 25 ms - Higher values are limited to this value |

9.13.12.10.4.2 Input status of digital inputs 1 to 6

Name:

DigitalInput or

DigitalInput01 to DigitalInput06

The input status of digital inputs 1 to 6 is mapped in this register.

Only function model 0 - Standard:

The "Packed inputs" setting in the Automation Studio I/O configuration is used to determine whether all of the bits from these registers should be set up individually as data points in the Automation Studio I/O mapping ("DigitalInput01" through "DigitalInput06") or whether this register should be displayed as an individual USINT data point ("DigitalInput").

| Data type | Value | Information |
|-----------|------------------------|---|
| USINT | 0 to 63 | Packed inputs = On |
| | See the bit structure. | Packed inputs = Off or function model \neq 0 - Standard |

Bit structure:

| Bit | Name | Value | Information |
|-----|----------------|--------|--------------------------------|
| 0 | DigitalInput01 | 0 or 1 | Input status - Digital input 1 |
| ... | | ... | |
| 5 | DigitalInput06 | 0 or 1 | Input state - Digital input 6 |

9.13.12.10.5 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time | |
|--------------------|-------------|
| Without filtering | 100 μ s |
| With filtering | 150 μ s |

9.13.12.10.6 Minimum I/O update time

The minimum I/O update time specifies how far the bus cycle can be reduced so that an I/O update is performed in each cycle.

| Minimum I/O update time | |
|-------------------------|-------------|
| Without filtering | 100 μ s |
| With filtering | 200 μ s |

9.13.13 X20(c)DI6372

Data sheet version: 3.19

9.13.13.1 General Information

The module is equipped with 6 inputs for 1 or 2-wire connections. The X20 6-pin terminal block can be used for universal 1-line wiring. Two-line wiring can be implemented using the 12-pin terminal block. The inputs on the module are designed for source connections.

- 6 digital inputs
- Source connection
- 2-wire connections
- Software input filter can be configured for entire module
- 1-wire connection type with 6-pin terminal block

9.13.13.2 Coated modules

Coated modules are X20 modules with a protective coating for the electronics component. This coating protects X20c modules from condensation and corrosive gases.

The modules' electronics are fully compatible with the corresponding X20 modules.

For simplification purposes, only images and module IDs of uncoated modules are used in this data sheet.

The coating has been certified according to the following standards:

- Condensation: BMW GS 95011-4, 2x 1 cycle
- Corrosive gas: EN 60068-2-60, method 4, exposure 21 days

9.13.13.2.1 -40°C starting temperature

The starting temperature describes the minimum permissible ambient temperature when the power is switched off at the time the coated module is switched on. This is permitted to be as low as -40°C. During operation, the conditions as specified in the technical data continue to apply.

Information:

It is important to absolutely ensure that there is no forced cooling by air currents in a closed control cabinet, for example using a fan or ventilation slots.

9.13.13.3 Order data

| Model number | Short description | Figure |

9.13.13.6 Pinout

9.13.13.7 Connection example

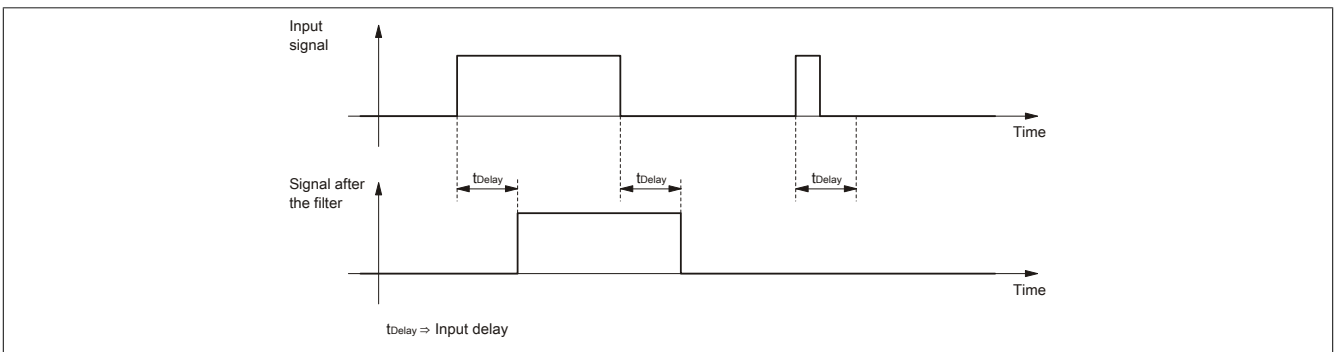

9.13.13.8 Input circuit diagram

9.13.13.9 Input filter

An input filter is available for each input. The input delay can be set using register "[ConfigOutput01](#)" on page 1525. Disturbance pulses which are shorter than the input delay are suppressed by the input filter.

9.13.13.10 Register description

9.13.13.10.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section ["General data points" on page 3790](#).

9.13.13.10.2 Function model 0 - Standard

| Register | Fixed offset | Name | Data type | Read | | Write | |
|----------------------|--------------|-------------------------------|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| Configuration | | | | | | | |
| 18 | - | ConfigOutput01 (input filter) | USINT | | | | • |
| Communication | | | | | | | |
| 0 | 1 | DigitalInput | USINT | • | | | |
| | | DigitalInput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | DigitalInput06 | Bit 5 | | | | |

Fixed modules require their data points to be in a specific order in the X2X frame. Cyclic access occurs according to a predefined offset, not based on the register address.

Acyclic access continues to be based on the register numbers.

9.13.13.10.3 Function model 254 - Bus Controller

| Register | Offset ¹⁾ | Name | Data type | Read | | Write | |
|----------------------|----------------------|---------------------------------------|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| Configuration | | | | | | | |
| 18 | - | ConfigOutput01 (input filter) | USINT | | | | • |
| Communication | | | | | | | |
| 0 | 0 | Input status of digital inputs 1 to 6 | USINT | • | | | |
| | | DigitalInput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | DigitalInput06 | Bit 5 | | | | |

1) The offset specifies where the register is within the CAN object.

9.13.13.10.3.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see ["Using I/O modules on the bus controller" on page 3789](#).

9.13.13.10.3.2 CAN I/O bus controller

The module occupies 1 digital logical slot on CAN I/O.

9.13.13.10.4 Digital inputs

Unfiltered

The input state is collected with a fixed offset to the network cycle and transferred in the same cycle.

Filtered

The filtered status is collected with a fixed offset to the network cycle and transferred in the same cycle. Filtering takes place asynchronously to the network in multiples of 200 µs with a network-related jitter of up to 50 µs.

9.13.13.10.4.1 Digital input filter

Name:

ConfigOutput01

This register can be used to specify the filter value for all digital inputs.

The filter value can be configured in steps of 100 µs. It makes sense to enter values in steps of 2, however, since the input signals are sampled every 200 µs.

| Data type | Value | Filter |
|-----------|-------|---|
| USINT | 0 | No software filter (bus controller default setting) |
| | 2 | 0.2 ms |
| | ... | ... |
| | 250 | 25 ms - Higher values are limited to this value |

9.13.13.10.4.2 Input status of digital inputs 1 to 6

Name:

DigitalInput or

DigitalInput01 to DigitalInput06

The input status of digital inputs 1 to 6 is mapped in this register.

Only function model 0 - Standard:

The "Packed inputs" setting in the Automation Studio I/O configuration is used to determine whether all of the bits from these registers should be set up individually as data points in the Automation Studio I/O mapping ("DigitalInput01" through "DigitalInput06") or whether this register should be displayed as an individual USINT data point ("DigitalInput").

| Data type | Value | Information |
|-----------|------------------------|--|
| USINT | 0 to 63 | Packed inputs = On |
| | See the bit structure. | Packed inputs = Off or function model ≠ 0 - Standard |

Bit structure:

| Bit | Name | Value | Information |
|-----|----------------|--------|--------------------------------|
| 0 | DigitalInput01 | 0 or 1 | Input status - Digital input 1 |
| ... | | ... | |
| 5 | DigitalInput06 | 0 or 1 | Input state - Digital input 6 |

9.13.13.10.5 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time | |
|--------------------|--------|
| Without filtering | 100 µs |
| With filtering | 150 µs |

9.13.13.10.6 Minimum I/O update time

The minimum I/O update time specifies how far the bus cycle can be reduced so that an I/O update is performed in each cycle.

| Minimum I/O update time | |
|-------------------------|--------|
| Without filtering | 100 µs |
| With filtering | 200 µs |

9.13.14 X20DI6373

Data sheet version: 2.10

9.13.14.1 General Information

The module has 6 inputs. The input circuit can be sink or source thanks to the potential-free design of the inputs.

- 6 digital inputs
- Sink/Source connection
- Software input filter can be configured for entire module

9.13.14.2 Order data

| Communication | | | | | | | |
| 0 | 0 | Input status of digital inputs 1 to 6 | USINT | • | | | |
| | | DigitalInput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | DigitalInput06 | Bit 5 | | | | |

1) The offset specifies where the register is within the CAN object.

9.13.14.9.3.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see ["Using I/O modules on the bus controller" on page 3789](#).

9.13.14.9.3.2 CAN I/O bus controller

The module occupies 1 digital logical slot on CAN I/O.

9.13.14.9.4 Digital inputs

Unfiltered

The input state is collected with a fixed offset to the network cycle and transferred in the same cycle.

Filtered

The filtered status is collected with a fixed offset to the network cycle and transferred in the same cycle. Filtering takes place asynchronously to the network in multiples of 200 µs with a network-related jitter of up to 50 µs.

9.13.14.9.4.1 Digital input filter

Name:

ConfigOutput01

This register can be used to specify the filter value for all digital inputs.

The filter value can be configured in steps of 100 µs. It makes sense to enter values in steps of 2, however, since the input signals are sampled every 200 µs.

| Data type | Value | Filter |
|-----------|-------|---|
| USINT | 0 | No software filter (bus controller default setting) |
| | 2 | 0.2 ms |
| | ... | ... |
| | 250 | 25 ms - Higher values are limited to this value |

9.13.14.9.4.2 Input status of digital inputs 1 to 6

Name:

DigitalInput or

DigitalInput01 to DigitalInput06

The input status of digital inputs 1 to 6 is mapped in this register.

Only function model 0 - Standard:

The "Packed inputs" setting in the Automation Studio I/O configuration is used to determine whether all of the bits from these registers should be set up individually as data points in the Automation Studio I/O mapping ("DigitalInput01" through "DigitalInput06") or whether this register should be displayed as an individual USINT data point ("DigitalInput").

| Data type | Value | Information |
|-----------|------------------------|--|
| USINT | 0 to 63 | Packed inputs = On |
| | See the bit structure. | Packed inputs = Off or function model ≠ 0 - Standard |

Bit structure:

| Bit | Name | Value | Information |
|-----|----------------|--------|--------------------------------|
| 0 | DigitalInput01 | 0 or 1 | Input status - Digital input 1 |
| ... | | ... | |
| 5 | DigitalInput06 | 0 or 1 | Input state - Digital input 6 |

9.13.14.9.5 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time | |
|--------------------|--------|
| Without filtering | 100 µs |
| With filtering | 150 µs |

9.13.14.9.6 Minimum I/O update time

The minimum I/O update time specifies how far the bus cycle can be reduced so that an I/O update is performed in each cycle.

| Minimum I/O update time | |
|-------------------------|--------|
| Without filtering | 100 µs |
| With filtering | 200 µs |

9.13.15 X20DI6553

Data sheet version: 3.07

9.13.15.1 General Information

The module is equipped with 6 inputs for 1-wire connections. It is designed for an input voltage of 100 to 120 VAC.

- 6 digital inputs
- 100 to 120 VAC inputs
- 50 Hz or 60 Hz
- 1-wire connections
- 240 V coded

Danger!

Risk of electric shock!

The terminal block must only be allowed to conduct voltage when it is inserted. It must not under any circumstances be removed or inserted when voltage is applied or have voltage applied to it when it is removed.

9.13.15.2 Order data

| Model number | Short description | Figure |
|--------------|---|--|
| | Digital inputs |  |
| X20DI6553 | X20 digital input module, 6 inputs, 100 to 120 VAC, 240 V keyed, 1-wire connections | |

9.13.15.4 Status LEDs

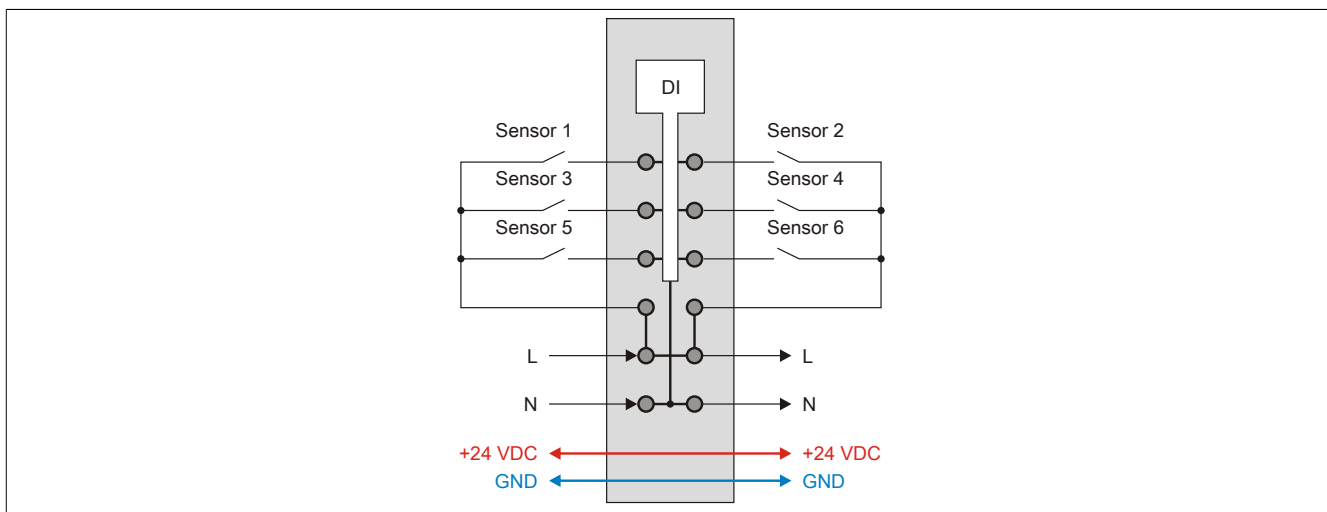

For a description of the various operating modes, see "Diagnostic LEDs" on page 3787.

| Image | LED | Color | Status | Description |
|---|-------|-----------------------------|--------------|---|
|  | r | Green | Off | No power to module |
| | | | Single flash | RESET mode |
| | | | Blinking | PREOPERATIONAL mode |
| | | | On | RUN mode |
| | e | Red | Off | Module supply not connected or everything OK |
| | | | Double flash | External supply is too low or not connected |
| | e + r | Red on / Green single flash | | Invalid firmware |
| | 1 - 6 | Green | | Input status of the corresponding digital input |

9.13.15.5 Pinout

9.13.15.6 Connection example

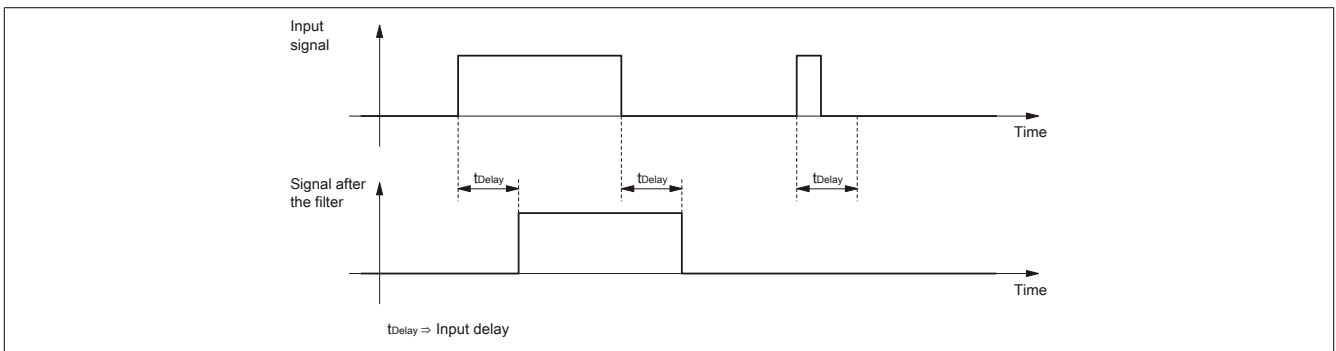

9.13.15.7 Input circuit diagram

9.13.15.8 Input filter

An input filter is available for each input. The input delay can be set using register "ConfigOutput01" on page 1537. Disturbance pulses which are shorter than the input delay are suppressed by the input filter.

9.13.15.9 Register description

9.13.15.9.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section "[General data points](#)" on page 3790.

9.13.15.9.2 Function model 0 - Standard

| Register | Fixed offset | Name | Data type | Read | | Write | |
|----------------------|--------------|-------------------------------|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| Configuration | | | | | | | |
| 18 | - | ConfigOutput01 (input filter) | USINT | | | | • |
| Communication | | | | | | | |
| 0 | 1 | DigitalInput | USINT | • | | | |
| | | DigitalInput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | DigitalInput06 | Bit 5 | | | | |
| | | PowerSupply | Bit 7 | | | | |

Fixed modules require their data points to be in a specific order in the X2X frame. Cyclic access occurs according to a predefined offset, not based on the register address.

Acyclic access continues to be based on the register numbers.

9.13.15.9.3 Function model 254 - Bus Controller

| Register | Offset ¹⁾ | Name | Data type | Read | | Write | |
|----------------------|----------------------|--------------------------------------|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| Configuration | | | | | | | |
| 18 | - | ConfigOutput01 (input filter) | USINT | | | | • |
| Communication | | | | | | | |
| 0 | 0 | Input state of digital inputs 1 to 6 | USINT | • | | | |
| | | DigitalInput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | DigitalInput06 | Bit 5 | | | | |
| | | PowerSupply | Bit 7 | | | | |

1) The offset specifies where the register is within the CAN object.

9.13.15.9.3.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see "[Using I/O modules on the bus controller](#)" on page 3789.

9.13.15.9.3.2 CAN I/O bus controller

The module occupies 1 digital logical slot on CAN I/O.

9.13.15.9.4 Digital inputs

Unfiltered

The input state is collected with a fixed offset to the network cycle and transferred in the same cycle.

Filtered

The filtered status is collected with a fixed offset to the network cycle and transferred in the same cycle. Filtering takes place asynchronously to the network in multiples of 200 µs with a network-related jitter of up to 50 µs.

9.13.15.9.4.1 Digital input filter

Name:

ConfigOutput01

This register can be used to specify the filter value for all digital inputs.

The filter value can be configured in steps of 100 μ s. It makes sense to enter values in steps of 2, however, since the input signals are sampled every 200 μ s.

| Data type | Value | Filter |
|-----------|-------|---|
| USINT | 0 | No software filter (bus controller default setting) |
| | 2 | 0.2 ms |
| | ... | ... |
| | 250 | 25 ms - Higher values are limited to this value |

9.13.15.9.4.2 Input state of digital inputs 1 to 6

Name:

DigitalInput or

DigitalInput01 to DigitalInput06

PowerSupply

This register contains the input state of digital inputs 1 to 6.

Only function model 0 - Standard:

Setting "Packed inputs" in the Automation Studio I/O configuration can be used to determine whether all bits of this register should be applied individually as data points in the Automation Studio I/O mapping ("DigitalInput01" to "DigitalInput06" and "PowerSupply") or whether this register should be displayed as a single USINT data point ("DigitalInput").

| Data type | Values | Information |
|-----------|------------------------|---|
| USINT | 0 to 63 | Packed inputs = On |
| | See the bit structure. | Packed inputs = Off or function model \neq 0 - Standard |

Bit structure:

| Bit | Description | Value | Information |
|-----|----------------|--------|-------------------------------|
| 0 | DigitalInput01 | 0 or 1 | Input state - Digital input 1 |
| ... | | ... | |
| 5 | DigitalInput04 | 0 or 1 | Input state - Digital input 6 |
| 6 | Reserved | 0 | |
| 7 | PowerSupply | 0 | Supply voltage too low |
| | | 1 | Supply voltage >80 VAC |

9.13.15.9.5 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time | |
|--------------------|-------------|
| Without filtering | 100 μ s |
| With filtering | 150 μ s |

9.13.15.9.6 Minimum I/O update time

The minimum I/O update time specifies how far the bus cycle can be reduced so that an I/O update is performed in each cycle.

| Minimum I/O update time | |
|-------------------------|-------------|
| Without filtering | 100 μ s |
| With filtering | 200 μ s |

9.13.16 X20DI8371

Data sheet version: 3.07

9.13.16.1 General Information

The module is equipped with eight inputs for 1-wire connections. The module is designed for sink input wiring.

- 8 digital inputs
- Sink connection
- 1-wire connections
- Software input filter can be configured for entire module

9.13.16.2 Order data

| Model number | Short description | Figure |
|--------------|---|--|
| | Digital inputs |  |

9.13.16.4 Status LEDs

For a description of the various operating modes, see "Diagnostic LEDs" on page 3787.

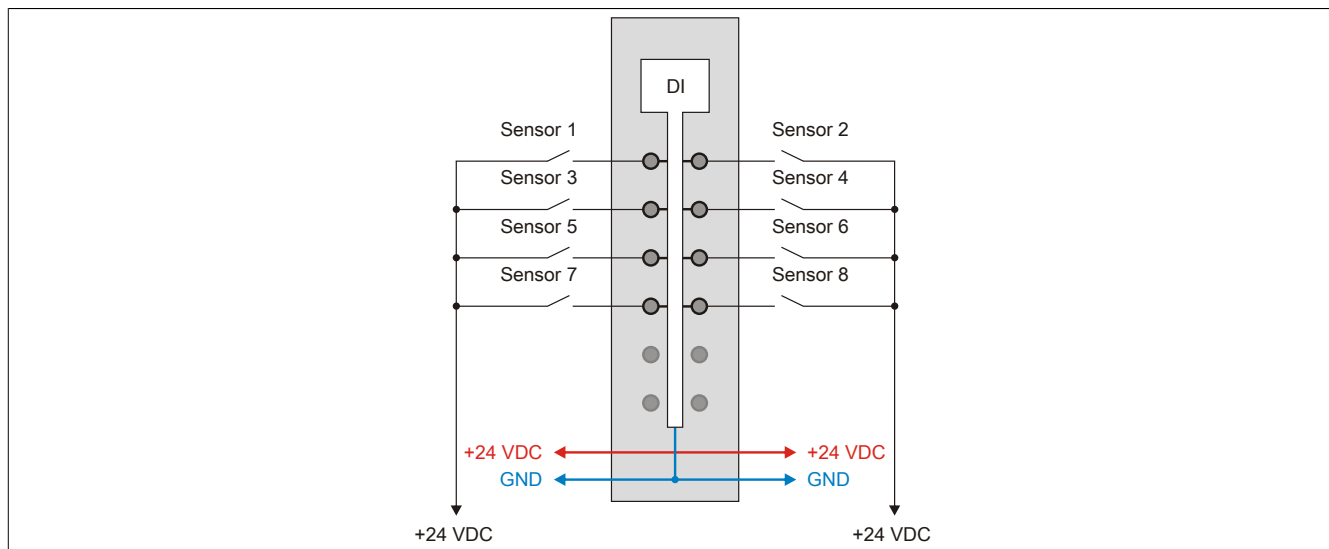

| Image | LED | Color | Status | Description |
|---|-------|-----------------------------|--------------|--|
|  | r | Green | Off | No power to module |
| | | | Single flash | RESET mode |
| | | | Blinking | PREOPERATIONAL mode |
| | | | Double flash | BOOT mode (during firmware update) ¹⁾ |
| | | | On | RUN mode |
| | e | Red | Off | Module supply not connected or everything OK |
| | e + r | Red on / Green single flash | | Invalid firmware |
| | 1 - 8 | Green | | Input status of the corresponding digital input |

1) Depending on the configuration, a firmware update can take up to several minutes.

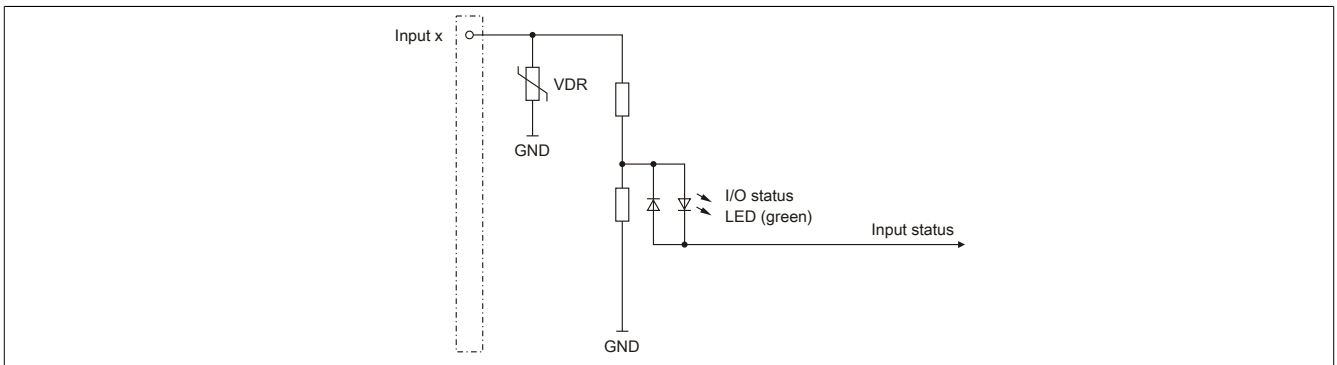

9.13.16.5 Pinout

9.13.16.6 Connection example

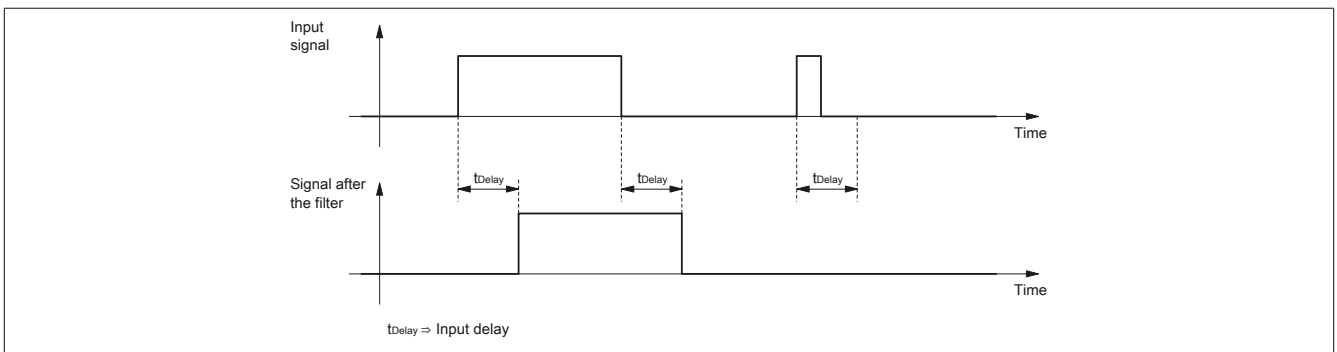

9.13.16.7 Input circuit diagram

9.13.16.8 Input filter

An input filter is available for each input. The input delay can be set using register "[ConfigOutput01](#)" on page 1543. Disturbance pulses which are shorter than the input delay are suppressed by the input filter.

9.13.16.9 Register description

9.13.16.9.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section ["General data points" on page 3790](#).

9.13.16.9.2 Function model 0 - Standard

| Register | Fixed offset | Name | Data type | Read | | Write | |
|----------------------|--------------|---|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| Configuration | | | | | | | |
| 18 | - | ConfigOutput01 (input filter) | USINT | | | | • |
| Communication | | | | | | | |
| 0 | 1 | DigitalInput | USINT | • | | | |
| | | DigitalInput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | DigitalInput08 | Bit 7 | | | | |

Fixed modules require their data points to be in a specific order in the X2X frame. Cyclic access occurs according to a predefined offset, not based on the register address.

Acyclic access continues to be based on the register numbers.

9.13.16.9.3 Function model 254 - Bus Controller

| Register | Offset ¹⁾ | Name | Data type | Read | | Write | |
|----------------------|----------------------|---|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| Configuration | | | | | | | |
| 18 | - | ConfigOutput01 (input filter) | USINT | | | | • |
| Communication | | | | | | | |
| 0 | 0 | DigitalInput | USINT | • | | | |
| | | DigitalInput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | DigitalInput08 | Bit 7 | | | | |

1) The offset specifies where the register is within the CAN object.

9.13.16.9.3.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see ["Using I/O modules on the bus controller" on page 3789](#).

9.13.16.9.3.2 CAN I/O bus controller

The module occupies 1 digital logical slot on CAN I/O.

9.13.16.9.4 Digital inputs

Unfiltered

The input state is collected with a fixed offset to the network cycle and transferred in the same cycle.

Filtered

The filtered status is collected with a fixed offset to the network cycle and transferred in the same cycle. Filtering takes place asynchronously to the network in multiples of 200 µs with a network-related jitter of up to 50 µs.

9.13.16.9.4.1 Digital input filter

Name:

ConfigOutput01

This register can be used to specify the filter value for all digital inputs.

The filter value can be configured in steps of 100 μ s. It makes sense to enter values in steps of 2, however, since the input signals are sampled every 200 μ s.

| Data type | Value | Filter |
|-----------|-------|---|
| USINT | 0 | No software filter (bus controller default setting) |
| | 2 | 0.2 ms |
| | ... | ... |
| | 250 | 25 ms - Higher values are limited to this value |

9.13.16.9.4.2 Input state of digital inputs 1 to 8

Name:

DigitalInput or

DigitalInput01 to DigitalInput08

This register is used to indicate the input state of digital inputs 1 to 8.

Only function model 0 - Standard:

The "Packed inputs" setting in the Automation Studio I/O configuration is used to determine whether all of this register's bits should be set up individually as data points in the Automation Studio I/O mapping ("DigitalInput01" through "DigitalInput08") or whether this register should be displayed as an individual USINT data point ("DigitalInput").

| Data type | Value | Information |
|-----------|------------------------|---|
| USINT | 0 to 255 | Packed inputs = On |
| | See the bit structure. | Packed inputs = Off or function model \neq 0 - Standard |

Bit structure:

| Bit | Name | Value | Information |
|-----|----------------|--------|-------------------------------|
| 0 | DigitalInput01 | 0 or 1 | Input state - Digital input 1 |
| ... | | ... | |
| 7 | DigitalInput08 | 0 or 1 | Input state - Digital input 8 |

9.13.16.9.5 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time | |
|--------------------|-------------|
| Without filtering | 100 μ s |
| With filtering | 150 μ s |

9.13.16.9.6 Minimum I/O update time

The minimum I/O update time specifies how far the bus cycle can be reduced so that an I/O update is performed in each cycle.

| Minimum I/O update time | |
|-------------------------|-------------|
| Without filtering | 100 μ s |
| With filtering | 200 μ s |

9.13.17 X20(c)DI9371

Data sheet version: 3.20

9.13.17.1 General Information

The module is equipped with 12 inputs for 1-wire connections. The module is designed for sink input wiring.

- 12 digital inputs
- Sink connection
- 1-wire connections
- Software input filter can be configured for entire module

9.13.17.2 Coated modules

Coated modules are X20 modules with a protective coating for the electronics component. This coating protects X20c modules from condensation and corrosive gases.

The modules' electronics are fully compatible with the corresponding X20 modules.

For simplification purposes, only images and module IDs of uncoated modules are used in this data sheet.

The coating has been certified according to the following standards:

- Condensation: BMW GS 95011-4, 2x 1 cycle
- Corrosive gas: EN 60068-2-60, method 4, exposure 21 days

9.13.17.2.1 -40°C starting temperature

The starting temperature describes the minimum permissible ambient temperature when the power is switched off at the time the coated module is switched on. This is permitted to be as low as -40°C. During operation, the conditions as specified in the technical data continue to apply.

Information:

It is important to absolutely ensure that there is no forced cooling by air currents in a closed control cabinet, for example using a fan or ventilation slots.

9.13.17.3 Order data

Be aware of the derating values below for the simultaneity factor.

Derating of simultaneity factor at 24 VDC input voltage

Derating of simultaneity factor at 28.8 VDC input voltage

9.13.17.11 Register description

9.13.17.11.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section ["General data points" on page 3790](#).

9.13.17.11.2 Function model 0 - Standard

| Register | Fixed offset | Name | Data type | Read | | Write | |
|----------------------|--------------|--|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| Configuration | | | | | | | |
| 18 | - | ConfigOutput01 (input filter) | USINT | | | | • |
| Communication | | | | | | | |
| - | 1 | DigitalInput | UINT | • | | | |
| 0 | 1 | Input status of digital inputs 1 to 8 | USINT | | | | |
| | | DigitalInput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | DigitalInput08 | Bit 7 | | | | |
| 1 | 2 | Input status of digital inputs 9 to 12 | USINT | • | | | |
| | | DigitalInput09 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | DigitalInput12 | Bit 3 | | | | |

Fixed modules require their data points to be in a specific order in the X2X frame. Cyclic access occurs according to a predefined offset, not based on the register address.

Acyclic access continues to be based on the register numbers.

9.13.17.11.3 Function model 254 - Bus Controller

| Register | Offset ¹⁾ | Name | Data type | Read | | Write | |
|----------------------|----------------------|--|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| Configuration | | | | | | | |
| 18 | - | ConfigOutput01 (input filter) | USINT | | | | • |
| Communication | | | | | | | |
| 0 | 0 | Input status of digital inputs 1 to 8 | USINT | • | | | |
| | | DigitalInput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | DigitalInput08 | Bit 7 | | | | |
| 1 | 1 | Input status of digital inputs 9 to 12 | USINT | • | | | |
| | | DigitalInput09 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | DigitalInput12 | Bit 3 | | | | |

1) The offset specifies where the register is within the CAN object.

9.13.17.11.3.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see ["Using I/O modules on the bus controller" on page 3789](#).

9.13.17.11.3.2 CAN I/O bus controller

The module occupies 2 digital logical slots on CAN I/O.

9.13.17.11.4 Digital inputs

Unfiltered

The input state is collected with a fixed offset to the network cycle and transferred in the same cycle.

Filtered

The filtered status is collected with a fixed offset to the network cycle and transferred in the same cycle. Filtering takes place asynchronously to the network in multiples of 200 µs with a network-related jitter of up to 50 µs.

9.13.17.11.4.1 Digital input filter

Name:

ConfigOutput01

This register can be used to specify the filter value for all digital inputs.

The filter value can be configured in steps of 100 μ s. It makes sense to enter values in steps of 2, however, since the input signals are sampled every 200 μ s.

| Data type | Value | Filter |
|-----------|-------|---|
| USINT | 0 | No software filter (bus controller default setting) |
| | 2 | 0.2 ms |
| | ... | ... |
| | 250 | 25 ms - Higher values are limited to this value |

9.13.17.11.4.2 Input state of digital inputs 1 to 12

Name:

DigitalInput or

DigitalInput01 to DigitalInput12

This register indicates the input state of digital inputs 1 to 12.

Only function model 0 - Standard

The "Packed inputs" setting in the Automation Studio I/O configuration is used to determine whether all of the bits from these registers should be set up individually as data points in the Automation Studio I/O mapping ("DigitalInput01" to "DigitalInput12") or whether this register should be displayed as an individual UINT data point ("DigitalInput").

| Data type | Values | Information |
|-----------|--------------------|---|
| UINT | 0 to 4095 | Packed inputs = On |
| USINT | See bit structure. | Packed inputs = Off or Function model <> 0 - Standard |

Bit structure:

Register 0

| Bit | Name | Value | Information |
|-----|----------------|--------|-------------------------------|
| 0 | DigitalInput01 | 0 or 1 | Input state - Digital input 1 |
| ... | ... | ... | ... |
| 7 | DigitalInput08 | 0 or 1 | Input state - Digital input 8 |

Register 1

| Bit | Name | Value | Information |
|-----|----------------|--------|--------------------------------|
| 0 | DigitalInput09 | 0 or 1 | Input state - Digital input 9 |
| ... | ... | ... | ... |
| 3 | DigitalInput12 | 0 or 1 | Input state - Digital input 12 |

9.13.17.11.5 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time | |
|--------------------|-------------|
| Without filtering | 100 μ s |
| With filtering | 150 μ s |

9.13.17.11.6 Minimum I/O update time

The minimum I/O update time specifies how far the bus cycle can be reduced so that an I/O update is performed in each cycle.

| Minimum I/O update time | |
|-------------------------|-------------|
| Without filtering | 100 μ s |
| With filtering | 200 μ s |

9.13.18 X20(c)DI9372

Data sheet version: 3.20

9.13.18.1 General Information

The module is equipped with 12 inputs for 1-wire connections. The module is designed for source input wiring.

- 12 digital inputs
- Source connection
- 1-wire connections
- Software input filter can be configured for entire module

9.13.18.2 Coated modules

Coated modules are X20 modules with a protective coating for the electronics component. This coating protects X20c modules from condensation and corrosive gases.

The modules' electronics are fully compatible with the corresponding X20 modules.

For simplification purposes, only images and module IDs of uncoated modules are used in this data sheet.

The coating has been certified according to the following standards:

- Condensation: BMW GS 95011-4, 2x 1 cycle
- Corrosive gas: EN 60068-2-60, method 4, exposure 21 days

9.13.18.2.1 -40°C starting temperature

The starting temperature describes the minimum permissible ambient temperature when the power is switched off at the time the coated module is switched on. This is permitted to be as low as -40°C. During operation, the conditions as specified in the technical data continue to apply.

Information:

It is important to absolutely ensure that there is no forced cooling by air currents in a closed control cabinet, for example using a fan or ventilation slots.

9.13.18.3 Order data

| Model number | Short description | Figure |
|--------------|--|--------|
| | Digital inputs | |
| X20DI9372 | X20 digital input module, 12 inputs, 24 VDC, source, configurable input filter, 1-wire connections | |

9.13.18.7 Connection example

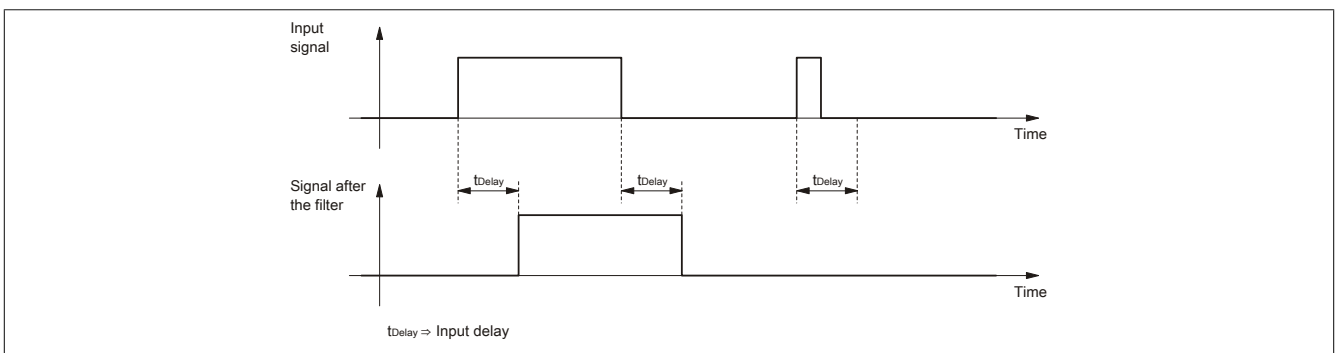

9.13.18.8 Input circuit diagram

9.13.18.9 Input filter

An input filter is available for each input. The input delay can be set using register "ConfigOutput01" on page 1557. Disturbance pulses which are shorter than the input delay are suppressed by the input filter.

9.13.18.10 Derating

Be aware of the derating values below for the simultaneity factor.

Derating of simultaneity factor at 24 VDC input voltage

Derating of simultaneity factor at 28.8 VDC input voltage

9.13.18.11 Register description

9.13.18.11.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section "[General data points](#)" on page 3790.

9.13.18.11.2 Function model 0 - Standard

| Register | Fixed offset | Name | Data type | Read | | Write | |
|----------------------|--------------|--|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| Configuration | | | | | | | |
| 18 | - | ConfigOutput01 (input filter) | USINT | | | | • |
| Communication | | | | | | | |
| - | 1 | DigitalInput | UINT | • | | | |
| 0 | 1 | Input status of digital inputs 1 to 8 | USINT | | | | |
| | | DigitalInput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | DigitalInput08 | Bit 7 | | | | |
| 1 | 2 | Input status of digital inputs 9 to 12 | USINT | • | | | |
| | | DigitalInput09 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | DigitalInput12 | Bit 3 | | | | |

Fixed modules require their data points to be in a specific order in the X2X frame. Cyclic access occurs according to a predefined offset, not based on the register address.

Acyclic access continues to be based on the register numbers.

9.13.18.11.3 Function model 254 - Bus Controller

| Register | Offset ¹⁾ | Name | Data type | Read | | Write | |
|----------------------|----------------------|--|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| Configuration | | | | | | | |
| 18 | - | ConfigOutput01 (input filter) | USINT | | | | • |
| Communication | | | | | | | |
| 0 | 0 | Input status of digital inputs 1 to 8 | USINT | • | | | |
| | | DigitalInput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | DigitalInput08 | Bit 7 | | | | |
| 1 | 1 | Input status of digital inputs 9 to 12 | USINT | • | | | |
| | | DigitalInput09 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | DigitalInput12 | Bit 3 | | | | |

1) The offset specifies where the register is within the CAN object.

9.13.18.11.3.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see "[Using I/O modules on the bus controller](#)" on page 3789.

9.13.18.11.3.2 CAN I/O bus controller

The module occupies 2 digital logical slots on CAN I/O.

9.13.18.11.4 Digital inputs

Unfiltered

The input state is collected with a fixed offset to the network cycle and transferred in the same cycle.

Filtered

The filtered status is collected with a fixed offset to the network cycle and transferred in the same cycle. Filtering takes place asynchronously to the network in multiples of 200 µs with a network-related jitter of up to 50 µs.

9.13.18.11.4.1 Digital input filter

Name:

ConfigOutput01

This register can be used to specify the filter value for all digital inputs.

The filter value can be configured in steps of 100 μ s. It makes sense to enter values in steps of 2, however, since the input signals are sampled every 200 μ s.

| Data type | Value | Filter |
|-----------|-------|---|
| USINT | 0 | No software filter (bus controller default setting) |
| | 2 | 0.2 ms |
| | ... | ... |
| | 250 | 25 ms - Higher values are limited to this value |

9.13.18.11.4.2 Input state of digital inputs 1 to 12

Name:

DigitalInput or

DigitalInput01 to DigitalInput12

This register indicates the input state of digital inputs 1 to 12.

Only function model 0 - Standard

The "Packed inputs" setting in the Automation Studio I/O configuration is used to determine whether all of the bits from these registers should be set up individually as data points in the Automation Studio I/O mapping ("DigitalInput01" to "DigitalInput12") or whether this register should be displayed as an individual UINT data point ("DigitalInput").

| Data type | Values | Information |
|-----------|--------------------|---|
| UINT | 0 to 4095 | Packed inputs = On |
| USINT | See bit structure. | Packed inputs = Off or Function model <> 0 - Standard |

Bit structure:

Register 0

| Bit | Name | Value | Information |
|-----|----------------|--------|-------------------------------|
| 0 | DigitalInput01 | 0 or 1 | Input state - Digital input 1 |
| ... | ... | ... | ... |
| 7 | DigitalInput08 | 0 or 1 | Input state - Digital input 8 |

Register 1

| Bit | Name | Value | Information |
|-----|----------------|--------|--------------------------------|
| 0 | DigitalInput09 | 0 or 1 | Input state - Digital input 9 |
| ... | ... | ... | ... |
| 3 | DigitalInput12 | 0 or 1 | Input state - Digital input 12 |

9.13.18.11.5 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time | |
|--------------------|-------------|
| Without filtering | 100 μ s |
| With filtering | 150 μ s |

9.13.18.11.6 Minimum I/O update time

The minimum I/O update time specifies how far the bus cycle can be reduced so that an I/O update is performed in each cycle.

| Minimum I/O update time | |
|-------------------------|-------------|
| Without filtering | 100 μ s |
| With filtering | 200 μ s |

9.13.19 X20DID371

Data sheet version: 2.07

9.13.19.1 General Information

The module is equipped with 8 inputs for 1-wire or 2-wire connections. The module is designed for sink input wiring.

- 8 digital inputs
- Sink connection
- 2-wire connections
- 24 VDC for sensor supply
- Software input filter can be configured for entire module

9.13.19.6 Connection example

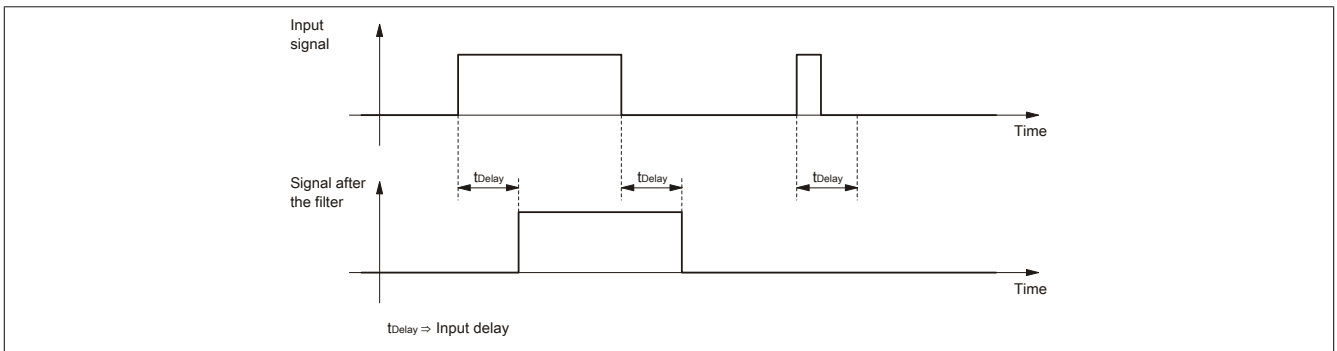

9.13.19.7 Input circuit diagram

9.13.19.8 Input filter

An input filter is available for each input. The input delay can be set using register "[ConfigOutput01](#)" on page 1563. Disturbance pulses which are shorter than the input delay are suppressed by the input filter.

9.13.19.9 Register description

9.13.19.9.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section ["General data points" on page 3790](#).

9.13.19.9.2 Function model 0 - Standard

| Register | Fixed offset | Name | Data type | Read | | Write | |
|----------------------|--------------|---|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| Configuration | | | | | | | |
| 18 | - | ConfigOutput01 (input filter) | USINT | | | | • |
| Communication | | | | | | | |
| 0 | 1 | DigitalInput | USINT | • | | | |
| | | DigitalInput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | DigitalInput08 | Bit 7 | | | | |

Fixed modules require their data points to be in a specific order in the X2X frame. Cyclic access occurs according to a predefined offset, not based on the register address.

Acyclic access continues to be based on the register numbers.

9.13.19.9.3 Function model 254 - Bus Controller

| Register | Offset ¹⁾ | Name | Data type | Read | | Write | |
|----------------------|----------------------|--|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| Configuration | | | | | | | |
| 18 | - | ConfigOutput01 (input filter) | USINT | | | | • |
| Communication | | | | | | | |
| 0 | 0 | Input state of digital inputs 1 to 8 | USINT | • | | | |
| | | DigitalInput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | DigitalInput08 | Bit 7 | | | | |

1) The offset specifies where the register is within the CAN object.

9.13.19.9.3.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see ["Using I/O modules on the bus controller" on page 3789](#).

9.13.19.9.3.2 CAN I/O bus controller

The module occupies 1 digital logical slot on CAN I/O.

9.13.19.9.4 Digital inputs

Unfiltered

The input state is collected with a fixed offset to the network cycle and transferred in the same cycle.

Filtered

The filtered status is collected with a fixed offset to the network cycle and transferred in the same cycle. Filtering takes place asynchronously to the network in multiples of 200 µs with a network-related jitter of up to 50 µs.

9.13.19.9.4.1 Digital input filter

Name:

ConfigOutput01

This register can be used to specify the filter value for all digital inputs.

The filter value can be configured in steps of 100 μ s. It makes sense to enter values in steps of 2, however, since the input signals are sampled every 200 μ s.

| Data type | Value | Filter |
|-----------|-------|---|
| USINT | 0 | No software filter (bus controller default setting) |
| | 2 | 0.2 ms |
| | ... | ... |
| | 250 | 25 ms - Higher values are limited to this value |

9.13.19.9.4.2 Input state of digital inputs 1 to 8

Name:

DigitalInput or

DigitalInput01 to DigitalInput08

This register is used to indicate the input state of digital inputs 1 to 8.

Only function model 0 - Standard:

The "Packed inputs" setting in the Automation Studio I/O configuration is used to determine whether all of this register's bits should be set up individually as data points in the Automation Studio I/O mapping ("DigitalInput01" through "DigitalInput08") or whether this register should be displayed as an individual USINT data point ("DigitalInput").

| Data type | Value | Information |
|-----------|------------------------|---|
| USINT | 0 to 255 | Packed inputs = On |
| | See the bit structure. | Packed inputs = Off or function model \neq 0 - Standard |

Bit structure:

| Bit | Name | Value | Information |
|-----|----------------|--------|-------------------------------|
| 0 | DigitalInput01 | 0 or 1 | Input state - Digital input 1 |
| ... | | ... | |
| 7 | DigitalInput08 | 0 or 1 | Input state - Digital input 8 |

9.13.19.9.5 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time | |
|--------------------|-------------|
| Without filtering | 100 μ s |
| With filtering | 150 μ s |

9.13.19.9.6 Minimum I/O update time

The minimum I/O update time specifies how far the bus cycle can be reduced so that an I/O update is performed in each cycle.

| Minimum I/O update time | |
|-------------------------|-------------|
| Without filtering | 100 μ s |
| With filtering | 200 μ s |

9.13.20 X20(c)DIF371

Data sheet version: 2.17

9.13.20.1 General Information

The module is equipped with 16 inputs for 1-wire connections. The module is designed for sink input wiring.

- 16 digital inputs
- Sink connection
- 1-wire connections
- Software input filter can be configured for entire module

9.13.20.2 Coated modules

Coated modules are X20 modules with a protective coating for the electronics component. This coating protects X20c modules from condensation and corrosive gases.

The modules' electronics are fully compatible with the corresponding X20 modules.

For simplification purposes, only images and module IDs of uncoated modules are used in this data sheet.

The coating has been certified according to the following standards:

- Condensation: BMW GS 95011-4, 2x 1 cycle
- Corrosive gas: EN 60068-2-60, method 4, exposure 21 days

9.13.20.3 Order data

9.13.20.6 Pinout

9.13.20.7 Connection example

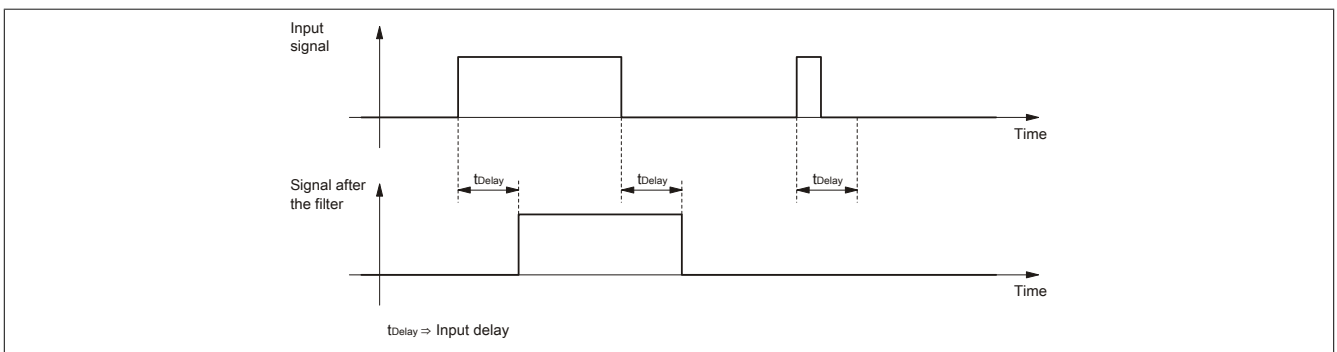

9.13.20.8 Input circuit diagram

9.13.20.9 Input filter

An input filter is available for each input. The input delay can be set using register "[ConfigOutput01](#)" on page 1570. Disturbance pulses which are shorter than the input delay are suppressed by the input filter.

9.13.20.10 Derating

Be aware of the derating values below for the simultaneity factor.

Derating of simultaneity factor at 24 VDC input voltage

Derating of simultaneity factor at 28.8 VDC input voltage

9.13.20.11 Register description

9.13.20.11.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section ["General data points" on page 3790](#).

9.13.20.11.2 Function model 0 - Standard

| Register | Fixed offset | Name | Data type | Read | | Write | |
|----------------------|--------------|--|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| Configuration | | | | | | | |
| 18 | - | ConfigOutput01 (input filter) | USINT | | | | • |
| Communication | | | | | | | |
| - | 1 | DigitalInput | UINT | • | | | |
| 0 | 1 | Input status of digital inputs 1 to 8 | USINT | | | | |
| | | DigitalInput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| 1 | 2 | DigitalInput08 | Bit 7 | | | | |
| | | Input status of digital inputs 9 to 16 | USINT | • | | | |
| | | DigitalInput09 | Bit 0 | | | | |
| ... | ... | ... | ... | | | | |
| | | DigitalInput16 | Bit 7 | | | | |

Fixed modules require their data points to be in a specific order in the X2X frame. Cyclic access occurs according to a predefined offset, not based on the register address.

Acyclic access continues to be based on the register numbers.

9.13.20.11.3 Function model 254 - Bus Controller

| Register | Offset ¹⁾ | Name | Data type | Read | | Write | |
|----------------------|----------------------|--|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| Configuration | | | | | | | |
| 18 | - | ConfigOutput01 (input filter) | USINT | | | | • |
| Communication | | | | | | | |
| 0 | 0 | Input status of digital inputs 1 to 8 | USINT | • | | | |
| | | DigitalInput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| 1 | 1 | DigitalInput08 | Bit 7 | | | | |
| | | Input status of digital inputs 9 to 16 | USINT | • | | | |
| | | DigitalInput09 | Bit 0 | | | | |
| ... | ... | ... | ... | | | | |
| | | DigitalInput16 | Bit 7 | | | | |

1) The offset specifies where the register is within the CAN object.

9.13.20.11.3.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see ["Using I/O modules on the bus controller" on page 3789](#).

9.13.20.11.3.2 CAN I/O bus controller

The module occupies 2 digital logical slots on CAN I/O.

9.13.20.11.4 Digital inputs

Unfiltered

The input state is collected with a fixed offset to the network cycle and transferred in the same cycle.

Filtered

The filtered status is collected with a fixed offset to the network cycle and transferred in the same cycle. Filtering takes place asynchronously to the network in multiples of 200 µs with a network-related jitter of up to 50 µs.

9.13.20.11.4.1 Digital input filter

Name:

ConfigOutput01

This register can be used to specify the filter value for all digital inputs.

The filter value can be configured in steps of 100 μ s. It makes sense to enter values in steps of 2, however, since the input signals are sampled every 200 μ s.

| Data type | Value | Filter |
|-----------|-------|---|
| USINT | 0 | No software filter (bus controller default setting) |
| | 2 | 0.2 ms |
| | ... | ... |
| | 250 | 25 ms - Higher values are limited to this value |

9.13.20.11.4.2 Input status of digital inputs 1 to 16

Name:

DigitalInput or

DigitalInput01 to DigitalInput16

The input status of digital inputs 9 to 16 is mapped in this register.

Function model 0 - Standard only:

The "packed inputs" setting in the Automation Studio I/O configuration is used to determine whether all of this register's bits should be set up individually as data points in the Automation Studio I/O mapping ("DigitalInput01" through "DigitalInput16") or whether this register should be displayed as an individual UINT data point ("DigitalInput").

| Data type | Value | Information |
|-----------|------------------------|---|
| USINT | 0 to 65535 | Packed inputs = On |
| | See the bit structure. | Packed inputs = Off or function model \neq 0 - Standard |

Bit structure:

Register 0:

| Bit | Description | Value | Information |
|-----|----------------|--------|--------------------------------|
| 0 | DigitalInput01 | 0 or 1 | Input status - Digital input 1 |
| ... | ... | ... | ... |
| 7 | DigitalInput08 | 0 or 1 | Input status - Digital input 8 |

Register 1:

| Bit | Name | Value | Information |
|-----|----------------|--------|---------------------------------|
| 0 | DigitalInput09 | 0 or 1 | Input status - Digital input 9 |
| ... | ... | ... | ... |
| 7 | DigitalInput16 | 0 or 1 | Input status - Digital input 16 |

9.13.20.11.5 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time | |
|--------------------|-------------|
| Without filtering | 100 μ s |
| With filtering | 150 μ s |

9.13.20.11.6 Minimum I/O update time

The minimum I/O update time specifies how far the bus cycle can be reduced so that an I/O update is performed in each cycle.

| Minimum I/O update time | |
|-------------------------|-------------|
| Without filtering | 100 μ s |
| With filtering | 200 μ s |

9.14 Digital mixed modules

Digital mixed modules are a combination of digital input and output modules. The states of the digital inputs or outputs are shown by the LED status indicators.

9.14.1 Summary

| Model number | Short description | Page |
|--------------|---|------|
| X20DM9324 | X20 digital mixed module, 8 inputs, 24 VDC, sink, configurable input filter, 4 outputs, 24 VDC, 0.5 A, source 1-wire connections | 1572 |
| X20cDM9324 | X20 digital mixed module, coated, 8 inputs, 24 VDC, sink, configurable input filter, 4 outputs, 24 VDC, 0.5 A, source, 1-wire connections | 1572 |

9.14.2 X20(c)DM9324

Data sheet version: 3.18

9.14.2.1 General information

This module is equipped with 8 inputs and 4 outputs for 1-wire connections. The inputs are designed for sink connections, the outputs for source connections.

- 8 digital inputs, sink connections
- 4 digital outputs, source connections
- 1-wire connections
- Configurable software input filter for entire module
- Integrated output protection

9.14.2.2 Coated modules

Coated modules are X20 modules with a protective coating for the electronics component. This coating protects X20c modules from condensation and corrosive gases.

The modules' electronics are fully compatible with the corresponding X20 modules.

For simplification purposes, only images and module IDs of uncoated modules are used in this data sheet.

The coating has been certified according to the following standards:

- Condensation: BMW GS 95011-4, 2x 1 cycle
- Corrosive gas: EN 60068-2-60, method 4, exposure 21 days

1) The offset specifies where the register is within the CAN object.

9.14.2.11.3.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see ["Using I/O modules on the bus controller" on page 3789](#).

9.14.2.11.3.2 CAN I/O bus controller

The module occupies 1 digital logical slot on CAN I/O.

9.14.2.11.4 Digital inputs

Unfiltered

The input state is collected with a fixed offset to the network cycle and transferred in the same cycle.

Filtered

The filtered status is collected with a fixed offset to the network cycle and transferred in the same cycle. Filtering takes place asynchronously to the network in multiples of 200 μ s with a network-related jitter of up to 50 μ s.

9.14.2.11.4.1 Input state of digital inputs 1 to 8

Name:

DigitalInput or
DigitalInput01 to DigitalInput08

This register is used to indicate the input state of digital inputs 1 to 8.

Only function model 0 - Standard:

The "Packed inputs" setting in the Automation Studio I/O configuration is used to determine whether all of this register's bits should be set up individually as data points in the Automation Studio I/O mapping ("DigitalInput01" through "DigitalInput08") or whether this register should be displayed as an individual USINT data point ("DigitalInput").

| Data type | Value | Information |
|-----------|------------------------|---|
| USINT | 0 to 255 | Packed inputs = On |
| | See the bit structure. | Packed inputs = Off or function model \neq 0 - Standard |

Bit structure:

| Bit | Name | Value | Information |
|-----|----------------|--------|-------------------------------|
| 0 | DigitalInput01 | 0 or 1 | Input state - Digital input 1 |
| ... | | ... | |
| 7 | DigitalInput08 | 0 or 1 | Input state - Digital input 8 |

9.14.2.11.4.2 Digital input filter

Name:

ConfigOutput01

This register can be used to specify the filter value for all digital inputs.

The filter value can be configured in steps of 100 μ s. It makes sense to enter values in steps of 2, however, since the input signals are sampled every 200 μ s.

| Data type | Value | Filter |
|-----------|-------|---|
| USINT | 0 | No software filter (bus controller default setting) |
| | 2 | 0.2 ms |
| | ... | ... |
| | 250 | 25 ms - Higher values are limited to this value |

9.14.2.11.5 Digital outputs

The output state is transferred to the output channels with a fixed offset (<60 μ s) based on the network cycle (SyncOut).

9.14.2.11.5.1 Switching state of digital outputs 1 to 4

Name:

DigitalOutput

DigitalOutput01 to DigitalOutput04

This register is used to store the switching state of digital outputs 1 to 4.

Only function model 0 - Standard:

Setting "Packed outputs" in the Automation Studio I/O configuration determines whether all bits of this register should be applied individually as data points in the Automation Studio I/O assignment ("DigitalOutput01" to "DigitalOutput0x") or whether this register should be displayed as a single USINT data point ("DigitalOutput").

| Data type | Values | Information |
|-----------|------------------------|---|
| USINT | 0 to 15 | Packed outputs = On |
| | See the bit structure. | Packed outputs = Off or function model \neq 0 - Standard. |

Bit structure:

| Bit | Description | Value | Information |
|-----|-----------------|-------|-------------------------|
| 0 | DigitalOutput01 | 0 | Digital output 01 reset |
| | | 1 | Digital output 01 set |
| ... | | ... | |
| 3 | DigitalOutput04 | 0 | Digital output 04 reset |
| | | 1 | Digital output 04 set |

9.14.2.11.6 Monitoring status of the digital outputs

On the module, the output states of the outputs are compared to the target states. The control of the output driver is used for the target state.

A change in the output state resets monitoring for that output. The status of each individual channel can be read. A change in the monitoring status is actively transmitted as an error message.

9.14.2.11.6.1 Status of digital outputs 1 to 4

Name:

StatusInput01

StatusDigitalOutput01 to StatusDigitalOutput04

This register contains the state of digital outputs 1 to 4.

Only function model 0 - Standard:

Setting "Packed outputs" in the Automation Studio I/O configuration determines whether all bits of this register should be applied individually as data points in the Automation Studio I/O assignment ("StatusDigitalOutput01" to "StatusDigitalOutput0x") or whether this register should be displayed as a single USINT data point ("StatusInput01").

| Data type | Values | Information |
|-----------|------------------------|---|
| USINT | 0 to 15 | Packed outputs = On |
| | See the bit structure. | Packed outputs = Off or function model \neq 0 - Standard. |

Bit structure:

| Bit | Description | Value | Information |
|-----|-----------------------|-------|---|
| 0 | StatusDigitalOutput01 | 0 | Channel 01: No error |
| | | 1 | Channel 01: <ul style="list-style-type: none"> Short circuit or overload Channel switched on and missing I/O power supply Channel switched off and external voltage applied on channel |
| ... | | ... | |
| 3 | StatusDigitalOutput04 | 0 | Channel 04: No error |
| | | 1 | Channel 04: For an error description, see channel 01. |

9.14.2.11.7 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time | |
|--------------------|-------------|
| Without filtering | 100 μ s |
| With filtering | 150 μ s |

9.14.2.11.8 Minimum I/O update time

The minimum I/O update time specifies how far the bus cycle can be reduced so that an I/O update is performed in each cycle.

| Minimum I/O update time | |
|-------------------------|-------------|
| Without filtering | 100 μ s |
| With filtering | 200 μ s |

9.15 Digital output modules

Digital output modules are used to control external loads (relays, motors, solenoids). The states of the digital outputs are indicated by status LEDs.

9.15.1 Summary

| Model number | Short description | Page |
|--------------|---|------|
| X20DO2321 | X20 digital output module, 2 outputs, 24 VDC, 0.5 A, sink, 3-wire connections | 1581 |
| X20DO2322 | X20 digital output module, 2 outputs, 24 VDC, 0.5 A, source, 3-wire connections | 1590 |
| X20DO2623 | X20 digital output module, 2 outputs, 100 to 240 VAC, 1 A, source, 240 V keyed, 3-wire connections | 1599 |
| X20DO2633 | X20 digital output module, 2 triac outputs, 48 to 240 VAC, 2 A, L-switching, phase angle control, 240 V keyed | 1610 |
| X20DO2649 | X20 digital output module, 2 relays, changeover contacts, 240 VAC / 5 A, 24 VDC / 5 A | 1626 |
| X20DO4321 | X20 digital output module, 4 outputs, 24 VDC, 0.5 A, sink, 3-wire connections | 1632 |
| X20DO4322 | X20 digital output module, 4 outputs, 24 VDC, 0.5 A, source, 3-wire connections | 1641 |
| X20DO4331 | X20 digital output module, 4 outputs, 24 VDC, 2 A, sink, 3-wire connections | 1649 |
| X20DO4332 | X20 digital output module, 4 outputs, 24 VDC, 2 A, source, 3-wire connections | 1659 |
| X20DO4332-1 | X20 digital output module, 4 outputs, 24 VDC, 2 A, source, 3-wire connections, PWM output | 1669 |
| X20DO4529 | X20 digital output module, 4 relays, changeover contacts, 115 VAC / 0.5 A, 24 VDC / 1 A | 1679 |
| X20DO4613 | X20 digital output module, 4 triac coupler outputs, 48 to 240 VAC, 50 mA, zero-crossing detection, 240 V keyed | 1686 |
| X20DO4623 | X20 digital output module, 4 outputs, 100 to 240 VAC, 0.5 A, source, 240 V keyed, 2-wire connections | 1699 |
| X20DO4633 | X20 digital output module, 4 triac outputs, 48 to 240 VAC, 1 A, L-switching, phase angle control, 240 V keyed | 1709 |
| X20DO4649 | X20 digital output module, 4 relays, N.O. contacts, 240 VAC / 5 A | 1726 |
| X20DO4F49 | X20 digital output module, 4 relays, 2x normally open contacts, 2x changeover contacts, 240 VAC / 2 A, 250 VDC / 0.28 A | 1732 |
| X20DO6321 | X20 digital output module, 6 outputs, 24 VDC, 0.5 A, sink, 2-wire connections | 1739 |
| X20DO6322 | X20 digital output module, 6 outputs, 24 VDC, 0.5 A, source, 2-wire connections | 1746 |
| X20DO6325 | X20 digital output module, 6 outputs, 24 VDC, 0.5 A, source, open line and overload detection, 2-wire connections | 1755 |
| X20DO6529 | X20 digital output module, 6 relays, normally open contacts, 115 VAC / 0.5 A, 30 VDC / 1 A | 1766 |
| X20DO6639 | X20 digital output module, 6 relays, normally open contacts, 240 VAC / 2 A, 30 VDC / 2 A | 1773 |
| X20DO8232 | X20 digital output module, 8 outputs, 12 VDC, 2 A, source, supply directly on module, 1-wire connections | 1779 |
| X20DO8322 | X20 digital output module, 8 outputs, 24 VDC, 0.5 A, source, 1-wire connections | 1791 |
| X20DO8323 | X20 digital output module, 8 outputs, 12 to 24 V, 0.5 A, sink/source, 1-wire connections, full bridge, half bridge, thermal overload protection | 1799 |
| X20DO8331 | X20 digital output module, 8 outputs, 24 VDC, 2 A, sink, supply directly on module, 1-wire connections | 1808 |
| X20DO8332 | X20 digital output module, 8 outputs, 24 VDC, 2 A, source, supply directly on module, 1-wire connections | 1820 |
| X20DO8332-1 | X20 digital output module, 8 outputs, 24 VDC, 2 A, source, optimized for inductive loads, power supply directly on module, 1-wire connections | 1832 |
| X20DO9321 | X20 digital output module, 12 outputs, 24 VDC, 0.5 A, sink, 1-wire connections | 1843 |
| X20DO9322 | X20 digital output module, 12 outputs, 24 VDC, 0.5 A, source, 1-wire connections | 1851 |
| X20DOD322 | X20 digital output module, 8 outputs, 24 VDC, 0.5 A, source, 2-wire connections | 1859 |
| X20DOF322 | X20 digital output module, 16 output, 24 VDC, 0.5 A, source, 1-wire connections | 1866 |
| X20cDO2633 | X20 digital output module, coated, 2 triac outputs, 48 to 240 VAC, 2 A, L-switching, phase angle control, 240 V keyed | 1610 |
| X20cDO4322 | X20 digital output module, coated, 4 outputs, 24 VDC, 0.5 A, source, 3-wire connections | 1641 |
| X20cDO4332 | X20 digital output module, coated, 4 outputs, 24 VDC, 2 A, source, 3-wire connections | 1659 |
| X20cDO4633 | X20 digital output module, coated, 4 triac outputs, 48 to 240 VAC, 1 A, L-switching, phase angle control, 240 V keyed | 1709 |
| X20cDO4649 | X20 digital output module, coated, 4 relays, N.O. contacts, 240 VAC / 5 A | 1726 |
| X20cDO6321 | X20 digital output module, coated, 6 outputs, 24 VDC, 0.5 A, sink, 2-wire connections | 1739 |
| X20cDO6322 | X20 digital output module, coated, 6 outputs, 24 VDC, 0.5 A, source, 2-wire connections | 1746 |
| X20cDO6529 | X20 digital output module, coated, 6 relays, normally open contacts, 115 VAC / 0.5 A, 30 VDC / 1 A | 1766 |
| X20cDO6639 | X20 digital output module, coated, 6 relays, normally open contacts, 240 VAC / 2 A, 30 VDC / 2 A | 1773 |
| X20cDO8331 | X20 digital output module, coated, 8 outputs, 24 VDC, 2 A, sink, supply directly on module, 1-wire connections | 1808 |
| X20cDO8332 | X20 digital output module, coated, 8 outputs, 24 VDC, 2 A, source, supply directly on module, 1-wire connections | 1820 |
| X20cDO9321 | X20 digital output module, coated, 12 outputs, 24 VDC, 0.5 A, sink, 1-wire connections | 1843 |
| X20cDO9322 | X20 digital output module, coated, 12 outputs, 24 VDC, 0.5 A, source, 1-wire connections | 1851 |
| X20cDOF322 | X20 digital output module, coated, 16 output, 24 VDC, 0.5 A, source, 1-wire connections | 1866 |

9.15.2 X2ODO2321

Data sheet version: 3.16

9.15.2.1 General information

The module is equipped with 2 outputs for 3-wire connections. It is designed for X20 6-pin terminal blocks. If needed (e.g. for logistical reasons), the 12-pin terminal block can also be used.

- 2 digital outputs
- Sink connection
- 3-wire connections
- 24 VDC and GND for actuator supply
- Integrated output protection
- OSP mode

9.15.2.2 Order data

| Model number | Short description | Figure |
|--------------|---|--|
| | Digital outputs |  |
| X2ODO2321 | X20 digital output module, 2 outputs, 24 VDC, 0.5 A, sink, 3-wire connections | |
| | Required accessories | |
| | Bus modules | |
| X20BM11 | X20 bus module, 24 VDC keyed, internal I/O supply continuous | |
| X20BM15 | X20 bus module, with node number switch, 24 VDC keyed, internal I/O supply continuous | |
| | Terminal blocks | |
| X20TB06 | X20 terminal block, 6-pin, 24 VDC keyed | |
| X20TB12 | X20 terminal block, 12-pin, 24 VDC keyed | |
| | | |

Table 296: X20DO2321 - Technical data

- 1) Number of outputs x $R_{DS(on)}$ x Nominal output current². For a calculation example, see section "Mechanical and electrical configuration" of the X20 system user's manual.
- 2) The power consumption of the sensors connected to the module is not permitted to exceed 12 W.

9.15.2.4 Status LEDs

For a description of the various operating modes, see "[Diagnostic LEDs](#)" on page 3787.

| Figure | LED | Color | Status | Description |
|--|-------|-----------------------------|----------------------------|---|
|  | r | Green | Off | Module supply not connected |
| | | | Single flash | Reset mode |
| | | | Blinking | PREOPERATIONAL mode |
| | | | On | RUN mode |
| | | | Flickering (approx. 10 Hz) | The module is in the OSP state. |
| | e | Red | Off | Module supply not connected or everything OK |
| | | | Single flash | Warning/Error on an I/O channel. Level monitoring for digital outputs has been triggered. |
| | e + r | Red on / Green single flash | Invalid firmware | |
| | 1 - 2 | Orange | | Output status of the corresponding digital output |

9.15.2.5 Pinout

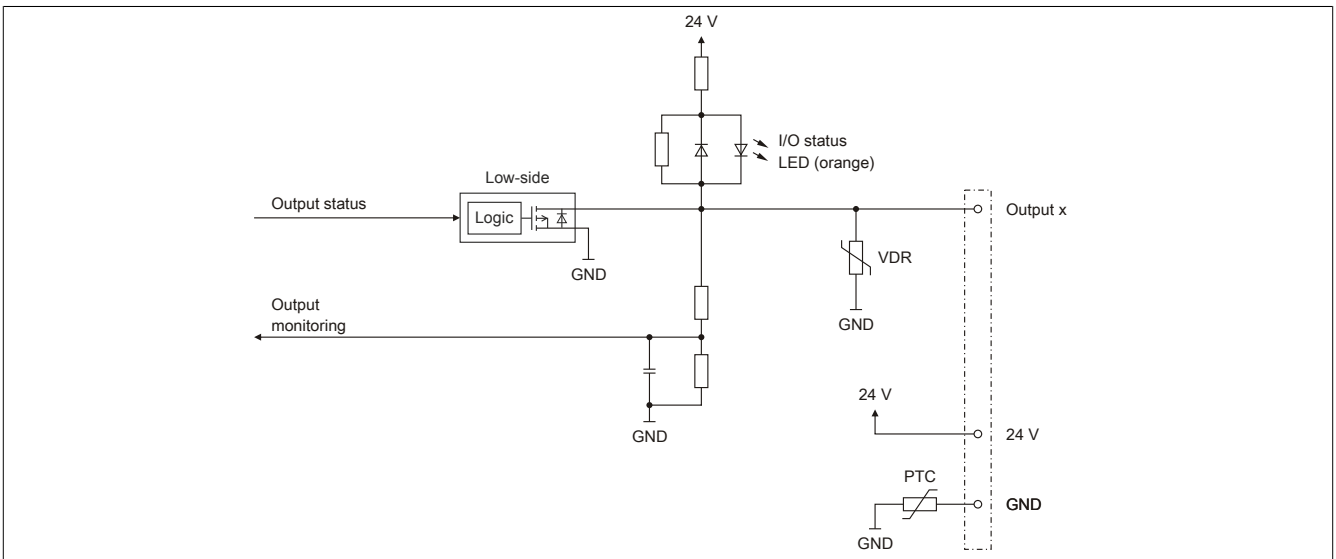

9.15.2.6 Connection example

9.15.2.7 OSP hardware requirements

In order to use OSP mode sensibly, it should be ensured that the power supply of the output module and CPU are independent of each other when the application is set up.

9.15.2.8 Output circuit diagram

9.15.2.9 Switching inductive loads

Environmental temperature: 60°C, all outputs with the same load

Information:

If the maximum number of operating cycles per second is exceeded, an external inverse diode must be used.

Operating conditions outside of the area in the diagram are not permitted!

9.15.2.10 Register description

9.15.2.10.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section "[General data points](#)" on page 3790.

9.15.2.10.2 Function model 0 - Standard

| Register | Fixed offset | Name | Data type | Read | | Write | |
|----------|--------------|-----------------------|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| 2 | 0 | DigitalOutput | USINT | | | • | |
| | | DigitalOutput01 | Bit 0 | | | | |
| | | DigitalOutput02 | Bit 1 | | | | |
| 30 | 1 | StatusInput01 | USINT | • | | | |
| | | StatusDigitalOutput01 | Bit 0 | | | | |
| | | StatusDigitalOutput02 | Bit 1 | | | | |

Fixed modules require their data points to be in a specific order in the X2X frame. Cyclic access occurs according to a predefined offset, not based on the register address.

Acyclic access continues to be based on the register numbers.

9.15.2.10.3 Function model 1 - OSP

| Register | Fixed offset | Name | Data type | Read | | Write | |
|----------|--------------|---|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| 2 | 0 | Switching state of digital outputs 1 to 2 | USINT | | | • | |
| | | DigitalOutput01 | Bit 0 | | | | |
| | | DigitalOutput02 | Bit 1 | | | | |
| 30 | 1 | Status of digital outputs 1 to 2 | USINT | • | | | |
| | | StatusDigitalOutput01 | Bit 0 | | | | |
| | | StatusDigitalOutput02 | Bit 1 | | | | |
| 34 | 1 | Enabling OPS output in the module | USINT | | | • | |
| | | OSPValid | Bit 0 | | | | |
| 32 | - | CfgOSPMode | USINT | | | | • |
| 36 | - | CfgOSPValue | USINT | | | | • |

Fixed modules require their data points to be in a specific order in the X2X frame. Cyclic access occurs according to a predefined offset, not based on the register address.

Acyclic access continues to be based on the register numbers.

9.15.2.10.4 Function model 254 - Bus Controller

| Register | Offset ¹⁾ | Name | Data type | Read | | Write | |
|----------|----------------------|---|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| 2 | 0 | Switching state of digital outputs 1 to 2 | USINT | | | • | |
| | | DigitalOutput01 | Bit 0 | | | | |
| | | DigitalOutput02 | Bit 1 | | | | |
| 30 | - | Status of digital outputs 1 to 2 | USINT | | • | | |
| | | StatusDigitalOutput01 | Bit 0 | | | | |
| | | StatusDigitalOutput02 | Bit 1 | | | | |

1) The offset specifies where the register is within the CAN object.

9.15.2.10.4.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see "[Using I/O modules on the bus controller](#)" on page 3789.

9.15.2.10.4.2 CAN I/O bus controller

The module occupies 1 digital logical slot on CAN I/O.

9.15.2.10.5 Digital outputs

The output state is transferred to the output channels with a fixed offset (<60 µs) based on the network cycle (SyncOut).

9.15.2.10.5.1 Switching state of digital outputs 1 to 2

Name:

DigitalOutput

DigitalOutput01 to DigitalOutput02

This register is used to store the switching state of digital outputs 1 to 2.

Only function model 0 - Standard:

Setting "Packed outputs" in the Automation Studio I/O configuration determines whether all bits of this register should be applied individually as data points in the Automation Studio I/O assignment ("DigitalOutput01" to "DigitalOutput0x") or whether this register should be displayed as a single USINT data point ("DigitalOutput").

| Data type | Value | Information |
|-----------|------------------------|--|
| USINT | 0 to 3 | Packed outputs = On |
| | See the bit structure. | Packed outputs = Off or function model ≠ 0 - Standard. |

Bit structure:

| Bit | Name | Value | Information |
|-----|-----------------|-------|-------------------------|
| 0 | DigitalOutput01 | 0 | Digital output 01 reset |
| | | 1 | Digital output 01 set |
| 1 | DigitalOutput02 | 0 | Digital output 02 reset |
| | | 1 | Digital output 02 set |

9.15.2.10.6 Monitoring status of the digital outputs

On the module, the output states of the outputs are compared to the target states. The control of the output driver is used for the target state.

A change in the output state resets monitoring for that output. The status of each individual channel can be read. A change in the monitoring status is actively transmitted as an error message.

9.15.2.10.6.1 Status of digital outputs 1 to 2

Name:

StatusInput01

StatusDigitalOutput01 to StatusDigitalOutput02

The status of digital outputs 1 to 2 is mapped in this register.

Only function model 0 - Standard:

Setting "Packed outputs" in the Automation Studio I/O configuration determines whether all bits of this register should be applied individually as data points in the Automation Studio I/O assignment ("StatusDigitalOutput01" to "StatusDigitalOutput0x") or whether this register should be displayed as a single USINT data point ("StatusInput01").

| Data type | Value | Information |
|-----------|------------------------|--|
| USINT | 0 to 3 | Packed outputs = On |
| | See the bit structure. | Packed outputs = Off or function model ≠ 0 - Standard. |

Bit structure:

| Bit | Name | Value | Information |
|-----|-----------------------|-------|---|
| 0 | StatusDigitalOutput01 | 0 | Channel 01: No error |
| | | 1 | Channel 01: <ul style="list-style-type: none"> • Short circuit or overload • Channel switched on and missing I/O power supply • Channel switched off and external voltage applied on channel |
| 1 | StatusDigitalOutput02 | 0 | Channel 02: No error |
| | | 1 | Channel 02: For error description, see channel 01 |

9.15.2.10.7 Function model "OSP"

In function model "OSP" (Operator Set Predefined), the user defines an analog value or digital pattern. This OSP value is output as soon as the communication between the module and master is aborted.

Functionality

The user has the choice between 2 OSP modes:

- Retain last valid value
- Replace with static value

In the first case, the module retains the last value recognized as a valid output status.

When selecting mode "Replace with static value", a plausible output value must be entered in the associated value register. When an OSP event occurs, this value is output instead of the value currently requested by the task.

9.15.2.10.7.1 Enabling OPS output in the module

Name:

OSPValid

This data point makes it possible to start the output of the module and request the use of OSP during operation.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|-------------|-------|---|
| 0 | OSPValid | 0 | Request OSP operation (after initial startup or module in stand-by) |
| | | 1 | Request normal operation |
| 1 - 7 | Reserved | 0 | |

Bit OSPValid exists once on the module and is managed by the user task. It must be set to start the enabled channels. As long as bit OSPValid remains set in the module, the module behaves the same as in function model "Standard".

If an OSP event occurs, e.g. communication between the module and master CPU aborted, then bit OSPValid is reset on the module. The module enters the OSP state and output occurs according to the configuration in register "OSPMode" on page 1589.

The following generally applies:

Even after regeneration of the communication channel, the OSP replacement value is still pending. The OSP state is only exited again when a set OSPValid bit is transferred.

When the master CPU is restarted, bit OSPValid bit is reinitialized in the master CPU. It must be set once more by the application and transferred via the bus.

In the event of brief communication errors between the module and master CPU (e.g. due to EMC), the cyclic registers fail to refresh for several bus cycles. Within the module, bit OSPValid is reset; the set bit is retained in the CPU, however. During the next successful transfer, the module-internal OSPValid bit is set again and the module automatically returns to normal operation.

If the task in the master CPU needs the information about which output mode the module is currently in, bit ModulOK can be evaluated.

Warning!

If bit OSPValid bit is reset to "0" by the module, the output status no longer depends on the responsible task in the master CPU. Nevertheless, output is made depending on the configuration of the OSP replacement value.

9.15.2.10.7.2 Setting OSP mode

Name:

CfgOSPMode

This register controls the behavior of a channel when using OSP.

| Data type | Values | Explanation |
|-----------|--------|---------------------------|
| USINT | 0 | Replace with static value |
| | 1 | Retain last valid value |

9.15.2.10.7.3 Defining an OSP-digital output value

Name:

CfgOSPValue

This register contains the digital output value that is output in "Replace with static value" mode during OSP operation.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-----|-------------|--------|--|
| 0 | | 0 or 1 | OSP output value for channel DigitalOutput00 |
| ... | | ... | |
| x | | 0 or 1 | OSP output value for channel DigitalOutput0x |

Warning!

"OSPValue" is only applied by the module if bit "OSPValid" has been set in the module.

9.15.2.10.8 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time |
|--------------------|
| 100 µs |

9.15.2.10.9 Minimum I/O update time

The minimum I/O update time specifies how far the bus cycle can be reduced so that an I/O update is performed in each cycle.

| Minimum I/O update time |
|---------------------------------|
| Equal to the minimum cycle time |

9.15.3 X20DO2322

Data sheet version: 3.16

9.15.3.1 General information

The module is equipped with 2 outputs for 3-wire connections. It is designed for X20 6-pin terminal blocks. If needed (e.g. for logistical reasons), the 12-pin terminal block can also be used.

- 2 digital outputs
- Source connection
- 3-wire connections
- 24 VDC and GND for actuator supply
- Integrated output protection
- OSP mode

9.15.3.2 Order data

| Model number | Short description | Figure |
|--------------|---|--|
| | Digital outputs |  |
| X20DO2322 | X20 digital output module, 2 outputs, 24 VDC, 0.5 A, source, 3-wire connections | |

- 1) Number of outputs x $R_{DS(on)}$ x Nominal output current². For a calculation example, see section "Mechanical and electrical configuration" of the X20 system user's manual.
- 2) At loads ≤ 1 k Ω
- 3) The power consumption of the sensors connected to the module is not permitted to exceed 12 W.

9.15.3.4 Status LEDs

For a description of the various operating modes, see "Diagnostic LEDs" on page 3787.

| Figure | LED | Color | Status | Description |
|---|-------|-----------------------------|----------------------------|---|
|  | r | Green | Off | Module supply not connected |
| | | | Single flash | RESET mode |
| | | | Blinking | PREOPERATIONAL mode |
| | | | On | RUN mode |
| | | | Flickering (approx. 10 Hz) | The module is in the OSP state. |
| | e | Red | Off | Module supply not connected or everything OK |
| | | | Single flash | Warning/Error on an I/O channel. Level monitoring for digital outputs has been triggered. |
| | e + r | Red on / Green single flash | Invalid firmware | |
| | 1 - 2 | Orange | | Output status of the corresponding digital output |

9.15.3.5 Pinout

9.15.3.6 Connection example

Caution!

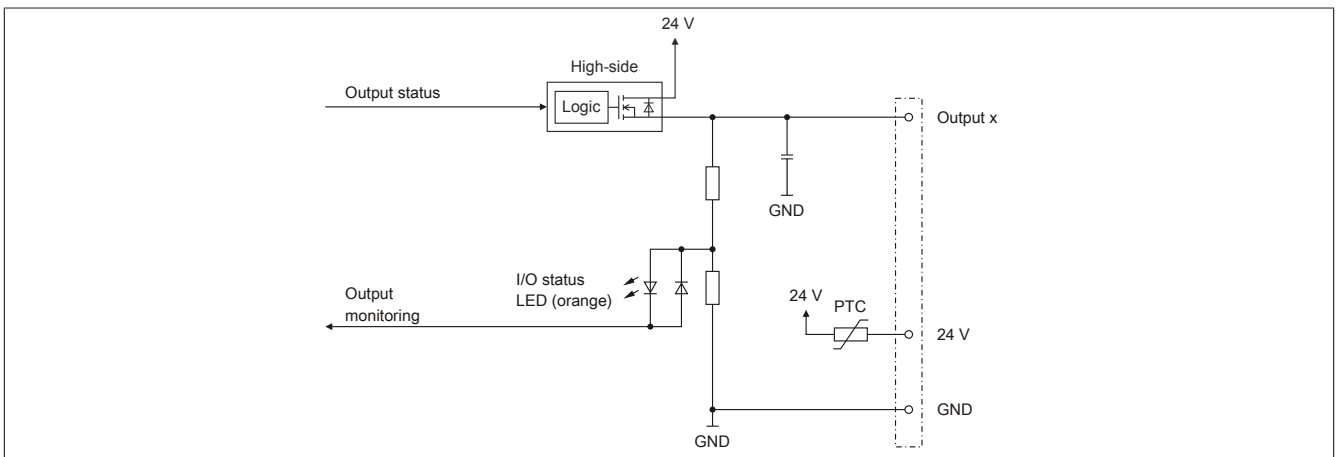

If the module is operated outside specifications, the output current may rise above the maximum permissible nominal current. This applies both to individual channels and to the summation current of the module.

Appropriate cable cross-sections or external safety measures must therefore be provided.

9.15.3.7 OSP hardware requirements

In order to use OSP mode sensibly, it should be ensured that the power supply of the output module and CPU are independent of each other when the application is set up.

9.15.3.8 Output circuit diagram

9.15.3.9 Switching inductive loads

Ambient temperature: 60°C, all outputs with the same load

Information:

If the maximum number of operating cycles per second is exceeded, an external inverse diode must be used.

Operating conditions outside of the area in the diagram are not permitted!

9.15.3.10 Register description

9.15.3.10.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section "[General data points](#)" on page 3790.

9.15.3.10.2 Function model 0 - Standard

| Register | Fixed offset | Name | Data type | Read | | Write | |
|----------|--------------|-----------------------|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| 2 | 0 | DigitalOutput | USINT | | | • | |
| | | DigitalOutput01 | Bit 0 | | | | |
| | | DigitalOutput02 | Bit 1 | | | | |
| 30 | 1 | StatusInput01 | USINT | • | | | |
| | | StatusDigitalOutput01 | Bit 0 | | | | |
| | | StatusDigitalOutput02 | Bit 1 | | | | |

Fixed modules require their data points to be in a specific order in the X2X frame. Cyclic access occurs according to a predefined offset, not based on the register address.

Acyclic access continues to be based on the register numbers.

9.15.3.10.3 Function model 1 - OSP

| Register | Fixed offset | Name | Data type | Read | | Write | |
|----------|--------------|---|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| 2 | 0 | Switching state of digital outputs 1 to 2 | USINT | | | • | |
| | | DigitalOutput01 | Bit 0 | | | | |
| | | DigitalOutput02 | Bit 1 | | | | |
| 30 | 1 | Status of digital outputs 1 to 2 | USINT | • | | | |
| | | StatusDigitalOutput01 | Bit 0 | | | | |
| | | StatusDigitalOutput02 | Bit 1 | | | | |
| 34 | 1 | Enabling OPS output in the module | USINT | | | • | |
| | | OSPValid | Bit 0 | | | | |
| 32 | - | CfgOSPMODE | USINT | | | | • |
| 36 | - | CfgOSPValue | USINT | | | | • |

Fixed modules require their data points to be in a specific order in the X2X frame. Cyclic access occurs according to a predefined offset, not based on the register address.

Acyclic access continues to be based on the register numbers.

9.15.3.10.4 Function model 254 - Bus Controller

| Register | Offset ¹⁾ | Name | Data type | Read | | Write | |
|----------|----------------------|---|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| 2 | 0 | Switching state of digital outputs 1 to 2 | USINT | | | • | |
| | | DigitalOutput01 | Bit 0 | | | | |
| | | DigitalOutput02 | Bit 1 | | | | |
| 30 | - | Status of digital outputs 1 to 2 | USINT | | • | | |
| | | StatusDigitalOutput01 | Bit 0 | | | | |
| | | StatusDigitalOutput02 | Bit 1 | | | | |

1) The offset specifies where the register is within the CAN object.

9.15.3.10.4.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see "[Using I/O modules on the bus controller](#)" on page 3789.

9.15.3.10.4.2 CAN I/O bus controller

The module occupies 1 digital logical slot on CAN I/O.

9.15.3.10.5 Digital outputs

The output state is transferred to the output channels with a fixed offset (<60 µs) based on the network cycle (SyncOut).

9.15.3.10.5.1 Switching state of digital outputs 1 to 2

Name:

DigitalOutput

DigitalOutput01 to DigitalOutput02

This register is used to store the switching state of digital outputs 1 to 2.

Only function model 0 - Standard:

Setting "Packed outputs" in the Automation Studio I/O configuration determines whether all bits of this register should be applied individually as data points in the Automation Studio I/O assignment ("DigitalOutput01" to "DigitalOutput0x") or whether this register should be displayed as a single USINT data point ("DigitalOutput").

| Data type | Value | Information |
|-----------|------------------------|--|
| USINT | 0 to 3 | Packed outputs = On |
| | See the bit structure. | Packed outputs = Off or function model ≠ 0 - Standard. |

Bit structure:

| Bit | Name | Value | Information |
|-----|-----------------|-------|-------------------------|
| 0 | DigitalOutput01 | 0 | Digital output 01 reset |
| | | 1 | Digital output 01 set |
| 1 | DigitalOutput02 | 0 | Digital output 02 reset |
| | | 1 | Digital output 02 set |

9.15.3.10.6 Monitoring status of the digital outputs

On the module, the output states of the outputs are compared to the target states. The control of the output driver is used for the target state.

A change in the output state resets monitoring for that output. The status of each individual channel can be read. A change in the monitoring status is actively transmitted as an error message.

9.15.3.10.6.1 Status of digital outputs 1 to 2

Name:

StatusInput01

StatusDigitalOutput01 to StatusDigitalOutput02

The status of digital outputs 1 to 2 is mapped in this register.

Only function model 0 - Standard:

Setting "Packed outputs" in the Automation Studio I/O configuration determines whether all bits of this register should be applied individually as data points in the Automation Studio I/O assignment ("StatusDigitalOutput01" to "StatusDigitalOutput0x") or whether this register should be displayed as a single USINT data point ("StatusInput01").

| Data type | Value | Information |
|-----------|------------------------|--|
| USINT | 0 to 3 | Packed outputs = On |
| | See the bit structure. | Packed outputs = Off or function model ≠ 0 - Standard. |

Bit structure:

| Bit | Name | Value | Information |
|-----|-----------------------|-------|---|
| 0 | StatusDigitalOutput01 | 0 | Channel 01: No error |
| | | 1 | Channel 01: <ul style="list-style-type: none"> • Short circuit or overload • Channel switched on and missing I/O power supply • Channel switched off and external voltage applied on channel |
| 1 | StatusDigitalOutput02 | 0 | Channel 02: No error |
| | | 1 | Channel 02: For error description, see channel 01 |

9.15.3.10.7 Function model "OSP"

In function model "OSP" (Operator Set Predefined), the user defines an analog value or digital pattern. This OSP value is output as soon as the communication between the module and master is aborted.

Functionality

The user has the choice between 2 OSP modes:

- Retain last valid value
- Replace with static value

In the first case, the module retains the last value recognized as a valid output status.

When selecting mode "Replace with static value", a plausible output value must be entered in the associated value register. When an OSP event occurs, this value is output instead of the value currently requested by the task.

9.15.3.10.7.1 Enabling OPS output in the module

Name:

OSPValid

This data point makes it possible to start the output of the module and request the use of OSP during operation.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|-------------|-------|---|
| 0 | OSPValid | 0 | Request OSP operation (after initial startup or module in stand-by) |
| | | 1 | Request normal operation |
| 1 - 7 | Reserved | 0 | |

Bit OSPValid exists once on the module and is managed by the user task. It must be set to start the enabled channels. As long as bit OSPValid remains set in the module, the module behaves the same as in function model "Standard".

If an OSP event occurs, e.g. communication between the module and master CPU aborted, then bit OSPValid is reset on the module. The module enters the OSP state and output occurs according to the configuration in register "OSPMode" on page 1598.

The following generally applies:

Even after regeneration of the communication channel, the OSP replacement value is still pending. The OSP state is only exited again when a set OSPValid bit is transferred.

When the master CPU is restarted, bit OSPValid bit is reinitialized in the master CPU. It must be set once more by the application and transferred via the bus.

In the event of brief communication errors between the module and master CPU (e.g. due to EMC), the cyclic registers fail to refresh for several bus cycles. Within the module, bit OSPValid is reset; the set bit is retained in the CPU, however. During the next successful transfer, the module-internal OSPValid bit is set again and the module automatically returns to normal operation.

If the task in the master CPU needs the information about which output mode the module is currently in, bit ModulOK can be evaluated.

Warning!

If bit OSPValid bit is reset to "0" by the module, the output status no longer depends on the responsible task in the master CPU. Nevertheless, output is made depending on the configuration of the OSP replacement value.

9.15.3.10.7.2 Setting OSP mode

Name:

CfgOSPMode

This register controls the behavior of a channel when using OSP.

| Data type | Values | Explanation |
|-----------|--------|---------------------------|
| USINT | 0 | Replace with static value |
| | 1 | Retain last valid value |

9.15.3.10.7.3 Defining an OSP-digital output value

Name:

CfgOSPValue

This register contains the digital output value that is output in "Replace with static value" mode during OSP operation.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-----|-------------|--------|--|
| 0 | | 0 or 1 | OSP output value for channel DigitalOutput00 |
| ... | | ... | |
| x | | 0 or 1 | OSP output value for channel DigitalOutput0x |

Warning!

"OSPValue" is only applied by the module if bit "OSPValid" has been set in the module.

9.15.3.10.8 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time |
|--------------------|
| 100 µs |

9.15.3.10.9 Minimum I/O update time

The minimum I/O update time specifies how far the bus cycle can be reduced so that an I/O update is performed in each cycle.

| Minimum I/O update time |
|---------------------------------|
| Equal to the minimum cycle time |

9.15.4 X2ODO2623

Data sheet version: 3.22

9.15.4.1 General information

The module is a digital output module that is equipped with 2 SSR outputs with zero cross-over switches and uses 3-line connections. The module is also equipped with integrated full-wave control. The supply (L and N) is fed directly to the module.

- 2 digital outputs
- Outputs with integrated snubber circuit
- Outputs with 100 to 240 VAC
- L switching
- 50 Hz or 60 Hz
- 3-wire connections
- Integrated full-wave control
- 240 V coding

Danger!

Risk of electric shock!

The terminal block is only permitted to conduct voltage when it is connected. It is not permitted to be disconnected or connected while voltage is applied or have voltage applied to it while it is removed under any circumstances.

This module is not permitted to be the last module connected on the X2X Link network. At least one subsequent X20ZF dummy module must provide protection against contact.

9.15.4.2 Order data

| Model number | Short description | Figure |
|--------------|--|---|

| | e + r | Red on / Green single flash | Invalid firmware | |
| | 1 - 2 | Orange | | Control status of the corresponding digital output |

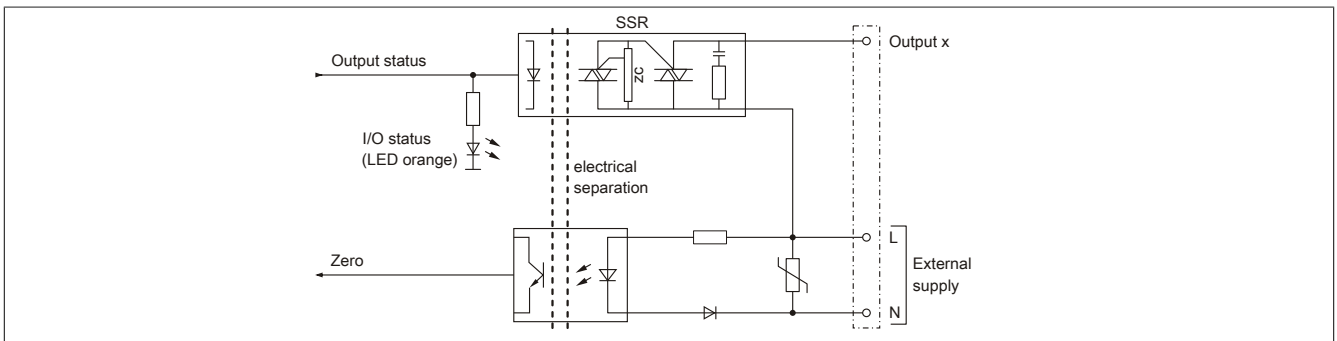

9.15.4.5 Pinout

9.15.4.6 Connection example

9.15.4.7 Output circuit diagram

9.15.4.8 Integrated full-wave control

Full-wave control is used to control power for electrical power consumers that are operated with AC voltage. Temperature control is a typical application

Unlike phase-angle control, the sine wave oscillation form of the mains voltage is not changed during full-wave control. This significantly reduces system perturbation.

The output voltage (channel) is switched on and off at a certain ratio. This switches the multi-cycle packets. A multi-cycle packet consists of a number of complete sine waves throughout a cycle. The relationship between the power-on duration and the cycle duration results in the desired effect of reduced power consumption by the connected power consumer.

With the full-wave control that is integrated in the module, a maximum of 24 full waves can be provided on the outputs per cycle. Control takes place in 4% steps.

| Settings | | Full waves | | | | | | | | | | | | | | | | | | | | | | | |
|----------|-----|------------|---|---|---|---|---|---|---|---|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|

Example of full-wave control (8%):

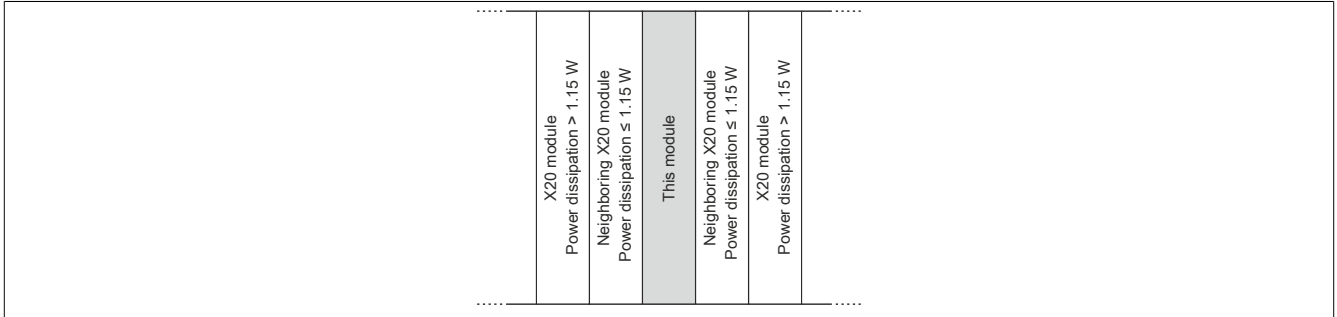

9.15.4.9 Derating

There is no derating when operated below 55°C.

During operation over 55°C, the power dissipation of the modules to the left and right of this module is not permitted to exceed 1.15 W!

For an example of calculating the power dissipation of I/O modules, see section "[Power dissipation calculation of I/O modules](#)" on page 101.

9.15.4.10 Register description

9.15.4.10.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section ["General data points" on page 3790](#).

9.15.4.10.2 Function model 0 - Standard

| Register | Fixed offset | Name | Data type | Read | | Write | |
|----------------------|--------------|---|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| Configuration | | | | | | | |
| 12 | 3 | ShiftOutput01 ¹⁾ | USINT | | | • | |
| 14 | 4 | ShiftOutput02 ¹⁾ | USINT | | | • | |
| 28 | - | ConfigOutput01 | USINT | | | | • |
| Communication | | | | | | | |
| 2 | 0 | DigitalOutput | USINT | | | • | |
| | | DigitalOutput01 | Bit 0 | | | | |
| | | DigitalOutput02 | Bit 1 | | | | |
| 4 | 1 | AnalogOutput01 | USINT | | | • | |
| 6 | 2 | AnalogOutput02 | USINT | | | • | |
| 30 | 1 | StatusInput01 | USINT | • | | | |
| | | ZeroCrossingInput | Bit 0 | | | | |
| | | ZeroCrossingStatus | Bit 4 | | | | |

1) Firmware version 816 and up.

Fixed modules require their data points to be in a specific order in the X2X frame. Cyclic access occurs according to a predefined offset, not based on the register address.

Acyclic access continues to be based on the register numbers.

9.15.4.10.3 Function model 254 - Bus Controller

| Register | Offset ¹⁾ | Name | Data type | Read | | Write | |
|----------------------|----------------------|--|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| Configuration | | | | | | | |
| 12 | - | ShiftOutput01 ²⁾ | USINT | | | | • |
| 14 | - | ShiftOutput02 ²⁾ | USINT | | | | • |
| 28 | - | ConfigOutput01 (output filter) | USINT | | | | • |
| Communication | | | | | | | |
| 4 | 0 | AnalogOutput01 | USINT | | | • | |
| 6 | 2 | AnalogOutput02 | USINT | | | • | |
| 30 | 0 | Zero crossing status | USINT | • | | | |
| | | ZeroCrossingInput | Bit 0 | | | | |
| | | ZeroCrossingStatus | Bit 4 | | | | |

1) The offset specifies where the register is within the CAN object.

2) Firmware version 816 and up.

9.15.4.10.3.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see ["Using I/O modules on the bus controller" on page 3789](#).

9.15.4.10.3.2 CAN I/O bus controller

The module occupies 1 analog logical slot on CAN I/O.

9.15.4.10.4 Digital outputs

The output status is transferred to the control switch asynchronously to the connected network. The outputs switch on when the voltage crosses zero and switch off when the current crosses zero.

9.15.4.10.4.1 Switching state of digital outputs 1 to 2

Name:

DigitalOutput

DigitalOutput01 to DigitalOutput02

This register is used to store the switching state of digital outputs 1 to 2.

Only function model 0 - Standard:

Setting "Packed outputs" in the Automation Studio I/O configuration determines whether all bits of this register should be applied individually as data points in the Automation Studio I/O assignment ("DigitalOutput01" to "DigitalOutput0x") or whether this register should be displayed as a single USINT data point ("DigitalOutput").

| Data type | Value | Information |
|-----------|------------------------|--|
| USINT | 0 to 3 | Packed outputs = On |
| | See the bit structure. | Packed outputs = Off or function model ≠ 0 - Standard. |

Bit structure:

| Bit | Name | Value | Information |
|-----|-----------------|-------|-------------------------|
| 0 | DigitalOutput01 | 0 | Digital output 01 reset |
| | | 1 | Digital output 01 set |
| 1 | DigitalOutput02 | 0 | Digital output 02 reset |
| | | 1 | Digital output 02 set |

Information:

The states in this register are only applied when the channels are set to DIGITAL in "Setting the output configuration" on page 1607.

When using the setting "packed outputs" ALL channels must be set to DIGITAL. Mixed operation is not possible.

9.15.4.10.5 Analog outputs

The output value is transferred to the control circuit in sync with the connected power mains according to the firing pattern table (see "Integrated full-wave control" on page 1603). The analog value is output with a resolution of ~4% over a duration of 24 complete waves. Values > 96% result in full control. Changes to the output value within an interval are applied after the next zero crossover.

9.15.4.10.5.1 Setting the output value from the firing pattern table

Name:

AnalogOutput01 to AnalogOutput02

These registers are used to set the output value from the firing pattern table.

Values between 0 and 100 correspond to the output value for the respective channel in percent. Values above 100 correspond to 100%.

| Data type | Value |
|-----------|----------|
| USINT | 0 to 100 |

Information:

The states in these registers are only applied when the channels are set to ANALOG in "Setting the output configuration" on page 1607.

9.15.4.10.5.2 Setting the output configuration

Name:

ConfigOutput01

Each channel can be configured for either "digital" or "analog" operation in this register. The corresponding DigitalOutput or AnalogOutput registers must be written depending on the setting.

| Data type | Values | Bus controller default setting |
|-----------|------------------------|--------------------------------|
| USINT | See the bit structure. | 3 |

Bit structure:

| Bit | Name | Value | Information |
|-------|-----------|-------|---|
| 0 | Channel 1 | 0 | Digital register is used |
| | | 1 | Analog register used (bus controller default setting) |
| 1 | Channel 2 | 0 | Digital register used |
| | | 1 | Analog register used (bus controller default setting) |
| 2 - 7 | Reserved | 0 | |

9.15.4.10.5.3 Shift switching pattern

Name:

ShiftOutput01 to ShiftOutput02

To prevent load peaks due to simultaneous switching of outputs, this register can be used to shift the switching pattern by a number of full waves. Due to the hardware used, it is not possible to shift by less than a full wave.

Values higher than 23 are limited to 23.

| Data type | Value | Information |
|-----------|---------|---|
| USINT | 0 | No shift (bus controller default setting) |
| | 1 to 23 | Size of the shift in number of full waves |

Example

Set 0 on Channel 1 and 1 on Channel 2. With the same control value (see "Integrated full-wave control" on page 1603) this delays the switching pattern of Channel 2 by one full wave.

9.15.4.10.6 Zero crossing status

Name:

ZeroCrossingInput

ZeroCrossingStatus

StatusInput01

Zero crossing detection uses a fixed filter time of 1 ms and a scanning frequency of 10 kHz. When a missing or too short period is detected, control is switched off until at least 2 periods are detected correctly, and the status flag is set accordingly. Control is offset by 2 ms from the negative half-wave until the next zero crossover is detected correctly or another error occurs. This is normally at least one complete wave.

Monitoring is activated at the first zero crossover after being switched on.

Only function model 0 - Standard:

Setting "Packed outputs" in the Automation Studio I/O configuration determines whether all bits of this register should be applied individually as data points in the Automation Studio I/O assignment ("ZeroCrossingInput" to "ZeroCrossingStatus") or whether this register should be displayed as a single USINT data point ("StatusInput01").

| Data type | Value | Information |
|-----------|------------------------|--|
| USINT | 0 to 17 | Packed outputs = On |
| | See the bit structure. | Packed outputs = Off or function model ≠ 0 - Standard. |

Bit structure:

| Bit | Description | Value | Information |
|-------|---------------------------------|-------|--------------------------------------|
| 0 | ZeroCrossingInput ¹⁾ | 0 | Signal during the negative half-wave |
| | | 1 | Signal during the positive half-wave |
| 1 - 3 | Reserved | 0 | |
| 4 | ZeroCrossingStatus | 0 | No error |
| | | 1 | Zero crossover failed |
| 5 - 7 | Reserved | 0 | |

1) Value is valid if no error has occurred (ZeroCrossingStatus= 0)

9.15.4.10.7 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time | |
|-------------------------|-------------|
| Digital mode | 100 μ s |
| Digital and analog mode | 150 μ s |

9.15.4.10.8 Minimum I/O update time

The minimum I/O update time specifies how far the bus cycle can be reduced so that an I/O update is performed in each cycle.

| Minimum I/O update time | |
|-------------------------|-------------|
| Digital mode | 100 μ s |
| Digital and analog mode | 150 μ s |

9.15.5 X20(c)DO2633

Data sheet version: 2.63

9.15.5.1 General information

The module is a digital output module with phase-angle control that is equipped with 2 Triac outputs using 3-line connections. The supply (L and N) is fed directly to the module.

- 2 digital outputs
- Outputs with integrated snubber circuit
- Outputs with 48 to 240 VAC
- L switching
- Zero-crossing detection
- Phase-angle control
- Open-circuit detection for each channel
- Negative half-waves can be switched off
- 50 Hz or 60 Hz
- 3-wire connections
- 240 V coding
- OSP mode
- Frequency mode

Danger!

Risk of electric shock!

The terminal block is only permitted to conduct voltage when it is connected. It is not permitted to be disconnected or connected while voltage is applied or have voltage applied to it while it is removed under any circumstances.

This module is not permitted to be the last module connected on the X2X Link network. At least one subsequent X20ZF dummy module must provide protection against contact.

9.15.5.2 Coated modules

Coated modules are X20 modules with a protective coating for the electronics component. This coating protects X20c modules from condensation and corrosive gases.

The modules' electronics are fully compatible with the corresponding X20 modules.

For simplification purposes, only images and module IDs of uncoated modules are used in this data sheet.

The coating has been certified according to the following standards:

- Condensation: BMW GS 95011-4, 2x 1 cycle
- Corrosive gas: EN 60068-2-60, method 4, exposure 21 days

9.15.5.2.1 Starting temperature

The starting temperature describes the minimum permissible ambient temperature when the power is switched off at the time the coated module is switched on. This is permitted to be as low as -40°C. During operation, the conditions as specified in the technical data continue to apply.

Information:

It is important to absolutely ensure that there is no forced cooling by air currents in a closed control cabinet, for example using a fan or ventilation slots.

9.15.5.3 Order data

| Model number | Short description | Figure |
|--------------|---|---|
| | Digital outputs |  |
| X20DO2633 | X20 digital output module, 2 triac outputs, 48 to 240 VAC, 2 A, L-switching, phase angle control, 240 V keyed | |
| X20cDO2633 | X20 digital output module, coated, 2 triac outputs, 48 to 240 VAC, 2 A, L-switching, phase angle control, 240 V keyed | |
| | Required accessories | |

9.15.5.5 Status LEDs

For a description of the various operating modes, see ["Diagnostic LEDs" on page 3787](#).

| Figure | LED | Color | Status | Description |
|---|-------|-------|-----------------------------|--|
|  | r | Green | Off | Module supply not connected |
| | | | Single flash | RESET mode |
| | | | Blinking | PREOPERATIONAL mode |
| | | | On | RUN mode |
| | | | Flickering (approx. 10 Hz) | Module is in OSP state |
| | e | Red | Off | Module supply not connected or everything OK |
| | | | On | Error or reset status |
| | | | Single flash | Zero cross-over signal has dropped out |
| | e + r | | Red on / Green single flash | Invalid firmware |
| | 1 - 2 | | Orange | |

9.15.5.6 Pinout

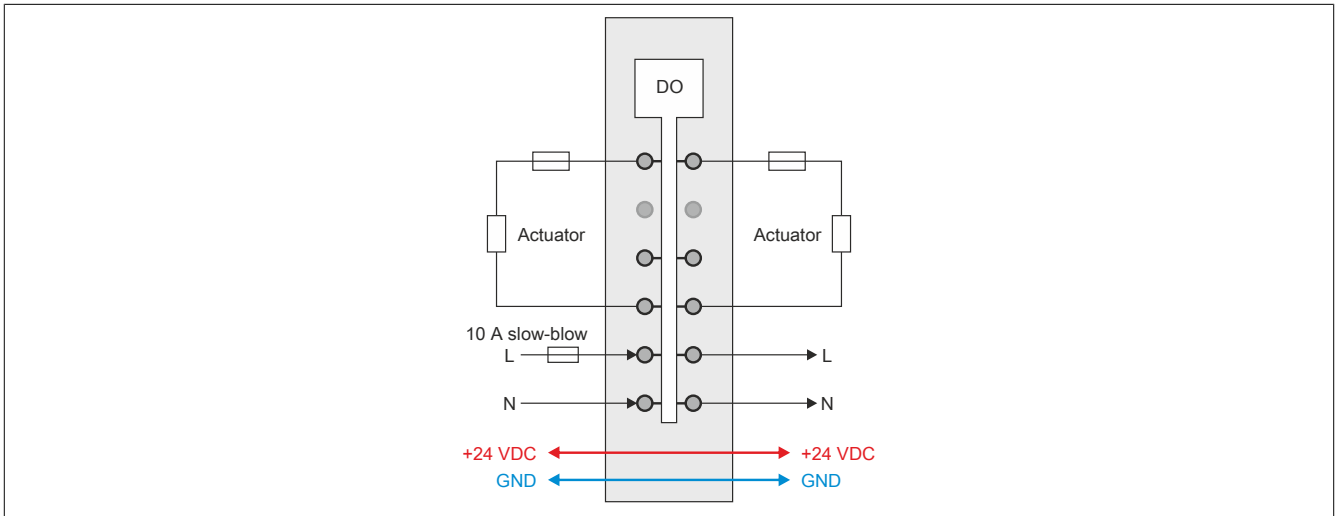

The following points must be taken into consideration when wiring the module:

- For thermal reasons, wires with a cross-section $\geq 1.5 \text{ mm}^2$ must be used to wire the module.
- The neutral return lines for the outputs must be wired to the terminal block separately for each channel and must not be bypassed in the field.
- A line filter must be used for the 240 V supply that provides $\geq 40 \text{ dB}$ attenuation at 150 kHz and works up to 5 MHz.

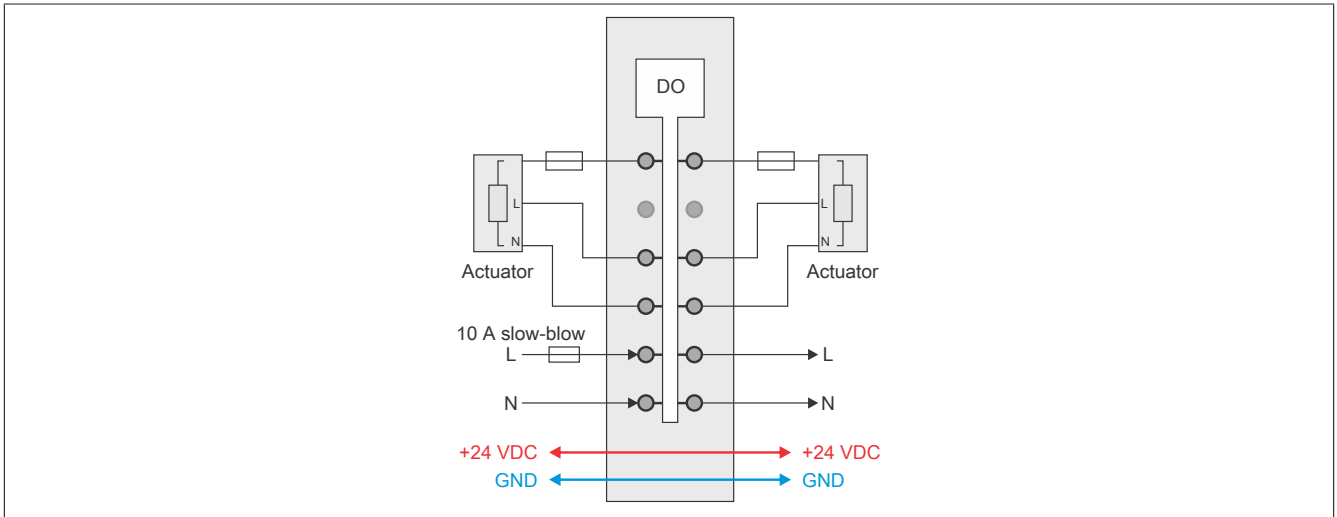

9.15.5.7 Connection example

2-wire connections

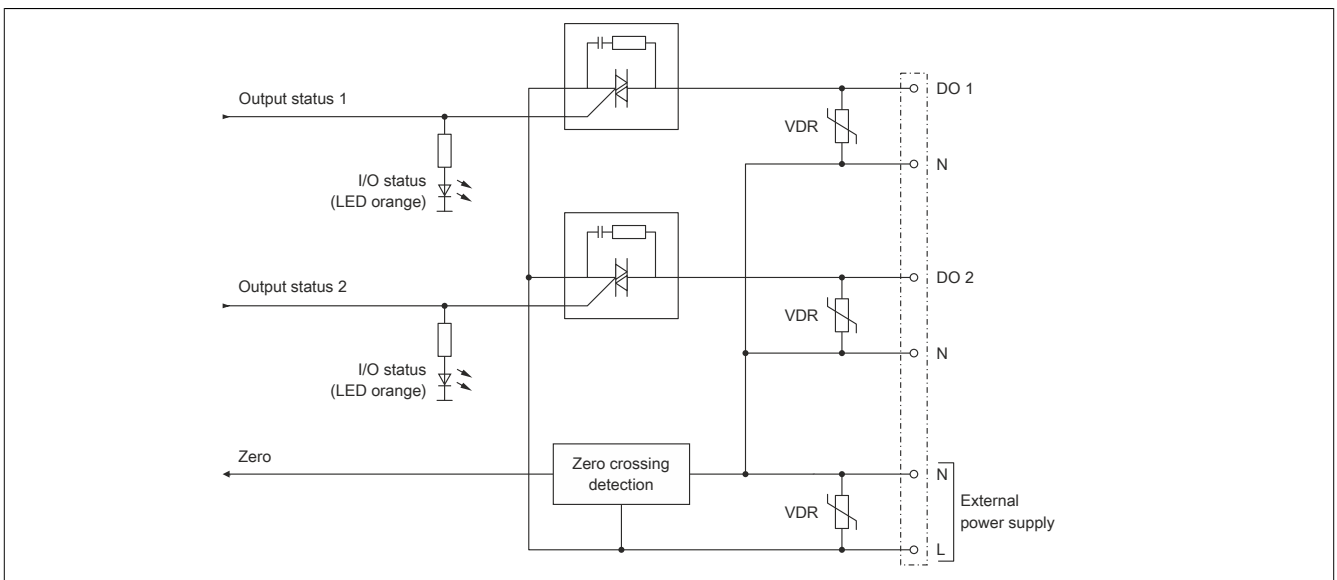

3-wire connections

9.15.5.8 OSP hardware requirements

In order to use OSP mode sensibly, it should be ensured that the power supply of the output module and CPU are independent of each other when the application is set up.

9.15.5.9 Output circuit diagram

9.15.5.10 External fuses

The following protective circuit must be used for safe operation:

| | Protective circuit | Value |
|------------------------|---------------------------|--|
| For the supply lines | Fuse | T 10 A |
| For the outputs | Fuse | Melting integral $I^2t \leq 78 \text{ A}^2\text{s}$ when $t_p = 10 \text{ ms}$ |
| With an inductive load | Varistor ¹⁾ | e.g. varistor with 275 V _{RMS} at 240 VAC |
| For the supply voltage | Line filter ²⁾ | Attenuation $\geq 40 \text{ dB}$ at 150 kHz, effective range up to 5 MHz |

1) See also section "Operation with inductive loads" on page 1615

2) Meeting the limit values specified in the standards EN 61131, EN 55011 and EN 55022 (each Class A) requires installation of a line filter in the 240 V supply line. Line filters such as the Schaffner FN 2412-8-44 can be used.

If periodic ground transients occur on the supply lines (as can occur with upstream inverters), it is necessary to use an asymmetric filter that keeps these types of changes in potential below a few volts (e.g. "Sinus Plus" from Schaffner) in addition to the symmetric filter.

9.15.5.11 Derating

The derating listed below must be applied for the current:

9.15.5.12 Operating principle

The digital output module was designed for phase control of resistive and inductive loads. The triac outputs do not have short circuit protection. The integrated open-circuit detection makes it possible to recognize defects on the load or the cabling (see "Open line detection" on page 1614).

The module is equipped with internal zero-crossing detection. Zero-crossing detection is the basis for a software PLL that generates 200 times the zero-crossing frequency. The output signal of the PLL is the base timer for the PWM outputs in both digital and analog mode.

Upon detection of lost periods or periods that are too short, control to the outputs is cut until the PLL is tuned correctly. The tuning procedure can take several seconds. In addition, the "ZeroCrossingStatus" bit is set and the error LED enabled (valid frequency range for the supply is 45 to 65 Hz).

Information:

The jitter of the output signals generated by the PLL and communication can reach 0.5%.

9.15.5.13 Open line detection

The module is equipped with open-circuit detection. Note that open-circuit detection only works when the output is enabled. An open-circuit will not be detected if the output is turned off.

In addition, open-circuit detection is restricted or doesn't work at all for inductive loads. This depends on the inductance of the load and should be determined beforehand, if necessary.

9.15.5.14 Parallel connection of outputs

Parallel connection of outputs is possible. Both the channels as well as the neutral conductors must be wired in parallel for this.

Maximum current is calculated as follows: Maximum current = Sum of individual currents * 0.9.

Example

2.5 A maximum current per channel: $(2 * 2.5 \text{ A}) * 0.9 \rightarrow 4.5 \text{ A}$ maximum current

The derating curve shown in section "Derating" on page 1614 assumes that the current is split evenly between the channels.

9.15.5.15 Operation with inductive loads

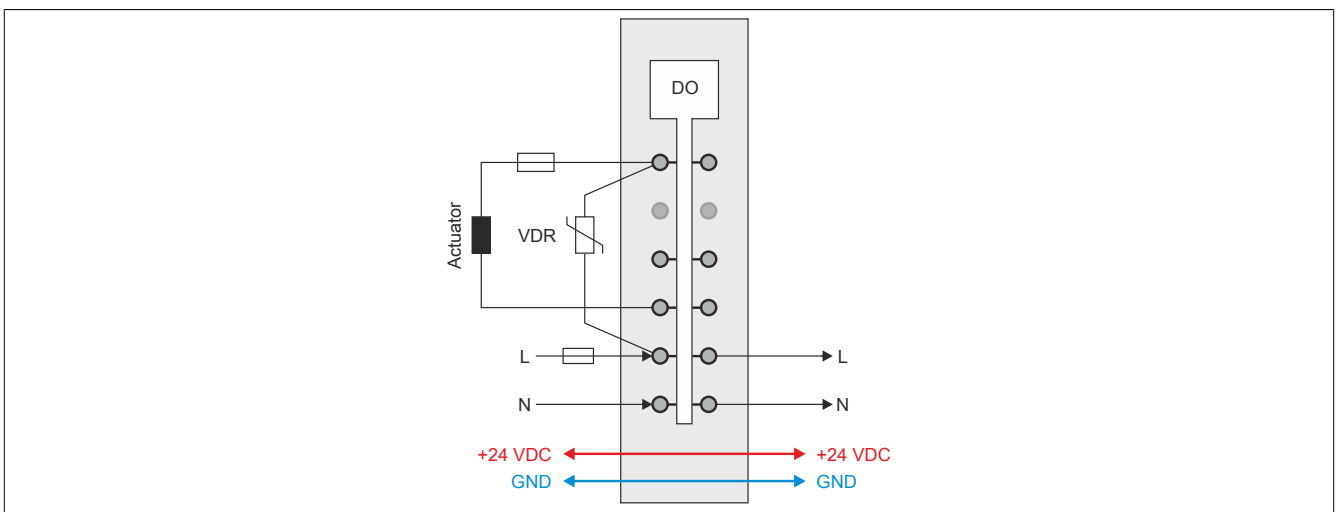

As inherent to its functional principal, the triac output is cleared when the current crosses zero. Because zero crossing for current is delayed with inductive loads, it is possible that the triac will be fired again even though it is not completely cleared at higher output values (between 50 and 100% depending on the inductance of the load). In this case, a full-wave is output. This causes the available control range (0 to 95%) to be changed.

For open line detection (LowCurrentStatus), a pause in control is required where the triac is not permitted to be fired. The full wave that is created with inductive loads causes open line detection to be triggered even though the load on the output is sufficient.

This behavior can be used to detect the full wave and properly adjust the control range (Example: If open line detection is triggered at a control value of 70%, that means that 0 to **70%** corresponds to 0 to **100%** output).

With inductive loads, a suitable varistor must be provided between the output DO x and the phase L (e.g. a varistor with 275 V_{RMS} at 240 VAC).

9.15.5.16 Register description

9.15.5.16.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section "[General data points](#)" on page 3790.

9.15.5.16.2 Function model 0 - Standard and Function model 2 - Frequency mode

The only difference between function model 2 and function model 0 is the possibility of generating half-wave patterns in various frequencies. Register 18 "CfO_Frequency" is an additional register for this.

| Register | Name | Data type | Read | | Write | |
|--------------------------------|-------------------------------------|-----------|--------|------------|--------|------------|
| | | | Cyclic | Non-cyclic | Cyclic | Non-cyclic |
| Configuration - General | | | | | | |
| 4 | AnalogOutput01 | USINT | | | • | |
| 6 | AnalogOutput02 | USINT | | | • | |
| 18 | CfO_Frequency | UINT | | | | • |
| 20 | CfO_SwitchOffValue1 | USINT | | | | • |
| 22 | CfO_SwitchOffValue2 | USINT | | | | • |
| 28 | CfO_OutputConfig | USINT | | | | • |
| 29 | CfO_OutputTolerance | USINT | | | | • |
| Communication | | | | | | |
| 2 | DigitalOutput | USINT | | | • | |
| | DigitalOutput01 | Bit 0 | | | | |
| | DigitalOutput02 | Bit 1 | | | | |

9.15.5.16.4 Function model 254 - Bus controller

| Register | Offset ¹⁾ | Name | Data type | Read | | Write | |
|--------------------------------|----------------------|-----------------------|-----------|--------|------------|--------|------------|
| | | | | Cyclic | Non-cyclic | Cyclic | Non-cyclic |
| Configuration - General | | | | | | | |
| 4 | 0 | AnalogOutput01 | USINT | | | • | |
| 6 | 2 | AnalogOutput02 | USINT | | | • | |
| 20 | - | CfO_SwitchOffValue1 | USINT | | | | • |
| 22 | - | CfO_SwitchOffValue2 | USINT | | | | • |
| 28 | - | CfO_OutputConfig | USINT | | | | • |
| 29 | - | CfO_OutputTolerance | USINT | | | | • |
| Communication | | | | | | | |
| 30 | 0 | Status of the outputs | USINT | • | | | |
| | | LowCurrentStatus1 | Bit 0 | | | | |
| | | LowCurrentStatus2 | Bit 1 | | | | |
| | | ZeroCrossingInput | Bit 4 | | | | |
| | | ZeroCrossingStatus | Bit 7 | | | | |

1) The offset specifies the position of the register within the CAN object.

9.15.5.16.4.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see ["Using I/O modules on the bus controller" on page 3789](#).

9.15.5.16.4.2 CAN I/O bus controller

The module occupies 1 analog logical slot on CAN I/O.

9.15.5.16.5 General information

The digital output module was designed for phase control of resistive and inductive loads. The triac outputs do not have short circuit protection, but have open line detection that can be used to find defects in the consumer or the wiring.

The module is equipped with internal zero-crossing detection. Zero crossing detection is the basis for a software PLL that generates 200 times the zero crossing frequency. The output signal of the PLL is the base timer for the 2 PWM outputs in both digital and analog mode.

Upon detection of lost periods or periods that are too short, control of the outputs is cut until the PLL is tuned correctly (can take several seconds). In addition, the "ZeroCrossingStatus" bit is set and the Error LED is enabled (valid frequency range for the supply is 45 to 65 Hz).

Information:

The jitter of the output signals generated by the PLL and communication can reach 0.5%.

9.15.5.16.6 Digital outputs

The output state of the outputs defined as digital is transferred to the output ports of the control switch in sync with the connected power mains. The switch-on state is applied when the voltage crosses zero on the positive half-wave and the switch-off state at the zero crossing for current in each half wave.

9.15.5.16.6.1 Switching state of digital outputs 1 to 2

Name:

DigitalOutput

DigitalOutput01 to DigitalOutput02

This register is used to store the switching state of digital outputs 1 to 2.

Only function model 0 - Standard:

Setting "Packed outputs" in the Automation Studio I/O configuration determines whether all bits of this register should be applied individually as data points in the Automation Studio I/O assignment ("DigitalOutput01" to "DigitalOutput0x") or whether this register should be displayed as a single USINT data point ("DigitalOutput").

| Data type | Value | Information |
|-----------|------------------------|--|
| USINT | 0 to 3 | Packed outputs = On |
| | See the bit structure. | Packed outputs = Off or function model ≠ 0 - Standard. |

Bit structure:

| Bit | Name | Value | Information |
|-----|-----------------|-------|-------------------------|
| 0 | DigitalOutput01 | 0 | Digital output 01 reset |
| | | 1 | Digital output 01 set |
| 1 | DigitalOutput02 | 0 | Digital output 02 reset |
| | | 1 | Digital output 02 set |

Information:

The states in these registers are only applied when the channels are set to DIGITAL in ["Configuration of the output channels"](#) on page 1621.

When using setting "Packed outputs", ALL channels must be set to DIGITAL. Mixed operation is not possible.

9.15.5.16.7 Analog outputs

The output value of the outputs defined as analog outputs (unit percent) is switched through to the control ports in sync with power mains. The analog value is output to the TRIAC control port in the range between (output value > SwitchOffValue) and (output value ≤ 95%) with a resolution of 1%.

A short triac turn-on delay is required for open line detection. Therefore even with output values ≥ 96%, there is a small pause in control.

Changes to the output value are applied at the next positive half-wave

9.15.5.16.7.1 Commutation angle for analog outputs 1 - 2

Name:

AnalogOutput01 to AnalogOutput02

These registers are used to set the commutation angle for phase angle control.

Values between 0 and 100 correspond to the output value for the respective channel in percent. Values above 100 correspond to 100%.

| Data type | Value |
|-----------|----------|
| USINT | 0 to 100 |

Information:

The commutation angle for phase angle control set in these registers are only applied when the channels are set to ANALOG in ["Configuration of the output channels"](#) on page 1621.

9.15.5.16.8 Output configuration

9.15.5.16.8.1 Configuring the half-wave pattern

Name:

CfO_Frequency

This register can only be used in [function model 2 - Frequency mode](#) and makes it possible to configure the output of half-wave patterns in various frequencies. The [commutation angle of the outputs](#) is not affected by this. The following frequency patterns can be configured:

- 100 half-waves

- 50 half-waves

- 33 half-waves

- 25 half-waves

With multichannel operation, the second channels should be operated with delayed half-waves in order to ensure that the load is placed evenly on the module.

| Data type | Values |
|-----------|------------------------|
| UINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|--------|-------------|--------------|--|
| 0 - 3 | Channel 1 | 0000 | 100 half-waves/second |
| | | 0001 | 50 half-waves/second |
| | | 0010 | 25 half-waves/second |
| | | 0011 | 33 half-waves/second |
| | | 0101 | 50 half-waves/second delayed by 1 half-wave |
| | | 0110 | 25 half-waves/second delayed by 2 half-waves |
| | | 0111 | 33 half-waves/second delayed by 1 half-wave |
| 4 - 7 | Channel 2 | 0000 to 0111 | See channel 1 |
| 8 - 15 | Reserved | - | |

Information:

This function is available beginning with firmware version 940. This can be included beginning with hardware variant 8.

9.15.5.16.8.2 Setting the switch-off time

Name:

CfO_SwitchOffValue1 and CfO_SwitchOffValue2

This register defines how far in front of the zero cross-over the internal control signal for the TRIAC is switched off. Increasing this value may be necessary in order to prevent unwanted firing of the TRIAC in the event of a slight disturbance in the mains frequency.

With smaller loads, it is important to ensure that this switch off value is not set to large (too early) to prevent switching off prematurely.

The triac can of course only be fired before the set switch-off time.

"SwitchOffValue" in the Automation Studio I/O configuration.

| Data type | Value | Description |
|-----------|---------|--|
| USINT | 5 to 50 | Switch-off time in %. Bus controller default setting: 5 |

9.15.5.16.8.3 Configuration of the output channels

Name:

CfO_OutputConfig

The configuration of the output channels is stored in this register.

"Output type digital/analog" and "Output type full/half wave" in the Automation Studio I/O configuration

| Data type | Values | Bus controller default setting |
|-----------|------------------------|--------------------------------|
| USINT | See the bit structure. | 3 |

Bit structure:

| Bit | Description | Value | Information |
|-------|--|-------|--|
| 0 | Channel 1: Digital/Analog output | 0 | Output channel 1 is defined as a digital output. The output status is defined by bit 0 of "Switching state of digital outputs 1 to 2" on page 1618. |
| | | 1 | Output channel 1 is defined as an analog output. The output status is defined by "Commutation angle for analog outputs 1 - 2" on page 1619. (Bus controller default setting) |
| 1 | Channel 2: Digital/Analog output | 0 | Output channel 2 is defined as a digital output. The output status is defined by bit 1 of "Switching state of digital outputs 1 to 2" on page 1618. |
| | | 1 | Output channel 2 is defined as an analog output. The output status is defined by "Commutation angle for analog outputs 1 - 2" on page 1619. (Bus controller default setting) |
| 2 - 3 | Reserved | - | |
| 4 | Channel 1: Full-wave/Half-wave control ¹⁾ | 0 | Full-wave control on output channel 1 (bus controller default setting) |
| | | 1 | Negative half-wave on output channel 1 is suppressed. |
| 5 | Channel 2: Full-wave/Half-wave control ¹⁾ | 0 | Full-wave control on output channel 2 (bus controller default setting) |
| | | 1 | Negative half-wave on output channel 2 is suppressed. |
| 6 - 7 | Reserved | - | |

1) Not available in [function model 2 - Frequency mode](#).

9.15.5.16.8.4 Switching behavior for zero-crossing errors

Name:

CfO_OutputTolerance

This register can be used to set the switching behavior of the trigger. After the number of zero-crossing errors configured in Bit 0 to 4, the output is switched off for at least 3 periods. This is followed by synchronization with the zero signal according to Bit 7.

| Data type | Values | Bus controller default setting |
|-----------|------------------------|--------------------------------|
| USINT | See the bit structure. | 0 |

Bit structure:

| Bit | Description | Value | Information |
|-------|--------------------|---------|--|
| 0 - 4 | Trigger for Resync | 0 to 30 | Number of zero crossing errors. Bus controller default setting: 0 |
| 5 - 6 | Reserved | - | |
| 7 | Fast settling | 0 | Quick adjustment (bus controller default setting) |
| | | 1 | PLL synchronization |

Fast synchronization

With this option, the trigger point is closed-loop controlled after each individual zero-crossover and input jitter.

- **Advantage:** Increased tolerance and faster response to deviations in mains frequency
- **Disadvantage:** Increased switch-on jitter for firing signal by zero cross signal $\pm 100 \mu\text{Sec}$

PLL synchronization

With this option the intervals between zero cross-overs are measured and the PLL frequency is updated accordingly.

- **Advantage:** Jitter-free firing signal
- **Disadvantage:** When the output is switched off, additional measurement phases are required before it can be switched back on.

Information:

This function is available starting with Firmware version 928. This can be installed with hardware version 8 and hardware revision B4 or higher.

9.15.5.16.9 Status of the outputs

Name:

LowCurrentStatus1 through LowCurrentStatus2

ZeroCrossingInput

ZeroCrossingStatus

StatusInput01

The operating status of the outputs is mapped in this register.

To determine "LowCurrentStatus", a check is made shortly before each triac ignition to determine whether there is a connection from the output via the consumer to the neutral conductor.

Only function model 0 - Standard:

Setting "Packed outputs" in the Automation Studio I/O configuration determines whether all bits of this register should be applied individually as data points in the Automation Studio I/O assignment ("LowCurrentStatus1" to "ZeroCrossingStatus") or whether this register should be displayed as a single USINT data point ("StatusInput01").

| Data type | Value | Information |
|-----------|------------------------|--|
| USINT | 0 to 255 | Packed outputs = On |
| | See the bit structure. | Packed outputs = Off or function model ≠ 0 - Standard. |

Bit structure:

| Bit | Name | Value | Information |
|-------|--------------------|-------|---|
| 0 | LowCurrentStatus1 | 0 | Current flow on activated output 1 |
| | | 1 | No current flow on activated output 1 |
| 1 | LowCurrentStatus2 | 0 | Current flow on activated output 2 |
| | | 1 | No current flow on activated output 2 |
| 2 - 3 | Reserved | - | |
| 4 | ZeroCrossingInput | 0 | Zero cross signal during the negative half-wave |
| | | 1 | Zero cross signal during the positive half-wave |
| 5 - 6 | Reserved | - | |
| 7 | ZeroCrossingStatus | 0 | Zero cross signal OK |
| | | 1 | Zero cross signal has dropped out |

9.15.5.16.10 Function model "OSP"

In function model "OSP" (Operator Set Predefined), the user defines an analog value or digital pattern. This OSP value is output as soon as the communication between the module and master is aborted.

Functionality

The user has the choice between 2 OSP modes:

- Retain last valid value
- Replace with static value

In the first case, the module retains the last value recognized as a valid output status.

When selecting mode "Replace with static value", a plausible output value must be entered in the associated value register. When an OSP event occurs, this value is output instead of the value currently requested by the task.

9.15.5.16.10.1 Enabling OPS output in the module

Name:

OSPValid

This data point makes it possible to start the output of the module and request the use of OSP during operation.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|-------------|-------|---|
| 0 | OSPValid | 0 | Request OSP operation (after initial startup or module in stand-by) |
| | | 1 | Request normal operation |
| 1 - 7 | Reserved | 0 | |

Bit OSPValid exists once on the module and is managed by the user task. It must be set to start the enabled channels. As long as bit OSPValid remains set in the module, the module behaves the same as in function model "Standard".

If an OSP event occurs, e.g. communication between the module and master CPU aborted, then bit OSPValid is reset on the module. The module enters the OSP state and output occurs according to the configuration in register "OSPMode" on page 1625.

The following generally applies:

Even after regeneration of the communication channel, the OSP replacement value is still pending. The OSP state is only exited again when a set OSPValid bit is transferred.

When the master CPU is restarted, bit OSPValid bit is reinitialized in the master CPU. It must be set once more by the application and transferred via the bus.

In the event of brief communication errors between the module and master CPU (e.g. due to EMC), the cyclic registers fail to refresh for several bus cycles. Within the module, bit OSPValid is reset; the set bit is retained in the CPU, however. During the next successful transfer, the module-internal OSPValid bit is set again and the module automatically returns to normal operation.

If the task in the master CPU needs the information about which output mode the module is currently in, bit ModulOK can be evaluated.

Warning!

If bit OSPValid bit is reset to "0" by the module, the output status no longer depends on the responsible task in the master CPU. Nevertheless, output is made depending on the configuration of the OSP replacement value.

9.15.5.16.10.2 Setting OSP mode

Name:

CfgOSPMode

This register controls the behavior of a channel when using OSP.

| Data type | Values | Explanation |
|-----------|--------|---------------------------|
| USINT | 0 | Replace with static value |
| | 1 | Retain last valid value |

9.15.5.16.10.3 Defining an OSP-digital output value

Name:

CfgOSPValue

This register contains the digital output value that is output in "Replace with static value" mode during OSP operation.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-----|-------------|--------|--|
| 0 | | 0 or 1 | OSP output value for channel DigitalOutput00 |
| ... | | ... | |
| x | | 0 or 1 | OSP output value for channel DigitalOutput0x |

Warning!

"OSPValue" is only applied by the module if bit "OSPValid" has been set in the module.

9.15.5.16.10.4 Define the OSP analog output value

Name:

CfgOSPValue01 to CfgOSPValue02

This register contains the analog output value, which is output in "Replace with static value" mode during OSP operation.

| Data type | Value |
|-----------|----------|
| USINT | 0 to 100 |

Warning!

"OSPValue" is only applied by the module if bit "OSPValid" has been set in the module.

9.15.5.16.11 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time | |
|--------------------|--------|
| All channels | 250 µs |

9.15.5.16.12 Minimum I/O update time

The minimum I/O update time specifies how far the bus cycle can be reduced so that an I/O update is performed in each cycle.

| Minimum I/O update time | |
|-------------------------|--------|
| All channels | 150 µs |

9.15.6 X20DO2649

Data sheet version: 3.17

9.15.6.1 General information

The module has 2 relay outputs.

- 2 digital outputs
- Relay module for 240 VAC / 30 VDC
- 2 change over contacts
- Single-channel isolated outputs

Danger!

Risk of electric shock!

The terminal block is only permitted to conduct voltage when it is connected. It is not permitted to be disconnected or connected while voltage is applied or have voltage applied to it while it is removed under any circumstances.

This module is not permitted to be the last module connected on the X2X Link network. At least one subsequent X20ZF dummy module must provide protection against contact.

Danger!

The voltage classes on the terminal block must not be mixed! Only operation at mains voltage (e.g. 230 VAC) OR safety extra-low voltage (e.g. 24 VDC SELV) is permitted.

9.15.6.2 Order data

| Model number | Short description | Figure |
|--------------|---|---|
| | Digital outputs |  |
| X20DO2649 | X20 digital output module, 2 relays, changeover contacts, 240 VAC / 5 A, 24 VDC / 5 A | |
| | Required accessories | |
| | Bus modules | |
| X20BM11 | X20 bus module, 24 VDC keyed, internal I/O supply continuous | |
| X20BM15 | X20 bus module, with node number switch, 24 VDC keyed, internal I/O supply continuous | |
| | Terminal blocks | |
| X20TB12 | X20 terminal block, 12-pin, 24 VDC keyed | |
| | | |

| | | | On | Error or reset status | |
| | e + r | | Red on / Green single flash | Invalid firmware | |
| | 1 - 2 | | Orange | | Output status of the corresponding digital output |

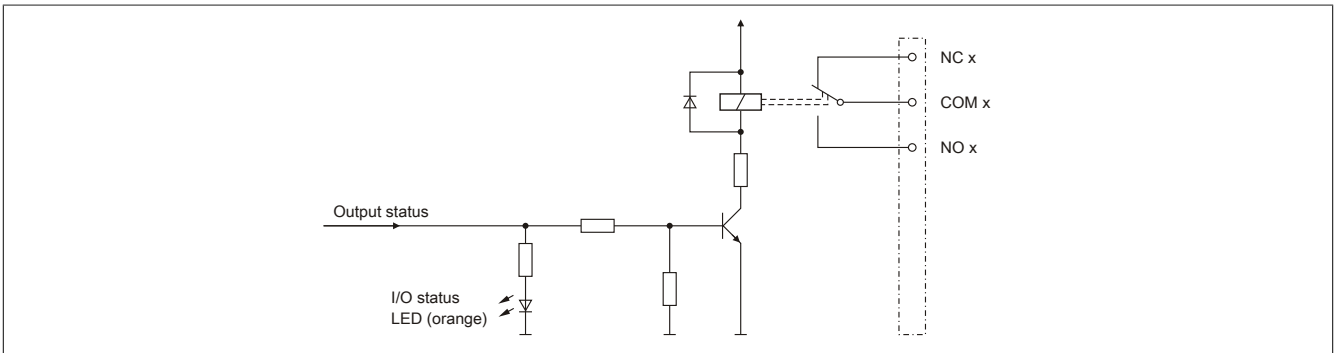

9.15.6.5 Pinout

9.15.6.6 Connection example

9.15.6.7 Output circuit diagram

9.15.6.8 Electrical service life

9.15.6.9 Derating

There is no derating when operated below 55°C.

When operating above 55°C, the maximum current per channel is reduced to 4 A and the maximum summation current to 8 A!

9.15.6.10 Register description

9.15.6.10.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section ["General data points" on page 3790](#).

9.15.6.10.2 Function model 0 - Standard

| Register | Fixed offset | Name | Data type | Read | | Write | |
|----------|--------------|-----------------|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| 2 | 0 | DigitalOutput | USINT | | | • | |
| | | DigitalOutput01 | Bit 0 | | | | |
| | | DigitalOutput02 | Bit 1 | | | | |

Fixed modules require their data points to be in a specific order in the X2X frame. Cyclic access occurs according to a predefined offset, not based on the register address.

Acyclic access continues to be based on the register numbers.

9.15.6.10.3 Function model 254 - Bus Controller

| Register | Offset ¹⁾ | Name | Data type | Read | | Write | |
|----------|----------------------|---|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| 2 | 0 | Switching state of digital outputs 1 to 2 | USINT | | | • | |
| | | DigitalOutput01 | Bit 0 | | | | |
| | | DigitalOutput02 | Bit 1 | | | | |

1) The offset specifies where the register is within the CAN object.

9.15.6.10.3.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see ["Using I/O modules on the bus controller" on page 3789](#).

9.15.6.10.3.2 CAN I/O bus controller

The module occupies 1 digital logical slot on CAN I/O.

9.15.6.10.4 Digital outputs

The output state is transferred to the output channels with a fixed offset (<60 µs) based on the network cycle (SyncOut).

9.15.6.10.4.1 Switching state of digital outputs 1 to 2

Name:

DigitalOutput

DigitalOutput01 to DigitalOutput02

This register is used to store the switching state of digital outputs 1 to 2.

Only function model 0 - Standard:

Setting "Packed outputs" in the Automation Studio I/O configuration determines whether all bits of this register should be applied individually as data points in the Automation Studio I/O assignment ("DigitalOutput01" to "DigitalOutput0x") or whether this register should be displayed as a single USINT data point ("DigitalOutput").

| Data type | Value | Information |
|-----------|------------------------|--|
| USINT | 0 to 3 | Packed outputs = On |
| | See the bit structure. | Packed outputs = Off or function model ≠ 0 - Standard. |

Bit structure:

| Bit | Name | Value | Information |
|-----|-----------------|-------|-------------------------|
| 0 | DigitalOutput01 | 0 | Digital output 01 reset |
| | | 1 | Digital output 01 set |
| 1 | DigitalOutput02 | 0 | Digital output 02 reset |
| | | 1 | Digital output 02 set |

9.15.6.10.5 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time |
|--------------------|
| 100 μ s |

9.15.6.10.6 Minimum I/O update time

The minimum I/O update time specifies how far the bus cycle can be reduced so that an I/O update is performed in each cycle.

| Minimum I/O update time |
|---------------------------------|
| Equal to the minimum cycle time |

9.15.7 X20DO4321

Data sheet version: 3.16

9.15.7.1 General information

The module is equipped with 4 outputs for 3-wire connections.

- 4 digital outputs
- Sink connection
- 3-wire connections
- 24 VDC and GND for actuator supply
- Integrated output protection
- OSP mode

9.15.7.2 Order data

Table 306: X20DO4321 - Technical data

- 1) Number of outputs x $R_{DS(on)}$ x Nominal output current². For a calculation example, see section "Mechanical and electrical configuration" of the X20 system user's manual.
- 2) The power consumption of the sensors connected to the module is not permitted to exceed 12 W.

9.15.7.4 Status LEDs

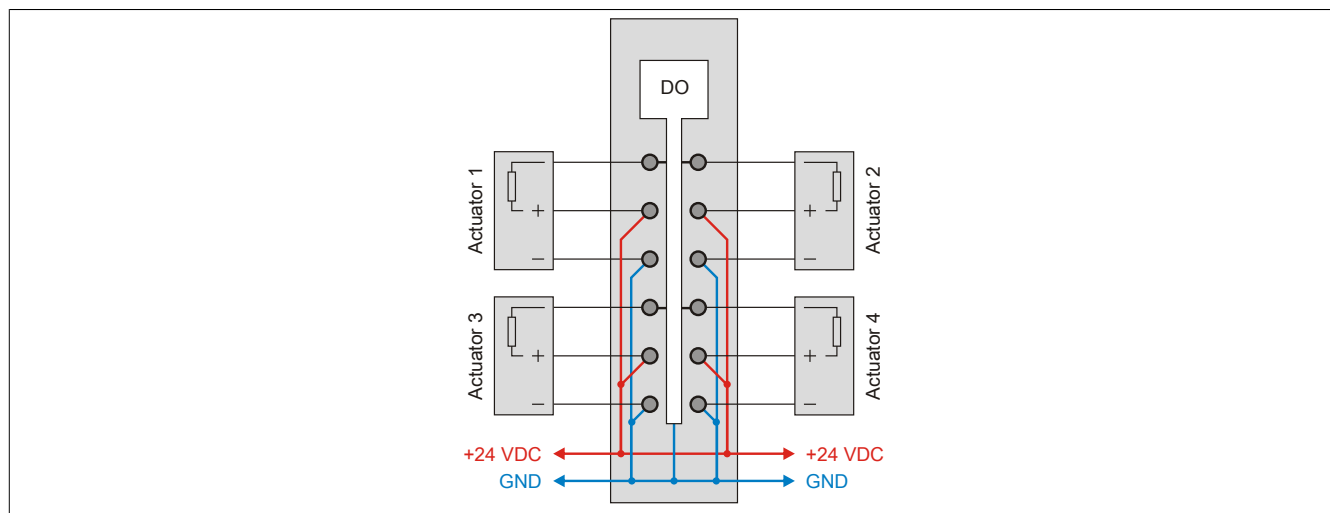

For a description of the various operating modes, see "Diagnostic LEDs" on page 3787.

| Figure | LED | Color | Status | Description | |
|---|-------|-------|-----------------------------|---|---|
|  | r | Green | Off | Module supply not connected | |
| | | | Single flash | Reset mode | |
| | | | Blinking | PREOPERATIONAL mode | |
| | | | On | RUN mode | |
| | | | Flickering (approx. 10 Hz) | Module is in OSP state | |
| | e | Red | Off | Module supply not connected or everything OK | |
| | | | Single flash | Warning/Error on an I/O channel. Level monitoring for digital outputs has been triggered. | |
| | e + r | | Red on / Green single flash | Invalid firmware | |
| | 1 - 4 | | Orange | | Output status of the corresponding digital output |

9.15.7.5 Pinout

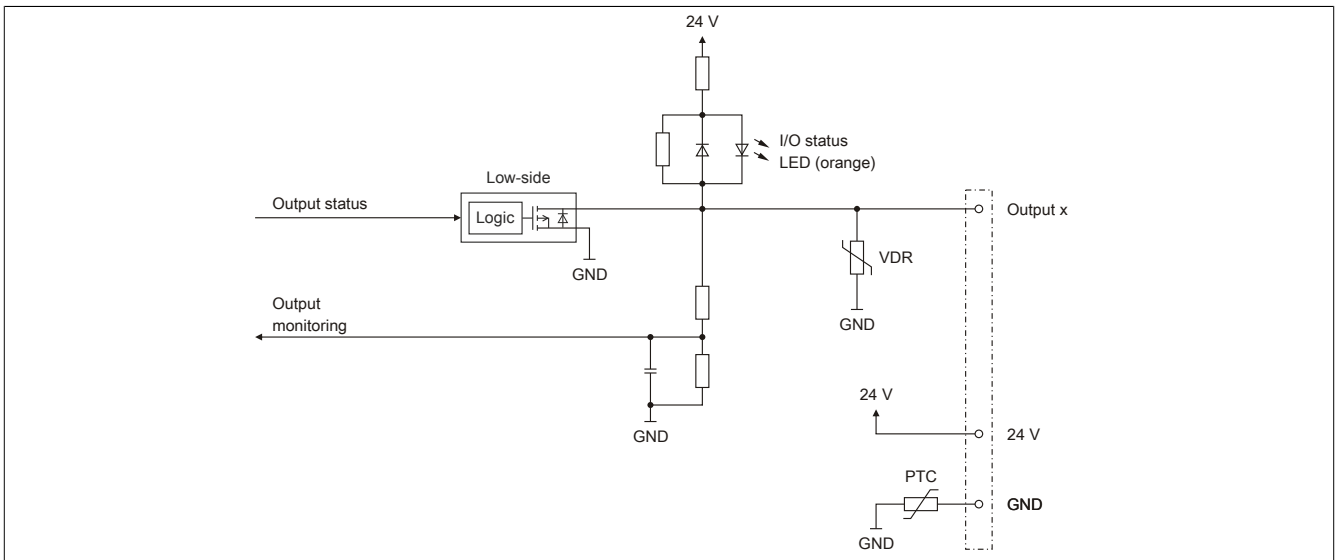

9.15.7.6 Connection example

9.15.7.7 OSP hardware requirements

In order to use OSP mode sensibly, it should be ensured that the power supply of the output module and CPU are independent of each other when the application is set up.

9.15.7.8 Output circuit diagram

9.15.7.9 Switching inductive loads

Environmental temperature: 60°C, all outputs with the same load

Information:

If the maximum number of operating cycles per second is exceeded, an external inverse diode must be used.

Operating conditions outside of the area in the diagram are not permitted!

9.15.7.10 Register description

9.15.7.10.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section ["General data points" on page 3790](#).

9.15.7.10.2 Function model 0 - Standard

| Register | Fixed offset | Name | Data type | Read | | Write | |
|----------|--------------|-----------------------|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| 2 | 0 | DigitalOutput | USINT | | | • | |
| | | DigitalOutput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | DigitalOutput04 | Bit 3 | | | | |
| 30 | 1 | StatusInput01 | USINT | • | | | |
| | | StatusDigitalOutput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | StatusDigitalOutput04 | Bit 3 | | | | |

Fixed modules require their data points to be in a specific order in the X2X frame. Cyclic access occurs according to a predefined offset, not based on the register address.

Acyclic access continues to be based on the register numbers.

9.15.7.10.3 Function model 1 - OSP

| Register | Fixed offset | Name | Data type | Read | | Write | |
|----------|--------------|---|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| 2 | 0 | Switching state of digital outputs 1 to 4 | USINT | | | • | |
| | | DigitalOutput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | DigitalOutput04 | Bit 3 | | | | |
| 30 | 1 | Status of digital outputs 1 to 4 | USINT | • | | | |
| | | StatusDigitalOutput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | StatusDigitalOutput04 | Bit 3 | | | | |
| 34 | 1 | Enabling OPS output in the module | USINT | | | • | |
| | | OSPValid | Bit 0 | | | | |
| 32 | - | CfgOSPMODE | USINT | | | | • |
| 36 | - | CfgOSPValue | USINT | | | | • |

Fixed modules require their data points to be in a specific order in the X2X frame. Cyclic access occurs according to a predefined offset, not based on the register address.

Acyclic access continues to be based on the register numbers.

9.15.7.10.4 Function model 254 - Bus Controller

| Register | Offset ¹⁾ | Name | Data type | Read | | Write | |
|----------|----------------------|---|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| 2 | 0 | Switching state of digital outputs 1 to 4 | USINT | | | • | |
| | | DigitalOutput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | DigitalOutput04 | Bit 3 | | | | |
| 30 | - | Status of digital outputs 1 to 4 | USINT | | • | | |
| | | StatusDigitalOutput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | StatusDigitalOutput04 | Bit 3 | | | | |

1) The offset specifies where the register is within the CAN object.

9.15.7.10.4.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see ["Using I/O modules on the bus controller" on page 3789](#).

9.15.7.10.4.2 CAN I/O bus controller

The module occupies 1 digital logical slot on CAN I/O.

9.15.7.10.5 Digital outputs

The output state is transferred to the output channels with a fixed offset (<60 µs) based on the network cycle (SyncOut).

9.15.7.10.5.1 Switching state of digital outputs 1 to 4

Name:

DigitalOutput

DigitalOutput01 to DigitalOutput04

This register is used to store the switching state of digital outputs 1 to 4.

Only function model 0 - Standard:

Setting "Packed outputs" in the Automation Studio I/O configuration determines whether all bits of this register should be applied individually as data points in the Automation Studio I/O assignment ("DigitalOutput01" to "DigitalOutput0x") or whether this register should be displayed as a single USINT data point ("DigitalOutput").

| Data type | Values | Information |
|-----------|------------------------|--|
| USINT | 0 to 15 | Packed outputs = On |
| | See the bit structure. | Packed outputs = Off or function model ≠ 0 - Standard. |

Bit structure:

| Bit | Description | Value | Information |
|-----|-----------------|-------|-------------------------|
| 0 | DigitalOutput01 | 0 | Digital output 01 reset |
| | | 1 | Digital output 01 set |
| ... | | ... | |
| 3 | DigitalOutput04 | 0 | Digital output 04 reset |
| | | 1 | Digital output 04 set |

9.15.7.10.6 Monitoring status of the digital outputs

On the module, the output states of the outputs are compared to the target states. The control of the output driver is used for the target state.

A change in the output state resets monitoring for that output. The status of each individual channel can be read. A change in the monitoring status is actively transmitted as an error message.

9.15.7.10.6.1 Status of digital outputs 1 to 4

Name:

StatusInput01

StatusDigitalOutput01 to StatusDigitalOutput04

This register contains the state of digital outputs 1 to 4.

Only function model 0 - Standard:

Setting "Packed outputs" in the Automation Studio I/O configuration determines whether all bits of this register should be applied individually as data points in the Automation Studio I/O assignment ("StatusDigitalOutput01" to "StatusDigitalOutput0x") or whether this register should be displayed as a single USINT data point ("StatusInput01").

| Data type | Values | Information |
|-----------|------------------------|--|
| USINT | 0 to 15 | Packed outputs = On |
| | See the bit structure. | Packed outputs = Off or function model ≠ 0 - Standard. |

Bit structure:

| Bit | Description | Value | Information |
|-----|-----------------------|-------|---|
| 0 | StatusDigitalOutput01 | 0 | Channel 01: No error |
| | | 1 | Channel 01: <ul style="list-style-type: none"> Short circuit or overload Channel switched on and missing I/O power supply Channel switched off and external voltage applied on channel |
| ... | | ... | |
| 3 | StatusDigitalOutput04 | 0 | Channel 04: No error |
| | | 1 | Channel 04: For an error description, see channel 01. |

9.15.7.10.7 Function model "OSP"

In function model "OSP" (Operator Set Predefined), the user defines an analog value or digital pattern. This OSP value is output as soon as the communication between the module and master is aborted.

Functionality

The user has the choice between 2 OSP modes:

- Retain last valid value
- Replace with static value

In the first case, the module retains the last value recognized as a valid output status.

When selecting mode "Replace with static value", a plausible output value must be entered in the associated value register. When an OSP event occurs, this value is output instead of the value currently requested by the task.

9.15.7.10.7.1 Enabling OPS output in the module

Name:

OSPValid

This data point makes it possible to start the output of the module and request the use of OSP during operation.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|-------------|-------|---|
| 0 | OSPValid | 0 | Request OSP operation (after initial startup or module in stand-by) |
| | | 1 | Request normal operation |
| 1 - 7 | Reserved | 0 | |

Bit OSPValid exists once on the module and is managed by the user task. It must be set to start the enabled channels. As long as bit OSPValid remains set in the module, the module behaves the same as in function model "Standard".

If an OSP event occurs, e.g. communication between the module and master CPU aborted, then bit OSPValid is reset on the module. The module enters the OSP state and output occurs according to the configuration in register "OSPMode" on page 1639.

The following generally applies:

Even after regeneration of the communication channel, the OSP replacement value is still pending. The OSP state is only exited again when a set OSPValid bit is transferred.

When the master CPU is restarted, bit OSPValid bit is reinitialized in the master CPU. It must be set once more by the application and transferred via the bus.

In the event of brief communication errors between the module and master CPU (e.g. due to EMC), the cyclic registers fail to refresh for several bus cycles. Within the module, bit OSPValid is reset; the set bit is retained in the CPU, however. During the next successful transfer, the module-internal OSPValid bit is set again and the module automatically returns to normal operation.

If the task in the master CPU needs the information about which output mode the module is currently in, bit ModulOK can be evaluated.

Warning!

If bit OSPValid bit is reset to "0" by the module, the output status no longer depends on the responsible task in the master CPU. Nevertheless, output is made depending on the configuration of the OSP replacement value.

9.15.7.10.7.2 Setting OSP mode

Name:

CfgOSPMode

This register controls the behavior of a channel when using OSP.

| Data type | Values | Explanation |
|-----------|--------|---------------------------|
| USINT | 0 | Replace with static value |
| | 1 | Retain last valid value |

9.15.7.10.7.3 Defining an OSP-digital output value

Name:

CfgOSPValue

This register contains the digital output value that is output in "Replace with static value" mode during OSP operation.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-----|-------------|--------|--|
| 0 | | 0 or 1 | OSP output value for channel DigitalOutput00 |
| ... | | ... | |
| x | | 0 or 1 | OSP output value for channel DigitalOutput0x |

Warning!

"OSPValue" is only applied by the module if bit "OSPValid" has been set in the module.

9.15.7.10.8 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time |
|--------------------|
| 100 µs |

9.15.7.10.9 Minimum I/O update time

The minimum I/O update time specifies how far the bus cycle can be reduced so that an I/O update is performed in each cycle.

| Minimum I/O update time |
|---------------------------------|
| Equal to the minimum cycle time |

9.15.8 X20(c)DO4322

Data sheet version: 3.27

9.15.8.1 General information

The module is equipped with 4 outputs for 3-wire connections.

- 4 digital outputs
- Source connection
- 3-wire connections
- 24 VDC and GND for actuator supply
- Integrated output protection
- OSP mode

9.15.8.2 Coated modules

Coated modules are X20 modules with a protective coating for the electronics component. This coating protects X20c modules from condensation and corrosive gases.

The modules' electronics are fully compatible with the corresponding X20 modules.

For simplification purposes, only images and module IDs of uncoated modules are used in this data sheet.

The coating has been certified according to the following standards:

- Condensation: BMW GS 95011-4, 2x 1 cycle
- Corrosive gas: EN 60068-2-60, method 4, exposure 21 days

9.15.8.2.1 Starting temperature

The starting temperature describes the minimum permissible ambient temperature when the power is switched off at the time the coated module is switched on. This is permitted to be as low as -40°C . During operation, the conditions as specified in the technical data continue to apply.

Information:

It is important to absolutely ensure that there is no forced cooling by air currents in a closed control cabinet, for example using a fan or ventilation slots.

9.15.8.3 Order data

| Model number | Short description | Figure |

| | e + r | | Red on / Green single flash | Invalid firmware | |
| | 1 - 4 | | Orange | | Output status of the corresponding digital output |

9.15.8.6 Pinout

9.15.8.7 Connection example

Caution!

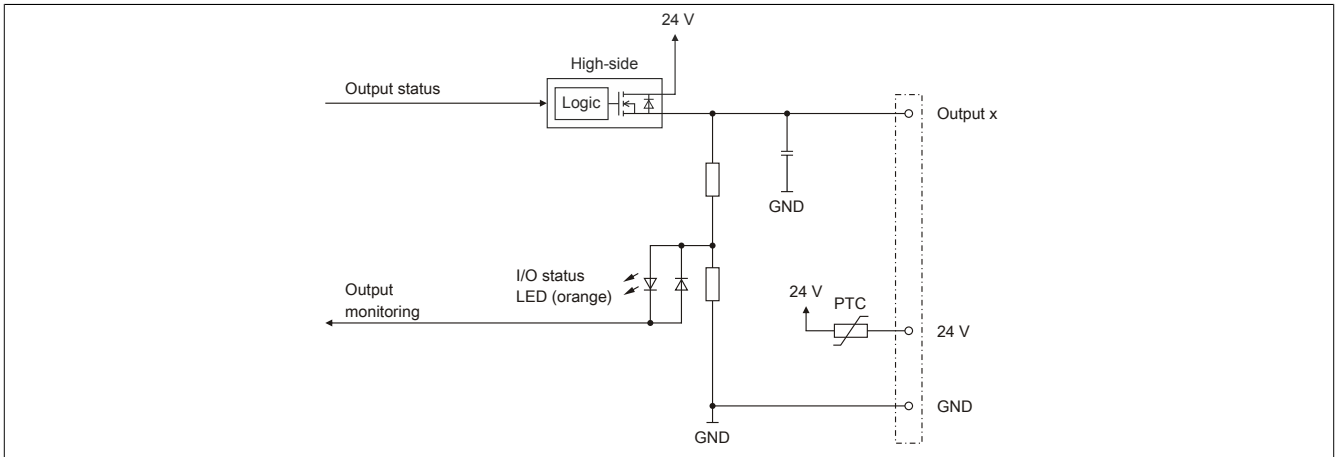

If the module is operated outside specifications, the output current may rise above the maximum permissible nominal current. This applies both to individual channels and to the summation current of the module.

Appropriate cable cross-sections or external safety measures must therefore be provided.

9.15.8.8 OSP hardware requirements

In order to use OSP mode sensibly, it should be ensured that the power supply of the output module and CPU are independent of each other when the application is set up.

9.15.8.9 Output circuit diagram

9.15.8.10 Switching inductive loads

Ambient temperature: 60°C, all outputs with the same load

Information:

If the maximum number of operating cycles per second is exceeded, an external inverse diode must be used.

Operating conditions outside of the area in the diagram are not permitted!

9.15.8.11 Register description

9.15.8.11.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section ["General data points" on page 3790](#).

9.15.8.11.2 Function model 0 - Standard

| Register | Fixed offset | Name | Data type | Read | | Write | |
|----------|--------------|-----------------------|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| 2 | 0 | DigitalOutput | USINT | | | • | |
| | | DigitalOutput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | DigitalOutput04 | Bit 3 | | | | |
| 30 | 1 | StatusInput01 | USINT | • | | | |
| | | StatusDigitalOutput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | StatusDigitalOutput04 | Bit 3 | | | | |

Fixed modules require their data points to be in a specific order in the X2X frame. Cyclic access occurs according to a predefined offset, not based on the register address.

Acyclic access continues to be based on the register numbers.

9.15.8.11.3 Function model 1 - OSP

| Register | Fixed offset | Name | Data type | Read | | Write | |
|----------|--------------|---|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| 2 | 0 | Switching state of digital outputs 1 to 4 | USINT | | | • | |
| | | DigitalOutput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | DigitalOutput04 | Bit 3 | | | | |
| 30 | 1 | Status of digital outputs 1 to 4 | USINT | • | | | |
| | | StatusDigitalOutput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | StatusDigitalOutput04 | Bit 3 | | | | |
| 34 | 1 | Enabling OPS output in the module | USINT | | | • | |
| | | OSPValid | Bit 0 | | | | |
| 32 | - | CfgOSPMODE | USINT | | | | • |
| 36 | - | CfgOSPValue | USINT | | | | • |

Fixed modules require their data points to be in a specific order in the X2X frame. Cyclic access occurs according to a predefined offset, not based on the register address.

Acyclic access continues to be based on the register numbers.

9.15.8.11.4 Function model 254 - Bus Controller

| Register | Offset ¹⁾ | Name | Data type | Read | | Write | |
|----------|----------------------|---|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| 2 | 0 | Switching state of digital outputs 1 to 4 | USINT | | | • | |
| | | DigitalOutput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | DigitalOutput04 | Bit 3 | | | | |
| 30 | - | Status of digital outputs 1 to 4 | USINT | | • | | |
| | | StatusDigitalOutput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | StatusDigitalOutput04 | Bit 3 | | | | |

1) The offset specifies where the register is within the CAN object.

9.15.8.11.4.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see ["Using I/O modules on the bus controller" on page 3789](#).

9.15.8.11.4.2 CAN I/O bus controller

The module occupies 1 digital logical slot on CAN I/O.

9.15.8.11.5 Digital outputs

The output state is transferred to the output channels with a fixed offset (<60 µs) based on the network cycle (SyncOut).

9.15.8.11.5.1 Switching state of digital outputs 1 to 4

Name:

DigitalOutput

DigitalOutput01 to DigitalOutput04

This register is used to store the switching state of digital outputs 1 to 4.

Only function model 0 - Standard:

Setting "Packed outputs" in the Automation Studio I/O configuration determines whether all bits of this register should be applied individually as data points in the Automation Studio I/O assignment ("DigitalOutput01" to "DigitalOutput0x") or whether this register should be displayed as a single USINT data point ("DigitalOutput").

| Data type | Values | Information |
|-----------|------------------------|--|
| USINT | 0 to 15 | Packed outputs = On |
| | See the bit structure. | Packed outputs = Off or function model ≠ 0 - Standard. |

Bit structure:

| Bit | Description | Value | Information |
|-----|-----------------|-------|-------------------------|
| 0 | DigitalOutput01 | 0 | Digital output 01 reset |
| | | 1 | Digital output 01 set |
| ... | | ... | |
| 3 | DigitalOutput04 | 0 | Digital output 04 reset |
| | | 1 | Digital output 04 set |

9.15.8.11.6 Monitoring status of the digital outputs

On the module, the output states of the outputs are compared to the target states. The control of the output driver is used for the target state.

A change in the output state resets monitoring for that output. The status of each individual channel can be read. A change in the monitoring status is actively transmitted as an error message.

9.15.8.11.6.1 Status of digital outputs 1 to 4

Name:

StatusInput01

StatusDigitalOutput01 to StatusDigitalOutput04

This register contains the state of digital outputs 1 to 4.

Only function model 0 - Standard:

Setting "Packed outputs" in the Automation Studio I/O configuration determines whether all bits of this register should be applied individually as data points in the Automation Studio I/O assignment ("StatusDigitalOutput01" to "StatusDigitalOutput0x") or whether this register should be displayed as a single USINT data point ("StatusInput01").

| Data type | Values | Information |
|-----------|------------------------|--|
| USINT | 0 to 15 | Packed outputs = On |
| | See the bit structure. | Packed outputs = Off or function model ≠ 0 - Standard. |

Bit structure:

| Bit | Description | Value | Information |
|-----|-----------------------|-------|---|
| 0 | StatusDigitalOutput01 | 0 | Channel 01: No error |
| | | 1 | Channel 01: <ul style="list-style-type: none"> Short circuit or overload Channel switched on and missing I/O power supply Channel switched off and external voltage applied on channel |
| ... | | ... | |
| 3 | StatusDigitalOutput04 | 0 | Channel 04: No error |
| | | 1 | Channel 04: For an error description, see channel 01. |

9.15.8.11.7 Function model "OSP"

In function model "OSP" (Operator Set Predefined), the user defines an analog value or digital pattern. This OSP value is output as soon as the communication between the module and master is aborted.

Functionality

The user has the choice between 2 OSP modes:

- Retain last valid value
- Replace with static value

In the first case, the module retains the last value recognized as a valid output status.

When selecting mode "Replace with static value", a plausible output value must be entered in the associated value register. When an OSP event occurs, this value is output instead of the value currently requested by the task.

9.15.8.11.7.1 Enabling OPS output in the module

Name:

OSPValid

This data point makes it possible to start the output of the module and request the use of OSP during operation.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|-------------|-------|---|
| 0 | OSPValid | 0 | Request OSP operation (after initial startup or module in stand-by) |
| | | 1 | Request normal operation |
| 1 - 7 | Reserved | 0 | |

Bit OSPValid exists once on the module and is managed by the user task. It must be set to start the enabled channels. As long as bit OSPValid remains set in the module, the module behaves the same as in function model "Standard".

If an OSP event occurs, e.g. communication between the module and master CPU aborted, then bit OSPValid is reset on the module. The module enters the OSP state and output occurs according to the configuration in register "OSPMode" on page 1648.

The following generally applies:

Even after regeneration of the communication channel, the OSP replacement value is still pending. The OSP state is only exited again when a set OSPValid bit is transferred.

When the master CPU is restarted, bit OSPValid bit is reinitialized in the master CPU. It must be set once more by the application and transferred via the bus.

In the event of brief communication errors between the module and master CPU (e.g. due to EMC), the cyclic registers fail to refresh for several bus cycles. Within the module, bit OSPValid is reset; the set bit is retained in the CPU, however. During the next successful transfer, the module-internal OSPValid bit is set again and the module automatically returns to normal operation.

If the task in the master CPU needs the information about which output mode the module is currently in, bit ModulOK can be evaluated.

Warning!

If bit OSPValid bit is reset to "0" by the module, the output status no longer depends on the responsible task in the master CPU. Nevertheless, output is made depending on the configuration of the OSP replacement value.

9.15.8.11.7.2 Setting OSP mode

Name:
CfgOSPMODE

This register controls the behavior of a channel when using OSP.

| Data type | Values | Explanation |
|-----------|--------|---------------------------|
| USINT | 0 | Replace with static value |
| | 1 | Retain last valid value |

9.15.8.11.7.3 Defining an OSP-digital output value

Name:
CfgOSPValue

This register contains the digital output value that is output in "Replace with static value" mode during OSP operation.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-----|-------------|--------|--|
| 0 | | 0 or 1 | OSP output value for channel DigitalOutput00 |
| ... | | ... | |
| x | | 0 or 1 | OSP output value for channel DigitalOutput0x |

Warning!

"OSPValue" is only applied by the module if bit "OSPValid" has been set in the module.

9.15.8.11.8 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time |
|--------------------|
| 100 µs |

9.15.8.11.9 Minimum I/O update time

The minimum I/O update time specifies how far the bus cycle can be reduced so that an I/O update is performed in each cycle.

| Minimum I/O update time |
|---------------------------------|
| Equal to the minimum cycle time |

9.15.9 X20DO4331

Data sheet version: 3.16

9.15.9.1 General information

The module is equipped with 4 outputs for 3-wire connections. The rated output current is 2 A.

- 4 digital outputs with 2 A
- Sink connection
- 3-wire connections
- 24 VDC and GND for actuator supply
- Integrated output protection
- OSP mode

9.15.9.2 Order data

| Model number | Short description | Figure |
|--------------|---|--|
| | Digital outputs |  |
| X20DO4331 | X20 digital output module, 4 outputs, 24 VDC, 2 A, sink, 3-wire connections | |
| | Required accessories | |

- 1) Number of outputs x $R_{DS(on)}$ x Nominal output current². For a calculation example, see section "Mechanical and electrical configuration" of the X20 system user's manual.
- 2) The power consumption of the sensors connected to the module is not permitted to exceed 12 W.

9.15.9.4 Status LEDs

For a description of the various operating modes, see "[Diagnostic LEDs](#)" on page 3787.

| Figure | LED | Color | Status | Description |
|--|-------|-----------------------------|----------------------------|---|
|  | r | Green | Off | Module supply not connected |
| | | | Single flash | RESET mode |
| | | | Blinking | PREOPERATIONAL mode |
| | | | On | RUN mode |
| | | | Flickering (approx. 10 Hz) | The module is in the OSP state. |
| | e | Red | Off | Module supply not connected or everything OK |
| | | | Single flash | Warning/Error on an I/O channel. Level monitoring for digital outputs has been triggered. |
| | e + r | Red on / Green single flash | Invalid firmware | |
| | 1 - 4 | Orange | | Output status of the corresponding digital output |

9.15.9.5 Pinout

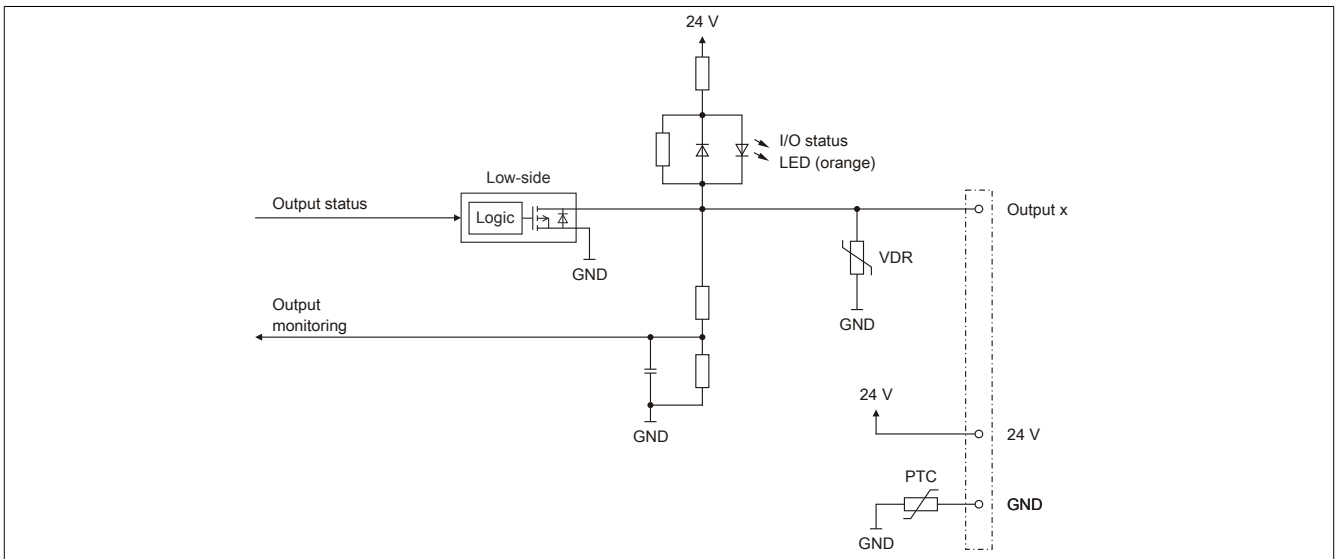

9.15.9.6 Connection example

9.15.9.7 OSP hardware requirements

In order to use OSP mode sensibly, it should be ensured that the power supply of the output module and CPU are independent of each other when the application is set up.

9.15.9.8 Output circuit diagram

9.15.9.9 Switching inductive loads

Environmental temperature: 40°C, all outputs with the same load.

Environmental temperature: 60°C, all outputs with the same load.

Information:

If the maximum number of operating cycles per second is exceeded, an external inverse diode must be used.

Operating conditions outside of the area in the diagram are not permitted!

9.15.9.10 Derating

The outputs of the X20DO4331 can handle up to 2A. To ensure optimal use of the module, it is important to assign the channels properly, and to keep in mind a potential derating.

The following table provides an overview of the number of fully used channels, the resulting best distribution, and a potential derating.

| Number of channels using 2A | Division | Derating |
|-----------------------------|---|--------------|
| 1 | Any | No |
| 2 | Possible divisions: 1, 3 2, 4 | No |
| 3 | Possible divisions: 1, 2, 4 1, 3, 4 | No |
| 4 | 1 - 4 | All channels |

Table 311: Operation with 2 A

Figure 158: Derating when 4 channels are operated with 2 A

Modules next to the X20DO4331 can have a maximum power dissipation of 1.5 W.

For an example of calculating the power dissipation of I/O modules, see section "[Power dissipation calculation of I/O modules](#)" on page 101.

9.15.9.11 Register description

9.15.9.11.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section ["General data points" on page 3790](#).

9.15.9.11.2 Function model 0 - Standard

| Register | Fixed offset | Name | Data type | Read | | Write | |
|----------|--------------|-----------------------|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| 2 | 0 | DigitalOutput | USINT | | | • | |
| | | DigitalOutput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | DigitalOutput04 | Bit 3 | | | | |
| 30 | 1 | StatusInput01 | USINT | • | | | |
| | | StatusDigitalOutput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | StatusDigitalOutput04 | Bit 3 | | | | |

Fixed modules require their data points to be in a specific order in the X2X frame. Cyclic access occurs according to a predefined offset, not based on the register address.

Acyclic access continues to be based on the register numbers.

9.15.9.11.3 Function model 1 - OSP

| Register | Fixed offset | Name | Data type | Read | | Write | |
|----------|--------------|---|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| 2 | 0 | Switching state of digital outputs 1 to 4 | USINT | | | • | |
| | | DigitalOutput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | DigitalOutput04 | Bit 3 | | | | |
| 30 | 1 | Status of digital outputs 1 to 4 | USINT | • | | | |
| | | StatusDigitalOutput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | StatusDigitalOutput04 | Bit 3 | | | | |
| 34 | 1 | Enabling OPS output in the module | USINT | | | • | |
| | | OSPValid | Bit 0 | | | | |
| 32 | - | CfgOSPMODE | USINT | | | | • |
| 36 | - | CfgOSPValue | USINT | | | | • |

Fixed modules require their data points to be in a specific order in the X2X frame. Cyclic access occurs according to a predefined offset, not based on the register address.

Acyclic access continues to be based on the register numbers.

9.15.9.11.4 Function model 254 - Bus Controller

| Register | Offset ¹⁾ | Name | Data type | Read | | Write | |
|----------|----------------------|---|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| 2 | 0 | Switching state of digital outputs 1 to 4 | USINT | | | • | |
| | | DigitalOutput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | DigitalOutput04 | Bit 3 | | | | |
| 30 | - | Status of digital outputs 1 to 4 | USINT | | • | | |
| | | StatusDigitalOutput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | StatusDigitalOutput04 | Bit 3 | | | | |

1) The offset specifies where the register is within the CAN object.

9.15.9.11.4.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see ["Using I/O modules on the bus controller" on page 3789](#).

9.15.9.11.4.2 CAN I/O bus controller

The module occupies 1 digital logical slot on CAN I/O.

9.15.9.11.5 Digital outputs

The output state is transferred to the output channels with a fixed offset (<60 µs) based on the network cycle (SyncOut).

9.15.9.11.5.1 Switching state of digital outputs 1 to 4

Name:

DigitalOutput

DigitalOutput01 to DigitalOutput04

This register is used to store the switching state of digital outputs 1 to 4.

Only function model 0 - Standard:

Setting "Packed outputs" in the Automation Studio I/O configuration determines whether all bits of this register should be applied individually as data points in the Automation Studio I/O assignment ("DigitalOutput01" to "DigitalOutput0x") or whether this register should be displayed as a single USINT data point ("DigitalOutput").

| Data type | Values | Information |
|-----------|------------------------|--|
| USINT | 0 to 15 | Packed outputs = On |
| | See the bit structure. | Packed outputs = Off or function model ≠ 0 - Standard. |

Bit structure:

| Bit | Description | Value | Information |
|-----|-----------------|-------|-------------------------|
| 0 | DigitalOutput01 | 0 | Digital output 01 reset |
| | | 1 | Digital output 01 set |
| ... | | ... | |
| 3 | DigitalOutput04 | 0 | Digital output 04 reset |
| | | 1 | Digital output 04 set |

9.15.9.11.6 Monitoring status of the digital outputs

On the module, the output states of the outputs are compared to the target states. The control of the output driver is used for the target state.

A change in the output state resets monitoring for that output. The status of each individual channel can be read. A change in the monitoring status is actively transmitted as an error message.

9.15.9.11.6.1 Status of digital outputs 1 to 4

Name:

StatusInput01

StatusDigitalOutput01 to StatusDigitalOutput04

This register contains the state of digital outputs 1 to 4.

Only function model 0 - Standard:

Setting "Packed outputs" in the Automation Studio I/O configuration determines whether all bits of this register should be applied individually as data points in the Automation Studio I/O assignment ("StatusDigitalOutput01" to "StatusDigitalOutput0x") or whether this register should be displayed as a single USINT data point ("StatusInput01").

| Data type | Values | Information |
|-----------|------------------------|--|
| USINT | 0 to 15 | Packed outputs = On |
| | See the bit structure. | Packed outputs = Off or function model ≠ 0 - Standard. |

Bit structure:

| Bit | Description | Value | Information |
|-----|-----------------------|-------|---|
| 0 | StatusDigitalOutput01 | 0 | Channel 01: No error |
| | | 1 | Channel 01: <ul style="list-style-type: none"> Short circuit or overload Channel switched on and missing I/O power supply Channel switched off and external voltage applied on channel |
| ... | | ... | |
| 3 | StatusDigitalOutput04 | 0 | Channel 04: No error |
| | | 1 | Channel 04: For an error description, see channel 01. |

9.15.9.11.7 Function model "OSP"

In function model "OSP" (Operator Set Predefined), the user defines an analog value or digital pattern. This OSP value is output as soon as the communication between the module and master is aborted.

Functionality

The user has the choice between 2 OSP modes:

- Retain last valid value
- Replace with static value

In the first case, the module retains the last value recognized as a valid output status.

When selecting mode "Replace with static value", a plausible output value must be entered in the associated value register. When an OSP event occurs, this value is output instead of the value currently requested by the task.

9.15.9.11.7.1 Enabling OPS output in the module

Name:

OSPValid

This data point makes it possible to start the output of the module and request the use of OSP during operation.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|-------------|-------|---|
| 0 | OSPValid | 0 | Request OSP operation (after initial startup or module in stand-by) |
| | | 1 | Request normal operation |
| 1 - 7 | Reserved | 0 | |

Bit OSPValid exists once on the module and is managed by the user task. It must be set to start the enabled channels. As long as bit OSPValid remains set in the module, the module behaves the same as in function model "Standard".

If an OSP event occurs, e.g. communication between the module and master CPU aborted, then bit OSPValid is reset on the module. The module enters the OSP state and output occurs according to the configuration in register "OSPMode" on page 1658.

The following generally applies:

Even after regeneration of the communication channel, the OSP replacement value is still pending. The OSP state is only exited again when a set OSPValid bit is transferred.

When the master CPU is restarted, bit OSPValid bit is reinitialized in the master CPU. It must be set once more by the application and transferred via the bus.

In the event of brief communication errors between the module and master CPU (e.g. due to EMC), the cyclic registers fail to refresh for several bus cycles. Within the module, bit OSPValid is reset; the set bit is retained in the CPU, however. During the next successful transfer, the module-internal OSPValid bit is set again and the module automatically returns to normal operation.

If the task in the master CPU needs the information about which output mode the module is currently in, bit ModulOK can be evaluated.

Warning!

If bit OSPValid bit is reset to "0" by the module, the output status no longer depends on the responsible task in the master CPU. Nevertheless, output is made depending on the configuration of the OSP replacement value.

9.15.9.11.7.2 Setting OSP mode

Name:

CfgOSPMODE

This register controls the behavior of a channel when using OSP.

| Data type | Values | Explanation |
|-----------|--------|---------------------------|
| USINT | 0 | Replace with static value |
| | 1 | Retain last valid value |

9.15.9.11.7.3 Defining an OSP-digital output value

Name:

CfgOSPValue

This register contains the digital output value that is output in "Replace with static value" mode during OSP operation.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-----|-------------|--------|--|
| 0 | | 0 or 1 | OSP output value for channel DigitalOutput00 |
| ... | | ... | |
| x | | 0 or 1 | OSP output value for channel DigitalOutput0x |

Warning!

"OSPValue" is only applied by the module if bit "OSPValid" has been set in the module.

9.15.9.11.8 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time |
|--------------------|
| 100 µs |

9.15.9.11.9 Minimum I/O update time

The minimum I/O update time specifies how far the bus cycle can be reduced so that an I/O update is performed in each cycle.

| Minimum I/O update time |
|---------------------------------|
| Equal to the minimum cycle time |

9.15.10 X20(c)DO4332

Data sheet version: 3.26

9.15.10.1 General information

The module is equipped with 4 outputs for 3-wire connections. The rated output current is 2 A.

- 4 digital outputs with 2 A
- Source connection
- 3-wire connections
- 24 VDC and GND for actuator supply
- Integrated output protection
- OSP mode

9.15.10.2 Coated modules

Coated modules are X20 modules with a protective coating for the electronics component. This coating protects X20c modules from condensation and corrosive gases.

The modules' electronics are fully compatible with the corresponding X20 modules.

For simplification purposes, only images and module IDs of uncoated modules are used in this data sheet.

The coating has been certified according to the following standards:

- Condensation: BMW GS 95011-4, 2x 1 cycle
- Corrosive gas: EN 60068-2-60, method 4, exposure 21 days

| | e + r | | Red on / Green single flash | Invalid firmware | |
| | 1 - 4 | | Orange | | Output status of the corresponding digital output |

9.15.10.6 Pinout

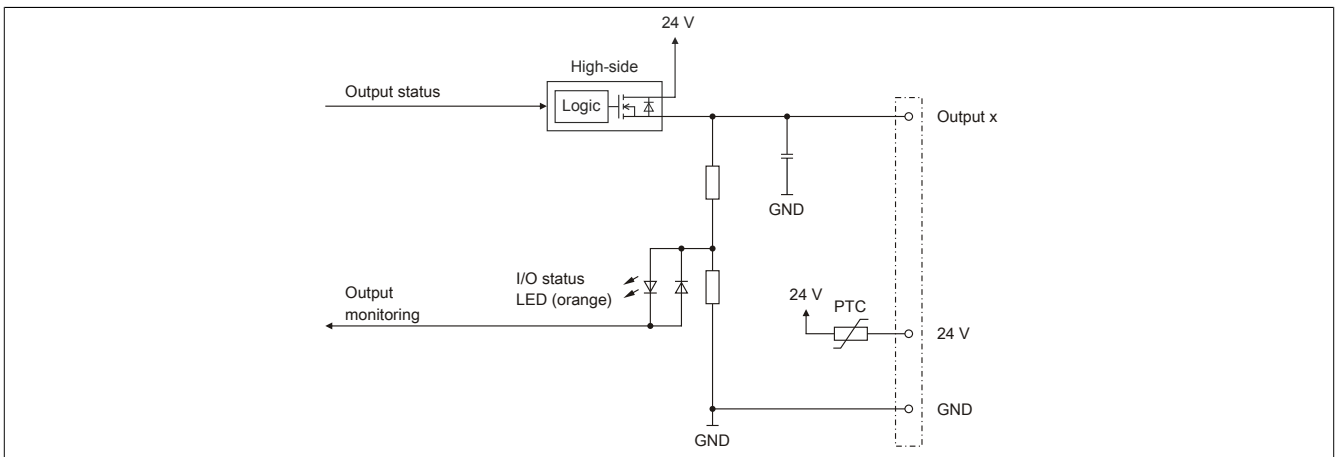

9.15.10.7 Connection example

9.15.10.8 OSP hardware requirements

In order to use OSP mode sensibly, it should be ensured that the power supply of the output module and CPU are independent of each other when the application is set up.

9.15.10.9 Output circuit diagram

9.15.10.10 Switching inductive loads (Rev. H0 and higher)

Environmental temperature: 50°C, all outputs with the same load.

Environmental temperature: 60°C, all outputs with the same load.

**Information:**

If the maximum number of operating cycles per second is exceeded, an external inverse diode must be used.

Operating conditions outside of the area in the diagram are not permitted!

9.15.10.11 Operation with 2 A

The outputs of the module can handle up to 2 A. With a total current of 4 A, no more than 2 channels are operable at full load. Correct channel assignments are important for achieving optimal use of the module.

The following table provides an overview of the number of fully used channels and the resulting best distribution.

| Number of channels using 2A | Division |
|-----------------------------|--|
| 1 | Any |
| 2 | The following channel numbers can be assigned: 1, 3 1, 4 2, 4 |

Information:

This section is only valid up to Rev. H0.

9.15.10.12 Derating

During operation over 55°C, the power dissipation of the modules to the left and right of this module is not permitted to exceed 1.15 W!

For an example of calculating the power dissipation of I/O modules, see section "[Power dissipation calculation of I/O modules](#)" on page 101.

Information:

This section is valid for Rev. H0 and later.

9.15.10.13 Register description

9.15.10.13.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section ["General data points" on page 3790](#).

9.15.10.13.2 Function model 0 - Standard

| Register | Fixed offset | Name | Data type | Read | | Write | |
|----------|--------------|-----------------------|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| 2 | 0 | DigitalOutput | USINT | | | • | |
| | | DigitalOutput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | DigitalOutput04 | Bit 3 | | | | |
| 30 | 1 | StatusInput01 | USINT | • | | | |
| | | StatusDigitalOutput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | StatusDigitalOutput04 | Bit 3 | | | | |

Fixed modules require their data points to be in a specific order in the X2X frame. Cyclic access occurs according to a predefined offset, not based on the register address.

Acyclic access continues to be based on the register numbers.

9.15.10.13.3 Function model 1 - OSP

| Register | Fixed offset | Name | Data type | Read | | Write | |
|----------|--------------|---|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| 2 | 0 | Switching state of digital outputs 1 to 4 | USINT | | | • | |
| | | DigitalOutput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | DigitalOutput04 | Bit 3 | | | | |
| 30 | 1 | Status of digital outputs 1 to 4 | USINT | • | | | |
| | | StatusDigitalOutput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | StatusDigitalOutput04 | Bit 3 | | | | |
| 34 | 1 | Enabling OPS output in the module | USINT | | | • | |
| | | OSPValid | Bit 0 | | | | |
| 32 | - | CfgOSPMODE | USINT | | | | • |
| 36 | - | CfgOSPValue | USINT | | | | • |

Fixed modules require their data points to be in a specific order in the X2X frame. Cyclic access occurs according to a predefined offset, not based on the register address.

Acyclic access continues to be based on the register numbers.

9.15.10.13.4 Function model 254 - Bus Controller

| Register | Offset ¹⁾ | Name | Data type | Read | | Write | |
|----------|----------------------|---|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| 2 | 0 | Switching state of digital outputs 1 to 4 | USINT | | | • | |
| | | DigitalOutput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | DigitalOutput04 | Bit 3 | | | | |
| 30 | - | Status of digital outputs 1 to 4 | USINT | | • | | |
| | | StatusDigitalOutput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | StatusDigitalOutput04 | Bit 3 | | | | |

1) The offset specifies where the register is within the CAN object.

9.15.10.13.4.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see ["Using I/O modules on the bus controller" on page 3789](#).

9.15.10.13.4.2 CAN I/O bus controller

The module occupies 1 digital logical slot on CAN I/O.

9.15.10.13.5 Digital outputs

The output state is transferred to the output channels with a fixed offset (<60 µs) based on the network cycle (SyncOut).

9.15.10.13.5.1 Switching state of digital outputs 1 to 4

Name:

DigitalOutput

DigitalOutput01 to DigitalOutput04

This register is used to store the switching state of digital outputs 1 to 4.

Only function model 0 - Standard:

Setting "Packed outputs" in the Automation Studio I/O configuration determines whether all bits of this register should be applied individually as data points in the Automation Studio I/O assignment ("DigitalOutput01" to "DigitalOutput0x") or whether this register should be displayed as a single USINT data point ("DigitalOutput").

| Data type | Values | Information |
|-----------|------------------------|--|
| USINT | 0 to 15 | Packed outputs = On |
| | See the bit structure. | Packed outputs = Off or function model ≠ 0 - Standard. |

Bit structure:

| Bit | Description | Value | Information |
|-----|-----------------|-------|-------------------------|
| 0 | DigitalOutput01 | 0 | Digital output 01 reset |
| | | 1 | Digital output 01 set |
| ... | | ... | |
| 3 | DigitalOutput04 | 0 | Digital output 04 reset |
| | | 1 | Digital output 04 set |

9.15.10.13.6 Monitoring status of the digital outputs

On the module, the output states of the outputs are compared to the target states. The control of the output driver is used for the target state.

A change in the output state resets monitoring for that output. The status of each individual channel can be read. A change in the monitoring status is actively transmitted as an error message.

9.15.10.13.6.1 Status of digital outputs 1 to 4

Name:

StatusInput01

StatusDigitalOutput01 to StatusDigitalOutput04

This register contains the state of digital outputs 1 to 4.

Only function model 0 - Standard:

Setting "Packed outputs" in the Automation Studio I/O configuration determines whether all bits of this register should be applied individually as data points in the Automation Studio I/O assignment ("StatusDigitalOutput01" to "StatusDigitalOutput0x") or whether this register should be displayed as a single USINT data point ("StatusInput01").

| Data type | Values | Information |
|-----------|------------------------|--|
| USINT | 0 to 15 | Packed outputs = On |
| | See the bit structure. | Packed outputs = Off or function model ≠ 0 - Standard. |

Bit structure:

| Bit | Description | Value | Information |
|-----|-----------------------|-------|---|
| 0 | StatusDigitalOutput01 | 0 | Channel 01: No error |
| | | 1 | Channel 01: <ul style="list-style-type: none"> • Short circuit or overload • Channel switched on and missing I/O power supply • Channel switched off and external voltage applied on channel |
| ... | | ... | |
| 3 | StatusDigitalOutput04 | 0 | Channel 04: No error |
| | | 1 | Channel 04: For an error description, see channel 01. |

9.15.10.13.7 Function model "OSP"

In function model "OSP" (Operator Set Predefined), the user defines an analog value or digital pattern. This OSP value is output as soon as the communication between the module and master is aborted.

Functionality

The user has the choice between 2 OSP modes:

- Retain last valid value
- Replace with static value

In the first case, the module retains the last value recognized as a valid output status.

When selecting mode "Replace with static value", a plausible output value must be entered in the associated value register. When an OSP event occurs, this value is output instead of the value currently requested by the task.

9.15.10.13.7.1 Enabling OPS output in the module

Name:

OSPValid

This data point makes it possible to start the output of the module and request the use of OSP during operation.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|-------------|-------|---|
| 0 | OSPValid | 0 | Request OSP operation (after initial startup or module in stand-by) |
| | | 1 | Request normal operation |
| 1 - 7 | Reserved | 0 | |

Bit OSPValid exists once on the module and is managed by the user task. It must be set to start the enabled channels. As long as bit OSPValid remains set in the module, the module behaves the same as in function model "Standard".

If an OSP event occurs, e.g. communication between the module and master CPU aborted, then bit OSPValid is reset on the module. The module enters the OSP state and output occurs according to the configuration in register "OSPMode" on page 1668.

The following generally applies:

Even after regeneration of the communication channel, the OSP replacement value is still pending. The OSP state is only exited again when a set OSPValid bit is transferred.

When the master CPU is restarted, bit OSPValid bit is reinitialized in the master CPU. It must be set once more by the application and transferred via the bus.

In the event of brief communication errors between the module and master CPU (e.g. due to EMC), the cyclic registers fail to refresh for several bus cycles. Within the module, bit OSPValid is reset; the set bit is retained in the CPU, however. During the next successful transfer, the module-internal OSPValid bit is set again and the module automatically returns to normal operation.

If the task in the master CPU needs the information about which output mode the module is currently in, bit ModulOK can be evaluated.

Warning!

If bit OSPValid bit is reset to "0" by the module, the output status no longer depends on the responsible task in the master CPU. Nevertheless, output is made depending on the configuration of the OSP replacement value.

9.15.10.13.7.2 Setting OSP mode

Name:
CfgOSPMode

This register controls the behavior of a channel when using OSP.

| Data type | Values | Explanation |
|-----------|--------|---------------------------|
| USINT | 0 | Replace with static value |
| | 1 | Retain last valid value |

9.15.10.13.7.3 Defining an OSP-digital output value

Name:
CfgOSPValue

This register contains the digital output value that is output in "Replace with static value" mode during OSP operation.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-----|-------------|--------|--|
| 0 | | 0 or 1 | OSP output value for channel DigitalOutput00 |
| ... | | ... | |
| x | | 0 or 1 | OSP output value for channel DigitalOutput0x |

Warning!

"OSPValue" is only applied by the module if bit "OSPValid" has been set in the module.

9.15.10.13.8 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time |
|--------------------|
| 100 µs |

9.15.10.13.9 Minimum I/O update time

The minimum I/O update time specifies how far the bus cycle can be reduced so that an I/O update is performed in each cycle.

| Minimum I/O update time |
|---------------------------------|
| Equal to the minimum cycle time |

9.15.11 X20DO4332-1

Data sheet version: 1.01

9.15.11.1 General information

The module is equipped with 4 outputs for 3-wire connections. The nominal output current is 2 A.

- 4 digital outputs with 2 A
- Source circuit
- 3-wire connections
- 24 VDC and GND for actuator power supply
- Integrated output protection
- OSP mode
- PWM mode

Table 315: X20DO4332-1 - Technical data

- 1) Number of outputs x $R_{DS(on)}$ x Nominal output current²⁾. For a calculation example, see section "Mechanical and electrical configuration" of the X20 system user's manual.
- 2) At loads \leq 1 k Ω .
- 3) Due to the freewheeling diode integrated in the module.
- 4) A parallel connection is not possible in PWM mode.
- 5) The power consumption of the sensors connected to the module is not permitted to exceed 12 W.

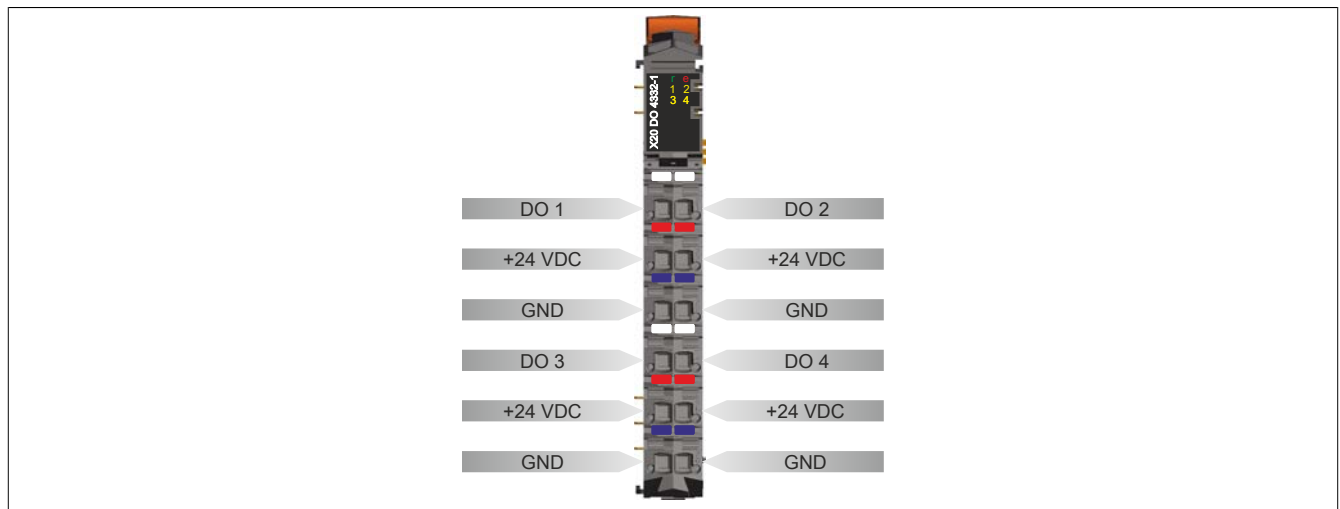

9.15.11.4 LED status indicators

For a description of the various operating modes, see "[Diagnostic LEDs](#)" on page 3787.

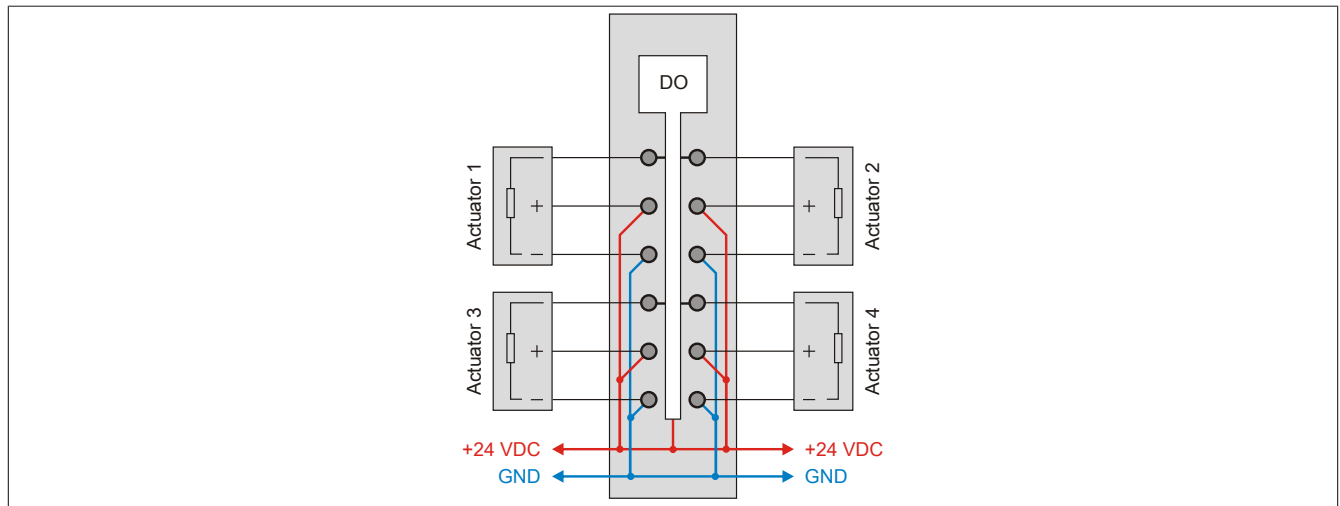

| Figure | LED | Color | Status | Description |
|---|-------|--------------------------------|----------------------------|---|
|  | r | Green | Off | No power to module |
| | | | Single flash | Mode RESET |
| | | | Blinking | Mode PREOPERATIONAL |
| | | | On | Mode RUN |
| | | | Flickering (approx. 10 Hz) | The module is in the OSP state. |
| | e | Red | Off | Module not supplied with power or everything OK |
| | | | Single flash | Warning/Error on an I/O channel. Level monitoring for digital outputs has been triggered. |
| | e + r | Solid red / Single green flash | Invalid firmware | |
| | 1 - 4 | Orange | | Output state of the corresponding digital output. ¹⁾ |

1) Die Helligkeit der Anzeige kann sich im PWM-Modus abhängig von Frequenz und Tastverhältnis ändern.

9.15.11.5 Pinout

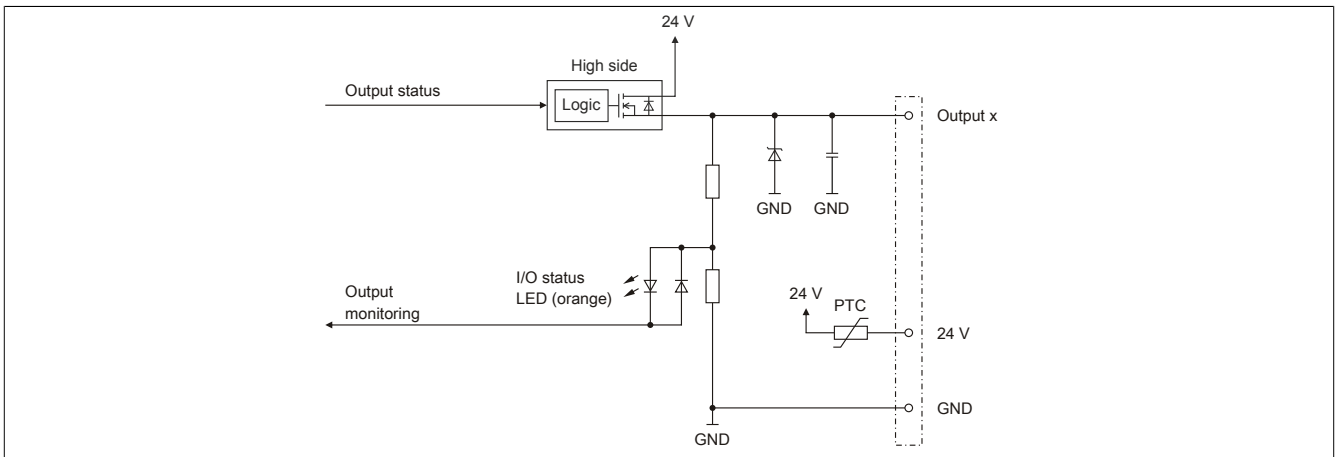

9.15.11.6 Connection example

9.15.11.7 OSP hardware requirements

In order to use OSP mode sensibly, it should be ensured that the power supply of the output module and CPU are independent of each other when the application is set up.

9.15.11.8 Output circuit diagram

9.15.11.9 Derating

During operation over 55°C, the power dissipation of the modules to the left and right of this module is not permitted to exceed 1.15 W!

For an example of calculating the power dissipation of I/O modules, see section "[Power dissipation calculation of I/O modules](#)" on page 101.

9.15.11.10 Register description

9.15.11.10.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section "[General data points](#)" on page 3790.

9.15.11.10.2 Function model 0 - Standard

| Register | Name | Data type | Read | | Write | |
|----------------------|-----------------------|-----------|--------|---------|--------|---------|
| | | | Cyclic | Acyclic | Cyclic | Acyclic |
| Communication | | | | | | |
| 2 | DigitalOutput | USINT | | | • | |
| | DigitalOutput01 | Bit 0 | | | | |
| | ... | ... | | | | |
| | DigitalOutput04 | Bit 3 | | | | |
| 30 | StatusInput01 | USINT | • | | | |
| | StatusDigitalOutput01 | Bit 0 | | | | |
| | ... | ... | | | | |
| | StatusDigitalOutput04 | Bit 3 | | | | |

9.15.11.10.3 Function model 1 - OSP

| Register | Name | Data type | Read | | Write | |
|----------------------|---|-----------|--------|---------|--------|---------|
| | | | Cyclic | Acyclic | Cyclic | Acyclic |
| Configuration | | | | | | |
| 32 | CfgOSPMODE | USINT | | (•) | | • |
| 36 | CfgOSPValue | USINT | | (•) | | • |
| Communication | | | | | | |
| 2 | Switching state of digital outputs 1 to 4 | USINT | | | • | |
| | DigitalOutput01 | Bit 0 | | | | |
| | ... | ... | | | | |
| | DigitalOutput04 | Bit 3 | | | | |
| 30 | Status of digital outputs 1 to 4 | USINT | • | | | |
| | StatusDigitalOutput01 | Bit 0 | | | | |
| | ... | ... | | | | |
| | StatusDigitalOutput04 | Bit 3 | | | | |
| 34 | Enabling OPS output in the module | USINT | | | • | |
| | OSPValid | Bit 0 | | | | |

9.15.11.10.4 Function model 3 - PWM

| Register | Name | Data type | Read | | Write | |
|----------------------|--------------------------------|-----------|--------|---------|--------|---------|
| | | | Cyclic | Acyclic | Cyclic | Acyclic |
| Configuration | | | | | | |
| 26 | CfgDitherFrequency | USINT | | | | • |
| 28 | CfgDitherAmplitude | USINT | | | | • |
| Communication | | | | | | |
| 2 * N + 2 | PwmOutput0N (index N = 1 to 4) | INT | | | • | |
| 12 | PwmPeriode | UINT | | | • | |
| 30 | StatusInput01 | USINT | • | | | |
| | StatusDigitalOutput01 | Bit 0 | | | | |
| | ... | ... | | | | |
| | StatusDigitalOutput04 | Bit 3 | | | | |

9.15.11.10.5 Function model 254 - Bus controller

| Register | Offset ¹⁾ | Name | Data type | Read | | Write | |
|----------------------|----------------------|--------------------------------|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| Configuration | | | | | | | |
| 12 | - | PwmPeriode | UINT | | | | • |
| 26 | - | CfgDitherFrequency | USINT | | | | • |
| 28 | - | CfgDitherAmplitude | USINT | | | | • |
| Communication | | | | | | | |
| 2 * N + 2 | 2 * N | PwmOutput0N (index N = 1 to 4) | INT | | | • | |
| 30 | - | StatusInput01 | USINT | | • | | |
| | | StatusDigitalOutput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | StatusDigitalOutput04 | Bit 3 | | | | |

1) The offset specifies the position of the register within the CAN object.

9.15.11.10.5.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see ["Using I/O modules on the bus controller" on page 3789](#).

9.15.11.10.5.2 CAN I/O bus controller

The module occupies 1 analog logical slot on CAN I/O.

9.15.11.10.6 Digital outputs

The output status is transferred to the output channels with a fixed offset in relation to the network cycle (SyncOut).

9.15.11.10.6.1 Switching state of digital outputs 1 to 4

Name:

DigitalOutput

DigitalOutput01 to DigitalOutput04

This register is used to store the switching state of digital outputs 1 to 4.

Only function model 0 - Standard:

Setting "Packed outputs" in the Automation Studio I/O configuration determines whether all bits of this register should be applied individually as data points in the Automation Studio I/O assignment ("DigitalOutput01" to "DigitalOutput0x") or whether this register should be displayed as a single USINT data point ("DigitalOutput").

| Data type | Values | Information |
|-----------|------------------------|--|
| USINT | 0 to 15 | Packed outputs = On |
| | See the bit structure. | Packed outputs = Off or function model ≠ 0 - Standard. |

Bit structure:

| Bit | Description | Value | Information |
|-----|-----------------|-------|-------------------------|
| 0 | DigitalOutput01 | 0 | Digital output 01 reset |
| | | 1 | Digital output 01 set |
| ... | | ... | |
| 3 | DigitalOutput04 | 0 | Digital output 04 reset |
| | | 1 | Digital output 04 set |

9.15.11.10.7 Monitoring status of the digital outputs

On the module, the output states of the outputs are compared to the target states. The control of the output driver is used for the target state.

A change in the output state resets monitoring for that output. The status of each individual channel can be read. A change in the monitoring status is actively transmitted as an error message.

9.15.11.10.7.1 Status of digital outputs 1 to 4

Name:

StatusInput01

StatusDigitalOutput01 to StatusDigitalOutput04

This register contains the state of digital outputs 1 to 4.

Only function model 0 - Standard:

Setting "Packed outputs" in the Automation Studio I/O configuration determines whether all bits of this register should be applied individually as data points in the Automation Studio I/O assignment ("StatusDigitalOutput01" to "StatusDigitalOutput0x") or whether this register should be displayed as a single USINT data point ("StatusInput01").

| Data type | Values | Information |
|-----------|------------------------|--|
| USINT | 0 to 15 | Packed outputs = On |
| | See the bit structure. | Packed outputs = Off or function model ≠ 0 - Standard. |

Bit structure:

| Bit | | Value | Information |
|-----|-----------------------|-------|---|
| 0 | StatusDigitalOutput01 | 0 | Channel 01: No error |
| | | 1 | Channel 01: <ul style="list-style-type: none"> • Short circuit or overload • Channel switched on and missing I/O power supply • Channel switched off and external voltage applied on channel |
| ... | | ... | |
| 3 | StatusDigitalOutput04 | 0 | Channel 04: No error |
| | | 1 | Channel 04: For an error description, see channel 01. |

9.15.11.10.8 Function model "OSP"

In function model "OSP" (Operator Set Predefined), the user defines an analog value or digital pattern. This OSP value is output as soon as the communication between the module and master is aborted.

Functionality

The user has the choice between 2 OSP modes:

- Retain last valid value
- Replace with static value

In the first case, the module retains the last value recognized as a valid output status.

When selecting mode "Replace with static value", a plausible output value must be entered in the associated value register. When an OSP event occurs, this value is output instead of the value currently requested by the task.

9.15.11.10.8.1 Enabling OPS output in the module

Name:

OSPValid

This data point makes it possible to start the output of the module and request the use of OSP during operation.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|-------------|-------|---|
| 0 | OSPValid | 0 | Request OSP operation (after initial startup or module in stand-by) |
| | | 1 | Request normal operation |
| 1 - 7 | Reserved | 0 | |

Bit OSPValid exists once on the module and is managed by the user task. It must be set to start the enabled channels. As long as bit OSPValid remains set in the module, the module behaves the same as in function model "Standard".

If an OSP event occurs, e.g. communication between the module and master CPU aborted, then bit OSPValid is reset on the module. The module enters the OSP state and output occurs according to the configuration in register "OSPMode" on page 1677.

The following generally applies:

Even after regeneration of the communication channel, the OSP replacement value is still pending. The OSP state is only exited again when a set OSPValid bit is transferred.

When the master CPU is restarted, bit OSPValid bit is reinitialized in the master CPU. It must be set once more by the application and transferred via the bus.

In the event of brief communication errors between the module and master CPU (e.g. due to EMC), the cyclic registers fail to refresh for several bus cycles. Within the module, bit OSPValid is reset; the set bit is retained in the CPU, however. During the next successful transfer, the module-internal OSPValid bit is set again and the module automatically returns to normal operation.

If the task in the master CPU needs the information about which output mode the module is currently in, bit ModulOK can be evaluated.

Warning!

If bit OSPValid bit is reset to "0" by the module, the output status no longer depends on the responsible task in the master CPU. Nevertheless, output is made depending on the configuration of the OSP replacement value.

9.15.11.10.8.2 Setting OSP mode

Name:

CfgOSPMode

This register controls the behavior of a channel when using OSP.

| Data type | Values | Explanation |
|-----------|--------|---------------------------|
| USINT | 0 | Replace with static value |
| | 1 | Retain last valid value |

9.15.11.10.8.3 Defining an OSP-digital output value

Name:

CfgOSPValue

This register contains the digital output value that is output in "Replace with static value" mode during OSP operation.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-----|-------------|--------|--|
| 0 | | 0 or 1 | OSP output value for channel DigitalOutput00 |
| ... | | ... | |
| x | | 0 or 1 | OSP output value for channel DigitalOutput0x |

Warning!

"OSPValue" is only applied by the module if bit "OSPValid" has been set in the module.

9.15.11.10.9 Function model "PWM"

9.15.11.10.9.1 Pulse width

Name:

PwmOutput01 to PwmOutput04

In this register, the PWM pulse width is specified as a percentage of the period duration. At the beginning of each period, the output is switched on for the percentage of time set in this register.

| Data type | Values | Information |
|-----------|------------|----------------------------------|
| INT | 0 to 32767 | 0 to 100% of the period duration |

9.15.11.10.9.2 Period duration

Name:

PwmPeriode

In this register, the PWM period duration is specified in μs .

| Data type | Values | Information |
|-----------|---------------|----------------------------------|
| UINT | 0 | PWM disabled |
| | 1000 to 65535 | Period duration in μs |

9.15.11.10.9.3 Dither

When the position setpoint for valves remains constant for a long period of time, especially in fluids, there is a risk that a valve will stick. This is normally prevented using "dithering". When doing so, the value is permitted to slightly oscillate around the position setpoint.

By default, dither is active for all outputs as soon as the following conditions are met:

- **Dither amplitude** and **dither frequency** are set to a value greater than 0.
- **Pulse width** is set to a value greater than 0 and less than 32767.

Dither is enabled or disabled for all outputs together.

Dither frequency

Name:

CfgDitherFrequency

The dither frequency for all 4 channels can be specified together in this register.

| Data type | Values | Information |
|-----------|----------|----------------------------|
| USINT | 0 to 250 | Corresponds to 0 to 250 Hz |

Dither amplitude

Name:

CfgDitherAmplitude

In this register, the change of the **pulse width** caused by the dither can be specified for all 4 channels together as a percentage. The change takes place in both the positive and negative direction.

If the **pulse width** is adjusted, the dithering is reset and reapplied in the direction of the change.

Example

Set **period duration**: 2000 μ s

DitherAmplitude: 10%

Result: The set pulse width oscillates by $\pm 100 \mu$ s (200μ s / 2).

| Data type | Values | Information |
|-----------|---------|---------------------------------|
| USINT | 0 | No dither |
| | 1 to 25 | 1 to 25% of the period duration |

9.15.11.10.10 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time |
|--------------------|
| 250 μ s |

9.15.11.10.11 Minimum I/O update time

The minimum I/O update time specifies how far the bus cycle can be reduced so that an I/O update is performed in each cycle.

| Minimum I/O update time |
|---------------------------------|
| Equal to the minimum cycle time |

9.15.12 X20DO4529

Data sheet version: 3.16

9.15.12.1 General information

The module is equipped with 4 relay outputs.

- 4 digital outputs
- Relay module for 115 VAC
- 4 change over contacts
- Single-channel isolated outputs

Danger!

Risk of electric shock!

The terminal block must only be allowed to conduct voltage when it is inserted. It must not under any circumstances be removed or inserted when voltage is applied or have voltage applied to it when it is removed.

Danger!

Die Spannungsclassen auf der Feldklemme dürfen nicht vermisch werden! Es ist ausschließlic der Betrieb bei Netzspannung (z. B. 115 VAC) ODER bei Sicherheitskleinspannung (z. B. 24 VDC SELV) erlaubt.

9.15.12.10 Register description

9.15.12.10.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section ["General data points" on page 3790](#).

9.15.12.10.2 Function model 0 - Standard

| Register | Fixed offset | Name | Data type | Read | | Write | |
|----------|--------------|-------------------------------|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| 2 | 0 | DigitalOutput | USINT | | | • | |
| | | DigitalOutput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | DigitalOutput04 | Bit 3 | | | | |

Fixed modules require their data points to be in a specific order in the X2X frame. Cyclic access occurs according to a predefined offset, not based on the register address.

Acyclic access continues to be based on the register numbers.

9.15.12.10.3 Function model 254 - Bus controller

| Register | Offset ¹⁾ | Name | Data type | Read | | Write | |
|----------|----------------------|---|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| 2 | 0 | Switching state of digital outputs 1 to 4 | USINT | | | • | |
| | | DigitalOutput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | DigitalOutput04 | Bit 3 | | | | |

1) The offset specifies the position of the register within the CAN object.

9.15.12.10.3.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see ["Using I/O modules on the bus controller" on page 3789](#).

9.15.12.10.3.2 CAN I/O bus controller

The module occupies 1 digital logical slot on CAN I/O.

9.15.12.10.4 Digital outputs

The output state is transferred to the output channels with a fixed offset (<60 μ s) based on the network cycle (SyncOut).

9.15.12.10.4.1 Switching state of digital outputs 1 to 4

Name:

DigitalOutput

DigitalOutput01 to DigitalOutput04

This register is used to store the switching state of digital outputs 1 to 4.

Only function model 0 - Standard:

Setting "Packed outputs" in the Automation Studio I/O configuration determines whether all bits of this register should be applied individually as data points in the Automation Studio I/O assignment ("DigitalOutput01" to "DigitalOutput0x") or whether this register should be displayed as a single USINT data point ("DigitalOutput").

| Data type | Values | Information |
|-----------|------------------------|---|
| USINT | 0 to 15 | Packed outputs = On |
| | See the bit structure. | Packed outputs = Off or function model \neq 0 - Standard. |

Bit structure:

| Bit | Description | Value | Information |
|-----|-----------------|-------|-------------------------|
| 0 | DigitalOutput01 | 0 | Digital output 01 reset |
| | | 1 | Digital output 01 set |
| ... | | ... | |
| 3 | DigitalOutput04 | 0 | Digital output 04 reset |
| | | 1 | Digital output 04 set |

9.15.12.10.5 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time |
|--------------------|
| 100 μ s |

9.15.12.10.6 Minimum I/O update time

The minimum I/O update time specifies how far the bus cycle can be reduced so that an I/O update is performed in each cycle.

| Minimum I/O update time |
|---------------------------------|
| Equal to the minimum cycle time |

9.15.13 X20DO4613

Data sheet version: 2.42

9.15.13.1 General information

The module is a digital output module that is equipped with 4 opto-triac outputs using phase-angle control. L and N are fed to the module for zero-crossing detection.

The 4 outputs are electrically isolated from one another and are used for controlling external power triacs or non-parallel thyristors.

- 4 digital outputs
- Controls external power triacs or non-parallel thyristors
- Outputs with 48 - 240 VAC
- 50 Hz or 60 Hz
- Outputs electrically isolated from one another
- Phase-angle control
- Zero-crossing detection
- Negative half-waves can be switched off
- 2-wire connections
- 240 V coding
- OSP mode
- Frequency mode

Danger!

Risk of electric shock!

The terminal block is only permitted to conduct voltage when it is connected. It is not permitted to be disconnected or connected while voltage is applied or have voltage applied to it while it is removed under any circumstances.

This module is not permitted to be the last module connected on the X2X Link network. At least one subsequent X20ZF dummy module must provide protection against contact.

9.15.13.2 Order data

9.15.13.4 Status LEDs

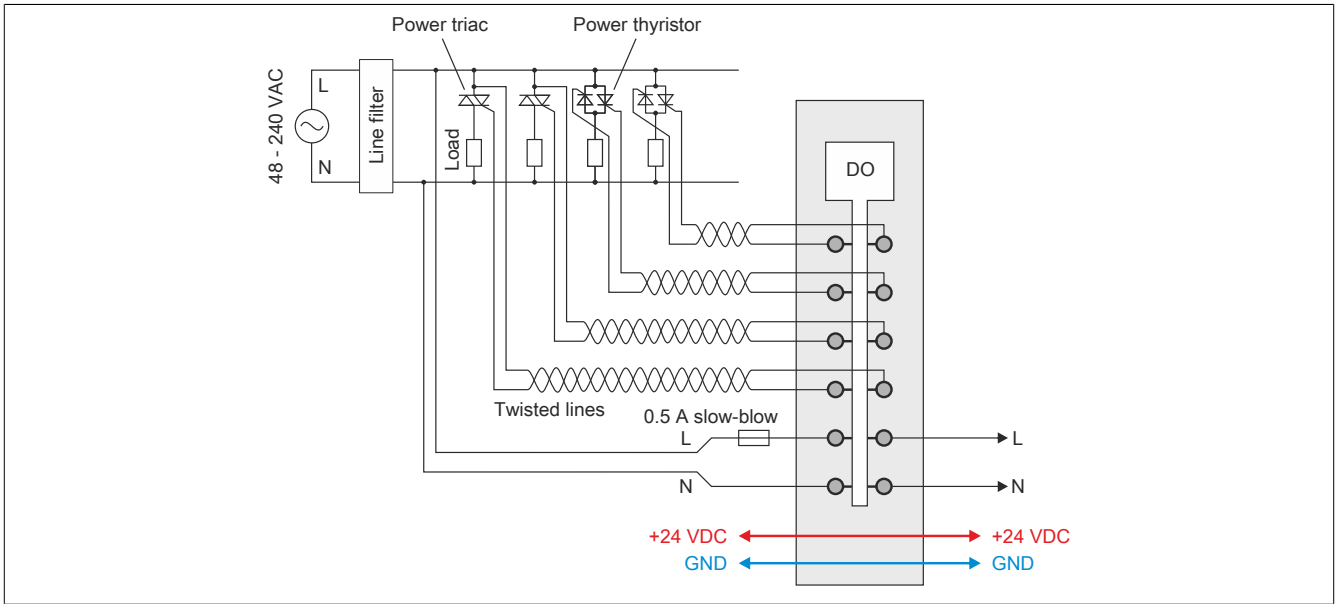

For a description of the various operating modes, see "Diagnostic LEDs" on page 3787.

| Figure | LED | Color | Status | Description |
|--|-------|-------|-----------------------------|--|
|  | r | Green | Off | Module supply not connected |
| | | | Single flash | RESET mode |
| | | | Blinking | PREOPERATIONAL mode |
| | | | On | RUN mode |
| | | | Flickering (approx. 10 Hz) | Module is in OSP state |
| | e | Red | Off | Module supply not connected or everything OK |
| | | | On | Error or reset status |
| | | | Single flash | Loss of zero-crossing signal (input voltage absent or too low) |
| | e + r | | Red on / Green single flash | Invalid firmware |
| | 1 - 4 | | Orange | |

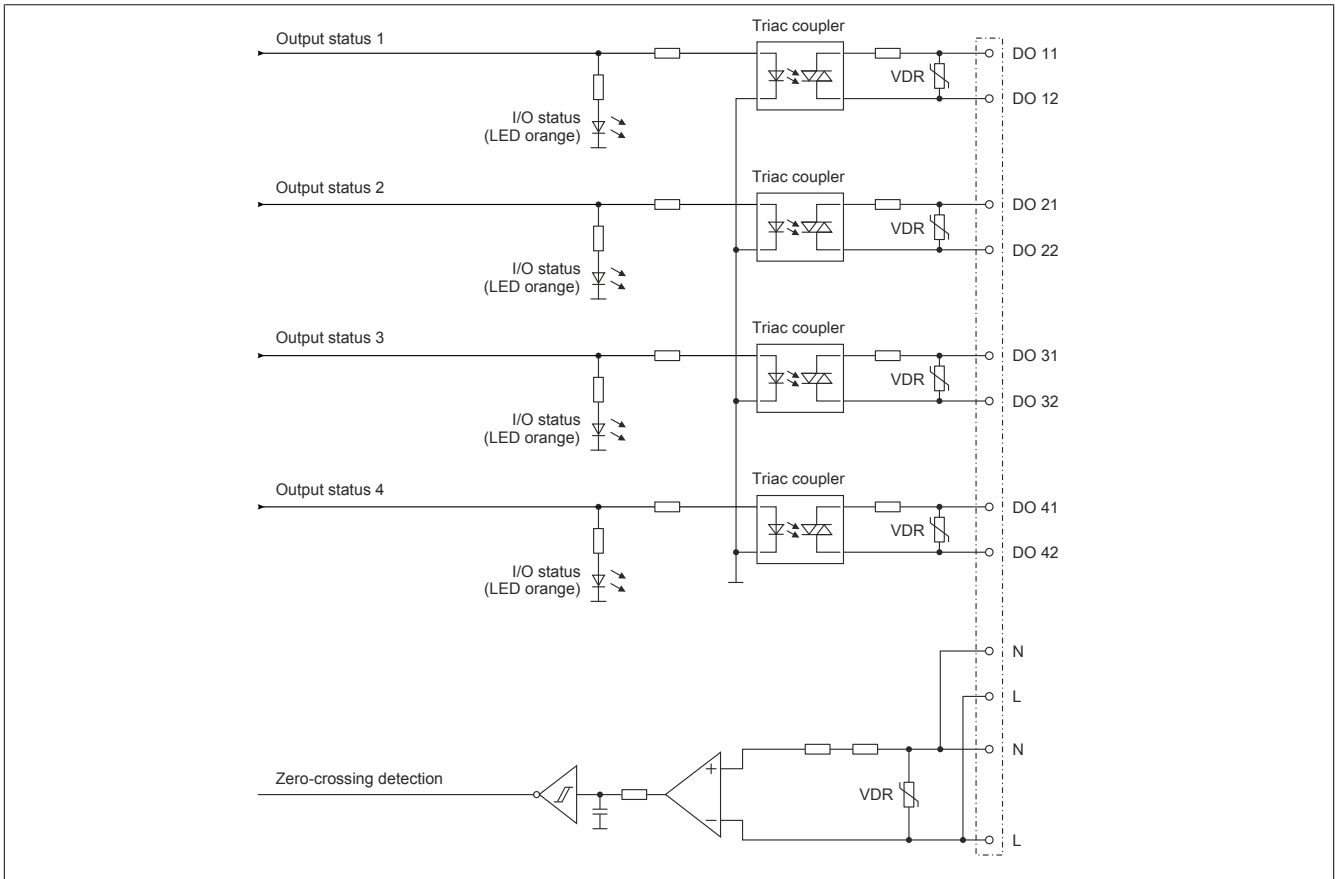

9.15.13.5 Pinout

9.15.13.6 Connection example

9.15.13.7 Output circuit diagram

9.15.13.8 Operating principle

The digital output module DO4613 was designed to control external triacs and thyristors.

The module is equipped with internal zero-crossing detection. Zero-crossing detection is the basis for a software PLL that generates 200 times the zero-crossing frequency. The output signal of the PLL is the base timer for the 4 PWM outputs in both digital and analog mode.

Upon detection of lost periods or periods that are too short, control to the outputs is cut until the PLL is tuned correctly. The tuning procedure can take several seconds. In addition, the "ZeroCrossingStatus" bit is set and the error LED enabled (valid frequency range for the supply is 47 to 63 Hz).

Information:

The jitter of the output signals generated by the PLL and communication can reach 0.5%.

9.15.13.9 Operation with inductive loads

As inherent to its functional principal, the triac output is cleared when the current crosses zero. Because zero crossing for current is delayed with inductive loads, it is possible that the triac will be fired again even though it is not completely cleared at higher output values (between 50 and 100% depending on the inductance of the load). In this case, a full-wave is output. This causes the available control range to be reduced (0 to 100%).

For control beyond the point of full-wave control (up to 100%), the value that is physically output no longer changes. However, this does not cause damage to the module.

9.15.13.10 Register description

9.15.13.10.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section "[General data points](#)" on page 3790.

9.15.13.10.2 Function model 0 - Standard and Function model 2 - Frequency mode

The only difference between function model 2 and function model 0 is the possibility of generating half-wave patterns in various frequencies. Register 18 "CfO_Frequency" is an additional register for this.

| Register | Name | Data type | Read | | Write | |
|--------------------------------|-----------------------------------|-----------|--------|------------|--------|------------|
| | | | Cyclic | Non-cyclic | Cyclic | Non-cyclic |
| Configuration - General | | | | | | |
| 2 + N * 2 | AnalogOutput0N (Index N = 1 to 4) | USINT | | | • | |
| 18 | CfO_Frequency | UINT | | | | • |
| 18 + N * 2 | ConfigOutput0N (Index N = 1 to 4) | USINT | | | | • |
| 28 | ConfigOutput05 | USINT | | | | • |
| 29 | CfO_OutputTolerance | USINT | | | | • |
| Communication | | | | | | |

| 32 | CfgOSPMode | USINT | | | | • |
| 36 | CfgOSPValue | USINT | | | | • |
| 36 + N * 2 | CfgOSPValue0N (Index N = 1 to 4) | USINT | | | | • |
| Communication | | | | | | |
| 2 | Switching state of digital outputs 1 to 4 | USINT | | | • | |
| | DigitalOutput01 | Bit 0 | | | | |
| | ... | ... | | | | |
| | DigitalOutput04 | Bit 3 | | | | |
| 30 | Status of the outputs | USINT | • | | | |
| | ZeroCrossingInput | Bit 4 | | | | |
| | ZeroCrossingStatus | Bit 7 | | | | |

9.15.13.10.4 Function model 254 - Bus controller

| Register | Offset | Name | Data type | Read | | Write | |
|--------------------------------|-------------|---|-----------|--------|------------|--------|------------|
| | | | | Cyclic | Non-cyclic | Cyclic | Non-cyclic |
| Configuration - General | | | | | | | |
| $2 + N * 2$ | $(N-1) * 2$ | AnalogOutput0N (Index N = 1 to 4) | USINT | | | • | |
| $18 + N * 2$ | - | ConfigOutput0N (Index N = 1 to 4) | USINT | | | | • |
| 28 | - | ConfigOutput05 | USINT | | | | • |
| 29 | - | CfO_OutputTolerance | USINT | | | | • |
| Communication | | | | | | | |
| 30 | 0 | Status of the outputs | USINT | • | | | |
| | | ZeroCrossingInput | Bit 4 | | | | |
| | | ZeroCrossingStatus | Bit 7 | | | | |

1) The offset specifies the position of the register within the CAN object.

9.15.13.10.4.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see "[Using I/O modules on the bus controller](#)" on page 3789.

9.15.13.10.4.2 CAN I/O bus controller

The module occupies 1 analog logical slot on CAN I/O.

9.15.13.10.5 General information

The digital output module was designed for phase control of resistive and inductive loads.

The module is equipped with internal zero-crossing detection. Zero crossing detection is the basis for a software PLL that generates 200 times the zero crossing frequency. The output signal of the PLL is the base timer for the 2 PWM outputs in both digital and analog mode.

Upon detection of lost periods or periods that are too short, control of the outputs is cut until the PLL is tuned correctly (can take several seconds). In addition, the "ZeroCrossingStatus" bit is set and the Error LED is enabled (valid frequency range for the supply is 45 to 65 Hz).

Information:

The jitter of the output signals generated by the PLL and communication can reach 0.5%.

9.15.13.10.6 Digital outputs

The output state of the outputs defined as digital is transferred to the output ports of the control switch in sync with the connected power mains. The switch-on state is applied when the voltage crosses zero on the positive half-wave and the switch-off state at the zero crossing for current in each half wave.

9.15.13.10.6.1 Switching state of digital outputs 1 to 4

Name:

DigitalOutput

DigitalOutput01 to DigitalOutput04

This register is used to store the switching state of digital outputs 1 to 4.

Only function model 0 - Standard:

Setting "Packed outputs" in the Automation Studio I/O configuration determines whether all bits of this register should be applied individually as data points in the Automation Studio I/O assignment ("DigitalOutput01" to "DigitalOutput0x") or whether this register should be displayed as a single USINT data point ("DigitalOutput").

| Data type | Values | Information |
|-----------|------------------------|--|
| USINT | 0 to 15 | Packed outputs = On |
| | See the bit structure. | Packed outputs = Off or function model ≠ 0 - Standard. |

Bit structure:

| Bit | Description | Value | Information |
|-----|-----------------|-------|-------------------------|
| 0 | DigitalOutput01 | 0 | Digital output 01 reset |
| | | 1 | Digital output 01 set |
| ... | | ... | |
| 3 | DigitalOutput04 | 0 | Digital output 04 reset |
| | | 1 | Digital output 04 set |

Information:

The states in these registers are only applied when the channels are set to DIGITAL in register "ConfigOutput05" on page 1695.

When using setting "Packed outputs", ALL channels must be set to DIGITAL. Mixed operation is not possible.

9.15.13.10.7 Analog outputs

The output value of the outputs defined as analog outputs (unit percent) is switched through to the control ports in sync with power mains. The analog value is output to the TRIAC control port in the range between (output value > SwitchOffValue) and (output value ≤ 95%) with a resolution of 1%.

Changes to the output value are applied at the next positive half-wave

9.15.13.10.7.1 Commutation angle for analog outputs 1 - 4

Name:

AnalogOutput01 to AnalogOutput04

These registers are used to set the commutation angle for phase angle control.

Values between 0 and 100 correspond to the output value for the respective channel in percent. Values above 100 correspond to 100%.

| Data type | Value |
|-----------|----------|
| USINT | 0 to 100 |

Information:

The commutation angle for phase angle control set in these registers are only applied when the channels are set to ANALOG in register "ConfigOutput05" on page 1695.

9.15.13.10.8 Output configuration

9.15.13.10.8.1 Configuring the half-wave pattern

Name:

CfO_Frequency

This register can only be used in [function model 2 - Frequency mode](#) and makes it possible to configure the output of half-wave patterns in various frequencies. The [commutation angle of the outputs](#) is not affected by this. The following frequency patterns can be configured:

- 100 half-waves

- 50 half-waves

- 33 half-waves

- 25 half-waves

With multichannel operation, the different channels should be operated with delayed half-waves in order to ensure that the load is placed evenly on the module.

| Data type | Values |
|-----------|------------------------|
| UINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|---------|-------------|--------------|--|
| 0 - 3 | Channel 1 | 0000 | 100 half-waves/second |
| | | 0001 | 50 half-waves/second |
| | | 0010 | 25 half-waves/second |
| | | 0011 | 33 half-waves/second |
| | | 0101 | 50 half-waves/second delayed by 1 half-wave |
| | | 0110 | 25 half-waves/second delayed by 2 half-waves |
| | | 0111 | 33 half-waves/second delayed by 1 half-wave |
| 4 - 7 | Channel 2 | 0000 to 0111 | See channel 1. |
| 8 - 11 | Channel 3 | 0000 to 0111 | See channel 1. |
| 12 - 15 | Channel 4 | 0000 to 0111 | See channel 1. |

Information:

This function is available beginning with firmware version 940. This can be included beginning with hardware variant 8.

9.15.13.10.8.2 Setting the switch-off time

Name:

ConfigOutput01 to ConfigOutput04

This register defines how far in front of the zero cross-over the internal control signal for the TRIAC is switched off. Increasing this value may be necessary in order to prevent unwanted firing of the TRIAC in the event of a slight disturbance in the mains frequency.

With smaller loads, it is important to ensure that this switch off value is not set to large (too early) to prevent switching off prematurely.

The triac can of course only be fired before the set switch-off time.

"SwitchOffValue" in the Automation Studio I/O configuration.

| Data type | Value | Description |
|-----------|---------|--|
| USINT | 5 to 50 | Switch-off time in %. Bus controller default setting: 0 |

9.15.13.10.8.3 Configuration of the output channels

Name:

ConfigOutput05

The configuration of the output channels is stored in this register.

"Output type digital/analog" and "Output type full/half wave" in the Automation Studio I/O configuration

| Data type | Values | Bus controller default setting |
|-----------|------------------------|--------------------------------|
| USINT | See the bit structure. | 15 |

Bit structure:

| Bit | Description | Value | Information |
|-----|--|-------|---|
| 0 | Channel 1: Digital/Analog output | 0 | Output channel 1 is defined as a digital output. The output status is defined by bit 0 of register "DigitalOutput 1 - 4" on page 1693. |
| | | 1 | Output channel 1 is defined as an analog output. The output status is defined by register "AnalogOutput01" on page 1693 (bus controller default setting). |
| ... | ... | ... | ... |
| 3 | Channel 4: Digital/Analog output | 0 | Output channel 4 is defined as a digital output. The output status is defined by bit 1 of register "DigitalOutput 1 - 4" on page 1693. |
| | | 1 | Output channel 2 is defined as an analog output. The output status is defined by register "AnalogOutput04" on page 1693 (bus controller default setting). |
| 4 | Channel 1: Full-wave/Half-wave control ¹⁾ | 0 | Full-wave control on output channel 1 (bus controller default setting) |
| | | 1 | Negative half-wave on output channel 1 is suppressed. |
| ... | ... | ... | ... |
| 7 | Channel 4: Full-wave/Half-wave control ¹⁾ | 0 | Full-wave control on output channel 4 (bus controller default setting) |
| | | 1 | Negative half-wave on output channel 4 is suppressed. |

1) Not available in function model 2 - Frequency mode.

9.15.13.10.8.4 Switching behavior for zero-crossing errors

Name:

CfO_OutputTolerance

This register can be used to set the switching behavior of the trigger. After the number of zero-crossing errors configured in Bit 0 to 4, the output is switched off for at least 3 periods. This is followed by synchronization with the zero signal according to Bit 7.

| Data type | Values | Bus controller default setting |
|-----------|------------------------|--------------------------------|
| USINT | See the bit structure. | 0 |

Bit structure:

| Bit | Description | Value | Information |
|-------|--------------------|---------|--|
| 0 - 4 | Trigger for Resync | 0 to 30 | Number of zero crossing errors. Bus controller default setting: 0 |
| 5 - 6 | Reserved | - | |
| 7 | Fast settling | 0 | Quick adjustment (bus controller default setting) |
| | | 1 | PLL synchronization |

Fast synchronization

With this option, the trigger point is closed-loop controlled after each individual zero-crossover and input jitter.

- **Advantage:** Increased tolerance and faster response to deviations in mains frequency
- **Disadvantage:** Increased switch-on jitter for firing signal by zero cross signal $\pm 100 \mu\text{Sec}$

PLL synchronization

With this option the intervals between zero cross-overs are measured and the PLL frequency is updated accordingly.

- **Advantage:** Jitter-free firing signal
- **Disadvantage:** When the output is switched off, additional measurement phases are required before it can be switched back on.

Information:

This function is available starting with Firmware version 928. This can be installed with hardware version 7 and hardware revision B4 or higher.

9.15.13.10.9 Status of the outputs

Name:

ZeroCrossingInput

ZeroCrossingStatus

StatusInput01

The operating status of the outputs is mapped in this register.

Only function model 0 - Standard:

Setting "Packed outputs" in the Automation Studio I/O configuration determines whether all bits of this register should be applied individually as data points in the Automation Studio I/O assignment ("ZeroCrossingInput" to "ZeroCrossingStatus") or whether this register should be displayed as a single USINT data point ("StatusInput01").

| Data type | Value | Information |
|-----------|------------------------|---|
| USINT | 0 to 255 | Packed outputs = On |
| | See the bit structure. | Packed outputs = Off or function model \neq 0 - Standard. |

Bit structure:

| Bit | Name | Value | Information |
|-------|--------------------|-------|---|
| 0 - 3 | Reserved | - | |
| 4 | ZeroCrossingInput | 0 | Zero cross signal during the negative half-wave |
| | | 1 | Zero cross signal during the positive half-wave |
| 5 - 6 | Reserved | - | |
| 7 | ZeroCrossingStatus | 0 | Zero cross signal OK |
| | | 1 | Zero cross signal has dropped out |

9.15.13.10.10 Function model "OSP"

In function model "OSP" (Operator Set Predefined), the user defines an analog value or digital pattern. This OSP value is output as soon as the communication between the module and master is aborted.

Functionality

The user has the choice between 2 OSP modes:

- Retain last valid value
- Replace with static value

In the first case, the module retains the last value recognized as a valid output status.

When selecting mode "Replace with static value", a plausible output value must be entered in the associated value register. When an OSP event occurs, this value is output instead of the value currently requested by the task.

9.15.13.10.10.1 Enabling OPS output in the module

Name:

OSPValid

This data point makes it possible to start the output of the module and request the use of OSP during operation.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|-------------|-------|---|
| 0 | OSPValid | 0 | Request OSP operation (after initial startup or module in stand-by) |
| | | 1 | Request normal operation |
| 1 - 7 | Reserved | 0 | |

Bit OSPValid exists once on the module and is managed by the user task. It must be set to start the enabled channels. As long as bit OSPValid remains set in the module, the module behaves the same as in function model "Standard".

If an OSP event occurs, e.g. communication between the module and master CPU aborted, then bit OSPValid is reset on the module. The module enters the OSP state and output occurs according to the configuration in register "OSPMode" on page 1698.

The following generally applies:

Even after regeneration of the communication channel, the OSP replacement value is still pending. The OSP state is only exited again when a set OSPValid bit is transferred.

When the master CPU is restarted, bit OSPValid bit is reinitialized in the master CPU. It must be set once more by the application and transferred via the bus.

In the event of brief communication errors between the module and master CPU (e.g. due to EMC), the cyclic registers fail to refresh for several bus cycles. Within the module, bit OSPValid is reset; the set bit is retained in the CPU, however. During the next successful transfer, the module-internal OSPValid bit is set again and the module automatically returns to normal operation.

If the task in the master CPU needs the information about which output mode the module is currently in, bit ModulOK can be evaluated.

Warning!

If bit OSPValid bit is reset to "0" by the module, the output status no longer depends on the responsible task in the master CPU. Nevertheless, output is made depending on the configuration of the OSP replacement value.

9.15.13.10.10.2 Setting OSP mode

Name:
CfgOSPMode

This register controls the behavior of a channel when using OSP.

| Data type | Values | Explanation |
|-----------|--------|---------------------------|
| USINT | 0 | Replace with static value |
| | 1 | Retain last valid value |

9.15.13.10.10.3 Defining an OSP-digital output value

Name:
CfgOSPValue

This register contains the digital output value that is output in "Replace with static value" mode during OSP operation.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-----|-------------|--------|--|
| 0 | | 0 or 1 | OSP output value for channel DigitalOutput00 |
| ... | | ... | |
| x | | 0 or 1 | OSP output value for channel DigitalOutput0x |

Warning!

"OSPValue" is only applied by the module if bit "OSPValid" has been set in the module.

9.15.13.10.10.4 Define the OSP analog output value

Name:
CfgOSPValue01 to CfgOSPValue04

This register contains the analog output value, which is output in "Replace with static value" mode during OSP operation.

| Data type | Value |
|-----------|----------|
| USINT | 0 to 100 |

Warning!

"OSPValue" is only applied by the module if bit "OSPValid" has been set in the module.

9.15.13.10.11 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time | |
|--------------------|--------|
| All channels | 250 µs |

9.15.13.10.12 Minimum I/O update time

The minimum I/O update time specifies how far the bus cycle can be reduced so that an I/O update is performed in each cycle.

| Minimum I/O update time | |
|-------------------------|--------|
| All channels | 150 µs |

9.15.14 X20DO4623

Data sheet version: 3.23

9.15.14.1 General information

The module is a digital output module that is equipped with 4 SSR outputs with zero cross-over switches and uses 2-line connections. The module is also equipped with integrated full-wave control. The supply (L and N) is fed directly to the module.

- 4 digital outputs
- Outputs with integrated snubber circuit
- Outputs with 100 to 240 VAC
- L switching
- 50 Hz or 60 Hz
- 2-wire connections
- Integrated full-wave control
- 240 V coding

Danger!

Risk of electric shock!

The terminal block is only permitted to conduct voltage when it is connected. It is not permitted to be disconnected or connected while voltage is applied or have voltage applied to it while it is removed under any circumstances.

This module is not permitted to be the last module connected on the X2X Link network. At least one subsequent X20ZF dummy module must provide protection against contact.

9.15.14.2 Order data

| Model number | Short description | Figure |
|--------------|--|---|
| | Digital outputs |  |

9.15.14.6 Connection example

9.15.14.7 Output circuit diagram

9.15.14.8 Integrated full-wave control

Full-wave control is used to control power for electrical power consumers that are operated with AC voltage. Temperature control is a typical application

Unlike phase-angle control, the sine wave oscillation form of the mains voltage is not changed during full-wave control. This significantly reduces system perturbation.

The output voltage (channel) is switched on and off at a certain ratio. This switches the multi-cycle packets. A multi-cycle packet consists of a number of complete sine waves throughout a cycle. The relationship between the power-on duration and the cycle duration results in the desired effect of reduced power consumption by the connected power consumer.

With the full-wave control that is integrated in the module, a maximum of 24 full waves can be provided on the outputs per cycle. Control takes place in 4% steps.

| Settings | | Full waves | | | | | | | | | | | | | | | | | | | | | | | |
|----------|-----|------------|---|---|---|---|---|---|---|---|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| SW% | % | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | 11 | 12 | 13 | 14 | 15 | 16 | 17 | 18 | 19 | 20 | 21 | 22 | 23 | 24 |

Example of full-wave control (8%):

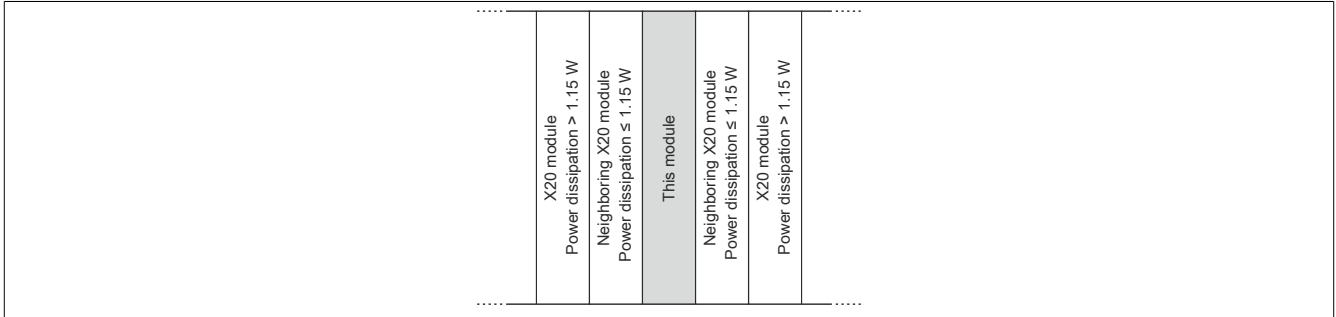

9.15.14.9 Derating

There is no derating when operated below 55°C.

During operation over 55°C, the power dissipation of the modules to the left and right of this module is not permitted to exceed 1.15 W!

For an example of calculating the power dissipation of I/O modules, see section "[Power dissipation calculation of I/O modules](#)" on page 101.

9.15.14.10 Register description

9.15.14.10.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section "[General data points](#)" on page 3790.

9.15.14.10.2 Function model 0 - Standard

| Register | Fixed offset | Name | Data type | Read | | Write | |
|----------------------|--------------|--|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| Configuration | | | | | | | |
| 28 | - | ConfigOutput01 (output filter) | USINT | | | | • |
| Communication | | | | | | | |
| 2 | 0 | DigitalOutput | USINT | | | • | |
| | | DigitalOutput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | DigitalOutput04 | Bit 3 | | | | |
| 4 | 1 | AnalogOutput01 | USINT | | | • | |
| 6 | 2 | AnalogOutput02 | USINT | | | • | |
| 8 | 3 | AnalogOutput03 | USINT | | | • | |
| 10 | 4 | AnalogOutput04 | USINT | | | • | |
| 30 | 1 | StatusInput01 | USINT | • | | | |
| | | ZeroCrossingInput | Bit 0 | | | | |
| | | ZeroCrossingStatus | Bit 4 | | | | |

Fixed modules require their data points to be in a specific order in the X2X frame. Cyclic access occurs according to a predefined offset, not based on the register address.

Acyclic access continues to be based on the register numbers.

9.15.14.10.3 Function model 254 - Bus Controller

| Register | Offset ¹⁾ | Name | Data type | Read | | Write | |
|----------------------|----------------------|--|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| Configuration | | | | | | | |
| 28 | - | ConfigOutput01 (output filter) | USINT | | | | • |
| Communication | | | | | | | |
| 4 | 0 | AnalogOutput01 | USINT | | | • | |
| 6 | 2 | AnalogOutput02 | USINT | | | • | |
| 8 | 4 | AnalogOutput03 | USINT | | | • | |
| 10 | 6 | AnalogOutput04 | USINT | | | • | |
| 30 | 0 | Zero crossing status | USINT | • | | | |
| | | ZeroCrossingInput | Bit 0 | | | | |
| | | ZeroCrossingStatus | Bit 4 | | | | |

1) The offset specifies where the register is within the CAN object.

9.15.14.10.3.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see "[Using I/O modules on the bus controller](#)" on page 3789.

9.15.14.10.3.2 CAN I/O bus controller

The module occupies 1 analog logical slot on CAN I/O.

9.15.14.10.4 Digital outputs

The output status is transferred to the control switch asynchronously to the connected network. The outputs switch on when the voltage crosses zero and switch off when the current crosses zero.

9.15.14.10.4.1 Switching state of digital outputs 1 to 4

Name:

DigitalOutput

DigitalOutput01 to DigitalOutput04

This register is used to store the switching state of digital outputs 1 to 4.

Only function model 0 - Standard:

Setting "Packed outputs" in the Automation Studio I/O configuration determines whether all bits of this register should be applied individually as data points in the Automation Studio I/O assignment ("DigitalOutput01" to "DigitalOutput0x") or whether this register should be displayed as a single USINT data point ("DigitalOutput").

| Data type | Values | Information |
|-----------|------------------------|--|
| USINT | 0 to 15 | Packed outputs = On |
| | See the bit structure. | Packed outputs = Off or function model ≠ 0 - Standard. |

Bit structure:

| Bit | Description | Value | Information |
|-----|-----------------|-------|-------------------------|
| 0 | DigitalOutput01 | 0 | Digital output 01 reset |
| | | 1 | Digital output 01 set |
| ... | | ... | |
| 3 | DigitalOutput04 | 0 | Digital output 04 reset |
| | | 1 | Digital output 04 set |

Information:

The states are only applied when the channels are set to DIGITAL in ["Setting the output configuration" on page 1707](#).

When using the setting "packed outputs" ALL channels must be set to DIGITAL. Mixed operation is not possible.

9.15.14.10.5 Analog outputs

The output value is transferred to the control circuit in sync with the connected power mains according to the firing pattern table (see ["Integrated full-wave control" on page 1703](#)). The analog value is output with a resolution of ~4% over a duration of 24 complete waves. Values > 96% result in full control. Changes to the output value within an interval are applied after the next zero crossover.

9.15.14.10.5.1 Setting the output value from the firing pattern table

Name:

AnalogOutput01 to AnalogOutput04

These registers are used to set the output value from the firing pattern table.

Values between 0 and 100 correspond to the output value for the respective channel in percent. Values above 100 correspond to 100%.

| Data type | Value |
|-----------|----------|
| USINT | 0 to 100 |

Information:

The states in these registers are only applied when the channels are set to ANALOG in ["Setting the output configuration" on page 1707](#).

9.15.14.10.5.2 Setting the output configuration

Name:

ConfigOutput01

Each channel can be configured for either "digital" or "analog" operation in this register. Depending on the setting, the corresponding DigitalOutput or AnalogOutput registers must be written.

| Data type | Values | Bus controller default setting |
|-----------|------------------------|--------------------------------|
| USINT | See the bit structure. | 15 |

Bit structure:

| Bit | Name | Value | Description |
|-------|-----------|-------|---|
| 0 | Channel 1 | 0 | Digital register is used |
| 1 | | 1 | Analog register used (bus controller default setting) |
| ... | | ... | |
| 3 | Channel 4 | 0 | Digital register is used |
| | | 1 | Analog register used (bus controller default setting) |
| 4 - 7 | Reserved | 0 | |

9.15.14.10.6 Zero crossing status

Name:

ZeroCrossingInput

ZeroCrossingStatus

StatusInput01

Zero crossing detection uses a fixed filter time of 1 ms and a scanning frequency of 10 kHz. When a missing or too short period is detected, control is switched off until at least 2 periods are detected correctly, and the status flag is set accordingly. Control is offset by 2 ms from the negative half-wave until the next zero crossover is detected correctly or another error occurs. This is normally at least one complete wave.

Monitoring is activated at the first zero crossover after being switched on.

Only function model 0 - Standard:

Setting "Packed outputs" in the Automation Studio I/O configuration determines whether all bits of this register should be applied individually as data points in the Automation Studio I/O assignment ("ZeroCrossingInput" to "ZeroCrossingStatus") or whether this register should be displayed as a single USINT data point ("StatusInput01").

| Data type | Value | Information |
|-----------|------------------------|--|
| USINT | 0 to 17 | Packed outputs = On |
| | See the bit structure. | Packed outputs = Off or function model ≠ 0 - Standard. |

Bit structure:

| Bit | Description | Value | Information |
|-------|---------------------------------|-------|--------------------------------------|
| 0 | ZeroCrossingInput ¹⁾ | 0 | Signal during the negative half-wave |
| | | 1 | Signal during the positive half-wave |
| 1 - 3 | Reserved | 0 | |
| 4 | ZeroCrossingStatus | 0 | No error |
| | | 1 | Zero crossover failed |
| 5 - 7 | Reserved | 0 | |

1) Value is valid if no error has occurred (ZeroCrossingStatus= 0)

9.15.14.10.7 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time | |
|-------------------------------|--------|
| Standard function model | 100 µs |
| Bus controller function model | 150 µs |

9.15.14.10.8 Minimum I/O update time

The minimum I/O update time specifies how far the bus cycle can be reduced so that an I/O update is performed in each cycle.

| Minimum I/O update time | |
|-------------------------|---------------------------------|
| Function model 0 | Equal to the minimum cycle time |
| Function model 1 | Equal to the minimum cycle time |

9.15.15 X20(c)DO4633

Data sheet version: 2.53

9.15.15.1 General information

The module is a digital output module with phase-angle control that is equipped with 4 Triac outputs using 2-line connections. The supply (L and N) is fed directly to the module.

- 4 digital outputs
- Outputs with integrated snubber circuit
- Outputs with 48 to 240 VAC
- L switching
- Zero-crossing detection
- Phase-angle control
- Open-circuit detection for each channel
- Negative half-waves can be switched off
- 50 Hz or 60 Hz
- 2-wire connections
- 240 V coding
- OSP mode
- Frequency mode

Danger!

Risk of electric shock!

The terminal block is only permitted to conduct voltage when it is connected. It is not permitted to be disconnected or connected while voltage is applied or have voltage applied to it while it is removed under any circumstances.

This module is not permitted to be the last module connected on the X2X Link network. At least one subsequent X20ZF dummy module must provide protection against contact.

9.15.15.2 Coated modules

Coated modules are X20 modules with a protective coating for the electronics component. This coating protects X20c modules from condensation and corrosive gases.

The modules' electronics are fully compatible with the corresponding X20 modules.

For simplification purposes, only images and module IDs of uncoated modules are used in this data sheet.

The coating has been certified according to the following standards:

- Condensation: BMW GS 95011-4, 2x 1 cycle
- Corrosive gas: EN 60068-2-60, method 4, exposure 21 days

9.15.15.2.1 Starting temperature

The starting temperature describes the minimum permissible ambient temperature when the power is switched off at the time the coated module is switched on. This is permitted to be as low as -40°C . During operation, the conditions as specified in the technical data continue to apply.

Information:

It is important to absolutely ensure that there is no forced cooling by air currents in a closed control cabinet, for example using a fan or ventilation slots.

9.15.15.3 Order data

| Model number | Short description | Figure |
|--------------|---|---|
| | Digital outputs |  |
| X20DO4633 | X20 digital output module, 4 triac outputs, 48 to 240 VAC, 1 A, L-switching, phase angle control, 240 V keyed | |

9.15.15.5 Status LEDs

For a description of the various operating modes, see ["Diagnostic LEDs" on page 3787](#).

| Figure | LED | Color | Status | Description |
|---|-------|-----------------------------|----------------------------|--|
|  | r | Green | Off | Module supply not connected |
| | | | Single flash | RESET mode |
| | | | Blinking | PREOPERATIONAL mode |
| | | | On | RUN mode |
| | | | Flickering (approx. 10 Hz) | Module is in OSP state |
| | e | Red | Off | Module supply not connected or everything OK |
| | | | On | Error or reset status |
| | | | Single flash | Loss of zero-crossing signal (I/O supply voltage not applied or too low) |
| | e + r | Red on / Green single flash | Invalid firmware | |
| | 1 - 4 | Orange | | Control status of the corresponding digital output |

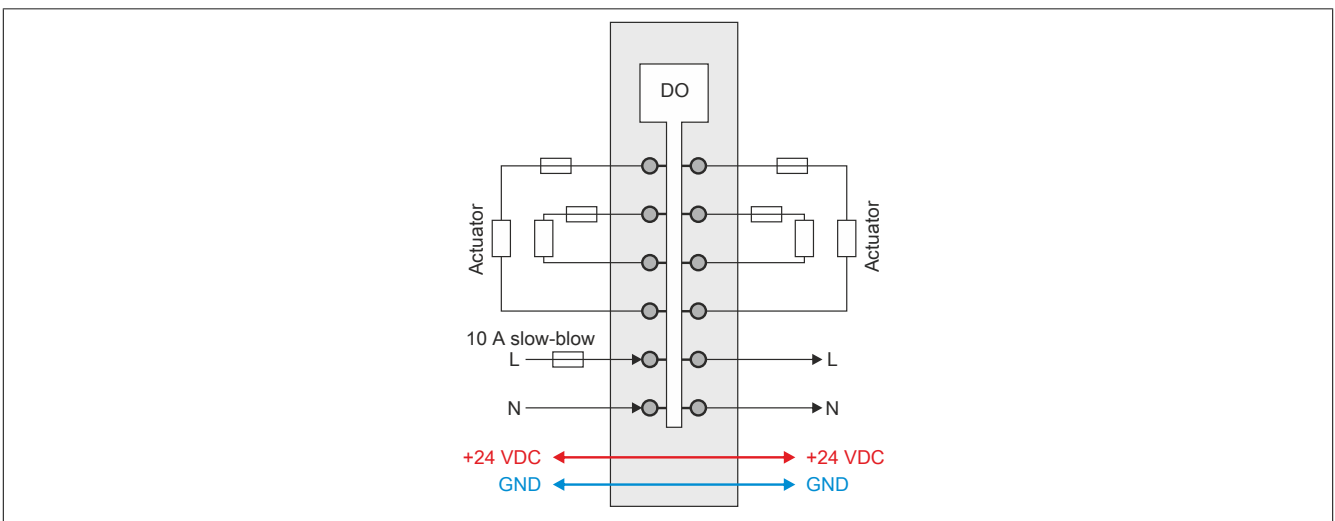

9.15.15.6 Pinout

The following points must be taken into consideration when wiring the module:

- For thermal reasons, wires with a cross-section $\geq 1.5 \text{ mm}^2$ must be used to wire the module.
- The neutral return lines for the outputs must be wired to the terminal block separately for each channel and must not be bypassed in the field.
- A line filter must be used for the 240 V supply that provides $\geq 40 \text{ dB}$ attenuation at 150 kHz and works up to 5 MHz.

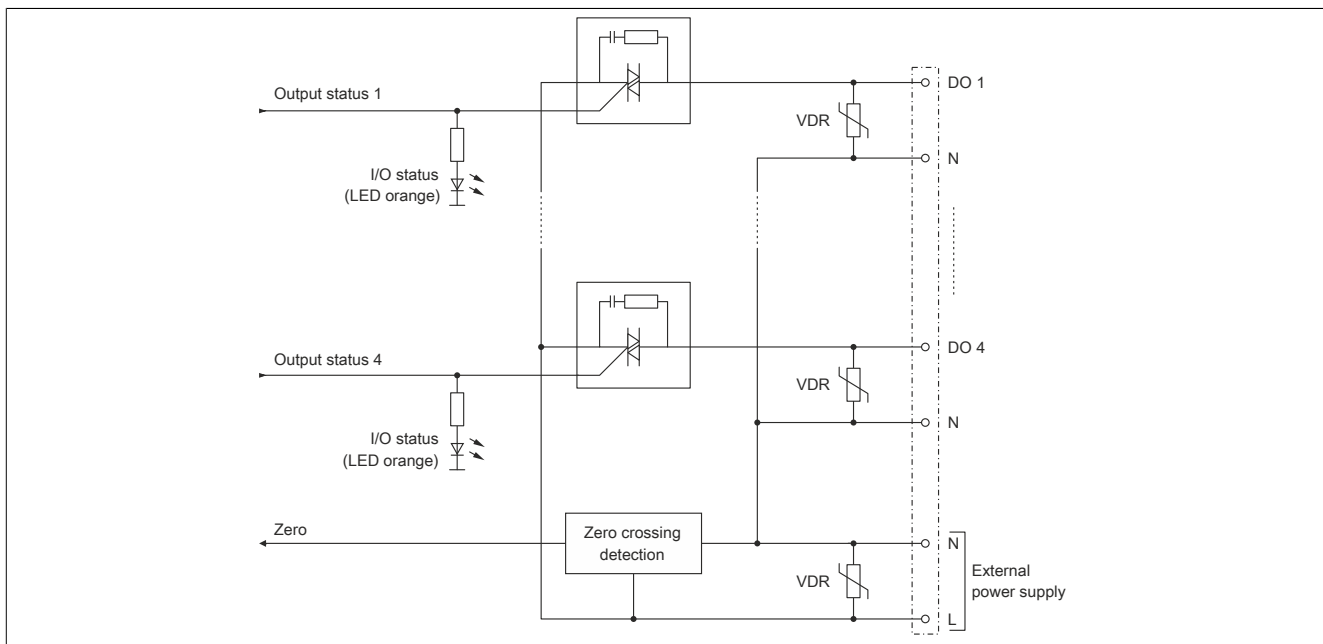

9.15.15.7 Connection example

9.15.15.8 OSP hardware requirements

In order to use OSP mode sensibly, it should be ensured that the power supply of the output module and CPU are independent of each other when the application is set up.

9.15.15.9 Output circuit diagram

9.15.15.10 External fuses

The following protective circuit must be used for safe operation:

| | Protective circuit | Value |
|------------------------|---------------------------|--|
| For the supply lines | Fuse | T 10 A |
| For the outputs | Fuse | Melting integral $I^2t \leq 36 \text{ A}^2\text{s}$ when $t_p = 10 \text{ ms}$ |
| With an inductive load | Varistor ¹⁾ | e.g. varistor with 275 V_{RMS} at 240 VAC |
| For the supply voltage | Line filter ²⁾ | Attenuation $\geq 40 \text{ dB}$ at 150 kHz, effective range up to 5 MHz |

- See also section "Operation with inductive loads" on page 1714
- Meeting the limit values specified in the standards EN 61131, EN 55011 and EN 55022 (each Class A) requires installation of a line filter in the 240 V supply line. Line filters such as the Schaffner FN 2412-8-44 can be used.
If periodic ground transients occur on the supply lines (as can occur with upstream inverters), it is necessary to use an asymmetric filter that keeps these types of changes in potential below a few volts (e.g. "Sinus Plus" from Schaffner) in addition to the symmetric filter.

9.15.15.11 Derating

The derating listed below must be applied for the current:

9.15.15.12 Operating principle

The digital output module was designed for phase control of resistive and inductive loads. The triac outputs do not have short circuit protection. The integrated open-circuit detection makes it possible to recognize defects on the load or the cabling (see "[Open line detection](#)" on page 1713).

The module is equipped with internal zero-crossing detection. Zero-crossing detection is the basis for a software PLL that generates 200 times the zero-crossing frequency. The output signal of the PLL is the base timer for the PWM outputs in both digital and analog mode.

Upon detection of lost periods or periods that are too short, control to the outputs is cut until the PLL is tuned correctly. The tuning procedure can take several seconds. In addition, the "ZeroCrossingStatus" bit is set and the error LED enabled (valid frequency range for the supply is 45 to 65 Hz).

Information:

The jitter of the output signals generated by the PLL and communication can reach 0.5%.

9.15.15.13 Open line detection

The module is equipped with open-circuit detection. Note that open-circuit detection only works when the output is enabled. An open-circuit will not be detected if the output is turned off.

In addition, open-circuit detection is restricted or doesn't work at all for inductive loads. This depends on the inductance of the load and should be determined beforehand, if necessary.

9.15.15.14 Operation with inductive loads

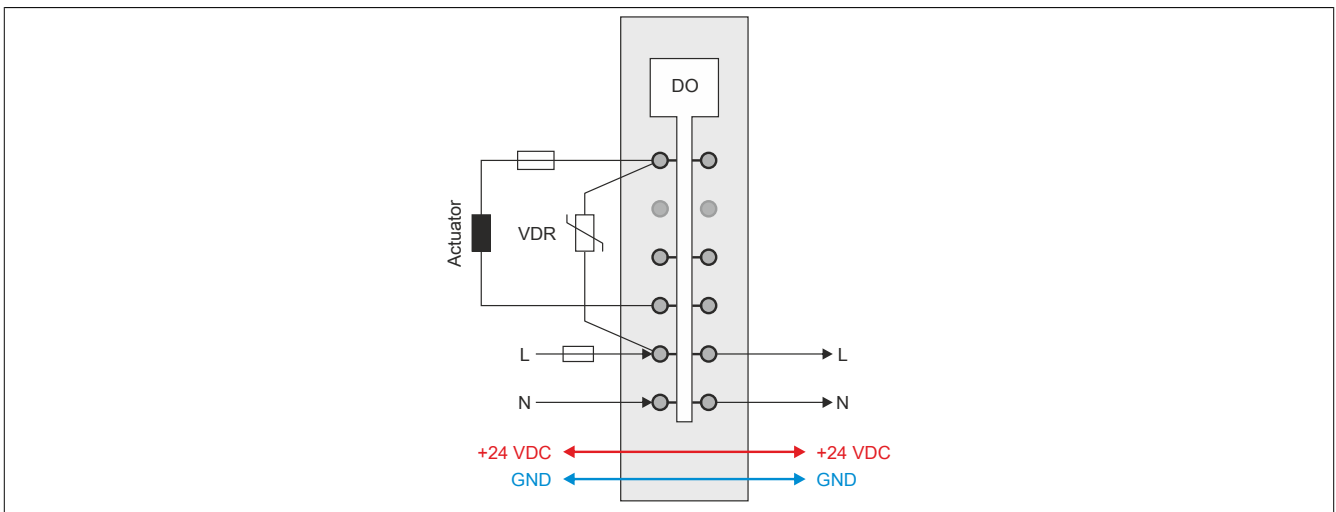

As inherent to its functional principal, the triac output is cleared when the current crosses zero. Because zero crossing for current is delayed with inductive loads, it is possible that the triac will be fired again even though it is not completely cleared at higher output values (between 50 and 100% depending on the inductance of the load). In this case, a full-wave is output. This causes the available control range (0 to 95%) to be changed.

For open line detection (LowCurrentStatus), a pause in control is required where the triac is not permitted to be fired. The full wave that is created with inductive loads causes open line detection to be triggered even though the load on the output is sufficient.

This behavior can be used to detect the full wave and properly adjust the control range (Example: If open line detection is triggered at a control value of 70%, that means that 0 to **70%** corresponds to 0 to **100%** output).

With inductive loads, a suitable varistor must be provided between the output DO x and the phase L (e.g. a varistor with 275 V_{RMS} at 240 VAC).

9.15.15.15 Register description

9.15.15.15.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section ["General data points" on page 3790](#).

9.15.15.15.2 Function model 0 - Standard and Function model 2 - Frequency mode

The only difference between function model 2 and function model 0 is the possibility of generating half-wave patterns in various frequencies. Register 18 "CfO_Frequency" is an additional register for this.

| Register | Name | Data type | Read | | Write | |
|--------------------------------|--|-----------|--------|------------|--------|------------|
| | | | Cyclic | Non-cyclic | Cyclic | Non-cyclic |
| Configuration - General | | | | | | |
| 2 + N * 2 | AnalogOutput0N (Index N = 1 to 4) | USINT | | | • | |
| 18 | CfO_Frequency | UINT | | | | • |
| 18 + N * 2 | CfO_SwitchOffValueN (Index N = 1 to 4) | USINT | | | | • |
| 28 | CfO_OutputConfig | USINT | | | | • |
| 29 | CfO_OutputTolerance | USINT | | | | • |
| Communication | | | | | | |
| 2 | DigitalOutput | USINT | | | • | |
| | DigitalOutput01 | Bit 0 | | | | |
| | ... | ... | | | | |
| | DigitalOutput04 | Bit 3 | | | | |
| 30 | StatusInput01 | USINT | • | | | |
| | LowCurrentStatus1 | Bit 0 | | | | |
| | ... | ... | | | | |
| | LowCurrentStatus4 | Bit 3 | | | | |
| | ZeroCrossingInput | Bit 4 | | | | |
| | ZeroCrossingStatus | Bit 7 | | | | |

9.15.15.15.3 Function model 1 - OSP

| Register | Name | Data type | Read | | Write | |
|--------------------------------|---|-----------|--------|------------|--------|------------|
| | | | Cyclic | Non-cyclic | Cyclic | Non-cyclic |
| Configuration - General | | | | | | |
| 2 + N * 2 | AnalogOutput0N (Index N = 1 to 4) | USINT | | | • | |
| 18 + N * 2 | CfO_SwitchOffValueN (Index N = 1 to 4) | USINT | | | | • |
| 28 | CfO_OutputConfig | USINT | | | | • |
| 29 | CfO_OutputTolerance | USINT | | | | • |
| Configuration - OSP | | | | | | |
| 34 | Enabling OPS output in the module | USINT | | | • | |
| | OSPValid | Bit 0 | | | | |
| 32 | Setting OSP mode | USINT | | | | • |
| 36 | CfgOSPValue | USINT | | | | • |
| 36 + N * 2 | CfgOSPValue0N (Index N = 1 to 4) | USINT | | | | • |
| Communication | | | | | | |
| 2 | Switching state of digital outputs 1 to 4 | USINT | | | • | |
| | DigitalOutput01 | Bit 0 | | | | |
| | ... | ... | | | | |
| | DigitalOutput04 | Bit 3 | | | | |
| 30 | Status of the outputs | USINT | • | | | |
| | LowCurrentStatus1 | Bit 0 | | | | |
| | ... | ... | | | | |
| | LowCurrentStatus4 | Bit 3 | | | | |
| | ZeroCrossingInput | Bit 4 | | | | |
| | ZeroCrossingStatus | Bit 7 | | | | |

9.15.15.15.4 Function model 254 - Bus controller

| Register | Offset ¹⁾ | Name | Data type | Read | | Write | |
|--------------------------------|----------------------|--|-----------|--------|------------|--------|------------|
| | | | | Cyclic | Non-cyclic | Cyclic | Non-cyclic |
| Configuration - General | | | | | | | |
| $2 + N * 2$ | $(N-1) * 2$ | AnalogOutput0N (Index N = 1 to 4) | USINT | | | • | |
| $18 + N * 2$ | - | CfO_SwitchOffValueN (Index N = 1 to 4) | USINT | | | | • |
| 28 | - | CfO_OutputConfig | USINT | | | | • |
| 29 | - | CfO_OutputTolerance | USINT | | | | • |
| Communication | | | | | | | |
| 30 | 0 | Status of the outputs | USINT | • | | | |
| | | LowCurrentStatus1 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | LowCurrentStatus4 | Bit 3 | | | | |
| | | ZeroCrossingInput | Bit 4 | | | | |
| | | ZeroCrossingStatus | Bit 7 | | | | |

1) The offset specifies the position of the register within the CAN object.

9.15.15.15.4.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see ["Using I/O modules on the bus controller" on page 3789](#).

9.15.15.15.4.2 CAN I/O bus controller

The module occupies 1 analog logical slot on CAN I/O.

9.15.15.15.5 General information

The digital output module was designed for phase control of resistive and inductive loads. The triac outputs do not have short circuit protection, but have open line detection that can be used to find defects in the consumer or the wiring.

The module is equipped with internal zero-crossing detection. Zero crossing detection is the basis for a software PLL that generates 200 times the zero crossing frequency. The output signal of the PLL is the base timer for the 2 PWM outputs in both digital and analog mode.

Upon detection of lost periods or periods that are too short, control of the outputs is cut until the PLL is tuned correctly (can take several seconds). In addition, the "ZeroCrossingStatus" bit is set and the Error LED is enabled (valid frequency range for the supply is 45 to 65 Hz).

Information:

The jitter of the output signals generated by the PLL and communication can reach 0.5%.

9.15.15.15.6 Digital outputs

The output state of the outputs defined as digital is transferred to the output ports of the control switch in sync with the connected power mains. The switch-on state is applied when the voltage crosses zero on the positive half-wave and the switch-off state at the zero crossing for current in each half wave.

9.15.15.15.6.1 Switching state of digital outputs 1 to 4

Name:

DigitalOutput

DigitalOutput01 to DigitalOutput04

This register is used to store the switching state of digital outputs 1 to 4.

Only function model 0 - Standard:

Setting "Packed outputs" in the Automation Studio I/O configuration determines whether all bits of this register should be applied individually as data points in the Automation Studio I/O assignment ("DigitalOutput01" to "DigitalOutput0x") or whether this register should be displayed as a single USINT data point ("DigitalOutput").

| Data type | Values | Information |
|-----------|------------------------|--|
| USINT | 0 to 15 | Packed outputs = On |
| | See the bit structure. | Packed outputs = Off or function model ≠ 0 - Standard. |

Bit structure:

| Bit | Description | Value | Information |
|-----|-----------------|-------|-------------------------|
| 0 | DigitalOutput01 | 0 | Digital output 01 reset |
| | | 1 | Digital output 01 set |
| ... | | ... | |
| 3 | DigitalOutput04 | 0 | Digital output 04 reset |
| | | 1 | Digital output 04 set |

Information:

The states in these registers are only applied when the channels are set to DIGITAL in register "[CfO_OutputConfig](#)" on page 1720.

When using setting "Packed outputs", ALL channels must be set to DIGITAL. Mixed operation is not possible.

9.15.15.15.7 Analog outputs

The output value of the outputs defined as analog outputs (unit percent) is switched through to the control ports in sync with power mains. The analog value is output to the TRIAC control port in the range between (output value > SwitchOffValue) and (output value ≤ 95%) with a resolution of 1%.

A short triac turn-on delay is required for open line detection. Therefore even with output values ≥ 96%, there is a small pause in control.

Changes to the output value are applied at the next positive half-wave

9.15.15.15.7.1 Commutation angle for analog outputs 1 - 4

Name:

AnalogOutput01 to AnalogOutput04

These registers are used to set the commutation angle for phase angle control.

Values between 0 and 100 correspond to the output value for the respective channel in percent. Values above 100 correspond to 100%.

| Data type | Value |
|-----------|----------|
| USINT | 0 to 100 |

Information:

The commutation angle for phase angle control set in these registers are only applied when the channels are set to ANALOG in register "CfO_OutputConfig" on page 1720.

9.15.15.15.8 Output configuration

9.15.15.15.8.1 Configuring the half-wave pattern

Name:

CfO_Frequency

This register can only be used in [function model 2 - Frequency mode](#) and makes it possible to configure the output of half-wave patterns in various frequencies. The [commutation angle of the outputs](#) is not affected by this. The following frequency patterns can be configured:

- 100 half-waves

- 50 half-waves

- 33 half-waves

- 25 half-waves

With multichannel operation, the different channels should be operated with delayed half-waves in order to ensure that the load is placed evenly on the module.

| Data type | Values |
|-----------|------------------------|
| UINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|---------|-------------|--------------|--|
| 0 - 3 | Channel 1 | 0000 | 100 half-waves/second |
| | | 0001 | 50 half-waves/second |
| | | 0010 | 25 half-waves/second |
| | | 0011 | 33 half-waves/second |
| | | 0101 | 50 half-waves/second delayed by 1 half-wave |
| | | 0110 | 25 half-waves/second delayed by 2 half-waves |
| | | 0111 | 33 half-waves/second delayed by 1 half-wave |
| | | 4 - 7 | Channel 2 |
| 8 - 11 | Channel 3 | 0000 to 0111 | See channel 1. |
| 12 - 15 | Channel 4 | 0000 to 0111 | See channel 1. |

Information:

This function is available beginning with firmware version 940. This can be included beginning with hardware variant 8.

9.15.15.15.8.2 Setting the switch-off time

Name:

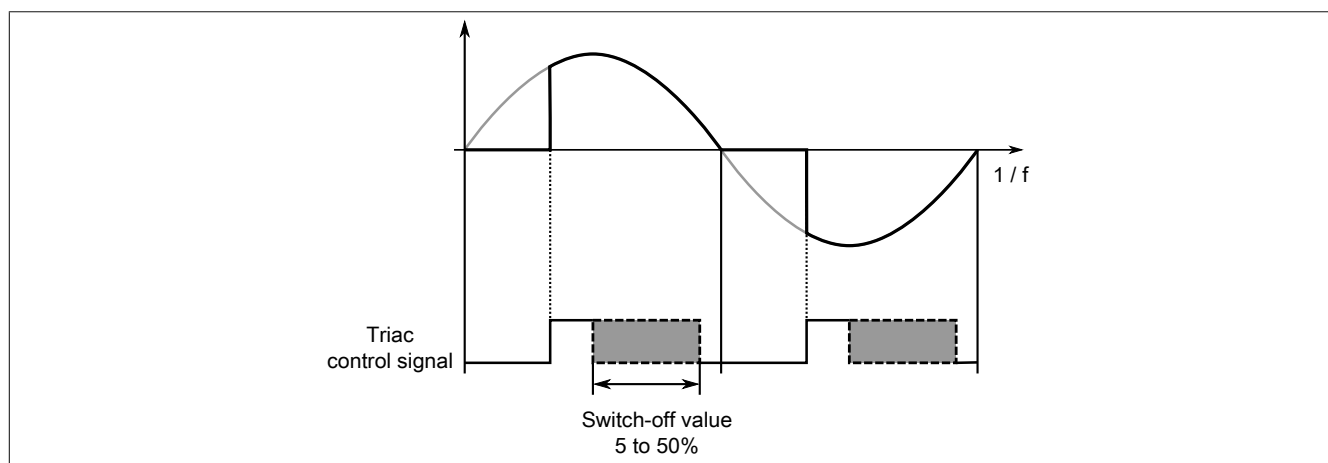

CfO_SwitchOffValue1 to CfO_SwitchOffValue4

This register defines how far in front of the zero cross-over the internal control signal for the TRIAC is switched off. Increasing this value may be necessary in order to prevent unwanted firing of the TRIAC in the event of a slight disturbance in the mains frequency.

With smaller loads, it is important to ensure that this switch off value is not set to large (too early) to prevent switching off prematurely.

The triac can of course only be fired before the set switch-off time.

"SwitchOffValue" in the Automation Studio I/O configuration.

| Data type | Value | Description |
|-----------|---------|--|
| USINT | 5 to 50 | Switch-off time in %. Bus controller default setting: 5 |

9.15.15.15.8.3 Configuration of the output channels

Name:

CfO_OutputConfig

The configuration of the output channels is stored in this register.

"Output type digital/analog" and "Output type full/half wave" in the Automation Studio I/O configuration

| Data type | Values | Bus controller default setting |
|-----------|------------------------|--------------------------------|
| USINT | See the bit structure. | 15 |

Bit structure:

| Bit | Description | Value | Information |
|-----|--|-------|---|
| 0 | Channel 1: Digital/Analog output | 0 | Output channel 1 is defined as a digital output. The output status is defined by bit 0 of register "DigitalOutput 1 - 4" on page 1717. |
| | | 1 | Output channel 1 is defined as an analog output. The output status is defined by register "AnalogOutput01" on page 1718 (bus controller default setting). |
| ... | ... | ... | ... |
| 3 | Channel 4: Digital/Analog output | 0 | Output channel 4 is defined as a digital output. The output status is defined by bit 3 of register "DigitalOutput 1 - 4" on page 1717. |
| | | 1 | Output channel 4 is defined as an analog output. The output status is defined by register "AnalogOutput04" on page 1718 (bus controller default setting). |
| 4 | Channel 1: Full-wave/Half-wave control ¹⁾ | 0 | Full-wave control on output channel 1 (bus controller default setting) |
| | | 1 | Negative half-wave on output channel 1 is suppressed. |
| ... | ... | ... | ... |
| 7 | Channel 4: Full-wave/Half-wave control ¹⁾ | 0 | Full-wave control on output channel 4 (bus controller default setting) |
| | | 1 | Negative half-wave on output channel 4 is suppressed. |

1) Not available in function model 2 - Frequency mode.

9.15.15.15.8.4 Switching behavior for zero-crossing errors

Name:

CfO_OutputTolerance

This register can be used to set the switching behavior of the trigger. After the number of zero-crossing errors configured in Bit 0 to 4, the output is switched off for at least 3 periods. This is followed by synchronization with the zero signal according to Bit 7.

| Data type | Values | Bus controller default setting |
|-----------|------------------------|--------------------------------|
| USINT | See the bit structure. | 0 |

Bit structure:

| Bit | Description | Value | Information |
|-------|--------------------|---------|--|
| 0 - 4 | Trigger for Resync | 0 to 30 | Number of zero crossing errors. Bus controller default setting: 0 |
| 5 - 6 | Reserved | - | |
| 7 | Fast settling | 0 | Quick adjustment (bus controller default setting) |
| | | 1 | PLL synchronization |

Fast synchronization

With this option, the trigger point is closed-loop controlled after each individual zero-crossover and input jitter.

- **Advantage:** Increased tolerance and faster response to deviations in mains frequency
- **Disadvantage:** Increased switch-on jitter for firing signal by zero cross signal $\pm 100 \mu\text{Sec}$

PLL synchronization

With this option the intervals between zero cross-overs are measured and the PLL frequency is updated accordingly.

- **Advantage:** Jitter-free firing signal
- **Disadvantage:** When the output is switched off, additional measurement phases are required before it can be switched back on.

Information:

This function is available starting with Firmware version 928. This can be installed with hardware version 8 and hardware revision B2 or higher.

9.15.15.15.9 Status of the outputs

Name:

LowCurrentStatus1 through LowCurrentStatus4

ZeroCrossingInput

ZeroCrossingStatus

StatusInput01

The operating status of the outputs is mapped in this register.

In order to determine the "LowCurrentStatus", the system checks if there is a neutral connection from the output via the consumer shortly before each triac firing.

Only function model 0 - Standard:

Setting "Packed outputs" in the Automation Studio I/O configuration determines whether all bits of this register should be applied individually as data points in the Automation Studio I/O assignment ("LowCurrentStatus1" to "ZeroCrossingStatus") or whether this register should be displayed as a single USINT data point ("StatusInput01").

| Data type | Value | Information |
|-----------|------------------------|--|
| USINT | 0 to 255 | Packed outputs = On |
| | See the bit structure. | Packed outputs = Off or function model ≠ 0 - Standard. |

Bit structure:

| Bit | Name | Value | Information |
|-------|--------------------|-------|---|
| 0 | LowCurrentStatus1 | 0 | Current flow on activated output 1 |
| | | 1 | No current flow on activated output 1 |
| ... | | ... | |
| 3 | LowCurrentStatus4 | 0 | Current flow on activated output 4 |
| | | 1 | No current flow on activated output 4 |
| 4 | ZeroCrossingInput | 0 | Zero cross signal during the negative half-wave |
| | | 1 | Zero cross signal during the positive half-wave |
| 5 - 6 | Reserved | - | |
| 7 | ZeroCrossingStatus | 0 | Zero cross signal OK |
| | | 1 | Zero cross signal has dropped out |

9.15.15.15.10 Function model "OSP"

In function model "OSP" (Operator Set Predefined), the user defines an analog value or digital pattern. This OSP value is output as soon as the communication between the module and master is aborted.

Functionality

The user has the choice between 2 OSP modes:

- Retain last valid value
- Replace with static value

In the first case, the module retains the last value recognized as a valid output status.

When selecting mode "Replace with static value", a plausible output value must be entered in the associated value register. When an OSP event occurs, this value is output instead of the value currently requested by the task.

9.15.15.15.10.1 Enabling OPS output in the module

Name:

OSPValid

This data point makes it possible to start the output of the module and request the use of OSP during operation.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|-------------|-------|---|
| 0 | OSPValid | 0 | Request OSP operation (after initial startup or module in stand-by) |
| | | 1 | Request normal operation |
| 1 - 7 | Reserved | 0 | |

Bit OSPValid exists once on the module and is managed by the user task. It must be set to start the enabled channels. As long as bit OSPValid remains set in the module, the module behaves the same as in function model "Standard".

If an OSP event occurs, e.g. communication between the module and master CPU aborted, then bit OSPValid is reset on the module. The module enters the OSP state and output occurs according to the configuration in register "OSPMode" on page 1723.

The following generally applies:

Even after regeneration of the communication channel, the OSP replacement value is still pending. The OSP state is only exited again when a set OSPValid bit is transferred.

When the master CPU is restarted, bit OSPValid bit is reinitialized in the master CPU. It must be set once more by the application and transferred via the bus.

In the event of brief communication errors between the module and master CPU (e.g. due to EMC), the cyclic registers fail to refresh for several bus cycles. Within the module, bit OSPValid is reset; the set bit is retained in the CPU, however. During the next successful transfer, the module-internal OSPValid bit is set again and the module automatically returns to normal operation.

If the task in the master CPU needs the information about which output mode the module is currently in, bit ModulOK can be evaluated.

Warning!

If bit OSPValid bit is reset to "0" by the module, the output status no longer depends on the responsible task in the master CPU. Nevertheless, output is made depending on the configuration of the OSP replacement value.

9.15.15.15.10.2 Setting OSP mode

Name:

CfgOSPMode

This register controls the behavior of a channel when using OSP.

| Data type | Values | Explanation |
|-----------|--------|---------------------------|
| USINT | 0 | Replace with static value |
| | 1 | Retain last valid value |

9.15.15.15.10.3 Defining an OSP-digital output value

Name:

CfgOSPValue

This register contains the digital output value that is output in "Replace with static value" mode during OSP operation.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-----|-------------|--------|--|
| 0 | | 0 or 1 | OSP output value for channel DigitalOutput00 |
| ... | | ... | |
| x | | 0 or 1 | OSP output value for channel DigitalOutput0x |

Warning!

"OSPValue" is only applied by the module if bit "OSPValid" has been set in the module.

9.15.15.15.10.4 Define the OSP analog output value

Name:

CfgOSPValue01 to CfgOSPValue04

This register contains the analog output value, which is output in "Replace with static value" mode during OSP operation.

| Data type | Value |
|-----------|----------|
| USINT | 0 to 100 |

Warning!

"OSPValue" is only applied by the module if bit "OSPValid" has been set in the module.

9.15.15.15.11 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time | |
|--------------------|--------|
| All channels | 250 µs |

9.15.15.15.12 Minimum I/O update time

The minimum I/O update time specifies how far the bus cycle can be reduced so that an I/O update is performed in each cycle.

| Minimum I/O update time | |
|-------------------------|--------|
| All channels | 150 µs |

9.15.16 X20(c)DO4649

Data sheet version: 2.28

9.15.16.1 General information

The module is equipped with 4 relay outputs.

- 4 digital outputs
- Relay module for 240 VAC / 30 VDC
- 4 normally open contacts
- Single-channel isolated outputs

Danger!

Risk of electric shock!

The terminal block is only permitted to conduct voltage when it is connected. It is not permitted to be disconnected or connected while voltage is applied or have voltage applied to it while it is removed under any circumstances.

This module is not permitted to be the last module connected on the X2X Link network. At least one subsequent X20ZF dummy module must provide protection against contact.

Danger!

The voltage classes on the terminal block must not be mixed! Only operation at mains voltage (e.g. 230 VAC) OR safety extra-low voltage (e.g. 24 VDC SELV) is permitted.

9.15.16.2 Coated modules

Coated modules are X20 modules with a protective coating for the electronics component. This coating protects X20c modules from condensation and corrosive gases.

The modules' electronics are fully compatible with the corresponding X20 modules.

For simplification purposes, only images and module IDs of uncoated modules are used in this data sheet.

The coating has been certified according to the following standards:

- Condensation: BMW GS 95011-4, 2x 1 cycle
- Corrosive gas: EN 60068-2-60, method 4, exposure 21 days

9.15.16.2.1 -40°C starting temperature

The starting temperature describes the minimum permissible ambient temperature when the power is switched off at the time the coated module is switched on. This is permitted to be as low as -40°C. During operation, the conditions as specified in the technical data continue to apply.

Information:

It is important to absolutely ensure that there is no forced cooling by air currents in a closed control cabinet, for example using a fan or ventilation slots.

9.15.16.3 Order data

| Model number | Short description | Figure |
|--------------|---|---|
| | Digital outputs |  |

- 2) With a resistive load. See also section "Electrical service life"

9.15.16.5 Status LEDs

For a description of the various operating modes, see ["Diagnostic LEDs" on page 3787](#).

| Figure | LED | Color | Status | Description | |
|---|-------|-------|-----------------------------|--|---|
|  | r | Green | Off | Module supply not connected | |
| | | | Single flash | RESET mode | |
| | | | Blinking | PREOPERATIONAL mode | |
| | | | On | RUN mode | |
| | e | Red | Off | Module supply not connected or everything OK | |
| | | | On | Error or reset status | |
| | e + r | | Red on / Green single flash | Invalid firmware | |
| | 1 - 4 | | Orange | | Output status of the corresponding digital output |

9.15.16.6 Pinout

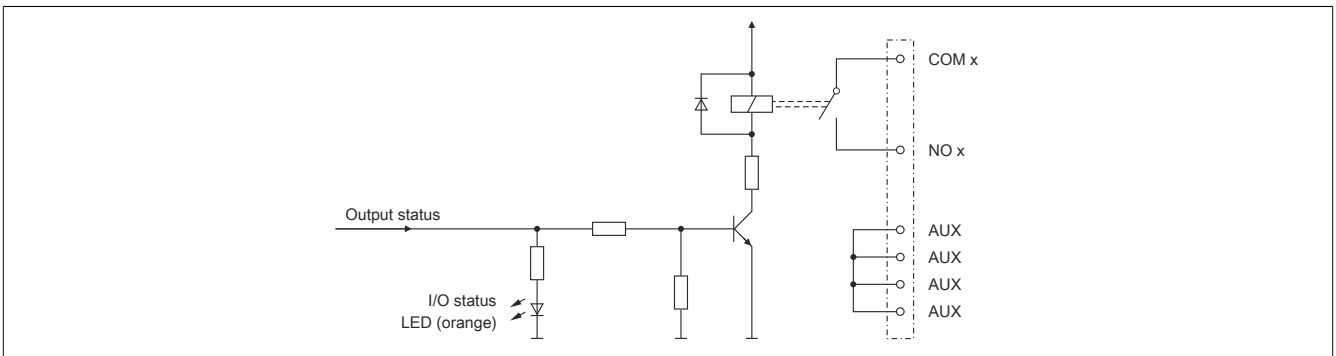

For easy wiring, 4 auxiliary contacts are available on the module starting with revision E0. They are connected together internally and can be loaded with a total of 10 A (see also section "Connection example" on page 1728).

9.15.16.7 Connection example

9.15.16.8 Output circuit diagram

9.15.16.9 Electrical service life

9.15.16.10 Derating

There is no derating when operated below 55°C.

When operating above 55°C, the maximum current per channel is reduced to 4 A and the maximum summation current to 8 A!

9.15.16.11 Register description

9.15.16.11.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section ["General data points" on page 3790](#).

9.15.16.11.2 Function model 0 - Standard

| Register | Fixed offset | Name | Data type | Read | | Write | |
|----------|--------------|-----------------|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| 2 | 0 | DigitalOutput | USINT | | | • | |
| | | DigitalOutput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | DigitalOutput04 | Bit 3 | | | | |

Fixed modules require their data points to be in a specific order in the X2X frame. Cyclic access occurs according to a predefined offset, not based on the register address.

Acyclic access continues to be based on the register numbers.

9.15.16.11.3 Function model 254 - Bus controller

| Register | Offset ¹⁾ | Name | Data type | Read | | Write | |
|----------|----------------------|---|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| 2 | 0 | Switching state of digital outputs 1 to 4 | USINT | | | • | |
| | | DigitalOutput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | DigitalOutput04 | Bit 3 | | | | |

1) The offset specifies the position of the register within the CAN object.

9.15.16.11.3.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see ["Using I/O modules on the bus controller" on page 3789](#).

9.15.16.11.3.2 CAN I/O bus controller

The module occupies 1 digital logical slot on CAN I/O.

9.15.16.11.4 Digital outputs

The output state is transferred to the output channels with a fixed offset (<60 μ s) based on the network cycle (SyncOut).

9.15.16.11.4.1 Switching state of digital outputs 1 to 4

Name:

DigitalOutput

DigitalOutput01 to DigitalOutput04

This register is used to store the switching state of digital outputs 1 to 4.

Only function model 0 - Standard:

Setting "Packed outputs" in the Automation Studio I/O configuration determines whether all bits of this register should be applied individually as data points in the Automation Studio I/O assignment ("DigitalOutput01" to "DigitalOutput0x") or whether this register should be displayed as a single USINT data point ("DigitalOutput").

| Data type | Values | Information |
|-----------|------------------------|---|
| USINT | 0 to 15 | Packed outputs = On |
| | See the bit structure. | Packed outputs = Off or function model \neq 0 - Standard. |

Bit structure:

| Bit | Description | Value | Information |
|-----|-----------------|-------|-------------------------|
| 0 | DigitalOutput01 | 0 | Digital output 01 reset |
| | | 1 | Digital output 01 set |
| ... | | ... | |
| 3 | DigitalOutput04 | 0 | Digital output 04 reset |
| | | 1 | Digital output 04 set |

9.15.16.11.5 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time |
|--------------------|
| 100 μ s |

9.15.16.11.6 Minimum I/O update time

The minimum I/O update time specifies how far the bus cycle can be reduced so that an I/O update is performed in each cycle.

| Minimum I/O update time |
|---------------------------------|
| Equal to the minimum cycle time |

9.15.17 X2DO4F49

Data sheet version: 1.05

9.15.17.1 General information

This module is equipped with 4 relay outputs. It can switch DC voltages up to 250 VDC and is therefore suitable for use in power generation systems.

- 4 digital outputs
- Relay module for 250 VDC / 240 VAC
- 2 normally open contacts and 2 changeover contacts
- Single-channel isolated outputs

Danger!

Risk of electric shock!

The terminal block is only permitted to conduct voltage when it is connected. It is not permitted to be disconnected or connected while voltage is applied or have voltage applied to it while it is removed under any circumstances.

This module is not permitted to be the last module connected on the X2X Link network. At least one subsequent X20ZF dummy module must provide protection against contact.

Danger!

The voltage classes on the terminal block must not be mixed! Only operation at mains voltage (e.g. 230 VAC) OR safety extra-low voltage (e.g. 24 VDC SELV) is permitted.

9.15.17.2 Order data

| Model number | Short description | Figure |

9.15.17.8 Electrical service life

The diagram shows the number of switching cycles based on current at 240 VAC and with resistive load.

9.15.17.9 Register description

9.15.17.9.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section ["General data points" on page 3790](#).

9.15.17.9.2 Function model 0 - Standard

| Register | Fixed offset | Name | Data type | Read | | Write | |
|----------|--------------|-----------------|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| 2 | 0 | DigitalOutput | USINT | | | • | |
| | | DigitalOutput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | DigitalOutput04 | Bit 3 | | | | |

Fixed modules require their data points to be in a specific order in the X2X frame. Cyclic access occurs according to a predefined offset, not based on the register address.

Acyclic access continues to be based on the register numbers.

9.15.17.9.3 Function model 254 - Bus controller

| Register | Offset ¹⁾ | Name | Data type | Read | | Write | |
|----------|----------------------|---|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| 2 | 0 | Switching state of digital outputs 1 to 4 | USINT | | | • | |
| | | DigitalOutput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | DigitalOutput04 | Bit 3 | | | | |

1) The offset specifies the position of the register within the CAN object.

9.15.17.9.3.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see ["Using I/O modules on the bus controller" on page 3789](#).

9.15.17.9.3.2 CAN I/O bus controller

The module occupies 1 digital logical slot on CAN I/O.

9.15.17.9.4 Digital outputs

The output state is transferred to the output channels with a fixed offset (<60 μ s) based on the network cycle (SyncOut).

9.15.17.9.4.1 Switching state of digital outputs 1 to 4

Name:

DigitalOutput

DigitalOutput01 to DigitalOutput04

This register is used to store the switching state of digital outputs 1 to 4.

Only function model 0 - Standard:

Setting "Packed outputs" in the Automation Studio I/O configuration determines whether all bits of this register should be applied individually as data points in the Automation Studio I/O assignment ("DigitalOutput01" to "DigitalOutput0x") or whether this register should be displayed as a single USINT data point ("DigitalOutput").

| Data type | Values | Information |
|-----------|------------------------|---|
| USINT | 0 to 15 | Packed outputs = On |
| | See the bit structure. | Packed outputs = Off or function model \neq 0 - Standard. |

Bit structure:

| Bit | Description | Value | Information |
|-----|-----------------|-------|-------------------------|
| 0 | DigitalOutput01 | 0 | Digital output 01 reset |
| | | 1 | Digital output 01 set |
| ... | | ... | |
| 3 | DigitalOutput04 | 0 | Digital output 04 reset |
| | | 1 | Digital output 04 set |

9.15.17.9.5 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time |
|--------------------|
| 250 μ s |

9.15.17.9.6 Minimum I/O update time

The minimum I/O update time specifies how far the bus cycle can be reduced so that an I/O update is performed in each cycle.

| Minimum I/O update time |
|---------------------------------|
| Equal to the minimum cycle time |

9.15.18 X20(c)DO6321

Data sheet version: 3.27

9.15.18.1 General information

The module is equipped with 6 outputs for 1 or 2-wire connections. The X20 6-pin terminal block can be used for universal 1-line wiring. 2-line wiring can be implemented using the 12-pin terminal block. The X20DO6321 is designed for sink output wiring.

- 6 digital outputs
- Sink connection
- 2-wire connections
- 24 VDC for signal supply
- Integrated output protection
- 1-wire connection type with 6-pin terminal block

9.15.18.2 Coated modules

Coated modules are X20 modules with a protective coating for the electronics component. This coating protects X20c modules from condensation and corrosive gases.

The modules' electronics are fully compatible with the corresponding X20 modules.

For simplification purposes, only images and module IDs of uncoated modules are used in this data sheet.

The coating has been certified according to the following standards:

- Condensation: BMW GS 95011-4, 2x 1 cycle
- Corrosive gas: EN 60068-2-60, method 4, exposure 21 days

9.15.18.2.1 Starting temperature

The starting temperature describes the minimum permissible ambient temperature when the power is switched off at the time the coated module is switched on. This is permitted to be as low as -40°C . During operation, the conditions as specified in the technical data continue to apply.

Information:

It is important to absolutely ensure that there is no forced cooling by air currents in a closed control cabinet, for example using a fan or ventilation slots.

9.15.18.7 Connection example

9.15.18.8 Output circuit diagram

9.15.18.9 Switching inductive loads

Environmental temperature: 60°C, all outputs with the same load

Information:

If the maximum number of operating cycles per second is exceeded, an external inverse diode must be used.

Operating conditions outside of the area in the diagram are not permitted!

9.15.18.10 Register description

9.15.18.10.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section ["General data points" on page 3790](#).

9.15.18.10.2 Function model 0 - Standard

| Register | Fixed offset | Name | Data type | Read | | Write | |
|----------|--------------|-----------------------|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| 2 | 0 | DigitalOutput | USINT | | | • | |
| | | DigitalOutput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | DigitalOutput06 | Bit 5 | | | | |
| 30 | 1 | StatusInput01 | USINT | • | | | |
| | | StatusDigitalOutput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | StatusDigitalOutput06 | Bit 5 | | | | |

Fixed modules require their data points to be in a specific order in the X2X frame. Cyclic access occurs according to a predefined offset, not based on the register address.

Acyclic access continues to be based on the register numbers.

9.15.18.10.3 Function model 254 - Bus Controller

| Register | Offset ¹⁾ | Name | Data type | Read | | Write | |
|----------|----------------------|---|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| 2 | 0 | Switching state of digital outputs 1 to 6 | USINT | | | • | |
| | | DigitalOutput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | DigitalOutput06 | Bit 5 | | | | |
| 30 | - | Status of digital outputs 1 to 6 | USINT | | • | | |
| | | StatusDigitalOutput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | StatusDigitalOutput06 | Bit 5 | | | | |

1) The offset specifies where the register is within the CAN object.

9.15.18.10.3.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see ["Using I/O modules on the bus controller" on page 3789](#).

9.15.18.10.3.2 CAN I/O bus controller

The module occupies 1 digital logical slot on CAN I/O.

9.15.18.10.4 Digital outputs

The output state is transferred to the output channels with a fixed offset (<60 µs) based on the network cycle (SyncOut).

9.15.18.10.4.1 Switching state of digital outputs 1 to 6

Name:

DigitalOutput

DigitalOutput01 to DigitalOutput06

The switching state of digital outputs 1 to 6 are stored in this register.

Only function model 0 - Standard:

Setting "Packed outputs" in the Automation Studio I/O configuration determines whether all bits of this register should be applied individually as data points in the Automation Studio I/O assignment ("DigitalOutput01" to "DigitalOutput0x") or whether this register should be displayed as a single USINT data point ("DigitalOutput").

| Data type | Values | Information |
|-----------|--------------------|--|
| USINT | 0 to 63 | Packed outputs = On |
| | See bit structure. | Packed outputs = Off or Function model <> 0 - Standard |

Bit structure:

| Bit | Name | Value | Information |
|-----|-----------------|-------|-------------------------|
| 0 | DigitalOutput01 | 0 | Digital output 01 reset |
| | | 1 | Digital output 01 set |
| ... | | ... | |
| 5 | DigitalOutput06 | 0 | Digital output 06 reset |
| | | 1 | Digital output 06 set |

9.15.18.10.5 Monitoring status of the digital outputs

On the module, the output states of the outputs are compared to the target states. The control of the output driver is used for the target state.

A change in the output state resets monitoring for that output. The status of each individual channel can be read. A change in the monitoring status is actively transmitted as an error message.

9.15.18.10.5.1 Status of digital outputs 1 to 6

Name:

StatusInput01

StatusDigitalOutput01 to StatusDigitalOutput06

The status of digital outputs 1 to 6 is mapped in this register.

Only function model 0 - Standard:

Setting "Packed outputs" in the Automation Studio I/O configuration determines whether all bits of this register should be applied individually as data points in the Automation Studio I/O assignment ("StatusDigitalOutput01" to "StatusDigitalOutput0x") or whether this register should be displayed as a single USINT data point ("StatusInput01").

| Data type | Values | Information |
|-----------|--------------------|--|
| USINT | 0 to 63 | Packed outputs = On |
| | See bit structure. | Packed outputs = Off or Function model <> 0 - Standard |

Bit structure:

| Bit | Name | Value | Information |
|-----|-----------------------|-------|---|
| 0 | StatusDigitalOutput01 | 0 | Channel 01: No error |
| | | 1 | Channel 01: <ul style="list-style-type: none"> Short circuit or overload Channel switched on and missing I/O power supply Channel switched off and external voltage applied on channel |
| ... | | ... | |
| 5 | StatusDigitalOutput06 | 0 | Channel 06: No error |
| | | 1 | Channel 06: For an error description, see channel 01. |

9.15.18.10.6 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time |
|--------------------|
| 100 μ s |

9.15.18.10.7 Minimum I/O update time

The minimum I/O update time specifies how far the bus cycle can be reduced so that an I/O update is performed in each cycle.

| Minimum I/O update time |
|---------------------------------|
| Equal to the minimum cycle time |

9.15.19 X20(c)DO6322

Data sheet version: 3.27

9.15.19.1 General information

The module is equipped with 6 outputs for 1 or 2-wire connections. The X20 6-pin terminal block can be used for universal 1-line wiring. 2-line wiring can be implemented using the 12-pin terminal block. The module is designed for source output wiring.

- 6 digital outputs
- Source connection
- 2-wire connections
- GND for signal supply
- Integrated output protection
- 1-wire connection type with 6-pin terminal block
- OSP mode

9.15.19.2 Coated modules

Coated modules are X20 modules with a protective coating for the electronics component. This coating protects X20c modules from condensation and corrosive gases.

The modules' electronics are fully compatible with the corresponding X20 modules.

For simplification purposes, only images and module IDs of uncoated modules are used in this data sheet.

The coating has been certified according to the following standards:

- Condensation: BMW GS 95011-4, 2x 1 cycle
- Corrosive gas: EN 60068-2-60, method 4, exposure 21 days

9.15.19.2.1 Starting temperature

The starting temperature describes the minimum permissible ambient temperature when the power is switched off at the time the coated module is switched on. This is permitted to be as low as -40°C . During operation, the conditions as specified in the technical data continue to apply.

Information:

It is important to absolutely ensure that there is no forced cooling by air currents in a closed control cabinet, for example using a fan or ventilation slots.

9.15.19.3 Order data

| Model number | Short description | Figure |
|--------------|---|---|

9.15.19.5 Status LEDs

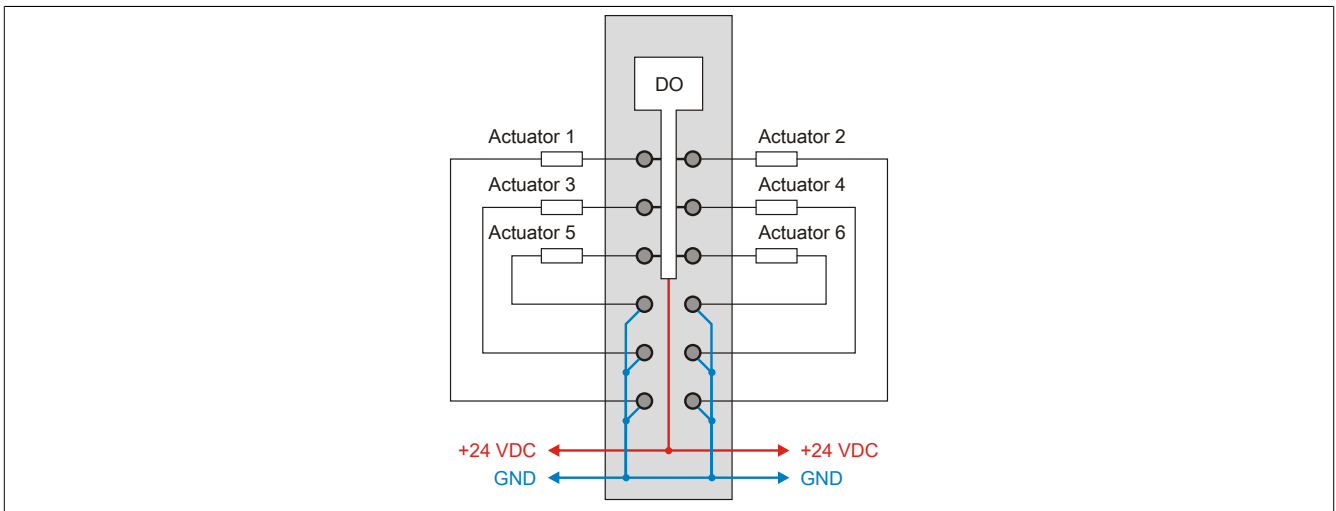

For a description of the various operating modes, see ["Diagnostic LEDs" on page 3787](#).

| Figure | LED | Color | Status | Description | |
|--|-------|-------|-----------------------------|---|---|
|  | r | Green | Off | Module supply not connected | |
| | | | Single flash | RESET mode | |
| | | | Blinking | PREOPERATIONAL mode | |
| | | | On | RUN mode | |
| | | | Flickering (approx. 10 Hz) | The module is in the OSP state. | |
| | e | Red | Off | Module supply not connected or everything OK | |
| | | | Single flash | Warning/Error on an I/O channel. Level monitoring for digital outputs has been triggered. | |
| | e + r | | Red on / Green single flash | Invalid firmware | |
| | 1 - 6 | | Orange | | Output status of the corresponding digital output |

9.15.19.6 Pinout

9.15.19.7 Connection example

Caution!

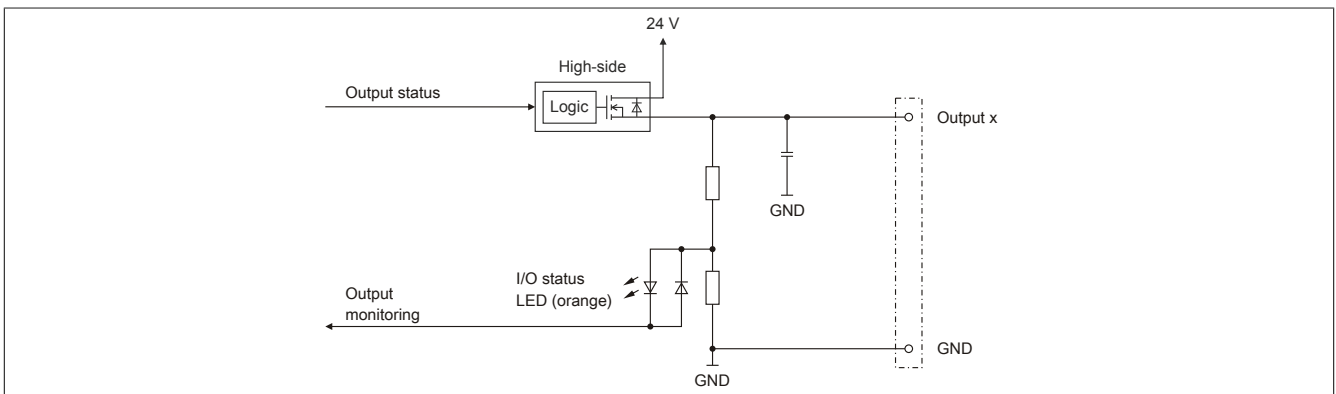

If the module is operated outside specifications, the output current may rise above the maximum permissible nominal current. This applies both to individual channels and to the summation current of the module.

Appropriate cable cross-sections or external safety measures must therefore be provided.

9.15.19.8 OSP hardware requirements

In order to use OSP mode sensibly, it should be ensured that the power supply of the output module and CPU are independent of each other when the application is set up.

9.15.19.9 Output circuit diagram

9.15.19.10 Switching inductive loads

Ambient temperature: 60°C, all outputs with the same load

Information:

If the maximum number of operating cycles per second is exceeded, an external inverse diode must be used.

Operating conditions outside of the area in the diagram are not permitted!

9.15.19.11 Register description

9.15.19.11.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section ["General data points" on page 3790](#).

9.15.19.11.2 Function model 0 - Standard

| Register | Fixed offset | Name | Data type | Read | | Write | |
|----------|--------------|-----------------------|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| 2 | 0 | DigitalOutput | USINT | | | • | |
| | | DigitalOutput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | DigitalOutput06 | Bit 5 | | | | |
| 30 | 1 | StatusInput01 | USINT | • | | | |
| | | StatusDigitalOutput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | StatusDigitalOutput06 | Bit 5 | | | | |

Fixed modules require their data points to be in a specific order in the X2X frame. Cyclic access occurs according to a predefined offset, not based on the register address.

Acyclic access continues to be based on the register numbers.

9.15.19.11.3 Function model 1 - OSP

| Register | Fixed offset | Name | Data type | Read | | Write | |
|----------|--------------|---|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| 2 | 0 | Switching state of digital outputs 1 to 6 | USINT | | | • | |
| | | DigitalOutput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | DigitalOutput06 | Bit 5 | | | | |
| 30 | 1 | Status of digital outputs 1 to 6 | USINT | | • | | |
| | | StatusDigitalOutput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | StatusDigitalOutput06 | Bit 5 | | | | |
| 34 | 1 | Enabling OPS output in the module | USINT | | | • | |
| | | OSPValid | Bit 0 | | | | |
| 32 | - | CfgOSPMODE | USINT | | | | • |
| 36 | - | CfgOSPValue | USINT | | | | • |

Fixed modules require their data points to be in a specific order in the X2X frame. Cyclic access occurs according to a predefined offset, not based on the register address.

Acyclic access continues to be based on the register numbers.

9.15.19.11.4 Function model 254 - Bus Controller

| Register | Offset ¹⁾ | Name | Data type | Read | | Write | |
|----------|----------------------|---|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| 2 | 0 | Switching state of digital outputs 1 to 6 | USINT | | | • | |
| | | DigitalOutput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | DigitalOutput06 | Bit 5 | | | | |
| 30 | - | Status of digital outputs 1 to 6 | USINT | | • | | |
| | | StatusDigitalOutput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | StatusDigitalOutput06 | Bit 5 | | | | |

1) The offset specifies where the register is within the CAN object.

9.15.19.11.4.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see ["Using I/O modules on the bus controller" on page 3789](#).

9.15.19.11.4.2 CAN I/O bus controller

The module occupies 1 digital logical slot on CAN I/O.

9.15.19.11.5 Digital outputs

The output state is transferred to the output channels with a fixed offset (<60 µs) based on the network cycle (SyncOut).

9.15.19.11.5.1 Switching state of digital outputs 1 to 6

Name:

DigitalOutput

DigitalOutput01 to DigitalOutput06

The switching state of digital outputs 1 to 6 are stored in this register.

Only function model 0 - Standard:

Setting "Packed outputs" in the Automation Studio I/O configuration determines whether all bits of this register should be applied individually as data points in the Automation Studio I/O assignment ("DigitalOutput01" to "DigitalOutput0x") or whether this register should be displayed as a single USINT data point ("DigitalOutput").

| Data type | Values | Information |
|-----------|--------------------|--|
| USINT | 0 to 63 | Packed outputs = On |
| | See bit structure. | Packed outputs = Off or Function model <> 0 - Standard |

Bit structure:

| Bit | Name | Value | Information |
|-----|-----------------|-------|-------------------------|
| 0 | DigitalOutput01 | 0 | Digital output 01 reset |
| | | 1 | Digital output 01 set |
| ... | | ... | |
| 5 | DigitalOutput06 | 0 | Digital output 06 reset |
| | | 1 | Digital output 06 set |

9.15.19.11.6 Monitoring status of the digital outputs

On the module, the output states of the outputs are compared to the target states. The control of the output driver is used for the target state.

A change in the output state resets monitoring for that output. The status of each individual channel can be read. A change in the monitoring status is actively transmitted as an error message.

9.15.19.11.6.1 Status of digital outputs 1 to 6

Name:

StatusInput01

StatusDigitalOutput01 to StatusDigitalOutput06

The status of digital outputs 1 to 6 is mapped in this register.

Only function model 0 - Standard:

Setting "Packed outputs" in the Automation Studio I/O configuration determines whether all bits of this register should be applied individually as data points in the Automation Studio I/O assignment ("StatusDigitalOutput01" to "StatusDigitalOutput0x") or whether this register should be displayed as a single USINT data point ("StatusInput01").

| Data type | Values | Information |
|-----------|--------------------|--|
| USINT | 0 to 63 | Packed outputs = On |
| | See bit structure. | Packed outputs = Off or Function model <> 0 - Standard |

Bit structure:

| Bit | Name | Value | Information |
|-----|-----------------------|-------|---|
| 0 | StatusDigitalOutput01 | 0 | Channel 01: No error |
| | | 1 | Channel 01: <ul style="list-style-type: none"> Short circuit or overload Channel switched on and missing I/O power supply Channel switched off and external voltage applied on channel |
| ... | | ... | |
| 5 | StatusDigitalOutput06 | 0 | Channel 06: No error |
| | | 1 | Channel 06: For an error description, see channel 01. |

9.15.19.11.7 Function model "OSP"

In function model "OSP" (Operator Set Predefined), the user defines an analog value or digital pattern. This OSP value is output as soon as the communication between the module and master is aborted.

Functionality

The user has the choice between 2 OSP modes:

- Retain last valid value
- Replace with static value

In the first case, the module retains the last value recognized as a valid output status.

When selecting mode "Replace with static value", a plausible output value must be entered in the associated value register. When an OSP event occurs, this value is output instead of the value currently requested by the task.

9.15.19.11.7.1 Enabling OPS output in the module

Name:

OSPValid

This data point makes it possible to start the output of the module and request the use of OSP during operation.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|-------------|-------|---|
| 0 | OSPValid | 0 | Request OSP operation (after initial startup or module in stand-by) |
| | | 1 | Request normal operation |
| 1 - 7 | Reserved | 0 | |

Bit OSPValid exists once on the module and is managed by the user task. It must be set to start the enabled channels. As long as bit OSPValid remains set in the module, the module behaves the same as in function model "Standard".

If an OSP event occurs, e.g. communication between the module and master CPU aborted, then bit OSPValid is reset on the module. The module enters the OSP state and output occurs according to the configuration in register "OSPMode" on page 1754.

The following generally applies:

Even after regeneration of the communication channel, the OSP replacement value is still pending. The OSP state is only exited again when a set OSPValid bit is transferred.

When the master CPU is restarted, bit OSPValid bit is reinitialized in the master CPU. It must be set once more by the application and transferred via the bus.

In the event of brief communication errors between the module and master CPU (e.g. due to EMC), the cyclic registers fail to refresh for several bus cycles. Within the module, bit OSPValid is reset; the set bit is retained in the CPU, however. During the next successful transfer, the module-internal OSPValid bit is set again and the module automatically returns to normal operation.

If the task in the master CPU needs the information about which output mode the module is currently in, bit ModulOK can be evaluated.

Warning!

If bit OSPValid bit is reset to "0" by the module, the output status no longer depends on the responsible task in the master CPU. Nevertheless, output is made depending on the configuration of the OSP replacement value.

9.15.19.11.7.2 Setting OSP mode

Name:

CfgOSPMode

This register controls the behavior of a channel when using OSP.

| Data type | Values | Explanation |
|-----------|--------|---------------------------|
| USINT | 0 | Replace with static value |
| | 1 | Retain last valid value |

9.15.19.11.7.3 Defining an OSP-digital output value

Name:

CfgOSPValue

This register contains the digital output value that is output in "Replace with static value" mode during OSP operation.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-----|-------------|--------|--|
| 0 | | 0 or 1 | OSP output value for channel DigitalOutput00 |
| ... | | ... | |
| x | | 0 or 1 | OSP output value for channel DigitalOutput0x |

Warning!**"OSPValue" is only applied by the module if bit "OSPValid" has been set in the module.****9.15.19.11.8 Minimum cycle time**

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time |
|--------------------|
| 100 µs |

9.15.19.11.9 Minimum I/O update time

The minimum I/O update time specifies how far the bus cycle can be reduced so that an I/O update is performed in each cycle.

| Minimum I/O update time |
|---------------------------------|
| Equal to the minimum cycle time |

9.15.20 X20DO6325

Data sheet version: 1.21

9.15.20.1 General information

The module is equipped with six outputs for 1 or 2-wire connections with diagnostic functions. The X20 6-pin terminal block can be used for universal 1-line wiring. Two-line wiring can be implemented using the 12-pin terminal block. The outputs on the module are designed for source connections.

- 6 digital outputs
- Source connection
- 2-wire connections
- GND for signal supply
- Integrated output protection
- 1-wire connection type with 6-pin terminal block
- Diagnostic functions (open line, short circuit and overload/overtemperature)
- OSP mode

9.15.20.4 LED status indicators

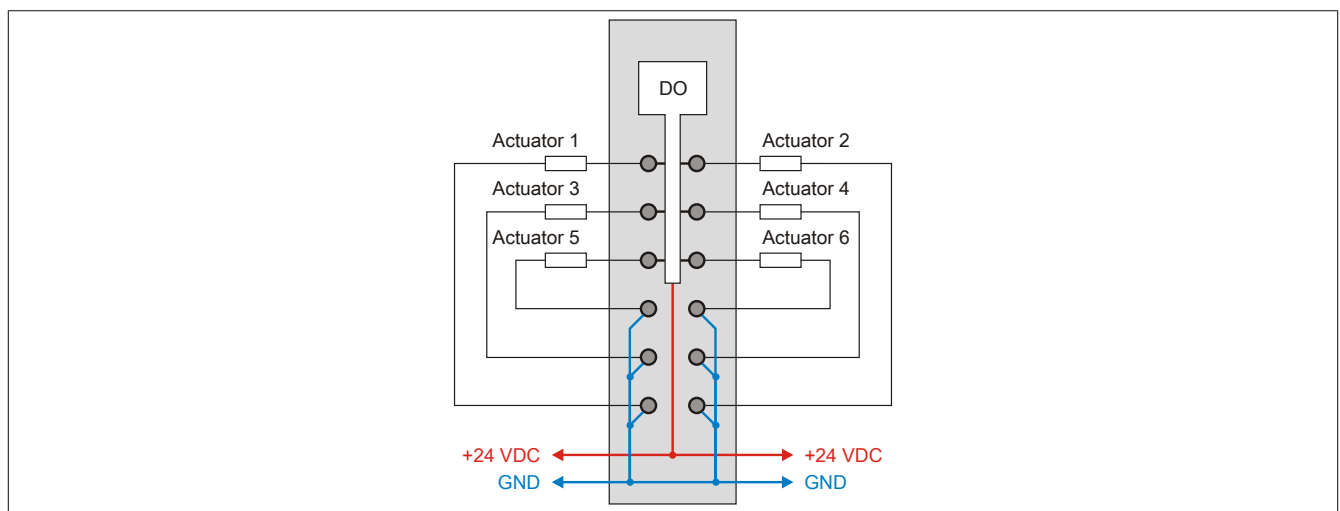

For a description of the various operating modes, see "[Diagnostic LEDs](#)" on page 3787.

| Figure | LED | Color | Status | Description |
|---|---------------|-------|-----------------------------|---|
|  | r | Green | Off | No power to module |
| | | | Single flash | RESET mode |
| | | | Blinking | PREOPERATIONAL mode |
| | | | On | RUN mode |
| | | | Flickering (approx. 10 Hz) | Module is in OSP mode |
| | e | Red | Off | No power to module or everything OK |
| | | | Single flash | Warning/Error on an I/O channel. Level monitoring for digital outputs has been triggered. |
| | | | Double flash | I/O supply is outside valid range. |
| | e + r | | Red on / Green single flash | Invalid firmware |
| | Channel 1 - 6 | | Orange | |
| Diagnostics 1 - 6 | | Red | | Monitoring of the corresponding digital output was tripped (short circuit, open line or overload) |

9.15.20.5 Pinout

9.15.20.6 Connection example

Caution!

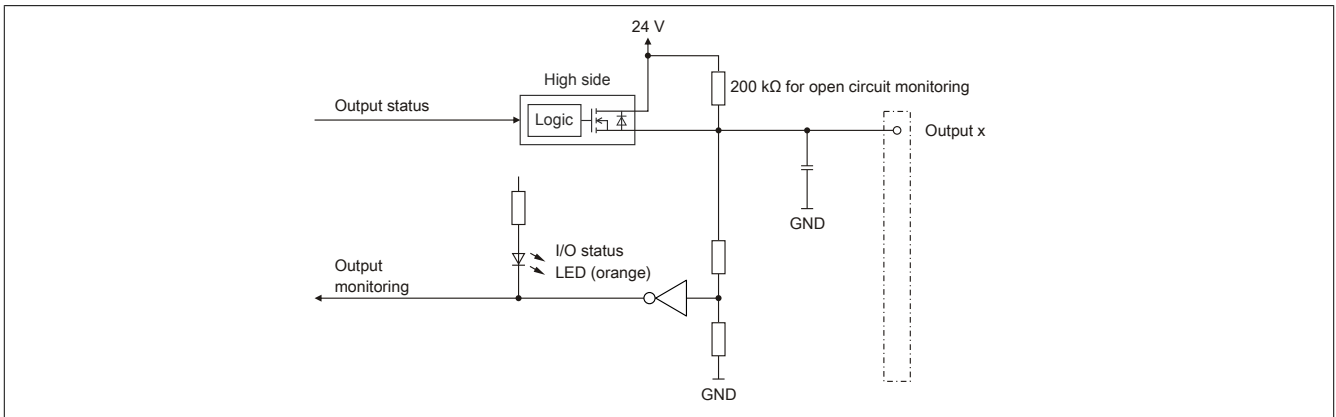

If the module is operated outside specifications, the output current may rise above the maximum permissible nominal current. This applies both to individual channels and to the summation current of the module.

Appropriate cable cross-sections or external safety measures must therefore be provided.

9.15.20.7 OSP hardware requirements

In order to use OSP mode sensibly, it should be ensured that the power supply of the output module and CPU are independent of each other when the application is set up.

9.15.20.8 Output circuit diagram

9.15.20.9 Open line detection

Each output is equipped with an internal 200 kOhm resistor to 24 V for open line detection.

If the charging resistance at the terminal is greater than 25 to 100 kOhm (tolerance range) an open line is therefore detected at 24 V. When switched on, this corresponds to a current of 0.2 to 1 mA with all tolerances taken into consideration.

| Supply voltage | Min. load | Max. load | Corresponds to load current when ON |
|----------------|-----------|-----------|-------------------------------------|
| 24 V | 100 kOhm | 25 kOhm | 0.2 to 1 mA |

9.15.20.10 Switching inductive loads

Environmental temperature: 60°C, all outputs with the same load

Information:

If the maximum number of operating cycles per second is exceeded, an external inverse diode must be used.

Operating conditions outside of the area in the diagram are not permitted!

9.15.20.11 Register description

9.15.20.11.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section "[General data points](#)" on page 3790.

9.15.20.11.2 Function model 0 - Standard

| Register | Name | Data type | Read | | Write | |

| | | ... | ... | | | | |
| | | DigitalStatusSum06 | Bit 5 | | | | |
| | | PowerSupply01 | Bit 7 | | | | |

1) The offset specifies the position of the register within the CAN object.

9.15.20.11.4.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see ["Using I/O modules on the bus controller" on page 3789](#).

9.15.20.11.4.2 CAN I/O bus controller

The module occupies 1 digital logical slot on CAN I/O.

9.15.20.11.5 Digital outputs

The output state is transferred to the output channels with a fixed offset (<60 µs) based on the network cycle (SyncOut).

9.15.20.11.5.1 Switching state of digital outputs 1 to 6

Name:

DigitalOutput

DigitalOutput01 to DigitalOutput06

The switching state of digital outputs 1 to 6 are stored in this register.

Only function model 0 - Standard:

Setting "Packed outputs" in the Automation Studio I/O configuration determines whether all bits of this register should be applied individually as data points in the Automation Studio I/O assignment ("DigitalOutput01" to "DigitalOutput0x") or whether this register should be displayed as a single USINT data point ("DigitalOutput").

| Data type | Values | Information |
|-----------|--------------------|--|
| USINT | 0 to 63 | Packed outputs = On |
| | See bit structure. | Packed outputs = Off or Function model <> 0 - Standard |

Bit structure:

| Bit | Name | Value | Information |
|-----|-----------------|-------|-------------------------|
| 0 | DigitalOutput01 | 0 | Digital output 01 reset |
| | | 1 | Digital output 01 set |
| ... | ... | ... | ... |
| 5 | DigitalOutput06 | 0 | Digital output 06 reset |
| | | 1 | Digital output 06 set |

9.15.20.11.6 Digital output status

The status of the outputs is checked every 4 ms. To suppress disturbances on the feedback inputs, two readings are compared.

The hardware diagnostics recognize the following states:

- Short circuit to ground GND (when output is ON)
- Short circuit to 24 VDC (when output is OFF)
- Open line (when output is OFF)
- Overtemperature / overload

The error is logged in the corresponding status registers and in the cumulative status register.

An open line error is also indicated by the corresponding LED. The LED indicator can be disabled so that an open (unused) channel does not constantly indicate an error.

9.15.20.11.6.1 Enabling the status LED

Name:

CfgBwStatus

For each output there is a corresponding enable bit. In this register, the bit can be set to define whether or not the status LED should be used to indicate an open line error. This allows the LED to be disabled for unused channels. In the bus controller function model the default value is 0xBF.

| Data type | Values | Bus controller default setting |
|-----------|------------------------|--------------------------------|
| USINT | See the bit structure. | 191 |

Bit structure:

| Bit | Name | Value | Information |
|-----|---------------|-------|--|
| 0 | Channel 01 | 0 | Open line indicator 01 disabled |
| | | 1 | Open circuit indicator 01 enabled (bus controller default setting) |
| ... | | ... | |
| 5 | Channel 06 | 0 | Open line indicator 06 disabled |
| | | 1 | Open circuit indicator 06 enabled (bus controller default setting) |
| 6 | Reserved | 0 | |
| 7 | PowerSupply01 | 0 | No error status indicators |
| | | 1 | Monitor supply voltage (bus controller default setting) |

9.15.20.11.6.2 Short circuit to GND and overtemperature

Name:

StatusInput01

DigitalStatusGnd01 to DigitalStatusGnd06

In this register, a short circuit or overtemperature error is indicated by the corresponding channel bit being set. It is not possible to differentiate between short circuit to GND and overload/overtemperature.

Only function model 0 - Standard:

The "Packed outputs" setting in the Automation Studio I/O configuration is used to determine whether all of the bits from this register should be set up individually as data points in the Automation Studio I/O mapping ("DigitalStatusGnd01" to "DigitalStatusGnd06") or whether this register should be displayed as an individual USINT data point ("StatusInput01").

| Data type | Values | Information |
|-----------|--------------------|--|
| USINT | 0 to 63 | Packed outputs = On |
| | See bit structure. | Packed outputs = Off or Function model <> 0 - Standard |

Bit structure:

| Bit | Name | Value | Information |
|-------|--------------------|-------|--------------------------------------|
| 0 | DigitalStatusGnd01 | 0 | No error |
| | | 1 | Channel 1: Short circuit or overload |
| ... | | ... | |
| 5 | DigitalStatusGnd06 | 0 | No error |
| | | 1 | Channel 6: Short circuit or overload |
| 6 - 7 | Reserved | 0 | |

9.15.20.11.6.3 Short circuit to voltage

Name:

StatusInput02

DigitalStatusVcc01 to DigitalStatusVcc06

In this register, a short circuit is indicated by the corresponding channel bit being set.

Only function model 0 - Standard:

The "Packed outputs" setting in the Automation Studio I/O configuration is used to determine whether all of the bits from this register should be set up individually as data points in the Automation Studio I/O mapping ("DigitalStatusVcc01" to "DigitalStatusVcc06") or whether this register should be displayed as an individual USINT data point ("StatusInput02").

| Data type | Values | Information |
|-----------|--------------------|--|
| USINT | 0 to 63 | Packed outputs = On |
| | See bit structure. | Packed outputs = Off or Function model <> 0 - Standard |

Bit structure:

| Bit | Name | Value | Information |
|-------|--------------------|-------|-------------------------------------|
| 0 | DigitalStatusVcc01 | 0 | No error |
| | | 1 | Channel 1: Short circuit to voltage |
| ... | | ... | |
| 5 | DigitalStatusVcc06 | 0 | No error |
| | | 1 | Channel 6: Short circuit to voltage |
| 6 - 7 | Reserved | 0 | |

9.15.20.11.6.4 Open circuit

Name:

StatusInput03

DigitalStatusBw01 to DigitalStatusBw06

In this register, an open circuit is indicated by the corresponding channel bit being set.

Only function model 0 - Standard:

The "Packed outputs" setting in the Automation Studio I/O configuration is used to determine whether all of the bits from this register should be set up individually as data points in the Automation Studio I/O mapping ("DigitalStatusBw01" to "DigitalStatusBw06") or whether this register should be displayed as an individual USINT data point ("StatusInput03").

| Data type | Values | Information |
|-----------|--------------------|--|
| USINT | 0 to 63 | Packed outputs = On |
| | See bit structure. | Packed outputs = Off or Function model <> 0 - Standard |

Bit structure:

| Bit | Name | Value | Information |
|-------|-------------------|-------|-------------------------|
| 0 | DigitalStatusBw01 | 0 | No error |
| | | 1 | Channel 1: Open circuit |
| ... | | ... | |
| 5 | DigitalStatusBw06 | 0 | No error |
| | | 1 | Channel 6: Open circuit |
| 6 - 7 | Reserved | 0 | |

9.15.20.11.6.5 Cumulative status

Name:

StatusInput04

DigitalStatusSum01 to DigitalStatusSum06

PowerSupply01

Every error found in the other status registers is also shown in this register. This provides an easy way to check whether any errors have occurred.

If the I/O supply fails, Bit 7 is set and all status bits in the other status registers are reset to 0.

Only function model 0 - Standard:

The "packed outputs" setting in the Automation Studio I/O configuration is used to determine whether all of this registers' bits should be set up individually as data points ("DigitalStatusSum01 through DigitalStatusSum06", "PowerSupply01") in the Automation Studio I/O mapping or whether this register should be displayed as an individual USINT data point ("StatusInput04").

| Data type | Value | Information |
|-----------|------------------------|--|
| USINT | 0 to 255 | Packed outputs = On |
| | See the bit structure. | Packed outputs = Off or function model ≠ 0 - Standard. |

Bit structure:

| Bit | Name | Value | Information |
|-----|--------------------|-------|------------------------------|
| 0 | DigitalStatusSum01 | 0 | No error |
| | | 1 | Channel 1: Error occurred |
| ... | | ... | |
| 5 | DigitalStatusSum06 | 0 | No error |
| | | 1 | Channel 6: Error occurred |
| 6 | Reserved | 0 | |
| 7 | PowerSupply01 | 0 | No error |
| | | 1 | Pending supply voltage error |

9.15.20.11.7 Function model "OSP"

In function model "OSP" (Operator Set Predefined), the user defines an analog value or digital pattern. This OSP value is output as soon as the communication between the module and master is aborted.

Functionality

The user has the choice between 2 OSP modes:

- Retain last valid value
- Replace with static value

In the first case, the module retains the last value recognized as a valid output status.

When selecting mode "Replace with static value", a plausible output value must be entered in the associated value register. When an OSP event occurs, this value is output instead of the value currently requested by the task.

9.15.20.11.7.1 Enabling OPS output in the module

Name:

OSPValid

This data point makes it possible to start the output of the module and request the use of OSP during operation.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|-------------|-------|---|
| 0 | OSPValid | 0 | Request OSP operation (after initial startup or module in stand-by) |
| | | 1 | Request normal operation |
| 1 - 7 | Reserved | 0 | |

Bit OSPValid exists once on the module and is managed by the user task. It must be set to start the enabled channels. As long as bit OSPValid remains set in the module, the module behaves the same as in function model "Standard".

If an OSP event occurs, e.g. communication between the module and master CPU aborted, then bit OSPValid is reset on the module. The module enters the OSP state and output occurs according to the configuration in register "OSPMode" on page 1765.

The following generally applies:

Even after regeneration of the communication channel, the OSP replacement value is still pending. The OSP state is only exited again when a set OSPValid bit is transferred.

When the master CPU is restarted, bit OSPValid bit is reinitialized in the master CPU. It must be set once more by the application and transferred via the bus.

In the event of brief communication errors between the module and master CPU (e.g. due to EMC), the cyclic registers fail to refresh for several bus cycles. Within the module, bit OSPValid is reset; the set bit is retained in the CPU, however. During the next successful transfer, the module-internal OSPValid bit is set again and the module automatically returns to normal operation.

If the task in the master CPU needs the information about which output mode the module is currently in, bit ModulOK can be evaluated.

Warning!

If bit OSPValid bit is reset to "0" by the module, the output status no longer depends on the responsible task in the master CPU. Nevertheless, output is made depending on the configuration of the OSP replacement value.

9.15.20.11.7.2 Setting OSP mode

Name:

CfgOSPMode

This register controls the behavior of a channel when using OSP.

| Data type | Values | Explanation |
|-----------|--------|---------------------------|
| USINT | 0 | Replace with static value |
| | 1 | Retain last valid value |

9.15.20.11.7.3 Defining an OSP-digital output value

Name:

CfgOSPValue

This register contains the digital output value that is output in "Replace with static value" mode during OSP operation.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-----|-------------|--------|--|
| 0 | | 0 or 1 | OSP output value for channel DigitalOutput00 |
| ... | | ... | |
| x | | 0 or 1 | OSP output value for channel DigitalOutput0x |

Warning!

"OSPValue" is only applied by the module if bit "OSPValid" has been set in the module.

9.15.20.11.8 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time |
|--------------------|
| 150 µs |

9.15.20.11.9 Minimum I/O update time

The minimum I/O update time specifies how far the bus cycle can be reduced so that an I/O update is performed in each cycle.

| Minimum I/O update time |
|---------------------------------|
| Equal to the minimum cycle time |

9.15.21 X20(c)DO6529

Data sheet version: 3.26

9.15.21.1 General information

The module is equipped with 6 relay outputs.

- 6 digital outputs
- Relay module for 115 VAC
- 6 normally open contacts
- Single-channel isolated outputs

Danger!

Risk of electric shock!

The terminal block must only be allowed to conduct voltage when it is inserted. It must not under any circumstances be removed or inserted when voltage is applied or have voltage applied to it when it is removed.

Danger!

Die Spannungsclassen auf der Feldklemme dürfen nicht vermisch werden! Es ist ausschließlich der Betrieb bei Netzspannung (z. B. 115 VAC) ODER bei Sicherheitskleinspannung (z. B. 24 VDC SELV) erlaubt.

9.15.21.2 Coated modules

Coated modules are X20 modules with a protective coating for the electronics component. This coating protects X20c modules from condensation and corrosive gases.

The modules' electronics are fully compatible with the corresponding X20 modules.

For simplification purposes, only images and module IDs of uncoated modules are used in this data sheet.

The coating has been certified according to the following standards:

- Condensation: BMW GS 95011-4, 2x 1 cycle
- Corrosive gas: EN 60068-2-60, method 4, exposure 21 days

9.15.21.3 Order data

9.15.21.6 Pinout

9.15.21.7 Connection example

9.15.21.8 Output circuit diagram

9.15.21.9 Maximum switching power

9.15.21.10 Electrical service life

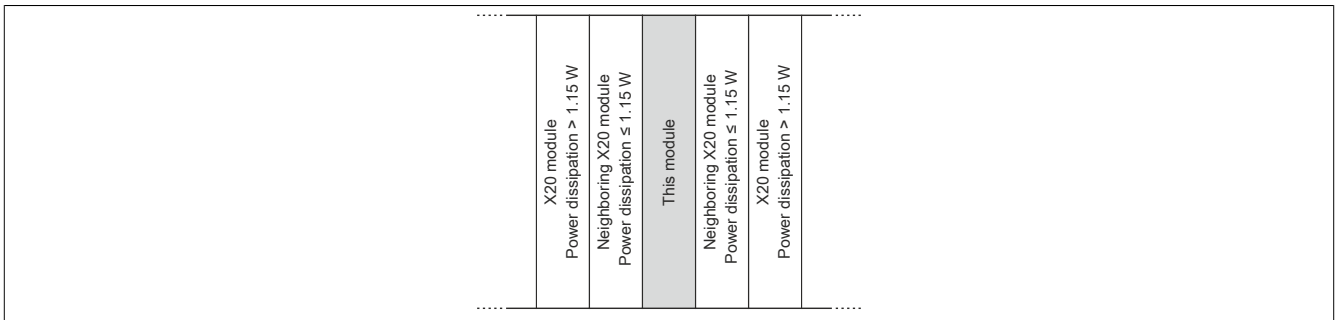

9.15.21.11 Derating

There is no derating when operated below 55°C.

During operation over 55°C, the power dissipation of the modules to the left and right of this module is not permitted to exceed 1.15 W!

For an example of calculating the power dissipation of I/O modules, see section "[Power dissipation calculation of I/O modules](#)" on page 101.

9.15.21.12 Register description

9.15.21.12.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section ["General data points" on page 3790](#).

9.15.21.12.2 Function model 0 - Standard

| Register | Fixed offset | Name | Data type | Read | | Write | |
|----------|--------------|-----------------|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| 2 | 0 | DigitalOutput | USINT | | | • | |
| | | DigitalOutput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | DigitalOutput06 | Bit 5 | | | | |

Fixed modules require their data points to be in a specific order in the X2X frame. Cyclic access occurs according to a predefined offset, not based on the register address.

Acyclic access continues to be based on the register numbers.

9.15.21.12.3 Function model 254 - Bus Controller

| Register | Offset ¹⁾ | Name | Data type | Read | | Write | |
|----------|----------------------|---|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| 2 | 0 | Switching state of digital outputs 1 to 6 | USINT | | | • | |
| | | DigitalOutput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | DigitalOutput06 | Bit 5 | | | | |

1) The offset specifies where the register is within the CAN object.

9.15.21.12.3.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see ["Using I/O modules on the bus controller" on page 3789](#).

9.15.21.12.3.2 CAN I/O bus controller

The module occupies 1 digital logical slot on CAN I/O.

9.15.21.12.4 Digital outputs

The output state is transferred to the output channels with a fixed offset (<60 μ s) based on the network cycle (SyncOut).

9.15.21.12.4.1 Switching state of digital outputs 1 to 6

Name:

DigitalOutput

DigitalOutput01 to DigitalOutput06

The switching state of digital outputs 1 to 6 are stored in this register.

Only function model 0 - Standard:

Setting "Packed outputs" in the Automation Studio I/O configuration determines whether all bits of this register should be applied individually as data points in the Automation Studio I/O assignment ("DigitalOutput01" to "DigitalOutput0x") or whether this register should be displayed as a single USINT data point ("DigitalOutput").

| Data type | Values | Information |
|-----------|--------------------|--|
| USINT | 0 to 63 | Packed outputs = On |
| | See bit structure. | Packed outputs = Off or Function model <> 0 - Standard |

Bit structure:

| Bit | Name | Value | Information |
|-----|-----------------|-------|-------------------------|
| 0 | DigitalOutput01 | 0 | Digital output 01 reset |
| | | 1 | Digital output 01 set |
| ... | | ... | |
| 5 | DigitalOutput06 | 0 | Digital output 06 reset |
| | | 1 | Digital output 06 set |

9.15.21.12.5 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time |
|--------------------|
| 100 μ s |

9.15.21.12.6 Minimum I/O update time

The minimum I/O update time specifies how far the bus cycle can be reduced so that an I/O update is performed in each cycle.

| Minimum I/O update time |
|---------------------------------|
| Equal to the minimum cycle time |

9.15.22 X20(c)DO6639

Data sheet version: 1.38

9.15.22.1 General information

The module is equipped with 6 relay outputs.

- 6 digital outputs
- Relay module for 240 VAC / 30 VDC
- Switching current 2 A
- 6 normally open contacts
- Single-channel isolated outputs

Danger!

Risk of electric shock!

The terminal block is only permitted to conduct voltage when it is connected. It is not permitted to be disconnected or connected while voltage is applied or have voltage applied to it while it is removed under any circumstances.

This module is not permitted to be the last module connected on the X2X Link network. At least one subsequent X20ZF dummy module must provide protection against contact.

Danger!

The voltage classes on the terminal block must not be mixed! Only operation at mains voltage (e.g. 230 VAC) OR safety extra-low voltage (e.g. 24 VDC SELV) is permitted.

9.15.22.2 Coated modules

Coated modules are X20 modules with a protective coating for the electronics component. This coating protects X20c modules from condensation and corrosive gases.

The modules' electronics are fully compatible with the corresponding X20 modules.

For simplification purposes, only images and module IDs of uncoated modules are used in this data sheet.

The coating has been certified according to the following standards:

- Condensation: BMW GS 95011-4, 2x 1 cycle
- Corrosive gas: EN 60068-2-60, method 4, exposure 21 days

9.15.22.3 Order data

9.15.22.8 Output circuit diagram

9.15.22.9 Electrical service life

9.15.22.10 Register description

9.15.22.10.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section ["General data points" on page 3790](#).

9.15.22.10.2 Function model 0 - Standard

| Register | Fixed offset | Name | Data type | Read | | Write | |
|----------|--------------|-----------------|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| 2 | 0 | DigitalOutput | USINT | | | • | |
| | | DigitalOutput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | DigitalOutput06 | Bit 5 | | | | |

Fixed modules require their data points to be in a specific order in the X2X frame. Cyclic access occurs according to a predefined offset, not based on the register address.

Acyclic access continues to be based on the register numbers.

9.15.22.10.3 Function model 254 - Bus Controller

| Register | Offset ¹⁾ | Name | Data type | Read | | Write | |
|----------|----------------------|---|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| 2 | 0 | Switching state of digital outputs 1 to 6 | USINT | | | • | |
| | | DigitalOutput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | DigitalOutput06 | Bit 5 | | | | |

1) The offset specifies where the register is within the CAN object.

9.15.22.10.3.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see ["Using I/O modules on the bus controller" on page 3789](#).

9.15.22.10.3.2 CAN I/O bus controller

The module occupies 1 digital logical slot on CAN I/O.

9.15.22.10.4 Digital outputs

The output state is transferred to the output channels with a fixed offset (<60 μ s) based on the network cycle (SyncOut).

9.15.22.10.4.1 Switching state of digital outputs 1 to 6

Name:

DigitalOutput

DigitalOutput01 to DigitalOutput06

The switching state of digital outputs 1 to 6 are stored in this register.

Only function model 0 - Standard:

Setting "Packed outputs" in the Automation Studio I/O configuration determines whether all bits of this register should be applied individually as data points in the Automation Studio I/O assignment ("DigitalOutput01" to "DigitalOutput0x") or whether this register should be displayed as a single USINT data point ("DigitalOutput").

| Data type | Values | Information |
|-----------|--------------------|--|
| USINT | 0 to 63 | Packed outputs = On |
| | See bit structure. | Packed outputs = Off or Function model <> 0 - Standard |

Bit structure:

| Bit | Name | Value | Information |
|-----|-----------------|-------|-------------------------|
| 0 | DigitalOutput01 | 0 | Digital output 01 reset |
| | | 1 | Digital output 01 set |
| ... | | ... | |
| 5 | DigitalOutput06 | 0 | Digital output 06 reset |
| | | 1 | Digital output 06 set |

9.15.22.10.5 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time |
|--------------------|
| 100 μ s |

9.15.22.10.6 Minimum I/O update time

The minimum I/O update time specifies how far the bus cycle can be reduced so that an I/O update is performed in each cycle.

| Minimum I/O update time |
|---------------------------------|
| Equal to the minimum cycle time |

9.15.23 X20DO8232

Data sheet version: 2.16

9.15.23.1 General information

The module is equipped with 8 outputs for 1-wire connections. The nominal output current is 2 A and the nominal voltage is 12 VDC.

The output supply is fed directly to the module. An additional supply module is not needed. There is no connection between the module and the I/O supply potential on the bus module.

- 8 digital outputs with 2 A
- Rated voltage 12 VDC
- Source connection
- 1-wire connection
- Power feed integrated in the module
- Integrated output protection

9.15.23.2 Order data

| | e + r | | Red on / Green single flash | Invalid firmware |
| 1 - 8 | | Orange | | Output status of the corresponding digital output |

9.15.23.5 Pinout

9.15.23.6 Connection example

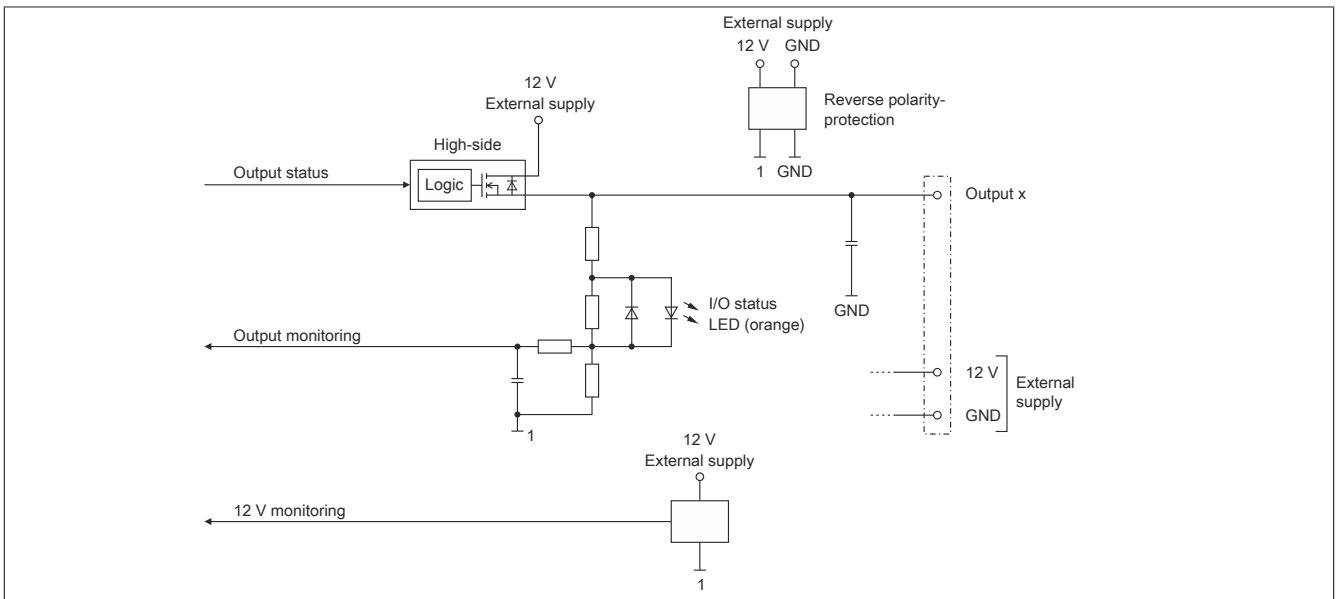

Caution!

If the module is operated outside specifications, the output current may rise above the maximum permissible nominal current. This applies both to individual channels and to the summation current of the module.

Appropriate cable cross-sections or external safety measures must therefore be provided.

9.15.23.7 Output circuit diagram

9.15.23.8 Switching inductive loads

Environmental temperature: 35°C, 4 outputs (1,3,5,7 or 2,4,6,8) with the same load.

Environmental temperature: 60°C, 4 outputs (1,3,5,7 or 2,4,6,8) with the same load.

Environmental temperature: 60°C, all outputs with the same load.

Information:

If the maximum number of operating cycles per second is exceeded, an external inverse diode must be used.

Operating conditions outside of the area in the diagram are not permitted!

9.15.23.9 Derating

The outputs of the module can handle up to 2 A. With a summation current of 8 A, no more than 4 channels are operable at full load. To ensure optimal use of the module, it is important to assign the channels properly, and to keep in mind a potential derating.

Correct channel assignment is important, since the 8 outputs are divided between 2 output drivers. The channels operated with 2 A must therefore be evenly divided between both output drivers.

Output driver 1: Channels 1 to 4
Output driver 2: Channels 5 to 8

The following table provides an overview of the number of fully used channels, the resulting best distribution, and a potential derating.

| Number of channels using 2 A | Division | Derating |
|------------------------------|--|--|
| 1 | Any | No |
| 2 | 1st channel with 2 A ... channel no. 1 to 4 2nd channel with 2 A ... channel no. 5 to 8 | No |
| 3 | Assign all even or all odd channel numbers. Examples: 1, 3, 5 2, 4, 6 3, 5, 7 4, 6, 8 | Channels 1 and 3 Channels 2 and 4 Channels 5 and 7 Channels 6 and 8 |
| 4 | Assign all even or all odd channel numbers. Possible divisions: 1, 3, 5, 7 2, 4, 6, 8 | On each channel On each channel |

Derating when 3 or 4 channels are operated with 2 A:

Information:

Only modules with a maximum power dissipation of 1 W are permitted to be operated next to the module.

For an example of calculating the power dissipation of I/O modules, see section "[Power dissipation calculation of I/O modules](#)" on page 101.

9.15.23.10 Register description

9.15.23.10.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section "[General data points](#)" on page 3790.

9.15.23.10.2 Function model 0 - Standard

| Register | Fixed offset | Name | Data type | Read | | Write | |
|----------|--------------|------------------------------|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| 2 | 0 | DigitalOutput | USINT | | | • | |
| | | DigitalOutput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | DigitalOutput08 | Bit 7 | | | | |
| 30 | 1 | StatusInput01 | USINT | • | | | |
| | | StatusDigitalOutput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | StatusDigitalOutput08 | Bit 7 | | | | |

| | | DigitalOutput08DelayEnable | Bit 7 | | | | |
| 8 | 3 | Setting the delay (OutputDelayTime) | USINT | | | • | |
| 30 | 1 | Status of digital outputs 1 to 8 | USINT | | • | | |
| | | StatusDigitalOutput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | StatusDigitalOutput08 | Bit 7 | | | | |
| 8192 | - | Reading the module ID | UINT | | • | | |
| 8196 | - | Status of the supply voltage | USINT | | • | | |
| | | PowerSupply01 | Bit 2 | • | | | |

Fixed modules require their data points to be in a specific order in the X2X frame. Cyclic access occurs according to a predefined offset, not based on the register address.

Acyclic access continues to be based on the register numbers.

9.15.23.10.4 Function model 254 - Bus Controller

| Register | Offset ¹⁾ | Name | Data type | Read | | Write | |
|----------|----------------------|---|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| 2 | - | Switching state of digital outputs 1 to 8 | USINT | | | • | |
| | | DigitalOutput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | DigitalOutput08 | Bit 7 | | | | |
| 30 | - | Status of digital outputs 1 to 8 | USINT | | • | | |
| | | StatusDigitalOutput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | StatusDigitalOutput08 | Bit 7 | | | | |
| 8192 | - | Reading the module ID | UINT | | • | | |
| 8196 | - | Status of the supply voltage | USINT | | • | | |
| | | PowerSupply01 | Bit 2 | | • | | |

1) The offset specifies where the register is within the CAN object.

9.15.23.10.4.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see ["Using I/O modules on the bus controller" on page 3789](#).

9.15.23.10.4.2 CAN I/O bus controller

The module occupies 1 digital logical slot on CAN I/O.

9.15.23.10.5 Digital outputs

The output state is transferred to the output channels with a fixed offset (<60 µs) based on the network cycle (SyncOut).

9.15.23.10.5.1 Switching state of digital outputs 1 to 8

Name:

DigitalOutput

DigitalOutput01 to DigitalOutput08

The switching state of digital outputs 1 to 8 are stored in this register.

Only function model 0 - Standard:

Setting "Packed outputs" in the Automation Studio I/O configuration determines whether all bits of this register should be applied individually as data points in the Automation Studio I/O assignment ("DigitalOutput01" to "DigitalOutput0x") or whether this register should be displayed as a single USINT data point ("DigitalOutput").

| Data type | Value | Information |
|-----------|------------------------|--|
| USINT | 0 to 255 | Packed outputs = On |
| | See the bit structure. | Packed outputs = Off or function model ≠ 0 - Standard. |

Bit structure:

| Bit | Name | Value | Information |
|-----|-----------------|-------|-------------------------|
| 0 | DigitalOutput01 | 0 | Digital output 01 reset |
| | | 1 | Digital output 01 set |
| ... | ... | ... | ... |
| 7 | DigitalOutput08 | 0 | Digital output 08 reset |
| | | 1 | Digital output 08 set |

9.15.23.10.6 Reading the module ID

Name:

asy_ModulID

This register offers the possibility to read the module ID.

| Data type | Values |
|-----------|-----------|
| UINT | Module ID |

9.15.23.10.7 Monitoring status of the digital outputs

On the module, the output states of the outputs are compared to the target states. The control of the output driver is used for the target state.

A change in the output state resets monitoring for that output. The status of each individual channel can be read. A change in the monitoring status is actively transmitted as an error message.

9.15.23.10.7.1 Status of digital outputs 1 to 8

Name:

StatusInput01

StatusDigitalOutput01 to StatusDigitalOutput08

This register is used to indicate the status of digital outputs 1 to 8.

Only function model 0 - Standard:

Setting "Packed outputs" in the Automation Studio I/O configuration determines whether all bits of this register should be applied individually as data points in the Automation Studio I/O assignment ("StatusDigitalOutput01" to "StatusDigitalOutput0x") or whether this register should be displayed as a single USINT data point ("StatusIn-put01").

| Data type | Value | Information |
|-----------|------------------------|--|
| USINT | 0 to 255 | Packed outputs = On |
| | See the bit structure. | Packed outputs = Off or function model ≠ 0 - Standard. |

Bit structure:

| Bit | Name | Value | Information |
|-----|-----------------------|-------|---|
| 0 | StatusDigitalOutput01 | 0 | Channel 01: No error |
| | | 1 | Channel 01: <ul style="list-style-type: none"> Short circuit or overload Channel switched on and missing I/O power supply Channel switched off and external voltage applied on channel |
| ... | ... | ... | ... |
| 8 | StatusDigitalOutput08 | 0 | Channel 08: No error |
| | | 1 | Channel 08: For an error description, see channel 01. |

9.15.23.10.8 Operating limit monitoring

The module's output supply is monitored. An I/O supply voltage of <10.2 V is displayed as a warning.

9.15.23.10.8.1 Status of the supply voltage

Name:

asy_SupplyStatus

The status of the I/O supply voltage is mapped in this register.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|-------|---------------|-------|--|
| 0 - 1 | Reserved | 0 | 0 |
| 2 | PowerSupply01 | 0 | I/O supply above the warning level of 10.2 V |
| | | 1 | I/O supply below the warning level of 10.2 V |
| 3 - 7 | Reserved | 0 | 0 |

9.15.23.10.9 Additional function - switch digital outputs w/ delay using switching mask

In function model 1 - Output switching, it is possible to control the digital outputs with a delay.

The OutputDelay mask can be used to activate the delay for each channel individually. The module is controlled here using a 100 µs-based timer and the Output or OutputDelayed register.

Behavior of function model 1 - Output switching

With a timer delay of 0:

Output: DigitalOutput0x bits

When the delay is changed:

The bit string for DigitalOutput0x bits is output. The timer restarts.

Output: DigitalOutput0x bits

After delay time has expired:

The channels whose bits are set in the mask for OutputDelay are adapted to the corresponding OutputDelayed bits.

Output: DigitalOutput0x bits (if Enable bit = FALSE)
OutputDelayed bits (if Enable bit = TRUE)

Information:

Adjusting the output and restarting the timer take place immediately after transferring the new delay, even if the previous time has not yet passed.

9.15.23.10.9.1 Switching state of delayed digital outputs 1 to 8

Name:

DigitalOutput01Delayed to Digital08Delayed

According to the corresponding bit in the OutputDelay mask, the switching state of all digital outputs 1 to 8 are stored in the OutputDelayed bits after the delay time has expired.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|-----|------------------------|-------|-------------------------|
| 0 | DigitalOutput01Delayed | 0 | Digital output 01 reset |
| | | 1 | Digital output 01 set |
| ... | | ... | |
| 7 | DigitalOutput08Delayed | 0 | Digital output 08 reset |
| | | 1 | Digital output 08 set |

Information:

After the delay time has expired, only the channels with a bit set in the OutputDelay mask are adjusted to the OutputDelayed bits.

9.15.23.10.9.2 Switching mask after the delay time has expired

Name:

DigitalOutput01DelayEnable to DigitalOutput08DelayEnable

These registers create the mask for OutputDelay. They define which outputs are switched to the bit string for the OutputDelayed register after the delay time has expired.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|-----|----------------------------|-------|-------------------------------------|
| 0 | DigitalOutput01DelayEnable | 0 | Digital output 01 remains unchanged |
| | | 1 | Digital output 01 is toggled |
| ... | | ... | |
| 7 | DigitalOutput08DelayEnable | 0 | Digital output 08 remains unchanged |
| | | 1 | Digital output 08 is toggled |

9.15.23.10.9.3 Setting the delay

Name:

OutputDelayTime

This register can be used to set the delay in 100 µs steps.

After the delay time has expired, the digital outputs are adjusted according to the switching mask (register 6) and the delayed output pattern (register 4).

| Data type | Value |
|-----------|--|
| USINT | 0 to 255 (in 100 µs steps) ¹⁾ |

1) The value 0 disables processing

9.15.23.10.10 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

9.15.23.10.11 Minimum I/O update time

The minimum I/O update time specifies how far the bus cycle can be reduced so that an I/O update is performed in each cycle.

9.15.24 X20DO8322

Data sheet version: 3.16

9.15.24.1 General information

The module is equipped with 8 outputs for 1-wire connections and designed for source output wiring.

- 8 digital outputs
- Source connection
- 1-wire connections
- Integrated output protection

9.15.24.2 Order data

| Model number | Short description | Figure |

9.15.24.5 Pinout

9.15.24.6 Connection example

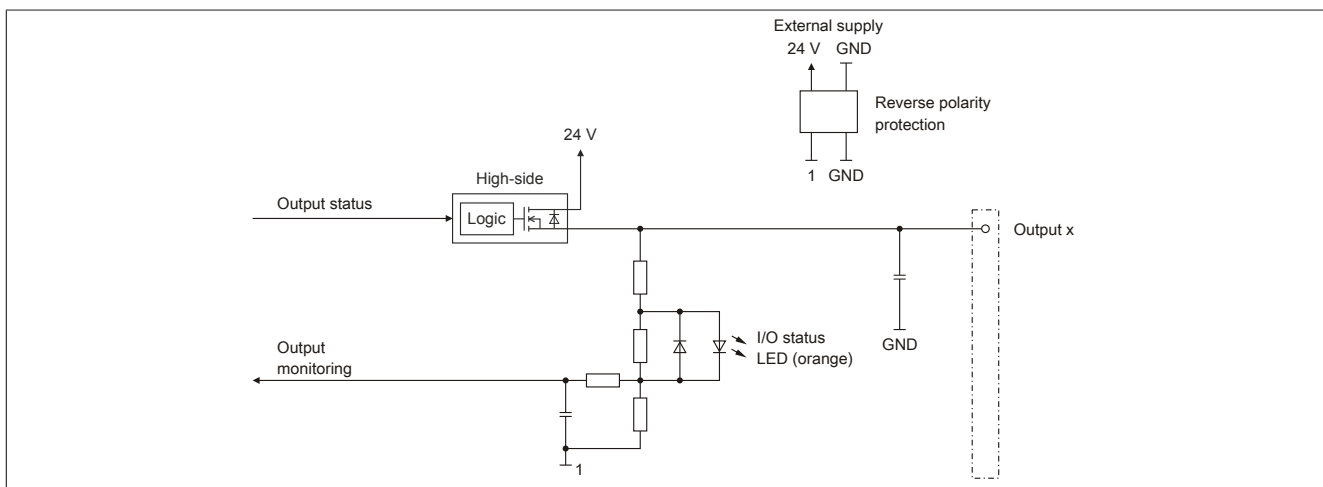

Caution!

If the module is operated outside specifications, the output current may rise above the maximum permissible nominal current. This applies both to individual channels and to the summation current of the module.

Appropriate cable cross-sections or external safety measures must therefore be provided.

9.15.24.7 Output circuit diagram

9.15.24.8 Switching inductive loads

Environmental temperature: 55°C, all outputs with the same load

Environmental temperature: 60°C, all outputs with the same load

Information:

If the maximum number of operating cycles per second is exceeded, an external inverse diode must be used.

Operating conditions outside of the area in the diagram are not permitted!

9.15.24.9 Register description

9.15.24.9.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section ["General data points" on page 3790](#).

9.15.24.9.2 Function model 0 - Standard

| Register | Fixed offset | Name | Data type | Read | | Write | |
|----------|--------------|-----------------------|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| 2 | 0 | DigitalOutput | USINT | | | • | |
| | | DigitalOutput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | DigitalOutput08 | Bit 7 | | | | |
| 30 | 1 | StatusInput01 | USINT | • | | | |
| | | StatusDigitalOutput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | StatusDigitalOutput08 | Bit 7 | | | | |

Fixed modules require their data points to be in a specific order in the X2X frame. Cyclic access occurs according to a predefined offset, not based on the register address.

Acyclic access continues to be based on the register numbers.

9.15.24.9.3 Function model 254 - Bus Controller

| Register | Offset ¹⁾ | Name | Data type | Read | | Write | |
|----------|----------------------|---|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| 2 | 0 | Switching state of digital outputs 1 to 8 | USINT | | | • | |
| | | DigitalOutput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | DigitalOutput08 | Bit 7 | | | | |
| 30 | - | Status of digital outputs 1 to 8 | USINT | | • | | |
| | | StatusDigitalOutput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | StatusDigitalOutput08 | Bit 7 | | | | |

1) The offset specifies where the register is within the CAN object.

9.15.24.9.3.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see ["Using I/O modules on the bus controller" on page 3789](#).

9.15.24.9.3.2 CAN I/O bus controller

The module occupies 1 digital logical slot on CAN I/O.

9.15.24.9.4 Digital outputs

The output state is transferred to the output channels with a fixed offset (<60 µs) based on the network cycle (SyncOut).

9.15.24.9.4.1 Switching state of digital outputs 1 to 8

Name:

DigitalOutput

DigitalOutput01 to DigitalOutput08

The switching state of digital outputs 1 to 8 are stored in this register.

Only function model 0 - Standard:

Setting "Packed outputs" in the Automation Studio I/O configuration determines whether all bits of this register should be applied individually as data points in the Automation Studio I/O assignment ("DigitalOutput01" to "DigitalOutput0x") or whether this register should be displayed as a single USINT data point ("DigitalOutput").

| Data type | Value | Information |
|-----------|------------------------|--|
| USINT | 0 to 255 | Packed outputs = On |
| | See the bit structure. | Packed outputs = Off or function model ≠ 0 - Standard. |

Bit structure:

| Bit | Name | Value | Information |
|-----|-----------------|-------|-------------------------|
| 0 | DigitalOutput01 | 0 | Digital output 01 reset |
| | | 1 | Digital output 01 set |
| ... | | ... | |
| 7 | DigitalOutput08 | 0 | Digital output 08 reset |
| | | 1 | Digital output 08 set |

9.15.24.9.5 Monitoring status of the digital outputs

On the module, the output states of the outputs are compared to the target states. The control of the output driver is used for the target state.

A change in the output state resets monitoring for that output. The status of each individual channel can be read. A change in the monitoring status is actively transmitted as an error message.

9.15.24.9.5.1 Status of digital outputs 1 to 8

Name:

StatusInput01

StatusDigitalOutput01 to StatusDigitalOutput08

This register is used to indicate the status of digital outputs 1 to 8.

Only function model 0 - Standard:

Setting "Packed outputs" in the Automation Studio I/O configuration determines whether all bits of this register should be applied individually as data points in the Automation Studio I/O assignment ("StatusDigitalOutput01" to "StatusDigitalOutput0x") or whether this register should be displayed as a single USINT data point ("StatusInput01").

| Data type | Value | Information |
|-----------|------------------------|--|
| USINT | 0 to 255 | Packed outputs = On |
| | See the bit structure. | Packed outputs = Off or function model ≠ 0 - Standard. |

Bit structure:

| Bit | Name | Value | Information |
|-----|-----------------------|-------|---|
| 0 | StatusDigitalOutput01 | 0 | Channel 01: No error |
| | | 1 | Channel 01: <ul style="list-style-type: none"> Short circuit or overload Channel switched on and missing I/O power supply Channel switched off and external voltage applied on channel |
| ... | | ... | |
| 8 | StatusDigitalOutput08 | 0 | Channel 08: No error |
| | | 1 | Channel 08: For an error description, see channel 01. |

9.15.24.9.6 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time |
|--------------------|
| 100 μ s |

9.15.24.9.7 Minimum I/O update time

The minimum I/O update time specifies how far the bus cycle can be reduced so that an I/O update is performed in each cycle.

| Minimum I/O update time |
|---------------------------------|
| Equal to the minimum cycle time |

9.15.25 X20DO8323

Data sheet version: 1.31

9.15.25.1 General Information

The module is an electrically isolated 8-channel digital output module. It can be configured as high-side or low-side or as a push/pull output for controlling 12 to 24 VDC DC motors.

- 8 digital outputs
- High-side or low-side connection
- Push/pull outputs
- 1-wire connections
- Integrated output protection

9.15.25.2 Order data

9.15.25.7 Output circuit diagram

9.15.25.8 Register description

9.15.25.8.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section "General data points" on page 3790.

9.15.25.8.2 Function model 0 - Default

| Register | Fixed offset | Name | Data type | Read | | Write | |
|----------------------|--------------|-----------------------|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| Configuration | | | | | | | |
| 4 | 1 | EnableDigitalOutput | USINT | | | • | |
| | | EnabDigitalOutput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | EnabDigitalOutput08 | Bit 7 | | | | |
| Communication | | | | | | | |
| 0 | 1 | DigitalInput | USINT | • | | | |
| | | DigitalInput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | DigitalInput08 | Bit 7 | | | | |
| 2 | 0 | DigitalOutput | USINT | | | • | |
| | | DigitalOutput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | DigitalOutput08 | Bit 7 | | | | |
| 30 | 2 | StatusInput01 | USINT | • | | | |
| | | StatusDigitalOutput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | StatusDigitalOutput08 | Bit 7 | | | | |
| 31 | 3 | Cumulative status | USINT | • | | | |
| | | StatusDigitalOutputs | Bit 0 | | | | |
| | | StatusSupplyLO | Bit 4 | | | | |
| | | StatusSupplyHI | Bit 5 | | | | |

Fixed modules require their data points to be in a specific order in the X2X frame. Cyclic access occurs according to a predefined offset, not based on the register address.

Acyclic access continues to be based on the register numbers.

9.15.25.8.3 Function model 254 - Bus Controller

| Register | Offset ¹⁾ | Name | Data type | Read | | Write | |
|----------------------|----------------------|---|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| Configuration | | | | | | | |
| 4 | - | Switching between inputs and outputs | USINT | | | | • |
| | | EnabDigitalOutput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | EnabDigitalOutput08 | Bit 7 | | | | |
| Communication | | | | | | | |
| 0 | 0 | Digital inputs | USINT | • | | | |
| | | DigitalInput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | DigitalInput08 | Bit 7 | | | | |
| 2 | 0 | Switching state of digital outputs 1 to 8 | USINT | | | • | |
| | | DigitalOutput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | DigitalOutput08 | Bit 7 | | | | |
| 30 | - | Status of digital outputs 1 to 8 | USINT | | • | | |
| | | StatusDigitalOutput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | StatusDigitalOutput08 | Bit 7 | | | | |
| 31 | - | Cumulative status | USINT | | • | | |
| | | StatusDigitalOutputs | Bit 0 | | | | |
| | | StatusSupplyLO | Bit 4 | | | | |
| | | StatusSupplyHI | Bit 5 | | | | |

1) The offset specifies where the register is within the CAN object.

9.15.25.8.3.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see ["Using I/O modules on the bus controller" on page 3789](#).

9.15.25.8.3.2 CAN I/O bus controller

The module occupies 1 digital logical slot on CAN I/O.

9.15.25.8.4 Digital outputs

The output state is sent to the output ports acyclically to the network in the system timer (100 µsec). (max. switch off jitter: 50 µsec, max. switch on jitter: 150 µsec)

The output state must be switched with at least a 300 µsec delay in order to prevent the high-side and low-side drivers from switching together.

9.15.25.8.4.1 Switching state of digital outputs 1 to 8

Name:

DigitalOutput

DigitalOutput01 to DigitalOutput08

The switching state of digital outputs 1 to 8 are stored in this register.

Only function model 0 - Standard:

Setting "Packed outputs" in the Automation Studio I/O configuration determines whether all bits of this register should be applied individually as data points in the Automation Studio I/O assignment ("DigitalOutput01" to "DigitalOutput0x") or whether this register should be displayed as a single USINT data point ("DigitalOutput").

| Data type | Value | Information |
|-----------|------------------------|--|
| USINT | 0 to 255 | Packed outputs = On |
| | See the bit structure. | Packed outputs = Off or function model ≠ 0 - Standard. |

Bit structure:

| Bit | Name | Value | Information |
|-----|-----------------|-------|-------------------------|
| 0 | DigitalOutput01 | 0 | Digital output 01 reset |
| | | 1 | Digital output 01 set |
| ... | | ... | |
| 7 | DigitalOutput08 | 0 | Digital output 08 reset |
| | | 1 | Digital output 08 set |

9.15.25.8.4.2 Status of digital outputs 1 to 8

Name:

StatusInput01

StatusDigitalOutput01 to StatusDigitalOutput08

This register is used to indicate the status of digital outputs 1 to 8.

Only function model 0 - Standard:

Setting "Packed outputs" in the Automation Studio I/O configuration determines whether all bits of this register should be applied individually as data points in the Automation Studio I/O assignment ("StatusDigitalOutput01" to "StatusDigitalOutput0x") or whether this register should be displayed as a single USINT data point ("StatusInput01").

| Data type | Value | Information |
|-----------|------------------------|--|
| USINT | 0 to 255 | Packed outputs = On |
| | See the bit structure. | Packed outputs = Off or function model ≠ 0 - Standard. |

Bit structure:

| Bit | Name | Value | Information |
|-----|-----------------------|-------|---|
| 0 | StatusDigitalOutput01 | 0 | Channel 01: No error |
| | | 1 | Channel 01: <ul style="list-style-type: none"> • Short circuit or overload • Channel switched on and missing I/O power supply • Channel switched off and external voltage applied on channel |
| ... | ... | ... | ... |
| 8 | StatusDigitalOutput08 | 0 | Channel 08: No error |
| | | 1 | Channel 08: For an error description, see channel 01. |

9.15.25.8.4.3 Switching between inputs and outputs

Name:

EnableDigitalOutput

EnabDigitalOutput01 through EnabDigitalOutput08

In this register, all channels can be connected as inputs or outputs. For each output there is a corresponding switching bit. Clearing this bit switches to tristate mode.

Function model 0 - Standard only:

The "packed outputs" setting in the Automation Studio I/O configuration is used to determine whether all of this registers' bits should be set up individually as data points in the Automation Studio I/O mapping ("EnabDigitalOutput01" through "EnabDigitalOutput08") or whether this register should be displayed as an individual USINT data point ("EnableDigitalOutput").

| Data type | Values | Information |
|-----------|------------------------|--|
| USINT | 0 to 255 | Packed outputs = On |
| | See the bit structure. | Packed outputs = off or function model <> 0 - Standard. Bus controller default setting: 255 |

Bit structure:

| Bit | Name | Value | Information |
|-----|---------------------|-------|---|
| 0 | EnabDigitalOutput01 | 0 | Channel 1 used as input |
| | | 1 | Channel 1 used as output (bus controller default setting) |
| ... | ... | ... | ... |
| 7 | EnabDigitalOutput08 | 0 | Channel 8 used as input |
| | | 1 | Channel 8 used as output (bus controller default setting) |

9.15.25.8.5 Digital inputs

Name:

DigitalInput

DigitalInput01 through DigitalInput08

The status of digital inputs 1 to 8 is mapped in this register.

The status of the digital inputs is read with a minimum update rate of 5 to 8 msec. according to the digital output status sample rate.

Only function model 0 - Standard:

The "packed outputs" setting in the Automation Studio I/O configuration is used to determine whether all of this registers' bits should be set up individually as data points in the Automation Studio I/O mapping ("DigitalInput01" through "DigitalInput0x") or whether this register should be displayed as an individual USINT data point ("DigitalInput").

| Data type | Value | Information |
|-----------|------------------------|--|
| USINT | 0 to 255 | Packed outputs = On |
| | See the bit structure. | Packed outputs = Off or function model ≠ 0 - Standard. |

Bit structure:

| Bit | Name | Value | Information |
|-----|----------------|--------|--------------------------------|
| 0 | DigitalInput01 | 0 or 1 | Input status - Digital input 1 |
| ... | ... | ... | ... |
| 7 | DigitalInput08 | 0 or 1 | Input status - Digital input 8 |

9.15.25.8.6 Cumulative status

Name:

StatusDigitalOutputs

StatusSupplyLO

StatusSupplyHI

The state of output monitoring and the supply voltage for all outputs are collected and mapped to this register.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|-------|----------------------|-------|---|
| 0 | StatusDigitalOutputs | 0 | No output monitoring |
| | | 1 | Output monitoring active for at least one channel |
| 1 - 3 | Reserved | 0 | |
| 4 | StatusSupplyLO | 0 | No error |
| | | 1 | Supply voltage too low (≤ 11.5 VDC) |
| 5 | StatusSupplyHI | 0 | No error |
| | | 1 | Supply voltage too high (> 30 VDC) |
| 6 - 7 | Reserved | 0 | |

9.15.25.8.7 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time |
|--------------------|
| 100 μ s |

9.15.25.8.8 Minimum I/O update time

The minimum I/O update time specifies how far the bus cycle can be reduced so that an I/O update is performed in each cycle.

| Minimum I/O update time | |
|-------------------------|-------------|
| All channels | 400 μ s |

9.15.26 X20(c)DO8331

Data sheet version: 3.26

9.15.26.1 General information

The module is equipped with 8 outputs for 1-wire connections. The rated output current is 2 A.

The output supply is fed directly to the module. An additional supply module is not needed. There is no connection between the module and the I/O supply potential on the bus module.

- 8 digital outputs with 2 A
- Sink connection
- 1-wire connections
- Power feed integrated in the module
- Integrated output protection

9.15.26.2 Coated modules

Coated modules are X20 modules with a protective coating for the electronics component. This coating protects X20c modules from condensation and corrosive gases.

The modules' electronics are fully compatible with the corresponding X20 modules.

For simplification purposes, only images and module IDs of uncoated modules are used in this data sheet.

The coating has been certified according to the following standards:

- Condensation: BMW GS 95011-4, 2x 1 cycle
- Corrosive gas: EN 60068-2-60, method 4, exposure 21 days

9.15.26.3 Order data

| Model number | Short description | Figure |
|--------------|--|---|
| | Digital outputs |  |
| X20DO8331 | X20 digital output module, 8 outputs, 24 VDC, 2 A, sink, supply directly on module, 1-wire connections | |
| X20cDO8331 | X20 digital output module, coated, 8 outputs, 24 VDC, 2 A, sink, supply directly on module, 1-wire connections | |
| | Required accessories | |
| | Bus modules | |
| X20BM11 | X20 bus module, 24 VDC keyed, internal I/O supply continuous | |
| X20BM15 | X20 bus module, with node number switch, 24 VDC keyed, internal I/O supply continuous | |
| X20cBM11 | X20 bus module, coated, 24 VDC keyed, internal I/O supply continuous | |
| | Terminal blocks | |
| X20TB12 | X20 terminal block, 12-pin, 24 VDC keyed | |

9.15.26.5 Status LEDs

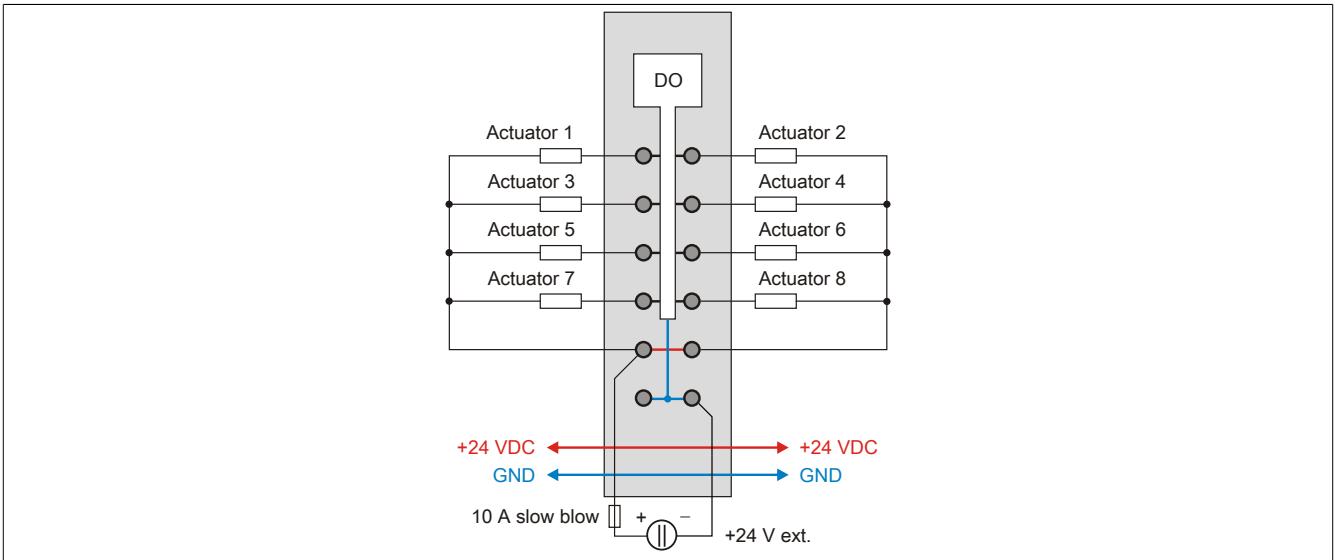

For a description of the various operating modes, see "Diagnostic LEDs" on page 3787.

| Figure | LED | Color | Status | Description | |
|--------|-------|-----------------------------|------------------|---|---|
| | r | Green | Off | Module supply not connected | |
| | | | Single flash | RESET mode | |
| | | | Blinking | PREOPERATIONAL mode | |
| | e | Red | On | RUN mode | |
| | | | Off | Module supply not connected or everything OK | |
| | | | Single flash | Warning/Error on an I/O channel. Level monitoring for digital outputs has been triggered. | |
| | e + r | Red on / Green single flash | Double flash | I/O supply too low | |
| | | | Invalid firmware | | |
| | 1 - 8 | Orange | | | Output status of the corresponding digital output |

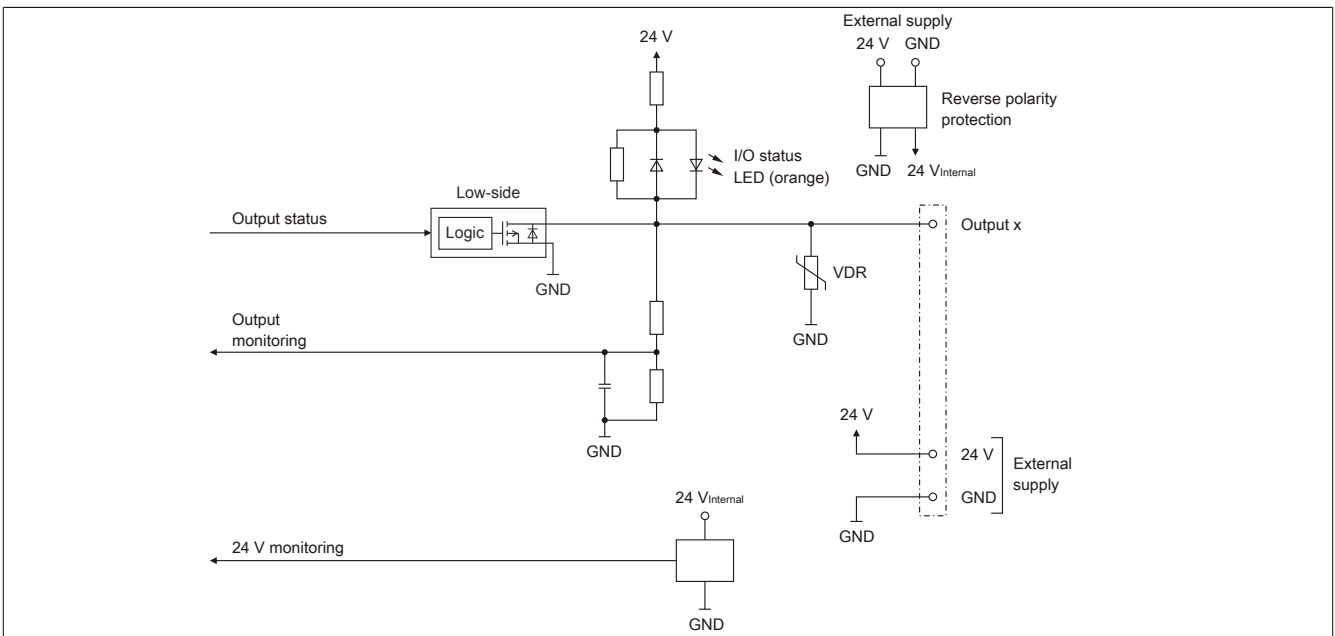

9.15.26.6 Pinout

9.15.26.7 Connection example

9.15.26.8 Output circuit diagram

9.15.26.9 Switching inductive loads

Environmental temperature: 35°C, 4 outputs (1,3,5,7 or 2,4,6,8) with the same load.

Environmental temperature: 60°C, 4 outputs (1,3,5,7 or 2,4,6,8) with the same load.

Environmental temperature: 60°C, all outputs with the same load.

Information:

If the maximum number of operating cycles per second is exceeded, an external inverse diode must be used.

Operating conditions outside of the area in the diagram are not permitted!

9.15.26.10 Derating

The outputs of the module can handle up to 2 A. With a summation current of 8 A, no more than 4 channels are operable at full load. To ensure optimal use of the module, it is important to assign the channels properly, and to keep in mind a potential derating.

Correct channel assignment is important, since the 8 outputs are divided between 2 output drivers. The channels operated with 2 A must therefore be evenly divided between both output drivers.

Output driver 1: Channels 1 to 4
Output driver 2: Channels 5 to 8

The following table provides an overview of the number of fully used channels, the resulting best distribution, and a potential derating.

| Number of channels using 2 A | Division | Derating |
|------------------------------|--|--|
| 1 | Any | No |
| 2 | 1st channel with 2 A ... channel no. 1 to 4 2nd channel with 2 A ... channel no. 5 to 8 | No |
| 3 | Assign all even or all odd channel numbers. Examples: 1, 3, 5 2, 4, 6 3, 5, 7 4, 6, 8 | Channels 1 and 3 Channels 2 and 4 Channels 5 and 7 Channels 6 and 8 |
| 4 | Assign all even or all odd channel numbers. Possible divisions: 1, 3, 5, 7 2, 4, 6, 8 | On each channel On each channel |

Derating when 3 or 4 channels are operated with 2 A:

Information:

Modules next to this module can have a maximum power dissipation of 1.5 W.

For an example of calculating the power dissipation of I/O modules, see section ["Power dissipation calculation of I/O modules"](#) on page 101.

9.15.26.11 Register description

9.15.26.11.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section ["General data points" on page 3790](#).

9.15.26.11.2 Function model 0 - Standard

| Register | Fixed offset | Name | Data type | Read | | Write | |
|----------|--------------|------------------------------|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| 2 | 0 | DigitalOutput | USINT | | | • | |
| | | DigitalOutput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | DigitalOutput08 | Bit 7 | | | | |
| 30 | 1 | StatusInput01 | USINT | | • | | |
| | | StatusDigitalOutput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | StatusDigitalOutput08 | Bit 7 | | | | |
| 8192 | - | Reading the module ID | UINT | | • | | |
| 8196 | - | Status of the supply voltage | USINT | | • | | |
| | | PowerSupply01 | Bit 2 | • | | | |

Fixed modules require their data points to be in a specific order in the X2X frame. Cyclic access occurs according to a predefined offset, not based on the register address.

Acyclic access continues to be based on the register numbers.

9.15.26.11.3 Function model 1 - Output switching

| Register | Fixed offset | Name | Data type | Read | | Write | |
|----------|--------------|---|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| 2 | 0 | Switching state of digital outputs 1 to 8 | USINT | | | • | |
| | | DigitalOutput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | DigitalOutput08 | Bit 7 | | | | |
| 4 | 1 | Switching state of delayed digital outputs 1 to 8 | USINT | | | • | |
| | | DigitalOutput01Delayed | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | DigitalOutput08Delayed | Bit 7 | | | | |
| 6 | 2 | Switching mask after the delay time has expired | USINT | | | • | |
| | | DigitalOutput01DelayEnable | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | DigitalOutput08DelayEnable | Bit 7 | | | | |
| 8 | 3 | Setting the delay (OutputDelayTime) | USINT | | | • | |
| 30 | 1 | Status of digital outputs 1 to 8 | USINT | | • | | |
| | | StatusDigitalOutput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | StatusDigitalOutput08 | Bit 7 | | | | |
| 8192 | - | Reading the module ID | UINT | | • | | |
| 8196 | - | Status of the supply voltage | USINT | | • | | |
| | | PowerSupply01 | Bit 2 | • | | | |

Fixed modules require their data points to be in a specific order in the X2X frame. Cyclic access occurs according to a predefined offset, not based on the register address.

Acyclic access continues to be based on the register numbers.

9.15.26.11.4 Function model 254 - Bus Controller

| Register | Offset ¹⁾ | Name | Data type | Read | | Write | |
|----------|----------------------|---|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| 2 | 0 | Switching state of digital outputs 1 to 8 | USINT | | | • | |
| | | DigitalOutput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | DigitalOutput08 | Bit 7 | | | | |
| 30 | - | Status of digital outputs 1 to 8 | USINT | | • | | |
| | | StatusDigitalOutput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | StatusDigitalOutput08 | Bit 7 | | | | |
| 8192 | - | Reading the module ID | UINT | | • | | |
| 8196 | - | Status of the supply voltage | USINT | | • | | |
| | | Power Supply01 | Bit 2 | | • | | |

1) The offset specifies where the register is within the CAN object.

9.15.26.11.4.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see ["Using I/O modules on the bus controller" on page 3789](#).

9.15.26.11.4.2 CAN I/O bus controller

The module occupies 1 digital logical slot on CAN I/O.

9.15.26.11.5 Digital outputs

The output state is transferred to the output channels with a fixed offset (<60 µs) based on the network cycle (SyncOut).

9.15.26.11.5.1 Switching state of digital outputs 1 to 8

Name:

DigitalOutput

DigitalOutput01 to DigitalOutput08

The switching state of digital outputs 1 to 8 are stored in this register.

Only function model 0 - Standard:

Setting "Packed outputs" in the Automation Studio I/O configuration determines whether all bits of this register should be applied individually as data points in the Automation Studio I/O assignment ("DigitalOutput01" to "DigitalOutput0x") or whether this register should be displayed as a single USINT data point ("DigitalOutput").

| Data type | Value | Information |
|-----------|------------------------|--|
| USINT | 0 to 255 | Packed outputs = On |
| | See the bit structure. | Packed outputs = Off or function model ≠ 0 - Standard. |

Bit structure:

| Bit | Name | Value | Information |
|-----|-----------------|-------|-------------------------|
| 0 | DigitalOutput01 | 0 | Digital output 01 reset |
| | | 1 | Digital output 01 set |
| ... | ... | ... | ... |
| 7 | DigitalOutput08 | 0 | Digital output 08 reset |
| | | 1 | Digital output 08 set |

9.15.26.11.6 Reading the module ID

Name:

asy_ModulID

This register offers the possibility to read the module ID.

| Data type | Values |
|-----------|-----------|
| UINT | Module ID |

9.15.26.11.7 Monitoring status of the digital outputs

On the module, the output states of the outputs are compared to the target states. The control of the output driver is used for the target state.

A change in the output state resets monitoring for that output. The status of each individual channel can be read. A change in the monitoring status is actively transmitted as an error message.

9.15.26.11.7.1 Status of digital outputs 1 to 8

Name:

StatusInput01

StatusDigitalOutput01 to StatusDigitalOutput08

This register is used to indicate the status of digital outputs 1 to 8.

Only function model 0 - Standard:

Setting "Packed outputs" in the Automation Studio I/O configuration determines whether all bits of this register should be applied individually as data points in the Automation Studio I/O assignment ("StatusDigitalOutput01" to "StatusDigitalOutput0x") or whether this register should be displayed as a single USINT data point ("StatusIn-put01").

| Data type | Value | Information |
|-----------|------------------------|--|
| USINT | 0 to 255 | Packed outputs = On |
| | See the bit structure. | Packed outputs = Off or function model ≠ 0 - Standard. |

Bit structure:

| Bit | Name | Value | Information |
|-----|-----------------------|-------|---|
| 0 | StatusDigitalOutput01 | 0 | Channel 01: No error |

9.15.26.11.8 Operating limit monitoring

The output supply of the module is monitored. I/O supply voltage <20.4 V is displayed as a warning.

9.15.26.11.8.1 Status of the supply voltage

Name:

asy_SupplyStatus

The status of the I/O supply voltage is mapped in this register.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|-------|---------------|-------|--|
| 0 - 1 | Reserved | 0 | |
| 2 | PowerSupply01 | 0 | I/O supply above the warning level of 20.4 V |
| | | 1 | I/O supply below the warning level of 20.4 V |
| 3 - 7 | Reserved | 0 | |

9.15.26.11.9 Additional function - switch digital outputs w/ delay using switching mask

In function model 1 - Output switching, it is possible to control the digital outputs with a delay.

The OutputDelay mask can be used to activate the delay for each channel individually. The module is controlled here using a 100 µs-based timer and the Output or OutputDelayed register.

Behavior of function model 1 - Output switching

With a timer delay of 0:

Output: DigitalOutput0x bits

When the delay is changed:

The bit string for DigitalOutput0x bits is output. The timer restarts.

Output: DigitalOutput0x bits

After delay time has expired:

The channels whose bits are set in the mask for OutputDelay are adapted to the corresponding OutputDelayed bits.

Output: DigitalOutput0x bits (if Enable bit = FALSE)
OutputDelayed bits (if Enable bit = TRUE)

Information:

Adjusting the output and restarting the timer take place immediately after transferring the new delay, even if the previous time has not yet passed.

9.15.26.11.9.1 Switching state of delayed digital outputs 1 to 8

Name:

DigitalOutput01Delayed to Digital08Delayed

According to the corresponding bit in the OutputDelay mask, the switching state of all digital outputs 1 to 8 are stored in the OutputDelayed bits after the delay time has expired.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|-----|------------------------|-------|-------------------------|
| 0 | DigitalOutput01Delayed | 0 | Digital output 01 reset |
| | | 1 | Digital output 01 set |
| ... | | ... | |
| 7 | DigitalOutput08Delayed | 0 | Digital output 08 reset |
| | | 1 | Digital output 08 set |

Information:

After the delay time has expired, only the channels with a bit set in the OutputDelay mask are adjusted to the OutputDelayed bits.

9.15.26.11.9.2 Switching mask after the delay time has expired

Name:

DigitalOutput01DelayEnable to DigitalOutput08DelayEnable

These registers create the mask for OutputDelay. They define which outputs are switched to the bit string for the OutputDelayed register after the delay time has expired.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|-----|----------------------------|-------|-------------------------------------|
| 0 | DigitalOutput01DelayEnable | 0 | Digital output 01 remains unchanged |
| | | 1 | Digital output 01 is toggled |
| ... | | ... | |
| 7 | DigitalOutput08DelayEnable | 0 | Digital output 08 remains unchanged |
| | | 1 | Digital output 08 is toggled |

9.15.26.11.9.3 Setting the delay

Name:

OutputDelayTime

This register can be used to set the delay in 100 µs steps.

After the delay time has expired, the digital outputs are adjusted according to the switching mask (register 6) and the delayed output pattern (register 4).

| Data type | Value |
|-----------|--|
| USINT | 0 to 255 (in 100 µs steps) ¹⁾ |

1) The value 0 disables processing

9.15.26.11.10 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time | |
|-------------------------------|--------|
| Standard function model | 100 µs |
| Bus controller function model | 150 µs |

9.15.26.11.11 Minimum I/O update time

The minimum I/O update time specifies how far the bus cycle can be reduced so that an I/O update is performed in each cycle.

| Minimum I/O update time | |
|-------------------------|---------------------------------|
| Function model 0 | Equal to the minimum cycle time |
| Function model 1 | Equal to the minimum cycle time |

9.15.27 X20(c)DO8332

Data sheet version: 3.27

9.15.27.1 General information

The module is equipped with 8 outputs for 1-wire connections. The rated output current is 2 A.

The output supply is fed directly to the module. An additional supply module is not needed. There is no connection between the module and the I/O supply potential on the bus module.

- 8 digital outputs with 2 A
- Source connection
- 1-wire connections
- Power feed integrated in the module
- Integrated output protection

9.15.27.2 Coated modules

Coated modules are X20 modules with a protective coating for the electronics component. This coating protects X20c modules from condensation and corrosive gases.

The modules' electronics are fully compatible with the corresponding X20 modules.

For simplification purposes, only images and module IDs of uncoated modules are used in this data sheet.

The coating has been certified according to the following standards:

- Condensation: BMW GS 95011-4, 2x 1 cycle
- Corrosive gas: EN 60068-2-60, method 4, exposure 21 days

9.15.27.2.1 Starting temperature

The starting temperature describes the minimum permissible ambient temperature when the power is switched off at the time the coated module is switched on. This is permitted to be as low as -40°C . During operation, the conditions as specified in the technical data continue to apply.

Information:

It is important to absolutely ensure that there is no forced cooling by air currents in a closed control cabinet, for example using a fan or ventilation slots.

9.15.27.3 Order data

9.15.27.5 Status LEDs

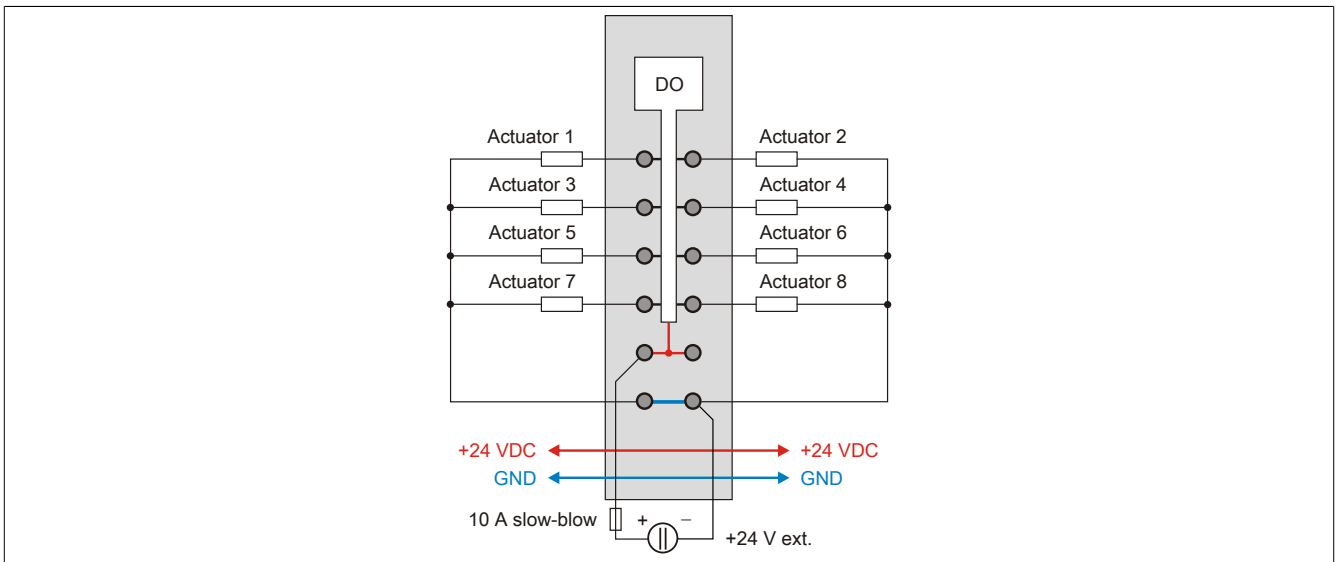

For a description of the various operating modes, see ["Diagnostic LEDs" on page 3787](#).

| Figure | LED | Color | Status | Description | |
|---|-------|-------|-----------------------------|---|---|
|  | r | Green | Off | Module supply not connected | |
| | | | Single flash | RESET mode | |
| | | | Blinking | PREOPERATIONAL mode | |
| | | | On | RUN mode | |
| | e | Red | Off | Module supply not connected or everything OK | |
| | | | Single flash | Warning/Error on an I/O channel. Level monitoring for digital outputs has been triggered. | |
| | | | Double flash | I/O supply too low | |
| | e + r | | Red on / Green single flash | Invalid firmware | |
| | 1 - 8 | | Orange | | Output status of the corresponding digital output |

9.15.27.6 Pinout

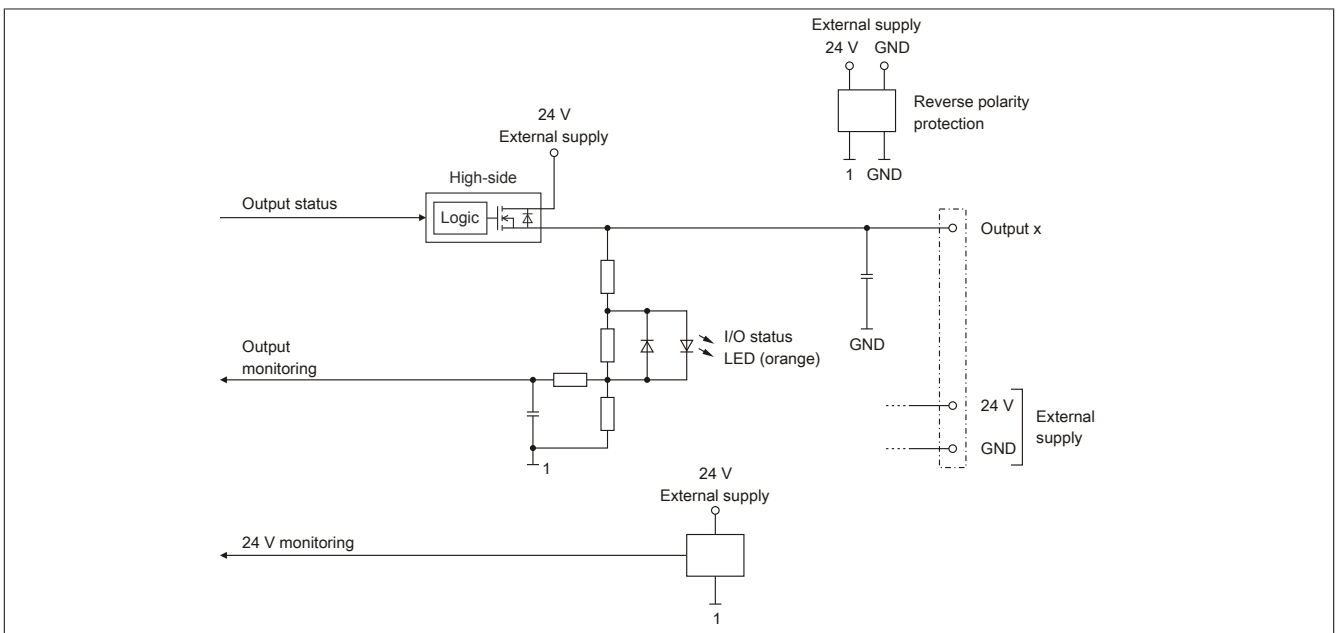

9.15.27.7 Connection example

**Caution!**

If the module is operated outside specifications, the output current may rise above the maximum permissible nominal current. This applies both to individual channels and to the summation current of the module.

Appropriate cable cross-sections or external safety measures must therefore be provided.

9.15.27.8 Output circuit diagram

9.15.27.9 Switching inductive loads

Environmental temperature: 35°C, 4 outputs (1,3,5,7 or 2,4,6,8) with the same load.

Environmental temperature: 60°C, 4 outputs (1,3,5,7 or 2,4,6,8) with the same load.

Environmental temperature: 60°C, all outputs with the same load.

Information:

If the maximum number of operating cycles per second is exceeded, an external inverse diode must be used.

Operating conditions outside of the area in the diagram are not permitted!

9.15.27.10 Derating

The outputs of the module can handle up to 2 A. With a summation current of 8 A, no more than 4 channels are operable at full load. To ensure optimal use of the module, it is important to assign the channels properly, and to keep in mind a potential derating.

Correct channel assignment is important, since the 8 outputs are divided between 2 output drivers. The channels operated with 2 A must therefore be evenly divided between both output drivers.

Output driver 1: Channels 1 to 4
Output driver 2: Channels 5 to 8

The following table provides an overview of the number of fully used channels, the resulting best distribution, and a potential derating.

| Number of channels using 2 A | Division | Derating |
|------------------------------|--|--|
| 1 | Any | No |
| 2 | 1st channel with 2 A ... channel no. 1 to 4 2nd channel with 2 A ... channel no. 5 to 8 | No |
| 3 | Assign all even or all odd channel numbers. Examples: 1, 3, 5 2, 4, 6 3, 5, 7 4, 6, 8 | Channels 1 and 3 Channels 2 and 4 Channels 5 and 7 Channels 6 and 8 |
| 4 | Assign all even or all odd channel numbers. Possible divisions: 1, 3, 5, 7 2, 4, 6, 8 | On each channel On each channel |

Derating when 3 or 4 channels are operated with 2 A:

Information:

Modules next to this module can have a maximum power dissipation of 1.5 W.

For an example of calculating the power dissipation of I/O modules, see section ["Power dissipation calculation of I/O modules"](#) on page 101.

9.15.27.11 Register description

9.15.27.11.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section ["General data points" on page 3790](#).

9.15.27.11.2 Function model 0 - Standard

| Register | Fixed offset | Name | Data type | Read | | Write | |
|----------|--------------|------------------------------|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| 2 | 0 | DigitalOutput | USINT | | | • | |
| | | DigitalOutput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | DigitalOutput08 | Bit 7 | | | | |
| 30 | 1 | StatusInput01 | USINT | | • | | |
| | | StatusDigitalOutput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | StatusDigitalOutput08 | Bit 7 | | | | |
| 8192 | - | Reading the module ID | UINT | | • | | |
| 8196 | - | Status of the supply voltage | USINT | | • | | |
| | | PowerSupply01 | Bit 2 | • | | | |

Fixed modules require their data points to be in a specific order in the X2X frame. Cyclic access occurs according to a predefined offset, not based on the register address.

Acyclic access continues to be based on the register numbers.

9.15.27.11.3 Function model 1 - Output switching

| Register | Fixed offset | Name | Data type | Read | | Write | |
|----------|--------------|---|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| 2 | 0 | Switching state of digital outputs 1 to 8 | USINT | | | • | |
| | | DigitalOutput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | DigitalOutput08 | Bit 7 | | | | |
| 4 | 1 | Switching state of delayed digital outputs 1 to 8 | USINT | | | • | |
| | | DigitalOutput01Delayed | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | DigitalOutput08Delayed | Bit 7 | | | | |
| 6 | 2 | Switching mask after the delay time has expired | USINT | | | • | |
| | | DigitalOutput01DelayEnable | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | DigitalOutput08DelayEnable | Bit 7 | | | | |
| 8 | 3 | Setting the delay (OutputDelayTime) | USINT | | | • | |
| 30 | 1 | Status of digital outputs 1 to 8 | USINT | | • | | |
| | | StatusDigitalOutput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | StatusDigitalOutput08 | Bit 7 | | | | |
| 8192 | - | Reading the module ID | UINT | | • | | |
| 8196 | - | Status of the supply voltage | USINT | | • | | |
| | | PowerSupply01 | Bit 2 | • | | | |

Fixed modules require their data points to be in a specific order in the X2X frame. Cyclic access occurs according to a predefined offset, not based on the register address.

Acyclic access continues to be based on the register numbers.

9.15.27.11.4 Function model 254 - Bus Controller

| Register | Offset ¹⁾ | Name | Data type | Read | | Write | |
|----------|----------------------|---|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| 2 | 0 | Switching state of digital outputs 1 to 8 | USINT | | | • | |
| | | DigitalOutput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | DigitalOutput08 | Bit 7 | | | | |
| 30 | - | Status of digital outputs 1 to 8 | USINT | | • | | |
| | | StatusDigitalOutput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | StatusDigitalOutput08 | Bit 7 | | | | |
| 8192 | - | Reading the module ID | UINT | | • | | |
| 8196 | - | Status of the supply voltage | USINT | | • | | |
| | | Power Supply01 | Bit 2 | | • | | |

1) The offset specifies where the register is within the CAN object.

9.15.27.11.4.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see ["Using I/O modules on the bus controller" on page 3789](#).

9.15.27.11.4.2 CAN I/O bus controller

The module occupies 1 digital logical slot on CAN I/O.

9.15.27.11.5 Digital outputs

The output state is transferred to the output channels with a fixed offset (<60 µs) based on the network cycle (SyncOut).

9.15.27.11.5.1 Switching state of digital outputs 1 to 8

Name:

DigitalOutput

DigitalOutput01 to DigitalOutput08

The switching state of digital outputs 1 to 8 are stored in this register.

Only function model 0 - Standard:

Setting "Packed outputs" in the Automation Studio I/O configuration determines whether all bits of this register should be applied individually as data points in the Automation Studio I/O assignment ("DigitalOutput01" to "DigitalOutput0x") or whether this register should be displayed as a single USINT data point ("DigitalOutput").

| Data type | Value | Information |
|-----------|------------------------|--|
| USINT | 0 to 255 | Packed outputs = On |
| | See the bit structure. | Packed outputs = Off or function model ≠ 0 - Standard. |

Bit structure:

| Bit | Name | Value | Information |
|-----|-----------------|-------|-------------------------|
| 0 | DigitalOutput01 | 0 | Digital output 01 reset |
| | | 1 | Digital output 01 set |
| ... | ... | ... | ... |
| 7 | DigitalOutput08 | 0 | Digital output 08 reset |
| | | 1 | Digital output 08 set |

9.15.27.11.6 Reading the module ID

Name:

asy_ModulID

This register offers the possibility to read the module ID.

| Data type | Values |
|-----------|-----------|
| UINT | Module ID |

9.15.27.11.7 Monitoring status of the digital outputs

On the module, the output states of the outputs are compared to the target states. The control of the output driver is used for the target state.

A change in the output state resets monitoring for that output. The status of each individual channel can be read. A change in the monitoring status is actively transmitted as an error message.

9.15.27.11.7.1 Status of digital outputs 1 to 8

Name:

StatusInput01

StatusDigitalOutput01 to StatusDigitalOutput08

This register is used to indicate the status of digital outputs 1 to 8.

Only function model 0 - Standard:

Setting "Packed outputs" in the Automation Studio I/O configuration determines whether all bits of this register should be applied individually as data points in the Automation Studio I/O assignment ("StatusDigitalOutput01" to "StatusDigitalOutput0x") or whether this register should be displayed as a single USINT data point ("StatusIn-put01").

| Data type | Value | Information |
|-----------|------------------------|--|
| USINT | 0 to 255 | Packed outputs = On |
| | See the bit structure. | Packed outputs = Off or function model ≠ 0 - Standard. |

Bit structure:

| Bit | Name | Value | Information |
|-----|-----------------------|-------|---|
| 0 | StatusDigitalOutput01 | 0 | Channel 01: No error |
| | | 1 | Channel 01: <ul style="list-style-type: none"> • Short circuit or overload • Channel switched on and missing I/O power supply • Channel switched off and external voltage applied on channel |
| ... | ... | ... | ... |
| 8 | StatusDigitalOutput08 | 0 | Channel 08: No error |
| | | 1 | Channel 08: For an error description, see channel 01. |

9.15.27.11.8 Operating limit monitoring

The output supply of the module is monitored. I/O supply voltage < V is displayed as a warning.

9.15.27.11.8.1 Status of the supply voltage

Name:

asy_SupplyStatus

The status of the I/O supply voltage is mapped in this register.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|-------|---------------|-------|--|
| 0 - 1 | Reserved | 0 | |
| 2 | PowerSupply01 | 0 | I/O supply above the warning level of 20.4 V |
| | | 1 | I/O supply below the warning level of 20.4 V |
| 3 - 7 | Reserved | 0 | |

9.15.27.11.9 Additional function - switch digital outputs w/ delay using switching mask

In function model 1 - Output switching, it is possible to control the digital outputs with a delay.

The OutputDelay mask can be used to activate the delay for each channel individually. The module is controlled here using a 100 µs-based timer and the Output or OutputDelayed register.

Behavior of function model 1 - Output switching

With a timer delay of 0:

Output: DigitalOutput0x bits

When the delay is changed:

The bit string for DigitalOutput0x bits is output. The timer restarts.

Output: DigitalOutput0x bits

After delay time has expired:

The channels whose bits are set in the mask for OutputDelay are adapted to the corresponding OutputDelayed bits.

Output: DigitalOutput0x bits (if Enable bit = FALSE)
OutputDelayed bits (if Enable bit = TRUE)

Information:

Adjusting the output and restarting the timer take place immediately after transferring the new delay, even if the previous time has not yet passed.

9.15.27.11.9.1 Switching state of delayed digital outputs 1 to 8

Name:

DigitalOutput01Delayed to Digital08Delayed

According to the corresponding bit in the OutputDelay mask, the switching state of all digital outputs 1 to 8 are stored in the OutputDelayed bits after the delay time has expired.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|-----|------------------------|-------|-------------------------|
| 0 | DigitalOutput01Delayed | 0 | Digital output 01 reset |
| | | 1 | Digital output 01 set |
| ... | | ... | |
| 7 | DigitalOutput08Delayed | 0 | Digital output 08 reset |
| | | 1 | Digital output 08 set |

Information:

After the delay time has expired, only the channels with a bit set in the OutputDelay mask are adjusted to the OutputDelayed bits.

9.15.27.11.9.2 Switching mask after the delay time has expired

Name:

DigitalOutput01DelayEnable to DigitalOutput08DelayEnable

These registers create the mask for OutputDelay. They define which outputs are switched to the bit string for the OutputDelayed register after the delay time has expired.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|-----|----------------------------|-------|-------------------------------------|
| 0 | DigitalOutput01DelayEnable | 0 | Digital output 01 remains unchanged |
| | | 1 | Digital output 01 is toggled |
| ... | | ... | |
| 7 | DigitalOutput08DelayEnable | 0 | Digital output 08 remains unchanged |
| | | 1 | Digital output 08 is toggled |

9.15.27.11.9.3 Setting the delay

Name:

OutputDelayTime

This register can be used to set the delay in 100 µs steps.

After the delay time has expired, the digital outputs are adjusted according to the switching mask (register 6) and the delayed output pattern (register 4).

| Data type | Value |
|-----------|--|
| USINT | 0 to 255 (in 100 µs steps) ¹⁾ |

1) The value 0 disables processing

9.15.27.11.10 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

9.15.27.11.11 Minimum I/O update time

The minimum I/O update time specifies how far the bus cycle can be reduced so that an I/O update is performed in each cycle.

9.15.28 X20DO8332-1

Data sheet version: 1.03

9.15.28.1 General information

The module is equipped with 8 outputs for 1-wire connections. The nominal output current is 2 A.

The output power supply is fed directly into the module. An additional power supply module is therefore not necessary. There is no connection between the module and the I/O power supply potential on the bus module.

- 8 digital outputs with 2 A
- Source circuit
- 1-wire connections
- Power supply integrated in the module
- Integrated output protection

- 1) Number of outputs x $R_{DS(on)}$ x Nominal output current². For a calculation example, see section "Mechanical and electrical configuration" of the X20 system user's manual.
- 2) Derating must be observed for summation current starting at 6 A.

9.15.28.4 LED status indicators

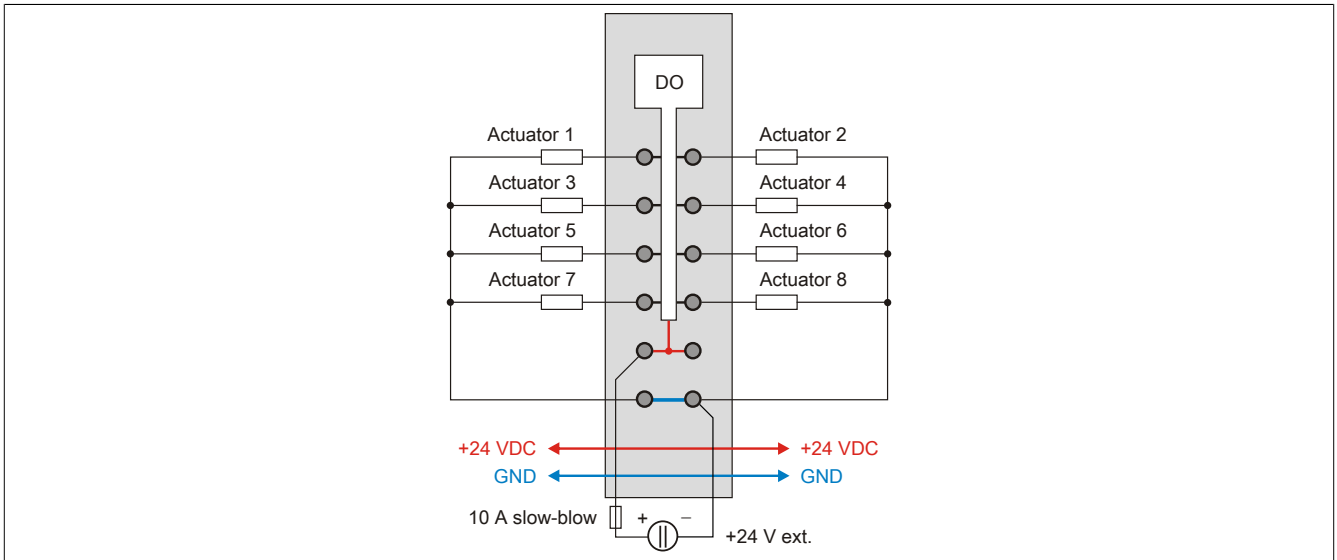

For a description of the various operating modes, see "[Diagnostic LEDs](#)" on page 3787.

| Figure | LED | Color | Status | Description | |
|---|-------|-------|--------------------------------|---|--|
|  | r | Green | Off | No power to module | |
| | | | Single flash | Mode RESET | |
| | | | Blinking | Mode PREOPERATIONAL | |
| | | | On | Mode RUN | |
| | e | Red | Off | No power to module or everything OK | |
| | | | Single flash | Warning/Error on an I/O channel. Level monitoring for digital outputs has been triggered. | |
| | | | Double flash | I/O power supply too low | |
| | e + r | | Solid red / Single green flash | Invalid firmware | |
| | 1 - 8 | | Orange | | Output state of the corresponding digital output |

9.15.28.5 Pinout

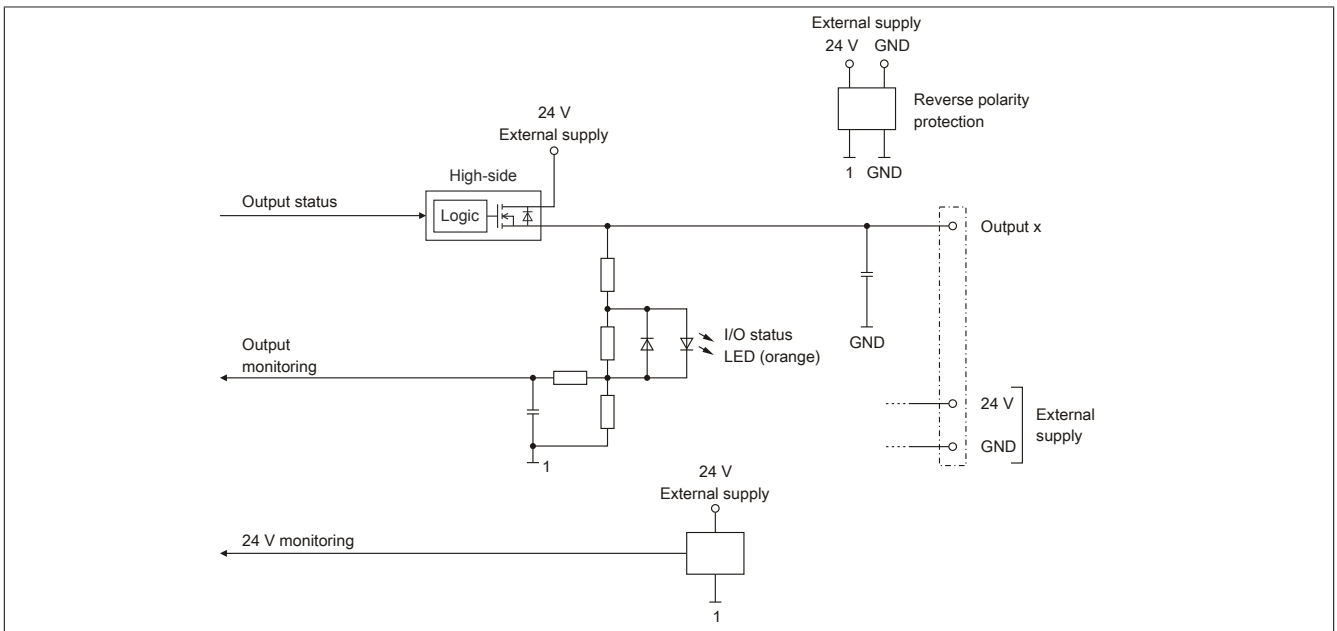

9.15.28.6 Connection example

**Caution!**

If the module is operated outside specifications, the output current may rise above the maximum permissible nominal current. This applies both to individual channels and to the summation current of the module.

Appropriate cable cross-sections or external safety measures must therefore be provided.

9.15.28.7 Output circuit diagram

9.15.28.8 Switching inductive loads

Ambient temperature: 35°C, 4 outputs with the same load.

Ambient temperature: 60°C, 4 outputs with the same load.

Ambient temperature: 60°C, all outputs with the same load.

Information:

If the maximum number of operating cycles per second is exceeded, an external inverse diode must be used.

Operating conditions outside of the area in the diagram are not permitted!

9.15.28.9 Derating

The outputs of the module can handle up to 2 A. With a summation current of 8 A, no more than 4 channels are operable at full load.

Derating must be taken into account starting at 6 A.

Information:

Only modules with a maximum power consumption of 1.5 W are permitted to be operated next to the module.

For an example of calculating the power dissipation of I/O modules, see section ["Power dissipation calculation of I/O modules"](#) on page 101.

9.15.28.10 Register description

9.15.28.10.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section ["General data points" on page 3790](#).

9.15.28.10.2 Function model 0 - Standard

| Register | Fixed offset | Name | Data type | Read | | Write | |
|----------|--------------|------------------------------|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| 2 | 0 | DigitalOutput | USINT | | | • | |
| | | DigitalOutput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | DigitalOutput08 | Bit 7 | | | | |
| 30 | 1 | StatusInput01 | USINT | | • | | |
| | | StatusDigitalOutput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | StatusDigitalOutput08 | Bit 7 | | | | |
| 8192 | - | Reading the module ID | UINT | | • | | |
| 8196 | - | Status of the supply voltage | USINT | | • | | |
| | | PowerSupply01 | Bit 2 | • | | | |

Fixed modules require their data points to be in a specific order in the X2X frame. Cyclic access occurs according to a predefined offset, not based on the register address.

Acyclic access continues to be based on the register numbers.

9.15.28.10.3 Function model 1 - Output switching

| Register | Fixed offset | Name | Data type | Read | | Write | |
|----------|--------------|---|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| 2 | 0 | Switching state of digital outputs 1 to 8 | USINT | | | • | |
| | | DigitalOutput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | DigitalOutput08 | Bit 7 | | | | |
| 4 | 1 | Switching state of delayed digital outputs 1 to 8 | USINT | | | • | |
| | | DigitalOutput01Delayed | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | DigitalOutput08Delayed | Bit 7 | | | | |
| 6 | 2 | Switching mask after the delay time has expired | USINT | | | • | |
| | | DigitalOutput01DelayEnable | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | DigitalOutput08DelayEnable | Bit 7 | | | | |
| 8 | 3 | Setting the delay (OutputDelayTime) | USINT | | | • | |
| 30 | 1 | Status of digital outputs 1 to 8 | USINT | | • | | |
| | | StatusDigitalOutput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | StatusDigitalOutput08 | Bit 7 | | | | |
| 8192 | - | Reading the module ID | UINT | | • | | |
| 8196 | - | Status of the supply voltage | USINT | | • | | |
| | | PowerSupply01 | Bit 2 | • | | | |

Fixed modules require their data points to be in a specific order in the X2X frame. Cyclic access occurs according to a predefined offset, not based on the register address.

Acyclic access continues to be based on the register numbers.

9.15.28.10.4 Function model 254 - Bus Controller

| Register | Offset ¹⁾ | Name | Data type | Read | | Write | |
|----------|----------------------|---|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| 2 | 0 | Switching state of digital outputs 1 to 8 | USINT | | | • | |
| | | DigitalOutput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | DigitalOutput08 | Bit 7 | | | | |
| 30 | - | Status of digital outputs 1 to 8 | USINT | | • | | |
| | | StatusDigitalOutput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | StatusDigitalOutput08 | Bit 7 | | | | |
| 8192 | - | Reading the module ID | UINT | | • | | |
| 8196 | - | Status of the supply voltage | USINT | | • | | |
| | | Power Supply01 | Bit 2 | | • | | |

1) The offset specifies where the register is within the CAN object.

9.15.28.10.4.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see ["Using I/O modules on the bus controller" on page 3789](#).

9.15.28.10.4.2 CAN I/O bus controller

The module occupies 1 digital logical slot on CAN I/O.

9.15.28.10.5 Digital outputs

The output state is transferred to the output channels with a fixed offset (<60 µs) based on the network cycle (SyncOut).

9.15.28.10.5.1 Switching state of digital outputs 1 to 8

Name:

DigitalOutput

DigitalOutput01 to DigitalOutput08

The switching state of digital outputs 1 to 8 are stored in this register.

Only function model 0 - Standard:

Setting "Packed outputs" in the Automation Studio I/O configuration determines whether all bits of this register should be applied individually as data points in the Automation Studio I/O assignment ("DigitalOutput01" to "DigitalOutput0x") or whether this register should be displayed as a single USINT data point ("DigitalOutput").

| Data type | Value | Information |
|-----------|------------------------|--|
| USINT | 0 to 255 | Packed outputs = On |
| | See the bit structure. | Packed outputs = Off or function model ≠ 0 - Standard. |

Bit structure:

| Bit | Name | Value | Information |
|-----|-----------------|-------|-------------------------|
| 0 | DigitalOutput01 | 0 | Digital output 01 reset |
| | | 1 | Digital output 01 set |
| ... | ... | ... | ... |
| 7 | DigitalOutput08 | 0 | Digital output 08 reset |
| | | 1 | Digital output 08 set |

9.15.28.10.6 Reading the module ID

Name:

asy_ModulID

This register offers the possibility to read the module ID.

| Data type | Values |
|-----------|-----------|
| UINT | Module ID |

9.15.28.10.7 Monitoring status of the digital outputs

On the module, the output states of the outputs are compared to the target states. The control of the output driver is used for the target state.

A change in the output state resets monitoring for that output. The status of each individual channel can be read. A change in the monitoring status is actively transmitted as an error message.

9.15.28.10.7.1 Status of digital outputs 1 to 8

Name:

StatusInput01

StatusDigitalOutput01 to StatusDigitalOutput08

This register is used to indicate the status of digital outputs 1 to 8.

Only function model 0 - Standard:

Setting "Packed outputs" in the Automation Studio I/O configuration determines whether all bits of this register should be applied individually as data points in the Automation Studio I/O assignment ("StatusDigitalOutput01" to "StatusDigitalOutput0x") or whether this register should be displayed as a single USINT data point ("StatusInput01").

| Data type | Value | Information |
|-----------|------------------------|--|
| USINT | 0 to 255 | Packed outputs = On |
| | See the bit structure. | Packed outputs = Off or function model ≠ 0 - Standard. |

Bit structure:

| Bit | Name | Value | Information |
|-----|-----------------------|-------|---|
| 0 | StatusDigitalOutput01 | 0 | Channel 01: No error |
| | | 1 | Channel 01: <ul style="list-style-type: none"> Short circuit or overload Channel switched on and missing I/O power supply Channel switched off and external voltage applied on channel |
| ... | ... | ... | ... |
| 8 | StatusDigitalOutput08 | 0 | Channel 08: No error |
| | | 1 | Channel 08: For an error description, see channel 01. |

9.15.28.10.8 Operating limit monitoring

The output supply of the module is monitored. I/O supply voltage <19.2 V is displayed as a warning.

9.15.28.10.8.1 Status of the supply voltage

Name:

asy_SupplyStatus

The status of the I/O supply voltage is mapped in this register.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|-------|---------------|-------|--|
| 0 - 1 | Reserved | 0 | |
| 2 | PowerSupply01 | 0 | I/O supply above the warning level of 20.4 V |
| | | 1 | I/O supply below the warning level of 20.4 V |
| 3 - 7 | Reserved | 0 | |

9.15.28.10.9 Additional function - switch digital outputs w/ delay using switching mask

In function model 1 - Output switching, it is possible to control the digital outputs with a delay.

The OutputDelay mask can be used to activate the delay for each channel individually. The module is controlled here using a 100 µs-based timer and the Output or OutputDelayed register.

Behavior of function model 1 - Output switching

With a timer delay of 0:

Output: DigitalOutput0x bits

When the delay is changed:

The bit string for DigitalOutput0x bits is output. The timer restarts.

Output: DigitalOutput0x bits

After delay time has expired:

The channels whose bits are set in the mask for OutputDelay are adapted to the corresponding OutputDelayed bits.

Output: DigitalOutput0x bits (if Enable bit = FALSE)
OutputDelayed bits (if Enable bit = TRUE)

Information:

Adjusting the output and restarting the timer take place immediately after transferring the new delay, even if the previous time has not yet passed.

9.15.28.10.9.1 Switching state of delayed digital outputs 1 to 8

Name:

DigitalOutput01Delayed to Digital08Delayed

According to the corresponding bit in the OutputDelay mask, the switching state of all digital outputs 1 to 8 are stored in the OutputDelayed bits after the delay time has expired.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|-----|------------------------|-------|-------------------------|
| 0 | DigitalOutput01Delayed | 0 | Digital output 01 reset |
| | | 1 | Digital output 01 set |
| ... | | ... | |
| 7 | DigitalOutput08Delayed | 0 | Digital output 08 reset |
| | | 1 | Digital output 08 set |

Information:

After the delay time has expired, only the channels with a bit set in the OutputDelay mask are adjusted to the OutputDelayed bits.

9.15.28.10.9.2 Switching mask after the delay time has expired

Name:

DigitalOutput01DelayEnable to DigitalOutput08DelayEnable

These registers create the mask for OutputDelay. They define which outputs are switched to the bit string for the OutputDelayed register after the delay time has expired.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|-----|----------------------------|-------|-------------------------------------|
| 0 | DigitalOutput01DelayEnable | 0 | Digital output 01 remains unchanged |
| | | 1 | Digital output 01 is toggled |
| ... | | ... | |
| 7 | DigitalOutput08DelayEnable | 0 | Digital output 08 remains unchanged |
| | | 1 | Digital output 08 is toggled |

9.15.28.10.9.3 Setting the delay

Name:

OutputDelayTime

This register can be used to set the delay in 100 µs steps.

After the delay time has expired, the digital outputs are adjusted according to the switching mask (register 6) and the delayed output pattern (register 4).

| Data type | Value |
|-----------|--|
| USINT | 0 to 255 (in 100 µs steps) ¹⁾ |

1) The value 0 disables processing

9.15.28.10.10 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time |
|--------------------|
| 150 µs |

9.15.28.10.11 Minimum I/O update time

The minimum I/O update time specifies how far the bus cycle can be reduced so that an I/O update is performed in each cycle.

| Minimum I/O update time |
|-------------------------|
| 150 µs |

9.15.29 X20(c)DO9321

Data sheet version: 3.17

9.15.29.1 General information

The module is equipped with 12 outputs for 1-wire connections. The module is designed for sink output wiring.

- 12 digital outputs
- Sink connection
- 1-wire connections
- Integrated output protection

9.15.29.2 Coated modules

Coated modules are X20 modules with a protective coating for the electronics component. This coating protects X20c modules from condensation and corrosive gases.

The modules' electronics are fully compatible with the corresponding X20 modules.

For simplification purposes, only images and module IDs of uncoated modules are used in this data sheet.

The coating has been certified according to the following standards:

- Condensation: BMW GS 95011-4, 2x 1 cycle
- Corrosive gas: EN 60068-2-60, method 4, exposure 21 days

9.15.29.2.1 Starting temperature

The starting temperature describes the minimum permissible ambient temperature when the power is switched off at the time the coated module is switched on. This is permitted to be as low as -40°C . During operation, the conditions as specified in the technical data continue to apply.

Information:

It is important to absolutely ensure that there is no forced cooling by air currents in a closed control cabinet, for example using a fan or ventilation slots.

9.15.29.3 Order data

9.15.29.6 Pinout

9.15.29.7 Connection example

9.15.29.8 Output circuit diagram**9.15.29.9 Derating**

There is no derating when operated below 55°C.

When operating above 55°C, the maximum current per channel is reduced to 0.35 A!

9.15.29.10 Switching inductive loads

Environmental temperature: 55°C, all outputs with the same load

Environmental temperature: 60°C, all outputs with the same load

Information:

If the maximum number of operating cycles per second is exceeded, an external inverse diode must be used.

Operating conditions outside of the area in the diagram are not permitted!

9.15.29.11 Register description

9.15.29.11.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section ["General data points" on page 3790](#).

9.15.29.11.2 Function model 0 - Standard

| Register | Fixed offset | Name | Data type | Read | | Write | |
|----------|--------------|--|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| | 1 | DigitalOutput | UINT | | | • | |
| 2 | 0 | Switching state of digital outputs 1 to 8 | USINT | | | • | |
| | | DigitalOutput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | DigitalOutput08 | Bit 7 | | | | |
| 3 | 1 | Switching state of digital outputs 9 to 12 | USINT | | | • | |
| | | DigitalOutput09 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | DigitalOutput12 | Bit 3 | | | | |
| | 1 | StatusInput01 | UINT | • | | | |
| 30 | 1 | Status of digital outputs 1 to 8 | USINT | • | | | |
| | | StatusDigitalOutput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | StatusDigitalOutput08 | Bit 7 | | | | |
| 31 | 2 | Status of digital outputs 9 to 12 | USINT | • | | | |
| | | StatusDigitalOutput09 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | StatusDigitalOutput12 | Bit 3 | | | | |

Fixed modules require their data points to be in a specific order in the X2X frame. Cyclic access occurs according to a predefined offset, not based on the register address.

Acyclic access continues to be based on the register numbers.

9.15.29.11.3 Function model 254 - Bus controller

| Register | Offset ¹⁾ | Name | Data type | Read | | Write | |
|----------|----------------------|--|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| 2 | 0 | Switching state of digital outputs 1 to 8 | USINT | | | • | |
| | | DigitalOutput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | DigitalOutput08 | Bit 7 | | | | |
| 3 | 1 | Switching state of digital outputs 9 to 12 | USINT | | | • | |
| | | DigitalOutput09 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | DigitalOutput12 | Bit 3 | | | | |
| 30 | - | Status of digital outputs 1 to 8 | USINT | | • | | |
| | | StatusDigitalOutput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | StatusDigitalOutput08 | Bit 7 | | | | |
| 31 | - | Status of digital outputs 9 to 12 | USINT | | • | | |
| | | StatusDigitalOutput09 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | StatusDigitalOutput12 | Bit 3 | | | | |

1) The offset specifies the position of the register within the CAN object.

9.15.29.11.3.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see ["Using I/O modules on the bus controller" on page 3789](#).

9.15.29.11.3.2 CAN I/O bus controller

The module occupies 2 digital logical slots on CAN I/O.

9.15.29.11.4 Digital outputs

The output state is transferred to the output channels with a fixed offset (<60 µs) based on the network cycle (SyncOut).

9.15.29.11.4.1 Switching state of digital outputs 1 to 12

Name:

DigitalOutput

DigitalOutput01 to DigitalOutput12

This register stores the switching state of digital outputs 1 to 12.

Only function model 0 - Standard:

Setting "Packed outputs" in the Automation Studio I/O configuration can be used to determine whether all bits of these registers should be applied individually as data points in the Automation Studio I/O mapping ("DigitalOutput01" to "DigitalOutput12") or whether these registers should be displayed as a single UINT data point ("DigitalOutput").

| Data type | Values | Information |
|-----------|------------------------|--|
| UINT | 0 to 4095 | Packed outputs = On |
| USINT | See the bit structure. | Packed outputs = Off or function model ≠ 0 - Standard. |

Bit structure:

Register 2, offset 0:

| Bit | Description | Value | Information |
|-----|-----------------|-------|-------------------------|
| 0 | DigitalOutput01 | 0 | Digital output 01 reset |
| | | 1 | Digital output 01 set |
| ... | | ... | |
| 7 | DigitalOutput08 | 0 | Digital output 08 reset |
| | | 1 | Digital output 08 set |

Register 3, offset 1:

| Bit | Description | Value | Information |
|-----|-----------------|-------|-------------------------|
| 0 | DigitalOutput09 | 0 | Digital output 09 reset |
| | | 1 | Digital output 09 set |
| ... | | ... | |
| 3 | DigitalOutput12 | 0 | Digital output 12 reset |
| | | 1 | Digital output 12 set |

9.15.29.11.5 Monitoring status of the digital outputs

On the module, the output states of the outputs are compared to the target states. The control of the output driver is used for the target state.

A change in the output state resets monitoring for that output. The status of each individual channel can be read. A change in the monitoring status is actively transmitted as an error message.

9.15.29.11.5.1 Status of digital outputs 1 to 12

Name:

StatusInput01

StatusDigitalOutput01 to StatusDigitalOutput12

This register contains the state of digital outputs 1 to 12.

Only function model 0 - Standard:

Setting "Packed outputs" in the Automation Studio I/O configuration can be used to determine whether all bits of these registers should be applied individually as data points in the Automation Studio I/O mapping ("StatusDigitalOutput01" to "StatusDigitalOutput12") or whether these registers should be displayed as a single UINT data point ("StatusInput01").

| Data type | Values | Information |
|-----------|------------------------|--|
| UINT | 0 to 4095 | Packed outputs = On |
| USINT | See the bit structure. | Packed outputs = Off or function model ≠ 0 - Standard. |

Bit structure:

Register 30, (offset 1):

| Bit | Description | Value | Description |
|-----|-----------------------|-------|---|
| 0 | StatusDigitalOutput01 | 0 | Channel 01: No error |
| | | 1 | Channel 01: <ul style="list-style-type: none"> Short circuit or overload Channel switched on and missing I/O power supply Channel switched off and external voltage applied on channel |
| ... | ... | ... | ... |
| 7 | StatusDigitalOutput08 | 0 | Channel 08: No error |
| | | 1 | Channel 08: For an error description, see channel 01. |

Register 31, (offset 2):

| Bit | Description | Value | Information |
|-----|-----------------------|-------|---|
| 0 | StatusDigitalOutput09 | 0 | Channel 09: No error |
| | | 1 | Channel 09: <ul style="list-style-type: none"> Short circuit or overload Channel switched on and missing I/O power supply Channel switched off and external voltage applied on channel |
| ... | ... | ... | ... |
| 3 | StatusDigitalOutput12 | 0 | Channel 12: No error |
| | | 1 | Channel 12: For an error description, see channel 09. |

9.15.29.11.6 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time |
|--------------------|
| 100 µs |

9.15.29.11.7 Minimum I/O update time

The minimum I/O update time specifies how far the bus cycle can be reduced so that an I/O update is performed in each cycle.

| Minimum I/O update time |
|---------------------------------|
| Equal to the minimum cycle time |

9.15.30 X20(c)DO9322

Data sheet version: 3.17

9.15.30.1 General information

The module is equipped with 12 outputs for 1-wire connections. The module is designed for source output wiring.

- 12 digital outputs
- Source connection
- 1-wire connections
- Integrated output protection

9.15.30.2 Coated modules

Coated modules are X20 modules with a protective coating for the electronics component. This coating protects X20c modules from condensation and corrosive gases.

The modules' electronics are fully compatible with the corresponding X20 modules.

For simplification purposes, only images and module IDs of uncoated modules are used in this data sheet.

The coating has been certified according to the following standards:

- Condensation: BMW GS 95011-4, 2x 1 cycle
- Corrosive gas: EN 60068-2-60, method 4, exposure 21 days

9.15.30.2.1 Starting temperature

The starting temperature describes the minimum permissible ambient temperature when the power is switched off at the time the coated module is switched on. This is permitted to be as low as -40°C . During operation, the conditions as specified in the technical data continue to apply.

Information:

It is important to absolutely ensure that there is no forced cooling by air currents in a closed control cabinet, for example using a fan or ventilation slots.

9.15.30.3 Order data

| Model number | Short description | Figure |
|--------------|--|---|
| | Digital outputs |  |
| X20DO9322 | X20 digital output module, 12 outputs, 24 VDC, 0.5 A, source, 1-wire connections | |

- Number of outputs x $R_{DS(on)}$ x Nominal output current². For a calculation example, see section "Mechanical and electrical configuration" of the X20 system user's manual.
- @ ≤ 1 k Ω

9.15.30.5 Status LEDs

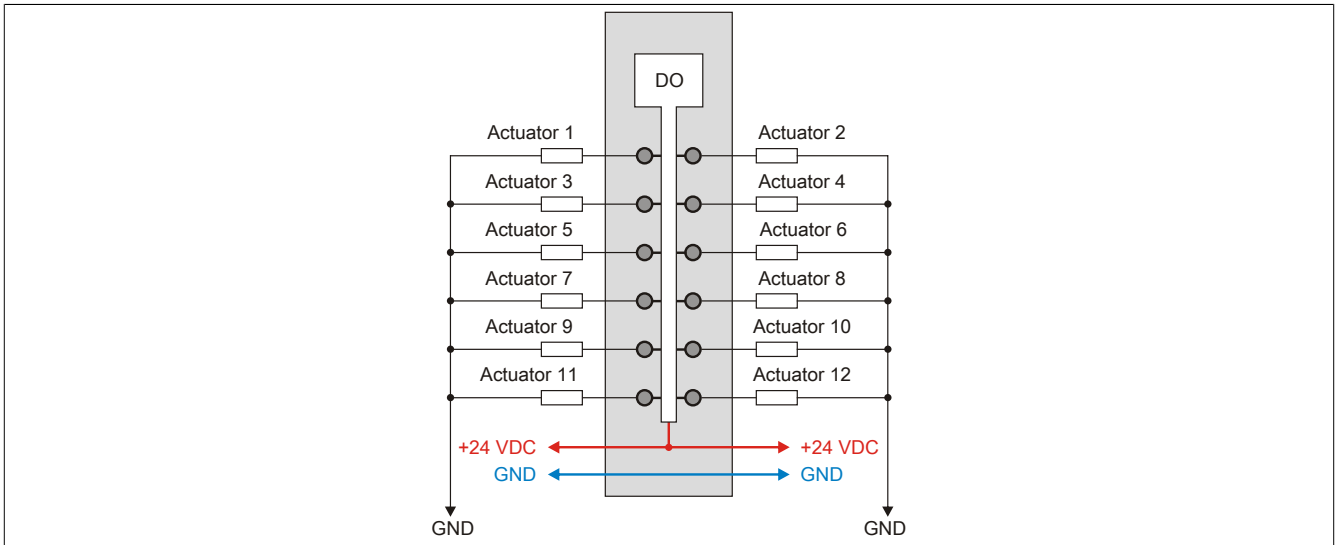

For a description of the various operating modes, see "Diagnostic LEDs" on page 3787.

| Figure | LED | Color | Status | Description | |
|--|--------|-------|-----------------------------|---|---|
|  | r | Green | Off | Module supply not connected | |
| | | | Single flash | RESET mode | |
| | | | Blinking | PREOPERATIONAL mode | |
| | | | On | RUN mode | |
| | e | Red | Off | Module supply not connected or everything OK | |
| | | | Single flash | Warning/Error on an I/O channel. Level monitoring for digital outputs has been triggered. | |
| | e + r | | Red on / Green single flash | Invalid firmware | |
| | 1 - 12 | | Orange | | Output status of the corresponding digital output |

9.15.30.6 Pinout

9.15.30.7 Connection example

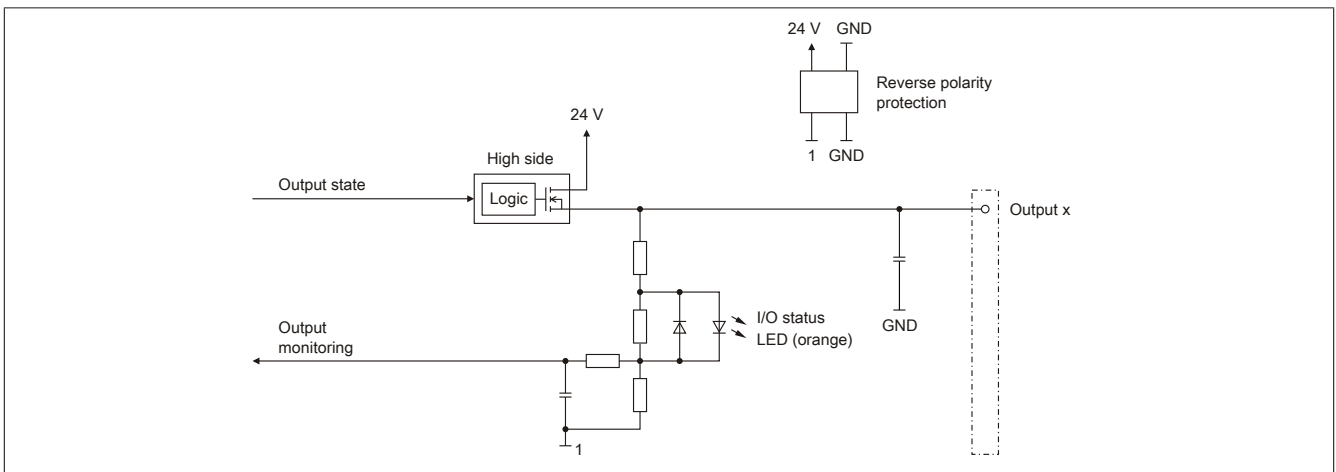

Caution!

If the module is operated outside specifications, the output current may rise above the maximum permissible nominal current. This applies both to individual channels and to the summation current of the module.

Appropriate cable cross-sections or external safety measures must therefore be provided.

9.15.30.8 Output circuit diagram

9.15.30.9 Derating

There is no derating when operated below 55°C.

When operating above 55°C, the maximum current per channel is reduced to 0.35 A!

9.15.30.10 Switching inductive loads

Ambient temperature: 55°C, all outputs with the same load

Ambient temperature: 60°C, all outputs with the same load

**Information:**

If the maximum number of operating cycles per second is exceeded, an external inverse diode must be used.

Operating conditions outside of the area in the diagram are not permitted!

9.15.30.11 Register description

9.15.30.11.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section ["General data points" on page 3790](#).

9.15.30.11.2 Function model 0 - Standard

| Register | Fixed offset | Name | Data type | Read | | Write | |
|----------|--------------|--|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| | 1 | DigitalOutput | UINT | | | • | |
| 2 | 0 | Switching state of digital outputs 1 to 8 | USINT | | | • | |
| | | DigitalOutput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | DigitalOutput08 | Bit 7 | | | | |
| 3 | 1 | Switching state of digital outputs 9 to 12 | USINT | | | • | |
| | | DigitalOutput09 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | DigitalOutput12 | Bit 3 | | | | |
| | 1 | StatusInput01 | UINT | • | | | |
| 30 | 1 | Status of digital outputs 1 to 8 | USINT | • | | | |
| | | StatusDigitalOutput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | StatusDigitalOutput08 | Bit 7 | | | | |
| 31 | 2 | Status of digital outputs 9 to 12 | USINT | • | | | |
| | | StatusDigitalOutput09 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | StatusDigitalOutput12 | Bit 3 | | | | |

Fixed modules require their data points to be in a specific order in the X2X frame. Cyclic access occurs according to a predefined offset, not based on the register address.

Acyclic access continues to be based on the register numbers.

9.15.30.11.3 Function model 254 - Bus controller

| Register | Offset ¹⁾ | Name | Data type | Read | | Write | |
|----------|----------------------|--|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| 2 | 0 | Switching state of digital outputs 1 to 8 | USINT | | | • | |
| | | DigitalOutput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | DigitalOutput08 | Bit 7 | | | | |
| 3 | 1 | Switching state of digital outputs 9 to 12 | USINT | | | • | |
| | | DigitalOutput09 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | DigitalOutput12 | Bit 3 | | | | |
| 30 | - | Status of digital outputs 1 to 8 | USINT | | • | | |
| | | StatusDigitalOutput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | StatusDigitalOutput08 | Bit 7 | | | | |
| 31 | - | Status of digital outputs 9 to 12 | USINT | | • | | |
| | | StatusDigitalOutput09 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | StatusDigitalOutput12 | Bit 3 | | | | |

1) The offset specifies the position of the register within the CAN object.

9.15.30.11.3.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see ["Using I/O modules on the bus controller" on page 3789](#).

9.15.30.11.3.2 CAN I/O bus controller

The module occupies 2 digital logical slots on CAN I/O.

9.15.30.11.4 Digital outputs

The output state is transferred to the output channels with a fixed offset (<60 µs) based on the network cycle (SyncOut).

9.15.30.11.4.1 Switching state of digital outputs 1 to 12

Name:

DigitalOutput

DigitalOutput01 to DigitalOutput12

This register stores the switching state of digital outputs 1 to 12.

Only function model 0 - Standard:

Setting "Packed outputs" in the Automation Studio I/O configuration can be used to determine whether all bits of these registers should be applied individually as data points in the Automation Studio I/O mapping ("DigitalOutput01" to "DigitalOutput12") or whether these registers should be displayed as a single UINT data point ("DigitalOutput").

| Data type | Values | Information |
|-----------|------------------------|--|
| UINT | 0 to 4095 | Packed outputs = On |
| USINT | See the bit structure. | Packed outputs = Off or function model ≠ 0 - Standard. |

Bit structure:

Register 2, offset 0:

| Bit | Description | Value | Information |
|-----|-----------------|-------|-------------------------|
| 0 | DigitalOutput01 | 0 | Digital output 01 reset |
| | | 1 | Digital output 01 set |
| ... | | ... | |
| 7 | DigitalOutput08 | 0 | Digital output 08 reset |
| | | 1 | Digital output 08 set |

Register 3, offset 1:

| Bit | Description | Value | Information |
|-----|-----------------|-------|-------------------------|
| 0 | DigitalOutput09 | 0 | Digital output 09 reset |
| | | 1 | Digital output 09 set |
| ... | | ... | |
| 3 | DigitalOutput12 | 0 | Digital output 12 reset |
| | | 1 | Digital output 12 set |

9.15.30.11.5 Monitoring status of the digital outputs

On the module, the output states of the outputs are compared to the target states. The control of the output driver is used for the target state.

A change in the output state resets monitoring for that output. The status of each individual channel can be read. A change in the monitoring status is actively transmitted as an error message.

9.15.30.11.5.1 Status of digital outputs 1 to 12

Name:

StatusInput01

StatusDigitalOutput01 to StatusDigitalOutput12

This register contains the state of digital outputs 1 to 12.

Only function model 0 - Standard:

Setting "Packed outputs" in the Automation Studio I/O configuration can be used to determine whether all bits of these registers should be applied individually as data points in the Automation Studio I/O mapping ("StatusDigitalOutput01" to "StatusDigitalOutput12") or whether these registers should be displayed as a single UINT data point ("StatusInput01").

| Data type | Values | Information |
|-----------|------------------------|--|
| UINT | 0 to 4095 | Packed outputs = On |
| USINT | See the bit structure. | Packed outputs = Off or function model ≠ 0 - Standard. |

Bit structure:

Register 30, (offset 1):

| Bit | Description | Value | Description |
|-----|-----------------------|-------|---|
| 0 | StatusDigitalOutput01 | 0 | Channel 01: No error |
| | | 1 | Channel 01: <ul style="list-style-type: none"> Short circuit or overload Channel switched on and missing I/O power supply Channel switched off and external voltage applied on channel |
| ... | ... | ... | ... |
| 7 | StatusDigitalOutput08 | 0 | Channel 08: No error |
| | | 1 | Channel 08: For an error description, see channel 01. |

Register 31, (offset 2):

| Bit | Description | Value | Information |
|-----|-----------------------|-------|---|
| 0 | StatusDigitalOutput09 | 0 | Channel 09: No error |
| | | 1 | Channel 09: <ul style="list-style-type: none"> Short circuit or overload Channel switched on and missing I/O power supply Channel switched off and external voltage applied on channel |
| ... | ... | ... | ... |
| 3 | StatusDigitalOutput12 | 0 | Channel 12: No error |
| | | 1 | Channel 12: For an error description, see channel 09. |

9.15.30.11.6 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time |
|--------------------|
| 100 µs |

9.15.30.11.7 Minimum I/O update time

The minimum I/O update time specifies how far the bus cycle can be reduced so that an I/O update is performed in each cycle.

| Minimum I/O update time |
|---------------------------------|
| Equal to the minimum cycle time |

9.15.31 X20DOD322

Data sheet version: 2.06

9.15.31.1 General information

The X20DOD322 module is equipped with eight outputs for 1-wire or 2-wire connections. The X20DOD322 is designed for source output wiring.

- 8 digital outputs
- Source connection
- 2-wire connections
- GND for signal supply
- Integrated output protection

9.15.31.2 Order data

9.15.31.4 Status LEDs

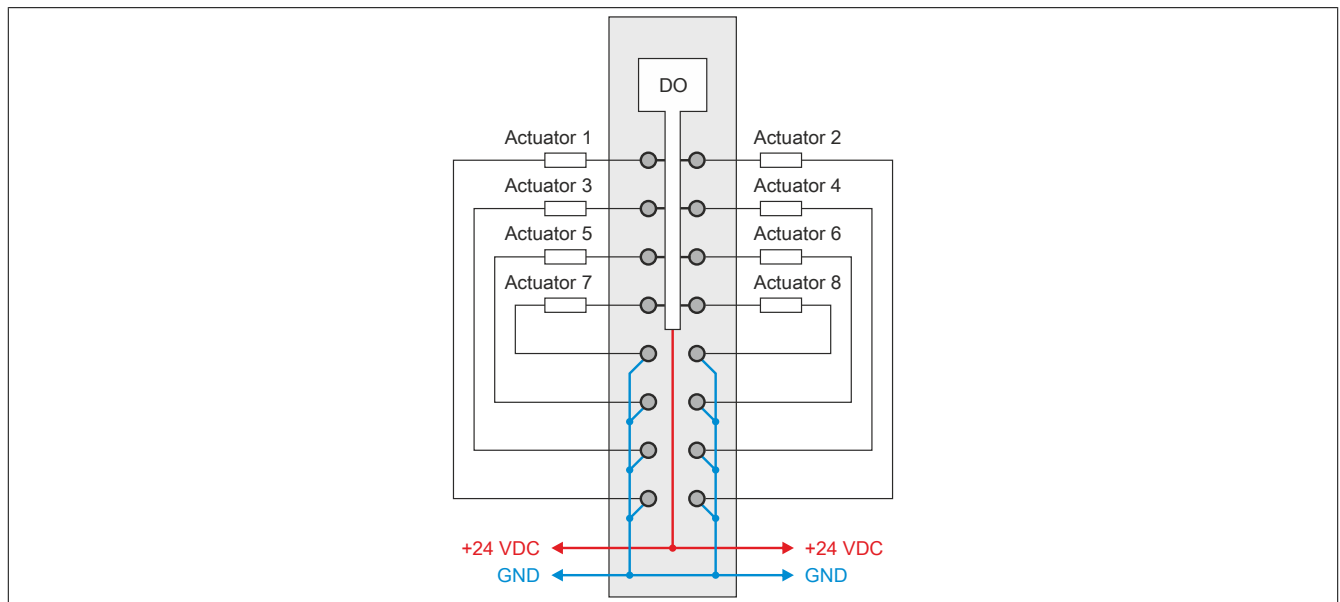

For a description of the various operating modes, see "[Diagnostic LEDs](#)" on page 3787.

| Figure | LED | Color | Status | Description |
|---|-------|--------|-----------------------------|---|
|  | S | Green | Off | Module supply not connected |
| | | | Single flash | RESET mode |
| | | | Blinking | PREOPERATIONAL mode |
| | | | On | RUN mode |
| | Red | Red | Off | Module supply not connected or everything OK |
| | | | Single flash | Warning/Error on an I/O channel. Level monitoring for digital outputs has been triggered. |
| | 1 - 8 | Orange | Red on / Green single flash | Invalid firmware |
| | | | | Output status of the corresponding digital output |

9.15.31.5 Pinout

9.15.31.6 Connection example

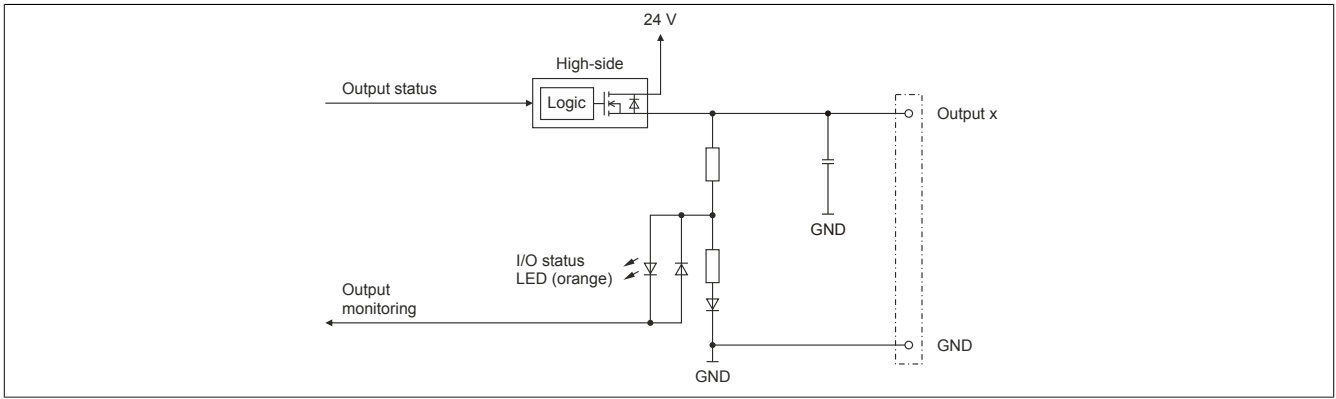

Caution!

If the module is operated outside specifications, the output current may rise above the maximum permissible nominal current. This applies both to individual channels and to the summation current of the module.

Appropriate cable cross-sections or external safety measures must therefore be provided.

9.15.31.7 Output circuit diagram

9.15.31.8 Switching inductive loads

Environmental temperature: 60°C, all outputs with the same load

Information:

If the maximum number of operating cycles per second is exceeded, an external inverse diode must be used.

Operating conditions outside of the area in the diagram are not permitted!

9.15.31.9 Register description

9.15.31.9.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section ["General data points" on page 3790](#).

9.15.31.9.2 Function model 0 - Standard

| Register | Fixed offset | Name | Data type | Read | | Write | |
|----------|--------------|-------------------------------------|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| 2 | 0 | DigitalOutput | USINT | | | • | |
| | | DigitalOutput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | DigitalOutput08 | Bit 7 | | | | |
| 30 | 1 | StatusDigitalOutput | USINT | • | | | |
| | | StatusDigitalOutput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | StatusDigitalOutput08 | Bit 7 | | | | |

Fixed modules require their data points to be in a specific order in the X2X frame. Cyclic access occurs according to a predefined offset, not based on the register address.

Acyclic access continues to be based on the register numbers.

9.15.31.9.3 Function model 254 - Bus Controller

| Register | Offset ¹⁾ | Name | Data type | Read | | Write | |
|----------|----------------------|---|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| 2 | 0 | Switching state of digital outputs 1 to 8 | USINT | | | • | |
| | | DigitalOutput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | DigitalOutput08 | Bit 7 | | | | |
| 30 | - | Status of digital outputs 1 to 8 | USINT | | • | | |
| | | StatusDigitalOutput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | StatusDigitalOutput08 | Bit 7 | | | | |

1) The offset specifies where the register is within the CAN object.

9.15.31.9.3.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see ["Using I/O modules on the bus controller" on page 3789](#).

9.15.31.9.3.2 CAN I/O bus controller

The module occupies 1 digital logical slot on CAN I/O.

9.15.31.9.4 Digital outputs

The output state is transferred to the output channels with a fixed offset (<60 µs) based on the network cycle (SyncOut).

9.15.31.9.4.1 Switching state of digital outputs 1 to 8

Name:

DigitalOutput

DigitalOutput01 to DigitalOutput08

The switching state of digital outputs 1 to 8 are stored in this register.

Only function model 0 - Standard:

Setting "Packed outputs" in the Automation Studio I/O configuration determines whether all bits of this register should be applied individually as data points in the Automation Studio I/O assignment ("DigitalOutput01" to "DigitalOutput0x") or whether this register should be displayed as a single USINT data point ("DigitalOutput").

| Data type | Value | Information |
|-----------|------------------------|--|
| USINT | 0 to 255 | Packed outputs = On |
| | See the bit structure. | Packed outputs = Off or function model ≠ 0 - Standard. |

Bit structure:

| Bit | Name | Value | Information |
|-----|-----------------|-------|-------------------------|
| 0 | DigitalOutput01 | 0 | Digital output 01 reset |
| | | 1 | Digital output 01 set |
| ... | | ... | |
| 7 | DigitalOutput08 | 0 | Digital output 08 reset |
| | | 1 | Digital output 08 set |

9.15.31.9.5 Monitoring status of the digital outputs

On the module, the output states of the outputs are compared to the target states. The control of the output driver is used for the target state.

A change in the output state resets monitoring for that output. The status of each individual channel can be read. A change in the monitoring status is actively transmitted as an error message.

9.15.31.9.5.1 Status of digital outputs 1 to 8

Name:

StatusDigitalOutput

StatusDigitalOutput01 to StatusDigitalOutput08

The status of digital outputs 1 to 8 is mapped in this register.

Only function model 0 - Standard:

Setting "Packed outputs" in the Automation Studio I/O configuration determines whether all bits of this register should be applied individually as data points in the Automation Studio I/O assignment ("StatusDigitalOutput01" to "StatusDigitalOutput0x") or whether this register should be displayed as a single USINT data point ("StatusDigitalOutput").

| Data type | Value | Information |
|-----------|------------------------|--|
| USINT | 0 to 255 | Packed outputs = On |
| | See the bit structure. | Packed outputs = Off or function model ≠ 0 - Standard. |

Bit structure:

| Bit | Name | Value | Information |
|-----|-----------------------|-------|---|
| 0 | StatusDigitalOutput01 | 0 | Channel 01: No error |
| | | 1 | Channel 01: <ul style="list-style-type: none"> Short circuit or overload Channel switched on and missing I/O power supply Channel switched off and external voltage applied on channel |
| ... | | ... | |
| 8 | StatusDigitalOutput08 | 0 | Channel 08: No error |
| | | 1 | Channel 08: For an error description, see channel 01. |

9.15.31.9.6 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time |
|--------------------|
| 100 μ s |

9.15.31.9.7 Minimum I/O update time

The minimum I/O update time specifies how far the bus cycle can be reduced so that an I/O update is performed in each cycle.

| Minimum I/O update time |
|---------------------------------|
| Equal to the minimum cycle time |

9.15.32 X20(c)DOF322

Data sheet version: 2.28

9.15.32.1 General information

The module is equipped with 16 outputs for 1-wire connections. The module is designed for source output wiring.

- 16 digital outputs
- Source connection
- 1-wire connections
- Integrated output protection

9.15.32.2 Coated modules

Coated modules are X20 modules with a protective coating for the electronics component. This coating protects X20c modules from condensation and corrosive gases.

The modules' electronics are fully compatible with the corresponding X20 modules.

For simplification purposes, only images and module IDs of uncoated modules are used in this data sheet.

The coating has been certified according to the following standards:

- Condensation: BMW GS 95011-4, 2x 1 cycle
- Corrosive gas: EN 60068-2-60, method 4, exposure 21 days

9.15.32.3 Order data

9.15.32.6 Pinout

9.15.32.7 Connection example

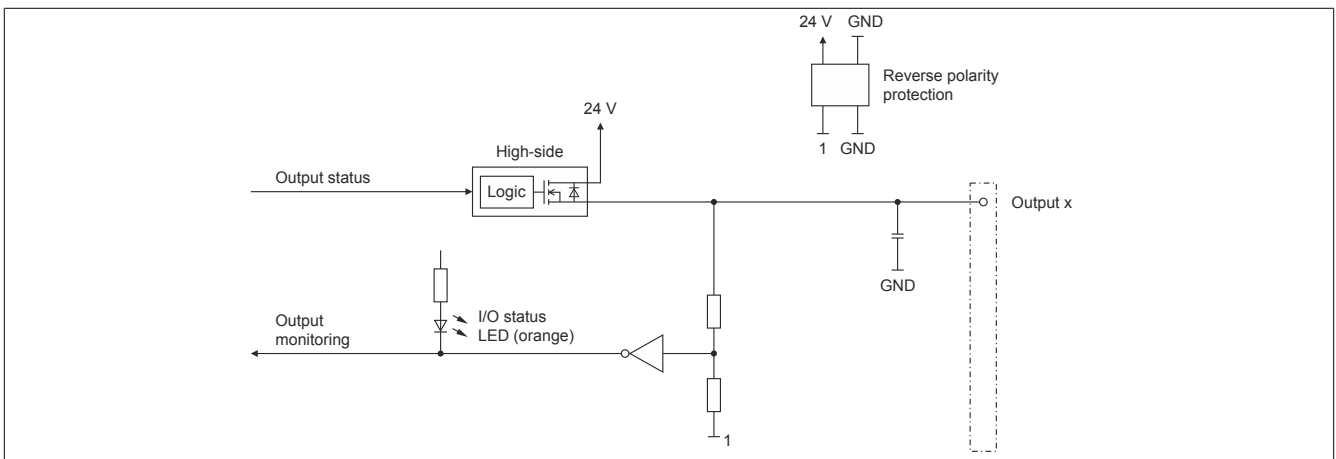

Caution!

If the module is operated outside specifications, the output current may rise above the maximum permissible nominal current. This applies both to individual channels and to the summation current of the module.

Appropriate cable cross-sections or external safety measures must therefore be provided.

9.15.32.8 Output circuit diagram

9.15.32.9 Derating

There is no derating when operated below 55°C.

When operating above 55°C, the maximum current per channel is reduced to 0.35 A!

9.15.32.10 Switching inductive loads

Environmental temperature: 55°C, all outputs with the same load

Environmental temperature: 60°C, all outputs with the same load

Information:

If the maximum number of operating cycles per second is exceeded, an external inverse diode must be used.

Operating conditions outside of the area in the diagram are not permitted!

9.15.32.11 Register description

9.15.32.11.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section ["General data points" on page 3790](#).

9.15.32.11.2 Function model 0 - Standard

| Register | Fixed offset | Name | Data type | Read | | Write | |
|-----------------------|--------------|--|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| 2 | 0 | DigitalOutput | UINT | | | • | |
| | | Switching state of digital outputs 1 to 8 | USINT | | | | |
| | | DigitalOutput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| DigitalOutput08 | Bit 7 | | | | | | |
| 3 | 1 | Switching state of digital outputs 9 to 16 | USINT | | | | |
| | | DigitalOutput09 | Bit 0 | | | | |
| | | ... | ... | | | | |

| | | StatusDigitalOutput09 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | StatusDigitalOutput16 | Bit 7 | | | | |

1) The offset specifies where the register is within the CAN object.

9.15.32.11.3.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see ["Using I/O modules on the bus controller" on page 3789](#).

9.15.32.11.3.2 CAN I/O bus controller

The module occupies 2 digital logical slots on CAN I/O.

9.15.32.11.4 Digital outputs

The output state is transferred to the output channels with a fixed offset (<60 µs) based on the network cycle (SyncOut).

9.15.32.11.4.1 Switching state of digital outputs 1 to 16

Name:

DigitalOutput

DigitalOutput01 to DigitalOutput16

The switching state of digital outputs 1 to 16 are stored in this register.

Function model 0 - Standard only:

The "Packed outputs" setting in the Automation Studio I/O configuration is used to determine whether all of these registers' bits should be set up individually as data points in the Automation Studio I/O mapping ("DigitalOutput01" through "DigitalOutput16") or whether these registers should be displayed as an individual UINT data point ("DigitalOutput").

| Data type | Values | Value |
|-----------|-------------------|--|
| UINT | 0 to 65535 | Packed outputs = on |
| USINT | See bit structure | Packed outputs = Off or function model ≠ 0 - Standard. |

Bit structure:

Register 2, Offset 0:

| Bit | Name | Value | Information |
|-----|-----------------|-------|-------------------------|
| 0 | DigitalOutput01 | 0 | Digital output 01 reset |
| | | 1 | Digital output 01 set |
| ... | | ... | |
| 7 | DigitalOutput08 | 0 | Digital output 08 reset |
| | | 1 | Digital output 08 set |

Register 3, Offset 1:

| Bit | Name | Value | Information |
|-----|-----------------|-------|-------------------------|
| 0 | DigitalOutput09 | 0 | Digital output 09 reset |
| | | 1 | Digital output 09 set |
| ... | | ... | |
| 7 | DigitalOutput16 | 0 | Digital output 16 reset |
| | | 1 | Digital output 16 set |

9.15.32.11.5 Monitoring status of the digital outputs

On the module, the output states of the outputs are compared to the target states. The control of the output driver is used for the target state.

A change in the output state resets monitoring for that output. The status of each individual channel can be read. A change in the monitoring status is actively transmitted as an error message.

9.15.32.11.5.1 Status of digital outputs 1 to 16

Name:

StatusDigitalOutput

StatusDigitalOutput01 to StatusDigitalOutput16

The status of digital outputs 1 to 16 is mapped in this register.

Function model 0 - Standard only:

The "packed outputs" setting in the Automation Studio I/O configuration is used to determine whether all of these registers' bits should be set up individually as data points in the Automation Studio I/O mapping ("StatusDigitalOutput01" through "StatusDigitalOutput16") or whether these registers should be displayed as an individual UINT data point ("StatusDigitalOutput").

| Data type | Values | |
|-----------|------------------------|--|
| UINT | 0 to 65535 | Packed outputs = on |
| USINT | See the bit structure. | Packed outputs = Off or function model ≠ 0 - Standard. |

Bit structure:

Register 30, Offset 1:

| Bit | Name | Value | Description |
|-----|-----------------------|-------|---|
| 0 | StatusDigitalOutput01 | 0 | Channel 01: No error |
| | | 1 | Channel 01: <ul style="list-style-type: none"> Short circuit or overload Channel switched on and missing I/O power supply Channel switched off and external voltage applied on channel |
| ... | | ... | |
| 7 | StatusDigitalOutput08 | 0 | Channel 08: No error |
| | | 1 | Channel 08: For error description, see channel 01 |

Register 31, Offset 2:

| Bit | Name | Value | Information |
|-----|-----------------------|-------|---|
| 0 | StatusDigitalOutput09 | 0 | Channel 09: No error |
| | | 1 | Channel 09: <ul style="list-style-type: none"> Short circuit or overload Channel switched on and missing I/O power supply Channel switched off and external voltage applied on channel |
| ... | | ... | |
| 7 | StatusDigitalOutput16 | 0 | Channel 16: No error |
| | | 1 | Channel 16: For error description, see channel 09 |

9.15.32.11.6 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time |
|--------------------|
| 100 µs |

9.15.32.11.7 Minimum I/O update time

The minimum I/O update time specifies how far the bus cycle can be reduced so that an I/O update is performed in each cycle.

| Minimum I/O update time |
|---------------------------------|
| Equal to the minimum cycle time |

9.16 Digital signal processing modules

The highly flexible digital signal processor modules can be implemented for a wide range of tasks involving the creation or processing of digital signals.

9.16.1 Summary

| Model number | Short description | Page |
|--------------|---|------|
| X20CM1201 | X20 combination module, 1 AB incremental encoder, 24 V, 4 digital inputs 24 V, 4 channels 24 V configurable as inputs or outputs, flexible digital controller logic | 1875 |
| X20DC1073 | X20 digital counter module, 1x SinCos, 1 Vss, 400 kHz input frequency, encoder monitoring, NetTime function | 1899 |
| X20DS1119 | X20 multifunction digital signal processor, 3 digital channels 5 V (symmetrical) configurable as inputs or outputs, 2 digital input channels 24 V (asymmetrical), max. 2 event counters, 1 universal counter pair as AB counter or up/down counter, linear movement generator (A/B, direction/frequency) with 1 reference pulse, 1 SSI absolute encoder, NetTime function | 1914 |
| X20DS1319 | X20 multifunction digital signal processor, 4 digital input channels, 4 digital channels configurable as inputs or outputs, 2 event counters 1 universal counter pair as AB counter or up/down counter, linear movement generator (A/B, direction/frequency) with max. 2 reference pulses, SSI absolute encoder, NetTime function | 1957 |
| X20DS1828 | X20 digital signal module, 1 HIPERFACE interface, NetTime function | 1999 |
| X20DS1928 | X20 digital signal module, 1 EnDat 2.1/2.2 interface, NetTime function | 2031 |
| X20DS4389 | X20 digital signal module, 4 digital inputs, 24 VDC, 4 digital outputs, 24 VDC, 0.1 A, oversampling I/O functions, time-triggered I/O functions, NetTime function | 2056 |
| X20cDS1119 | X20 multifunction digital signal processor, coated, 3 digital channels 5 V (symmetrical) configurable as inputs or outputs, 2 digital input channels 24 V (asymmetrical), max. 2 event counters, 1 universal counter pair as AB counter or up/down counter, linear movement generator (A/B, direction/frequency) with 1 reference pulse, 1 SSI absolute encoder, NetTime function | 1914 |

9.16.2 X20CM1201

Data sheet version: 3.13

9.16.2.1 General information

The module can be used to configure and carry out simple movements. For this purpose, the module has one AB encoder input and a total of 8 digital channels. Four of them are inputs, and the other 4 can be set as either an input or an output. Various output bit patterns are stored directly in the module.

The module is perfectly suited for easy to create drive control tasks for program and event controlled motor movements. Feed movements using drives with 2 speeds and forward/reverse movement are created easily and efficiently.

- Command-dependent digital pattern output
- Counter-dependent output circuit
- Event-controlled abort criteria
- 4 digital inputs
- 4 digital channels, configurable as inputs or outputs

9.16.2.2 Order data

| Model number | Short description | Figure |
|--------------|---|--|
| | Digital signal processing and preparation |  |
| X20CM1201 | X20 combination module, 1 AB incremental encoder, 24 V, 4 digital inputs 24 V, 4 channels 24 V configurable as inputs or outputs, flexible digital controller logic | |
| | Required accessories | |
| | Bus modules | |

| Digital inputs | |
| Quantity | 4 + 4 additional channels, configurable as inputs or outputs |
| Nominal voltage | 24 VDC |
| Input voltage | 24 VDC -15 % / +20 % |
| Input current at 24 VDC | Approx. 1.3 mA |
| Input circuit | Sink |
| Input filter | |
| Hardware | ≤2 μs |
| Software | - |
| Connection type | 1-wire connections |
| Input resistance | 18.4 kΩ |
| Switching threshold | |
| Low | <5 VDC |
| High | >15 VDC |
| Isolation voltage between channel and bus | 500 V _{eff} |
| AB incremental encoder | |
| Quantity | 1 |
| Encoder inputs | 24 V, asymmetrical |
| Counter size | 32-bit |
| Input frequency | Max. 100 kHz |
| Evaluation | 4x |
| Encoder power supply | Module-internal, max. 600 mA |
| Overload characteristics of encoder power supply | Short circuit protection, overload protection |
| Digital outputs | |
| Quantity | Up to 4, configurable as inputs or outputs using software |
| Variant | Push / Pull / Push-Pull |
| Nominal voltage | 24 VDC |
| Switching voltage | 24 VDC -15 % / +20 % |
| Nominal output current | 0.1 A |
| Total nominal current | 0.4 A |
| Connection type | 1-wire connections |
| Output circuit | Sink or source |
| Output protection | Thermal cutoff if overcurrent or short circuit occurs, integrated protection for switching inductances |
| Actuator power supply | Module-internal, max. 600 mA |
| Diagnostic status | Output monitoring |
| Leakage current when switched off | Max. 25 μA |
| Residual voltage | <0.9 V at 0.1 A rated current |
| Peak short-circuit current | <10 A |
| Switch-on in the event of overload shutdown or short-circuit shutdown | Approx. 10 ms (depends on the module temperature) |
| Switching delay | |
| 0 → 1 | <2 μs |
| 1 → 0 | <2 μs |

Table 359: X20CM1201 - Technical data

| Model number | X20CM1201 | |
|--|--|--|
| Switching frequency | | |
| Resistive load | Max. 24 kHz | |
| Inductive load | See section "Switching inductive loads" (at 90% duty cycle). | |
| Braking voltage when switching off inductive loads | Switching voltage + 0.6 VDC | |
| Isolation voltage between channel and bus | 500 V _{eff} | |
| Electrical properties | | |
| Electrical isolation | Channel isolated from bus Channel not isolated from channel | |
| Operating conditions | | |
| Mounting orientation | | |
| Horizontal | Yes | |
| Vertical | Yes | |
| Installation elevation above sea level | | |
| 0 to 2000 m | No limitations | |

9.16.2.4 LED status indicators

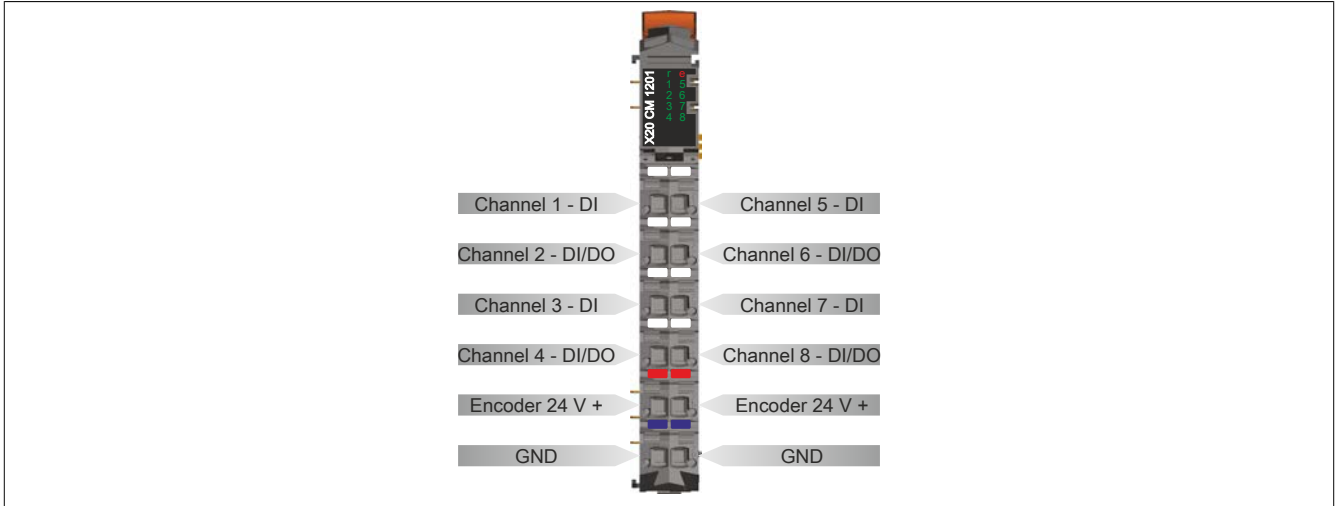

For a description of the various operating modes, see "[Diagnostic LEDs](#)" on page 3787.

| Figure | LED | Color | Status | Description |
|---|-------|-------|--------------|--|
|  | r | Green | Off | No power to module |
| | | | Single flash | RESET mode |
| | | | Double flash | BOOT mode (during firmware update) ¹⁾ |
| | | | Blinking | PREOPERATIONAL mode |
| | e | Red | On | RUN mode |
| | | | Off | No power to module or everything OK |
| | 1 - 8 | Green | On | Error or reset status |
| | | | Off | Status of the corresponding digital signal |

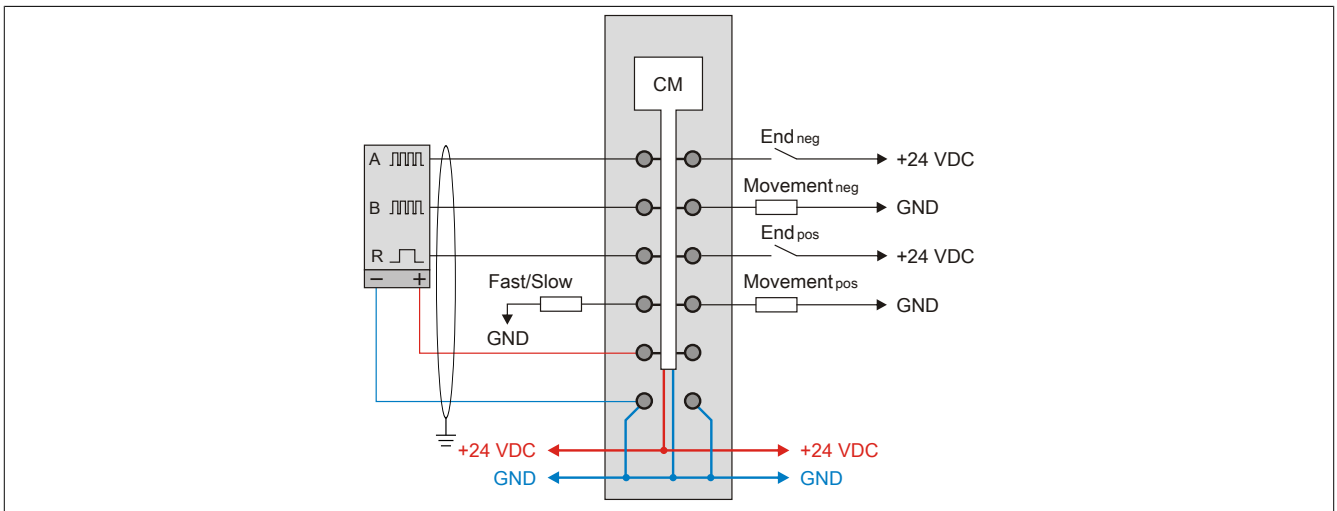

1) Depending on the configuration, a firmware update can take up to several minutes.

9.16.2.5 Pinout

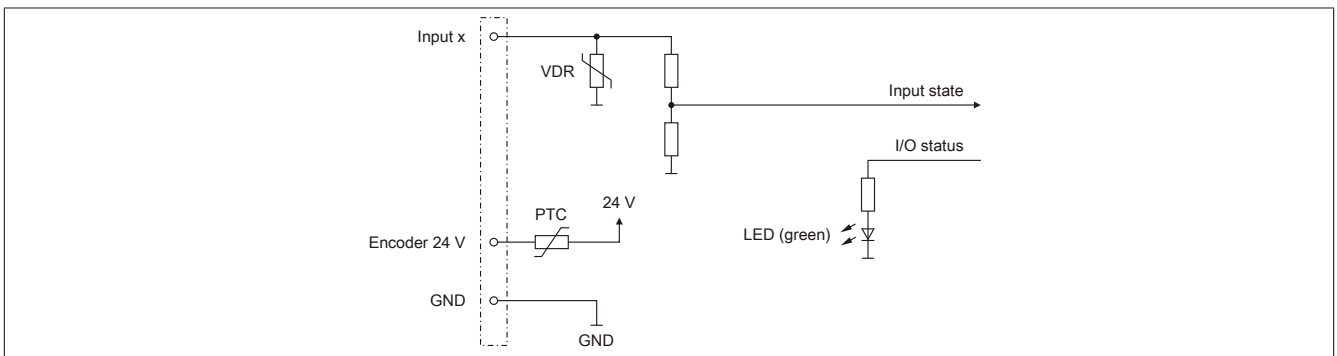

Shielded cables must be used for all signal lines.

9.16.2.10 Register description

9.16.2.10.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section ["General data points" on page 3790](#).

9.16.2.10.2 Function model 0 - Standard

| Register | Name | Data type | Read | | Write | |
|--|--|-----------|--------|---------|--------|---------|
| | | | Cyclic | Acyclic | Cyclic | Acyclic |
| Configuration | | | | | | |
| 130 | CycleTimeCff | | | | | • |
| Communication - Command interface | | | | | | |
| 1 | SendCommand | USINT | | | • | |

| 12 | 4 | SendData | DINT | | | • | |
| 1 | 1 | ReadStatus | USINT | • | | | |
| 3 | 0 | ReadIndex | USINT | • | | | |
| 12 | 4 | ReadData | DINT | • | | | |
| Communication - Display register | | | | | | | |
| 20 | - | ABRposition | DINT | | • | | |
| 28 | - | TargetABRposition | DINT | | • | | |
| 36 | - | ErrorInfo | UDINT | | • | | |
| 47 | - | Displaying the digital inputs | USINT | | • | | |
| | | DigitalInput01 | Bit 0 | | | | |
| | | ... | ... | | | | |
| | | DigitalInput08 | Bit 7 | | | | |
| 55 | - | Status of encoder power supply | USINT | | • | | |
| | | PowerSupply01 | Bit 0 | | | | |

1) The offset specifies the position of the register within the CAN object.

9.16.2.10.3.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see ["Using I/O modules on the bus controller" on page 3789](#).

9.16.2.10.3.2 CAN I/O bus controller

The module occupies 1 analog logical slot on CAN I/O.

9.16.2.10.4 General

This is a low-end positioning module that supports 2 speed movements in positive and negative directions. No active position check is performed. The movements are started using a command interface and stopped by the position comparator (target position) or user-defined trigger conditions (input edge/ comparison). Every movement step is time-monitored. Up to 8 movement steps can be linked to form one continuous movement.

Position, input states and timeout periods are checked during each system cycle.

9.16.2.10.4.1 Types of movement

The module supports the following types of movement:

- Negative direction - fast
- Negative direction - slow
- Stop
- Positive direction - slow
- Positive direction - fast

The initial state of each type of movement is defined by the user. In order to avoid false input levels on the motor (caused by signal runtimes), and ensure timing (e.g. during direction change), there are additional [command parameters](#) to describe a operating mode change:

- 0x93 Negative directional setup state
- 0x88 Negative directional setup time
- 0x8A Negative directional stop time
- 0x95 Positive direction setup state
- 0x89 Positive direction setup time
- 0x8B Positive direction stop time
- 0x94 Stop state

Information:

No directional stop state is defined. To allow error handling, the directional stop state must be the same as STOP. Speed changes in the same direction of movement are not evaluated as changes in the operating mode of the movement.

9.16.2.10.4.2 Movement blocks

The module supports 4 movement blocks: Each movement block contains up to 8 movement steps. Each step is comprised of the following parameters:

- Target position - relative or absolute
- Timeout or delay
- Trigger condition - edge or comparator value (signal level)
- Error information

A block's movement steps can be executed as one continuous movement. The following parameters must be configured before the movement start command is issued:

- Step activation
- Step target position interpolation - relative or absolute
- Step speed - slow or fast
- Trigger mode - off or "Comparator value = true" or "Comparator value = false"

9.16.2.10.4.3 Movement generator

When a movement start command is issued, the mode of the active movement step is calculated based on the preceding target position. Step parameters may also be changed after the start as long as the step direction is not changed. Otherwise a movement error occurs. To ensure correct directional interpretation, the movement step position/range is limited to ± 1073741824 .

The target position of a step configured with a trigger is evaluated as the end position (error position). This means the position at the time of the trigger condition becomes the effective target position. Because this position is unknown when the calculation is made by the movement generator, the set end position is used for calculating the next absolute movement step. As a result, it is recommended to proceed with a relative movement step following a triggered step. A successive absolute movement step must be outside the positioning range of the triggered step.

If a movement step is configured as a standstill, i.e. relative position = 0, or the new absolute position = previous target position, a delay has occurred. If no trigger is configured, the parameter step timeout is evaluated as a simple delay time and not as an error state.

9.16.2.10.4.4 Tolerance monitoring

The module constantly monitors the position tolerance, even when no movements are active. Jitter and overshoot tolerances must be configured for both directions. Depending on the previous movement direction, a tolerance window is calculated based on the current target position. Because the movement generator uses the last target position, movements within the tolerance window must be avoided to prevent errors from occurring.

9.16.2.10.4.5 Homing

Homing is not implemented in this module as a movement function. The target position of a completed movement can be applied as the home position via command.

9.16.2.10.4.6 Safety monitoring

Safety monitoring refers to the hardware limit switches and software limit positions.

A safe input status (masks and comparator values) for positive and negative movements must be configured. Software end positions – minimum and maximum positions – can also be configured for both directions.

The module monitors these two positions from the time the parameter 0x93 or 0x95 "Positive directional setup state" is set. Monitoring is ended when the parameter 0x94 "Stop state" is set.

Because a trigger condition aborts the movement step before a safety check, a hardware limit switch can also be used as a trigger condition without generating an error.

9.16.2.10.5 Command description

9.16.2.10.5.1 No action

This command can be used as a placeholder during development or to separate 2 identical commands.

| Code | 0x00 |
|-------------|------|
| Parameter | 0 |
| Data 0 to 3 | 0 |

9.16.2.10.5.2 Configure display mode

This command can be used to configure how the values in the "ReadIndex" on page 1892 and "ReadData" on page 1892 registers are displayed. Up to 4 display values can be displayed simultaneously. Possible selections include the command parameters 0xC0 = current position, to 0xC3 = I/O states.

| Code | 0x01 |
|-----------|--|
| Parameter | Display control: 0 Scheduler off; Data 0 used for display 1 Scheduler cycle = X2X cycle; The next display cycle starts with each X2X cycle 2 Scheduler cycle = Command cycle; The next display cycle starts with each completed command |
| Data 0 | Parameter number of display cycle 1 (Default: 0xC0 = current position) |
| ... | ... |
| Data 3 | Parameter number of display cycle 4 (Default: 0xC0 = current position) |

9.16.2.10.5.3 Enables the interface

This command activates the movement interface. The status of the interface is displayed in the "ReadStatus" on page 1891 register (bit 5). The interface is disabled following a reset. This is necessary to ensure a consistent parameter field.

| Code | 0x02 |
|-------------|------|
| Parameter | 0 |
| Data 0 to 3 | 0 |

9.16.2.10.5.4 Configure parameters

| Code | 0x03 |
|-------------|--------------------|
| Parameter | See parameter list |
| Data 0 to 3 | Parameter data |

Parameter list

| Address | Parameters | Information |
|--------------------------|------------------------|--|
| Movement blocks | | |
| 0x00 | "Motion block" | Block 1 |
| 0x20 | "Motion block" | Block 2 |
| 0x40 | "Motion block" | Block 3 |
| 0x60 | "Motion block" | Block 4 |

| 0xC4 - 0xFF | Reserved | |

Motion block

Parameter addresses: 0x00 to 0x7F

Each motion block contains 8 steps with 4 parameters each.

Calculating step addresses

Step address = Motion block address + Step address offset

| Step address offset Offset = (Step - 1) * 4 | Step number |
|--|-------------|
| + 0x0 | Step 1 |
| + 0x4 | Step 2 |
| ... | ... |
| + 0x18 | Step 7 |
| + 0x1B | Step 8 |

4 parameters per step

| Parameter address | Parameters |
|-------------------|--|
| Step address + 0 | "Position" (relative or absolute) |
| Step address + 1 | "Timeout or delay" |
| Step address + 2 | "Trigger condition" (edge or comparator value) |
| Step address + 3 | "Error information" (read-only) |

Example

Calculating the trigger parameter in the 5th step of the 3rd motion block.

Parameter address: 0x40 (motion block 3) + 0x10 (offset of step 5) + 0x02 (offset of parameter address) = 0x52

Position

This parameter specifies a position in steps.

| Data type | Value | Information |
|-----------|---------------------------|--|
| DINT | -1073741824 to 1073741823 | For a description of this, see "Movement generator" on page 1882 . |

Timeout or delay

This parameter sets the time within which a specified position must be reached. A corresponding error is output in the event of a timeout. In the stop state, this parameter specifies the duration of the stop state.

| Data type | Value | Information |
|-----------|--------------------|------------------------------|
| DINT | 0 to 2,147,483,647 | Default: 50, time in μ s |

Trigger condition

Depending on bits 2 and 3 in the data structure of each motion block (see ["Start a movement block" on page 1888](#)), either the "Edge" or "Comparator value" structure is selected as the trigger condition.

Edge

| Bit | Description | Value | Information |
|---------|---------------------------|-------|-------------|
| 0 | Falling edge - channel 01 | 0 | Disabled |
| | | 1 | Enabled |
| ... | ... | ... | ... |
| 7 | Falling edge - channel 08 | 0 | Disabled |
| | | 1 | Enabled |
| 8 - 15 | Reserved | 0 | |
| 16 | Rising edge - channel 01 | 0 | Disabled |
| | | 1 | Enabled |
| ... | ... | ... | ... |
| 23 | Rising edge - channel 08 | 0 | Disabled |
| | | 1 | Enabled |
| 24 - 31 | Reserved | 0 | |

Comparator value

| Bit | Description | Value | Information |
|---------|--------------------------------|--------|-------------|
| 0 | Enable mask - channel 01 | 0 | Disabled |
| | | 1 | Enabled |
| ... | ... | ... | ... |
| 7 | Enable mask - channel 08 | 0 | Disabled |
| | | 1 | Enabled |
| 8 - 15 | Reserved | 0 | |
| 15 | Comparative state - channel 01 | 0 or 1 | |
| ... | ... | ... | ... |
| 23 | Comparative state - channel 08 | 0 or 1 | |
| 24 - 31 | Reserved | 0 | |

Error information

This parameter contains the read back display value. For a description of the error information, see register "ErrorInfo" on page 1893.

The parameter for the display command is 0.

Jitter tolerance

Parameter addresses: 0x80 to 0x81

This parameter determines the jitter range of the encoder.

| Data type | Values |
|-----------|---------------------------------|
| DINT | -2,147,483,648 to 2,147,483,647 |

Overshoot tolerance

Parameter addresses: 0x82 to 0x83

This parameter specifies the permitted tolerance range between the planned stop position and the stop position that can actually be reached in practice.

| Data type | Values |
|-----------|---------------------------------|
| DINT | -2,147,483,648 to 2,147,483,647 |

Setup time

Parameter addresses: 0x0x88 to 0x89

This parameter determines the length of the setup state between the stop time and the next positive or negative motion step.

| Data type | Value | Information |
|-----------|--------------------|------------------------------|
| DINT | 0 to 2,147,483,647 | Default: 50, time in μ s |

Stop time

Parameter addresses: 0x8A to 0x8B

This parameter defines the time of the stop state between 2 active motion steps.

| Data type | Value | Information |
|-----------|--------------------|------------------------------|
| DINT | 0 to 2,147,483,647 | Default: 50, time in μ s |

Output configuration

Parameter address: 0x90

This parameter defines the configuration of the digital outputs.

| Bit | Description | Value | Information |
|---------|--------------------------|-------|-------------|
| 0 - 1 | Reserved | 0 | |
| 2 | Push driver - channel 02 | 0 | Disabled |
| | | 1 | Enabled |
| 3 | Pull driver - channel 02 | 0 | Disabled |
| | | 1 | Enabled |
| 4 - 5 | Reserved | 0 | |
| 6 | Push driver - channel 04 | 0 | Disabled |
| | | 1 | Enabled |
| 7 | Pull driver - channel 04 | 0 | Disabled |
| | | 1 | Enabled |
| 8 - 9 | Reserved | 0 | |
| 10 | Push driver - channel 06 | 0 | Disabled |
| | | 1 | Enabled |
| 11 | Pull driver - channel 06 | 0 | Disabled |
| | | 1 | Enabled |
| 12 - 13 | Reserved | 0 | |
| 14 | Push driver - channel 08 | 0 | Disabled |
| | | 1 | Enabled |
| 15 | Pull driver - channel 08 | 0 | Disabled |
| | | 1 | Enabled |
| 16 - 31 | Reserved | 0 | |

Output states

Parameter addresses: 0x91 to 0x97

The output states of channels can be configured individually for each motion state (see "Types of movement" on page 1881).

| Bit | Description | Value | Information |
|---------|-------------|-------|---------------|
| 0 | Reserved | 0 | |
| 1 | Channel 02 | 0 | No action |
| | | 1 | Clear channel |
| 2 | Reserved | 0 | |
| 3 | Channel 04 | 0 | No action |
| | | 1 | Clear channel |
| 4 | Reserved | 0 | |
| 5 | Channel 06 | 0 | No action |
| | | 1 | Clear channel |
| 6 | Reserved | 0 | |
| 7 | Channel 08 | 0 | No action |
| | | 1 | Clear channel |
| 8 - 16 | Reserved | 0 | |
| 17 | Channel 02 | 0 | No action |
| | | 1 | Set channel |
| 18 | Reserved | 0 | |
| 19 | Channel 04 | 0 | No action |
| | | 1 | Set channel |
| 20 | Reserved | 0 | |
| 21 | Channel 06 | 0 | No action |
| | | 1 | Set channel |
| 22 | Reserved | 0 | |
| 23 | Channel 08 | 0 | No action |
| | | 1 | Set channel |
| 24 - 31 | Reserved | 0 | |

Safe inputs

Parameter addresses: 0x98 to 0x99

This parameter enables the hardware limit switches according to their channel assignment and defines their logical state for starting a movement. The comparative state specifies the logical level on the input at which a motion is permitted or can be started.

| Bit | Description | Value | Information |
|---------|--------------------------------|--------|-------------|
| 0 | Enable mask - channel 01 | 0 | Disabled |
| | | 1 | Enabled |
| ... | | ... | |
| 7 | Enable mask - channel 08 | 0 | Disabled |
| | | 1 | Enabled |
| 8 - 15 | Reserved | 0 | |
| 15 | Comparative state - channel 01 | 0 or 1 | |
| ... | | | |
| 23 | Comparative state - channel 08 | 0 or 1 | |
| 24 - 31 | Reserved | 0 | |

Safe position

Parameter addresses: 0x9C to 0x9F

These parameters define the minimum and maximum software limit positions of the path to be moved.

| Data type | Value |
|-----------|---------------------------|
| DINT | -1073741824 to 1073741824 |

9.16.2.10.5.5 Configure counters

This command can be used to assign the hardware channels to the AB counter. With an ABR counter, the R input can be connected to any hardware channel as the trigger signal.

| Code | 0x04 |
|-------------|-------------------------|

| Data 0 | See data structure |
| Data 1 to 3 | 0 |

Parameter structure:

| Bit | Description | Value | Information |
|-------|-------------------------|-------|---------------------------------------|
| 0 - 1 | Counter connection pair | 00 | Pair 1 (A: channel 01, B: channel 02) |
| | | 01 | Pair 2 (A: channel 03, B: channel 04) |
| | | 10 | Pair 3 (A: channel 05, B: channel 06) |
| | | 11 | Pair 4 (A: channel 07, B: channel 08) |
| 2 - 7 | Reserved | 0 | |

Data structure:

| Bit | Description | Value | Information |
|-------|--------------------|-------|--|
| 0 - 1 | Counter mode | 00 | AB encoder |
| | | 01 | Up/down counter (A: timing, B: up/down signal) |
| | | 10 | Edge counter - channel A |
| | | 11 | Edge counter - channel B |
| 2 | Counting direction | 0 | Positive |
| | | 1 | Negative |
| 3 - 7 | Reserved | 0 | |

9.16.2.10.5.6 Homing

Assumes the target position of the last successful movement step as a reference position.

| Code | 0x05 |
|-------------|---------------|
| Parameter | 0 |
| Data 0 to 3 | Home position |

9.16.2.10.5.7 Stops the movement.

The movement step in progress is stopped. This command always results in a movement error.

| Code | 0x06 |
|-------------|------|
| Parameter | 0 |
| Data 0 to 3 | 0 |

9.16.2.10.5.8 Acknowledge movement error

The movement error is cleared. If this command is executed when the error is still present, the current position is assumed as the target position. The basis of the relative position becomes unclear.

| Code | 0x07 |
|-------------|------|
| Parameter | 0 |
| Data 0 to 3 | 0 |

9.16.2.10.5.9 Start a movement block

This command starts a movement block consisting of up to 8 steps.

| | |
|-------------|--|
| Code | 0x08 (Block 1) 0x09 (Block 2) 0x0A (Block 3) 0x0B (Block 4) |
| Parameter | See parameter structure |
| Data 0 to 3 | See data structure |

Parameter structure:

| Bit | Description | Value | Information |
|-----|-------------|-------|------------------------|
| 0 | Step 1 | 0 | No movement. |
| | | 1 | Perform movement step. |
| ... | | ... | |
| 7 | Step 8 | 0 | No movement. |
| | | 1 | Perform movement step. |

Data structure:

| Bit | Description | Value | Information |
|---------|--------------------------|-------|---------------------------|
| 0 | Step 1 position setting: | 0 | Relative |
| | | 1 | Absolute |
| 1 | Step 1 speed: | 0 | Slow |
| | | 1 | Fast |
| 2 - 3 | Step 1 trigger mode: | 00 | No trigger |
| | | 01 | Edge trigger |
| | | 10 | Comparator value "true" |
| | | 11 | Comparator value "false" |
| 4 - 7 | Step 2 | x | Like step 1 / Bits 0 to 2 |
| ... | | | |
| 28 - 31 | Step 8 | x | Like step 1 / Bits 0 to 2 |

9.16.2.10.5.10 Selecting error information

At the end of each movement step, the command parameter "Addr + 3" (see ["Motion blocks - Calculating the address" on page 1883](#)) can be used to read the error information selected in this register. This error information is displayed in registers ["ReadIndex" on page 1892](#) and ["ReadData" on page 1892](#).

| | |
|-------------|---|
| Code | 0x00 |
| Parameter | 0 Error information (default) 1 Timestamp 2 Current position 3 Target position |
| Data 0 to 3 | 0 |

9.16.2.10.6 Command interface

A command interface is available to the user. A command consists of:

- "Command" on page 1890 (in the command description: code)
- "Command parameter" on page 1890 (in the command description: parameters)
- "Command data" on page 1891 (in the command description: Data 0 to 3)

The following commands can be executed:

- "No action" on page 1882
- "Configure display mode" on page 1882
- "Enable the interface" on page 1883
- "Configure parameters" on page 1883
- "Configure counters" on page 1887
- "Perform homing" on page 1887
- "Stop the movement" on page 1887
- "Acknowledge movement error" on page 1887
- "Start a movement block" on page 1888
- "Select debug information" on page 1888

The module returns:

- "System status" on page 1891
- "Display parameter number" on page 1892
- "Display data content" on page 1892

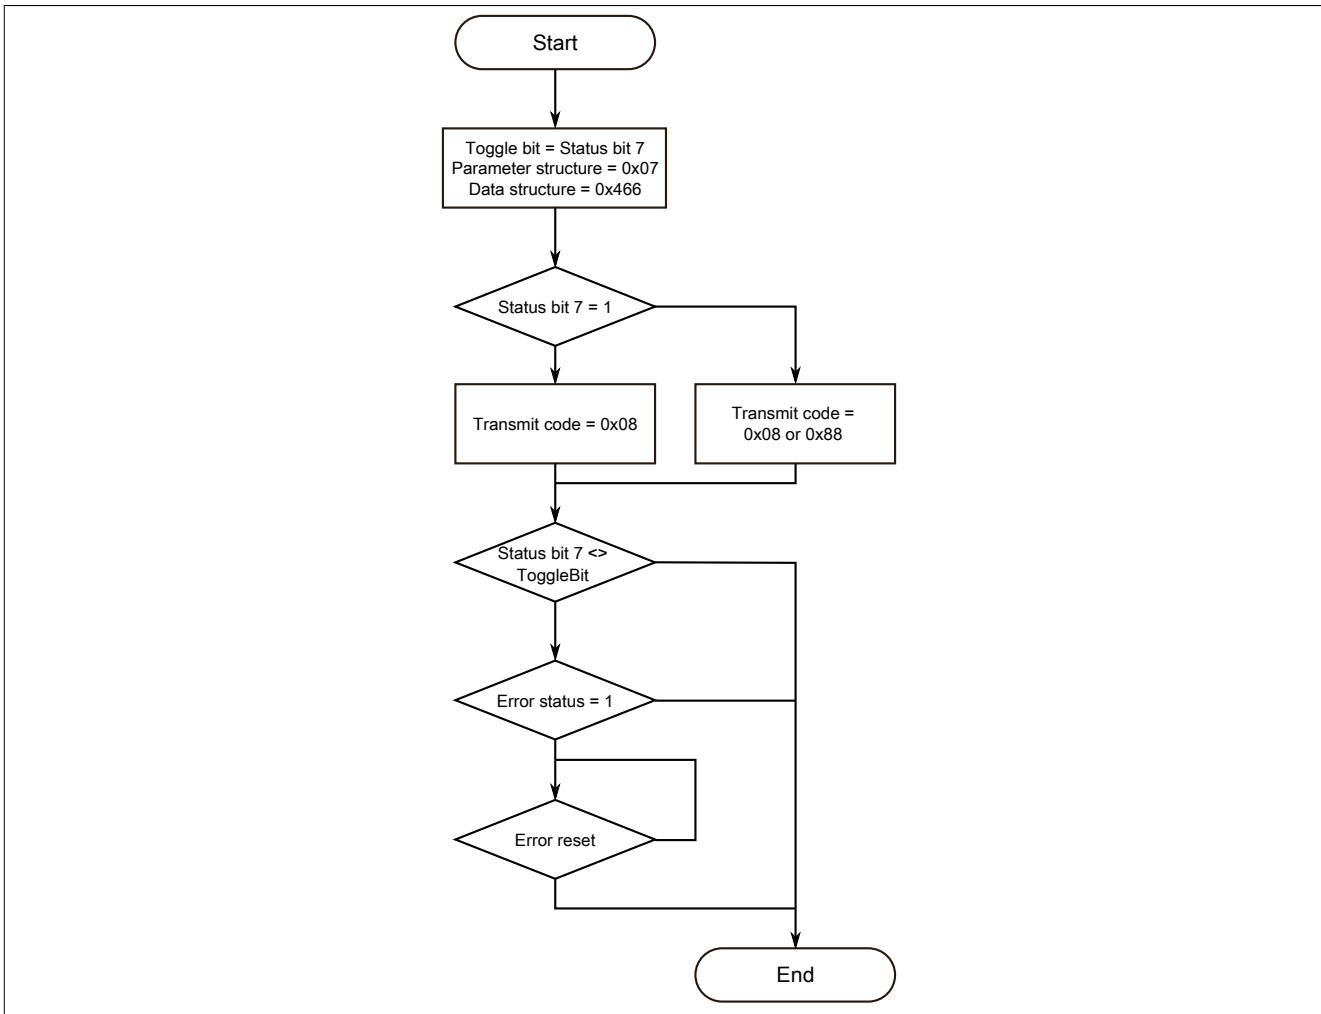

The module detects a new command through a change in the command register. The toggle bit must be changed in order to detect when the command issued in the "ReadStatus" on page 1891 register is applied. Identical commands can be executed immediately following one another simply by changing the toggle bit.

9.16.2.10.6.1 Execution of a command

Commands must be sent by the application using the command interface. Due to the simple structure of the command interface, it is also possible to send them via CAN.

All commands are executed as follows:

- 1) Write command parameters (register "SendCommandParam" on page 1890) and command data (register "SendData" on page 1891).
- 2) Write command with changed toggle bit.
When bit 7 in the command register (register "SendCommand" on page 1890) is toggled, the module executes the command with the command parameter and command data.
- 3) Wait until bit 7 in the response register (register "ReadStatus" on page 1891) matches bit 7 in the command register.
- 4) Read additional status information from the response register if necessary.
- 5) If additional commands should be sent, proceed with step 1.

9.16.2.10.6.2 Send command

Name:
SendCommand

The commands described under "Command description" on page 1882 can be sent from this register. Bit 7 must be toggled to apply the commands.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|---------------------------------------|-------|-------------|
| 0 - 6 | Command code | x | |
| 7 | Toggle bit for applying a new command | x | |

9.16.2.10.6.3 Send command parameters

Name:
SendCommandParam

Specific parameters for the command to be sent must be entered in this register. The required parameters are listed under "Command description" on page 1882 for the respective commands.

| Data type | Value | Information |
|-----------|-------|-------------------|
| USINT | x | Command parameter |

9.16.2.10.6.4 Send command data

Name:
SendData

Specific parameters for the command to be sent must be entered in this register. The required data is listed under "Command description" on page 1882 for the respective commands.

Data 0 to 3 are sent as a single DINT value. The following structure is used:

| Data type | Value | Information |
|-----------|-------|---------------------|
| DINT | x | Command data 0 to 3 |

9.16.2.10.6.5 Read status

Name:
ReadStatus

The commands and the current status can be checked in this register. Bit 7 can be used to check whether an issued command has been applied.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|--------------------|-------|---------------------|
| 0 - 1 | Reserved | 0 | |
| 2 | Position | 0 | Not yet reached |
| | | 1 | Reached |
| 3 | Motion | 0 | In motion |
| | | 1 | completed |
| 4 | Numerator | 0 | Not yet configured |
| | | 1 | Configured |
| 5 | Interface | 0 | Not enabled |
| | | 1 | Enabled |
| 6 | Command | 0 | No error |
| | | 1 | Error occurred |
| 7 | Command toggle bit | x | Value that was read |

9.16.2.10.6.6 Read parameter number

Name:

ReadIndex

This register displays the parameter number returned in response to a display command. See ["Configure display mode" on page 1882](#) and ["Selecting error information" on page 1888](#).

| Data type | Value | Information |
|-----------|-------|-------------------|
| USINT | x | Parameter numbers |

9.16.2.10.6.7 Read parameter data

Name:

ReadData

This register displays the parameter data returned in response to a display command. See ["Configure display mode" on page 1882](#) and ["Selecting error information" on page 1888](#).

| Data type | Value | Information |
|-----------|-------|----------------|
| DINT | x | Parameter data |

9.16.2.10.6.8 Special display parameters

The following 4 registers correspond to display parameters 0xC0 to 0xC3 in the command description ["Configure parameters" on page 1883](#). This frees up the ["ReadData" on page 1892](#) register for other data.

Indicates the current position.

Name:

ABRPosition

This register shows the current position in the current step. It corresponds with the parameter 0xC0 in ["Configure parameters" on page 1883](#).

| Data type | Values |
|-----------|---------------------------------|
| DINT | -2,147,483,648 to 2,147,483,647 |

Indicates the current target position

Name:

TargetABRposition

This register shows the target position of the current step. It corresponds with the parameter 0xC1 in ["Configure parameters" on page 1883](#).

| Data type | Values |
|-----------|---------------------------------|
| DINT | -2,147,483,648 to 2,147,483,647 |

Displays the error information

Name:

ErrorInfo

This register displays error information. It corresponds with the parameter 0xC2 in "Configure parameters" on page 1883.

| Data type | Values |
|-----------|------------------------|
| UDINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|---------|--|------------|--|
| 0 | Tolerance error - negative | 0 | No error |
| | | 1 | Error occurred |
| 1 | Tolerance error - positive | 0 | No error |
| | | 1 | Error occurred |
| 2 | Timeout | 0 | No timeout |
| | | 1 | Timeout |
| 3 - 7 | Reserved | 0 | |
| 8 | Safety monitoring error - Inputs (hardware limit switch) | 0 | No error |
| | | 1 | Error occurred |
| 9 | Safety monitoring error - Position (software limit position) | 0 | No error |
| | | 1 | Error occurred |
| 10 - 15 | Reserved | 0 | |
| 16 - 18 | Error status information | 000 | Reserved |
| | | 001 | Negative directional stop state |
| | | 010 | Negative movement |
| | | 011 | Negative directional setup state |
| | | 100 | Stop state |
| | | 101 | Positive directional setup state |
| | | 110 | Positive movement |
| | | 111 | Positive directional stop state |
| 19 | Reserved | 0 | |
| 20 - 24 | Invalid step number | 000 to 111 | Number of the step that does not contain any movement information. |
| | | 1000 | Inactive motion step (tolerance check) |
| 25 - 31 | Reserved | 0 | |

Displaying the digital inputs

Name:

DigitalInput01 to DigitalInput08

This register displays the status of the digital inputs or read back outputs. It corresponds with the parameter 0xC3 in "Configure parameters" on page 1883.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-----|----------------|--------|--------------------------|
| 0 | DigitalInput01 | 0 or 1 | Input status - channel 1 |
| ... | | ... | |
| 7 | DigitalInput08 | 0 or 1 | Input status - channel 8 |

9.16.2.10.7 Sample configurations

9.16.2.10.7.1 Movement example

The channels have been set as follows for this example:

| Hardware channel | Direction | Function assignment |
|------------------|-----------|------------------------|
| 1 | Input | ABR encoder - signal A |
| 2 | Input | ABR encoder - signal B |
| 3 | Input | ABR encoder - signal R |
| 4 | Output | Fast speed |
| 5 | Input | Negative limit switch |
| 6 | Output | Negative direction |
| 7 | Input | Positive limit switch |
| 8 | Output | Positive direction |

Enable interface

| | Value | Description |
|-------------|-------|-------------|
| Code | 0x02 | |
| Parameter | 0 | |
| Data 0 to 3 | 0 | |

Configure parameters

| | Value | Description |
|-------------|-------------------|-------------|
| Code | 0x03 | |
| Parameter | Parameter numbers | |
| Data 0 to 3 | Parameter data | |

The following parameters must be configured:

| Code | Parameter | Data | Description |
|------|-----------|------------|---|
| 0x03 | 0x80 | APPL | Negative jitter tolerance [μs] (application-specific) |
| 0x03 | 0x81 | APPL | Positive jitter tolerance [μs] (application-specific) |
| 0x03 | 0x82 | APPL | Negative overshoot tolerance [μs] (application-specific) |
| 0x03 | 0x83 | APPL | Positive overshoot tolerance [μs] (application-specific) |
| 0x03 | 0x88 | APPL | Negative setup time [μs] (application-specific) |
| 0x03 | 0x89 | APPL | Positive setup time [μs] (application-specific) |
| 0x03 | 0x8A | APPL | Negative stop time [μs] (application-specific) |
| 0x03 | 0x8B | APPL | Positive stop time [μs] (application-specific) |
| 0x03 | 0x90 | 0x0000CCC0 | Output configuration: Channel 04, channel 06, channel 08 as push/pull outputs |
| 0x03 | 0x91 | 0x00280080 | Output states - fast negative movement: Set channels 04 and 06, clear channel 08 |
| 0x03 | 0x92 | 0x00200088 | Output states - slow negative movement: Set channel 06, clear channels 04 and 08 |
| 0x03 | 0x93 | 0x000000A8 | Output states - negative setup: Clear channels 04, 06 and 08 |
| 0x03 | 0x94 | 0x000000A8 | Output states - stop: Clear channels 04, 06 and 08 |
| 0x03 | 0x95 | 0x000000A8 | Output states - positive setup: Clear channels 04, 06 and 08 |
| 0x03 | 0x96 | 0x00800028 | Output states - slow positive movement: Set channel 08, clear channels 04 and 06 |
| 0x03 | 0x97 | 0x00880020 | Output states - fast positive movement: Set channels 04 and 08, clear channel 06 |
| 0x03 | 0x98 | 0x00000014 | Safe input state - negative: Channel 03 active, status of channel 03 (level) = 0, Channel 05 active, status of channel 05 (level) = 0 |
| 0x03 | 0x99 | 0x00000044 | Safe input state - positive: Channel 03 active, status of channel 03 (level) = 0, Channel 07 active, status of channel 07 (level) = 0 |

Configure counters

| | Value | Description |
|-------------|-------|--------------------------------|
| Code | 0x04 | |
| Parameter | 0x00 | Counter pair 1 |
| Data 0 | 0 | AB encoder, positive direction |
| Data 1 to 3 | 0 | |

9.16.2.10.7.2 Homing example

Configure parameters

| | Value |
|-------------|-------------------|
| Code | 0x03 |
| Parameter | Parameter numbers |
| Data 0 to 3 | Parameter data |

The following parameters must be configured:

| Code | Parameter | Data | Description |
|---------------|-----------|------------|--|
| Step 1 | | | |
| 0x03 | 0x00 | 0x3FFFFFFF | Position positive (relative) |
| 0x03 | 0x01 | 0x01C9C380 | Timeout (30 s) |
| 0x03 | 0x02 | 0x00400000 | Trigger condition (edge of channel 07 = 1) |
| Step 2 | | | |
| 0x03 | 0x04 | 0xC0000001 | Position negative (relative) |
| 0x03 | 0x05 | 0x01C9C380 | Timeout (30 s) |
| 0x03 | 0x06 | 0x00100000 | Trigger condition (edge of channel 05 = 1) |
| Step 3 | | | |
| 0x03 | 0x08 | 0x3FFFFFFF | Position positive (relative) |
| 0x03 | 0x09 | 0x01C9C380 | Timeout (30 s) |
| 0x03 | 0x0A | 0x00040000 | Trigger condition (edge of channel 03 = 1) |

Start movement

| | Value | Description |
|-------------|------------|---|
| Code | 0x08 | Block 1 |
| Parameter | 0x07 | Activate steps 1 to 3 |
| Data 0 to 3 | 0x00000466 | Step 1: Relative, fast, trigger on edge of channel 07 Step 2: Relative, fast, trigger on edge of channel 05 Step 3: Relative, slow, trigger on edge of channel 03 |

Wait until the movement is complete.

Homing

| | Value | Description |
|-------------|-------|---------------|
| Code | 0x05 | |
| Parameter | 0 | |
| Data 0 to 3 | x | Home position |

9.16.2.10.7.3 Standard positioning example

Configure parameters

| | Value |
|-------------|-------------------|
| Code | 0x03 |
| Parameter | Parameter numbers |
| Data 0 to 3 | Parameter data |

The following parameters must be configured:

| Code | Parameter | Data | Description |
|------|-----------|------|-------------------|
| 0x03 | 0x00 | X1 | Pre-stop position |
| 0x03 | 0x04 | X2 | Stop position |

Start movement

| | Value | Description |
|-------------|------------|--|
| Code | 0x08 | Block 1 |
| Parameter | 0x03 | Activate steps 1 and 2 |
| Data 0 to 3 | 0x00000011 | Step 1: absolute, slow, trigger off Step 2: absolute, slow, trigger off |

9.16.2.10.7.4 Standard positioning example with stop

Configure parameters

| | Value |
|-------------|-------------------|
| Code | 0x03 |
| Parameter | Parameter numbers |
| Data 0 to 3 | Parameter data |

The following parameters must be configured:

| Code | Parameter | Data | Description |
|------|-----------|--------|-----------------------|
| 0x03 | 0x00 | X1 | Pre-stop position |
| 0x03 | 0x04 | X2 | Stop position |
| 0x03 | 0x08 | 0 | Relative movement |
| 0x03 | 0x09 | T_STOP | Stop delay [μ s] |

Start movement

| Code | Value | Description |
|-------------|------------|---|
| Code | 0x08 | Block 1 |
| Parameter | 0x07 | Activate steps 1 to 3 |
| Data 0 to 3 | 0x00000011 | Step 1: absolute, slow, trigger off Step 2: absolute, slow, trigger off Step 3: relative, trigger off |

9.16.2.10.8 General module register**9.16.2.10.8.1 Configures the system cycle time**

Name:

CycleTimeCff

This register configures the module's system cycle time.

| Data type | Value | Information |
|-----------|-----------|--|
| UINT | 25 to 255 | System cycle time in μs . Bus controller default setting: 50 μs |

9.16.2.10.8.2 Status of encoder power supply

Name:

PowerSupply01

This register indicates the state of the integrated encoder power supply. A faulty encoder power supply is output as a warning.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|---------------|-------|------------------------------------|
| 0 | PowerSupply01 | 0 | 24 VDC encoder power supply OK |
| | | 1 | 24 VDC encoder power supply faulty |
| 1 - 7 | Reserved | - | |

9.16.2.10.9 Minimum I/O update time

The minimum I/O update time specifies how far the bus cycle can be reduced so that an I/O update is performed in each cycle.

| Minimum I/O update time |
|-------------------------|
| 100 μs |

9.16.2.10.10 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time |
|--------------------|
| 100 μs |

9.16.3 X20DC1073

Data sheet version: 1.40

9.16.3.1 General information

The module is equipped with a SinCos encoder interface. The input signals are monitored. This makes it possible to detect open or shorted lines as well as encoder supply failures.

- SinCos encoder interface
- Encoder input monitoring
- 5 VDC and GND for encoder supply
- NetTime timestamp: Position time
- Can be used with a SafeLOGIC controller

SinCos encoders

SinCos encoders with 1 V_{ss} are mostly used in linear drives and systems with high-resolution optical or magnetic position measurement systems. The module can process input signals with a frequency of up to 400 kHz.

NetTime timestamp for the position

It is not just the position value that is important for highly dynamic positioning tasks, but also the exact time the position is measured. The module is equipped with a NetTime function for this that supplies a timestamp for the recorded position with microsecond accuracy.

The timestamp function is based on synchronized timers. If a timestamp event occurs, the module immediately saves the current NetTime. After the respective data is transferred to the CPU, including this precise moment, the CPU can then evaluate the data using its own NetTime (or system time), if necessary.

9.16.3.2 Order data

| Model number | Short description | Figure |
|--------------|--|---|
| | Digital signal processing and preparation |  |
| X20DC1073 | X20 digital counter module, 1x SinCos, 1 V _{ss} , 400 kHz input frequency, encoder monitoring, NetTime function | |
| | Required accessories | |
| | Bus modules | |
| X20BM11 | X20 bus module, 24 VDC keyed, internal I/O supply continuous | |
| X20BM15 | X20 bus module, with node number switch, 24 VDC keyed, internal I/O supply continuous | |
| | Terminal blocks | |
| X20TB12 | X20 terminal block, 12-pin, 24 VDC keyed | |

9.16.3.4 LED status indicators

For a description of the various operating modes, see "Diagnostic LEDs" on page 3787.

| Figure | LED | Color | Status | Description | |
|---|-----|-------|--------------|--|--|
|  | r | Green | Off | No power to module | |
| | | | Single flash | RESET mode | |
| | | | Double flash | BOOT mode (during firmware update) ¹⁾ | |
| | | | Blinking | PREOPERATIONAL mode | |
| | | | On | RUN mode | |
| | e | Red | Off | No power to module or everything OK | |
| | | | On | Error or reset state. Possible cause: <ul style="list-style-type: none"> Encoder supply error | |
| | | | Single flash | I/O error. Possible cause: <ul style="list-style-type: none"> Sine/Cosine relative position error (open line) | |
| | UP | Green | On | | The "UP/DN" LEDs are lit depending on the rotational direction and the speed of the connected encoder. The "UP" LED indicates when the encoder position changes in the positive direction. |
| | | | | | |

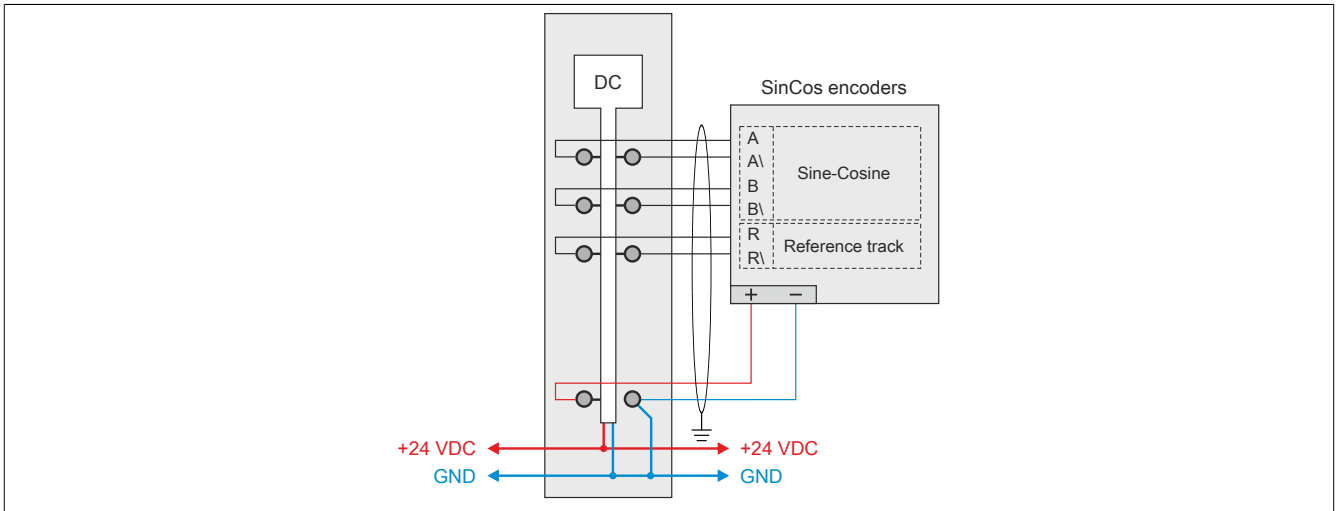

1) Depending on the configuration, a firmware update can take up to several minutes.

9.16.3.5 Pinout

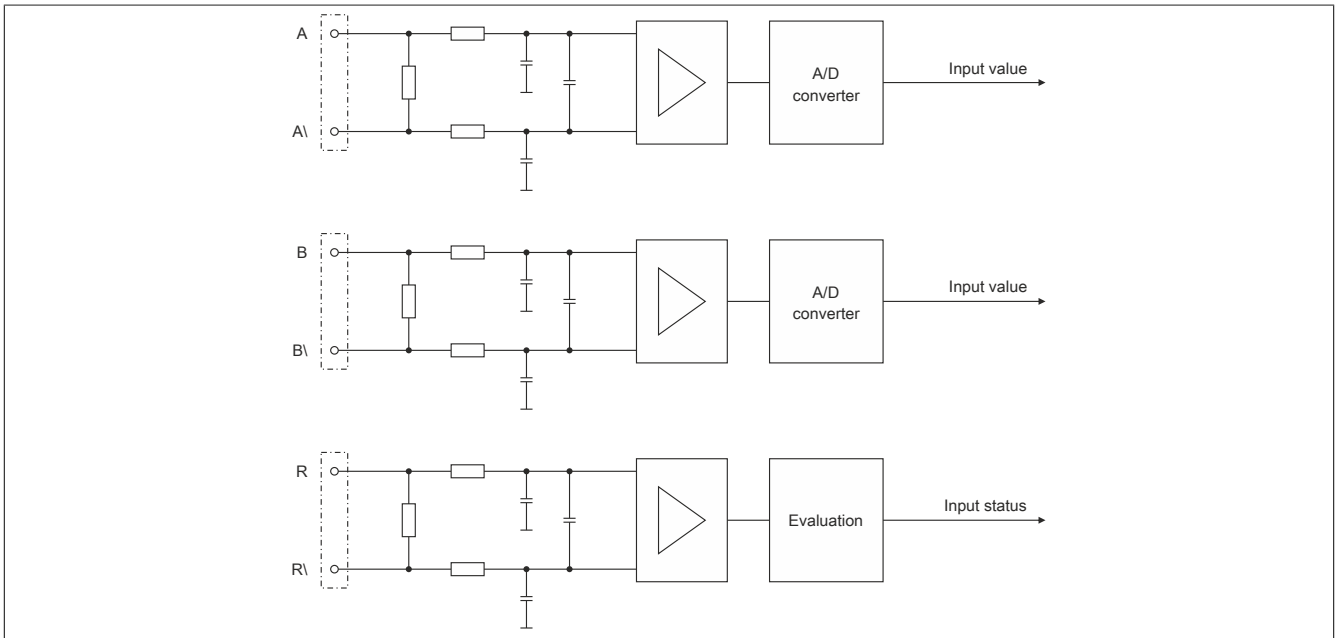

Shielded cables must be used for all signal lines.

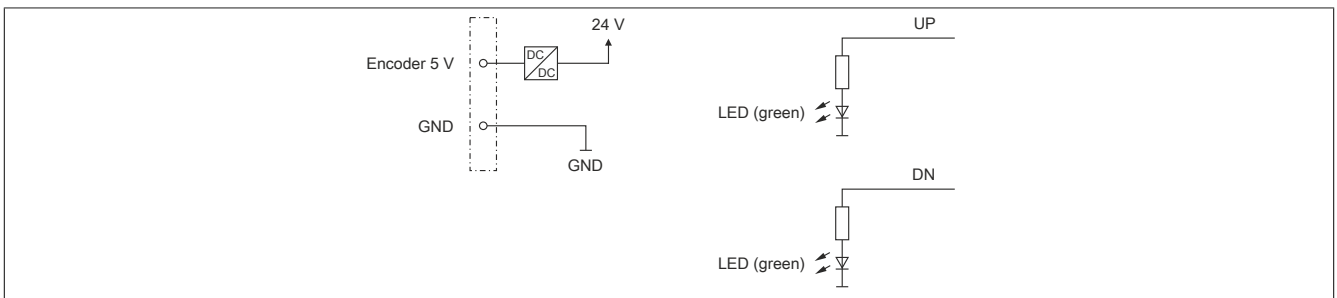

9.16.3.6 Connection example

9.16.3.7 Analog inputs - Input circuit diagram

9.16.3.8 Circuit diagram for the encoder supply and LEDs

9.16.3.9 Calculating the maximum encoder cable length

The following encoder data is assumed for this sample calculation:

| Encoder data | |
|-------------------------------|-----------------|
| Input voltage | 4.75 V – 5.25 V |
| Max. input current | 0.12 A |
| Module encoder output | |
| Min. output voltage at 300 mA | 4.86 V |

Calculation of the maximum voltage drop for the cable

The maximum permitted voltage drop is calculated using the minimum encoder output voltage for the module ($U_{\text{ModuleMin}}$) and the minimum encoder input voltage ($U_{\text{EncoderMin}}$) of the encoder being used.

$$U_{\text{CableMax}} = (U_{\text{ModuleMin}} - U_{\text{EncoderMin}}) / 2$$

Example: $U_{\text{CableMax}} = (4.86 \text{ V} - 4.75 \text{ V}) / 2 = 0.055 \text{ V}$

Calculation of the maximum cable length

$$\text{Cable length}_{\text{Max}} = U_{\text{CableMax}} * \text{Wire cross section (mm}^2\text{)} / (0.01786 * I_{\text{Encoder}})$$

This means:

I_{Encoder} Current consumption of encoder in amps
 U_{CableMax} Maximum permitted voltage drop in volts

Example with resolver cable "8BCR0xxxx.1111A-0"

Encoder with 120 mA max. current consumption

Resolver cable cross section = 0.25 mm²

Results in a total cable length of:

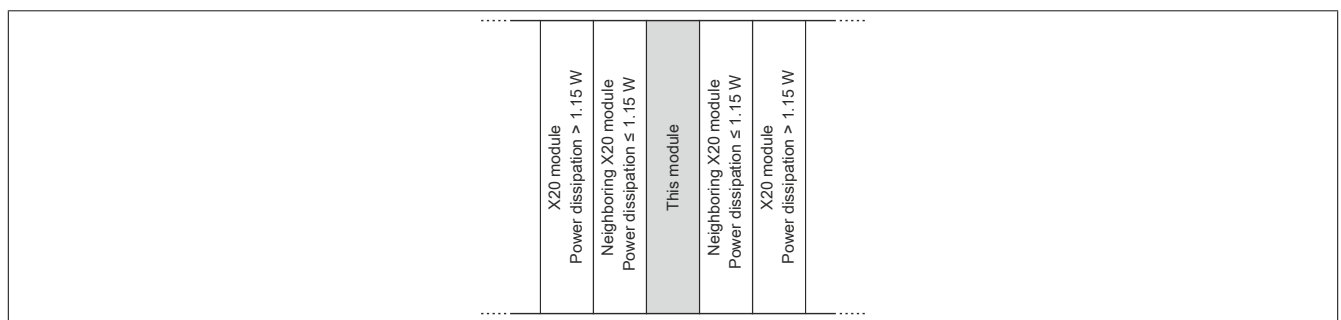

$$\text{Cable length}_{\text{Max}} = 0.055 \text{ V} * 0.25 \text{ mm}^2 / 0.01786 * 0.12 \text{ A} = 6.41 \text{ m}$$

9.16.3.10 Derating

There is no derating when operated below 55°C.

During operation over 55°C, the power dissipation of the modules to the left and right of this module is not permitted to exceed 1.15 W!

For an example of calculating the power dissipation of I/O modules, see section "[Power dissipation calculation of I/O modules](#)" on page 101.

9.16.3.11 Register description

9.16.3.11.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section "[General data points](#)" on page 3790.

9.16.3.11.2 Function model 0 - default

| Register | Name | Data type | Read | | Write | |

1) The offset specifies the position of the register within the CAN object.

9.16.3.11.3.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see ["Using I/O modules on the bus controller" on page 3789](#).

9.16.3.11.3.2 CAN I/O bus controller

The module occupies 1 analog logical slot on CAN I/O.

9.16.3.11.4 Module configuration

The following configuration register can be used to configure different module settings. They can be used, for example, to modify the module's behavior on an X2X Link network. One configuration register is available for the user.

9.16.3.11.4.1 Data query

Name:

CfO_SlframeGenID

This register can be used to define when the synchronous/cyclic input data is generated. "X2X cycle optimized" should be set for jitter-free data acquisition. "Fast reaction" can be set for the best performance.

| Data type | Value | Information |
|-----------|-------|--|
| USINT | 9 | Fast reaction |
| | 14 | X2X cycle optimized; Bus controller default |

9.16.3.11.5 Basic functions

This module can import the position of a motor shaft when used together with a sin/cos encoder. The received position data is prepared in 2 different formats and given a [timestamp](#). 5 registers are available for further processing. This allows the user to choose which format is best suited for individual application.

9.16.3.11.5.1 SDC counter register

Name:
SDCLifeCount

The 8-bit counter register is needed for the SDC software package. It is incremented with the system clock to allow the SDC to check the validity of the data frame.

| Data type | Values |
|-----------|-------------|
| SINT | -128 to 127 |

9.16.3.11.5.2 Absolute position values

Name:
PositionHW
PositionLW

The absolute position of the encoder is defined using 64-bit resolution. The position value is stored in the PositionHW and PositionLW registers. The upper 32 bits are stored the PositionHW register, while the lower 32 bits are stored in the PositionLW register.

For SinCos signal evaluation, see ["Format of the SinCos signal" on page 1908](#) for information regarding the data format.

| Data type | Value |
|-----------|--------------------|
| 2x UDINT | 0 to 4,294,967,295 |

9.16.3.11.5.3 SDC position value

Name:
Position

The SDC library requires a signed 32-bit position value. The position's low word can be accessed separately for this. The value can also be used as default position value, however.

For SinCos signal evaluation, see ["Format of the SinCos signal" on page 1908](#) for information regarding the data format.

| Data type | Value |
|-----------|---------------------------------|
| DINT | -2,147,483,648 to 2,147,483,647 |

9.16.3.11.5.4 NetTime of the position values

Name:
PosTime

The current NetTime value is assigned to each determined position in this register. The NetTime is recorded with μ s accuracy.

The SDC library requires a 16 bit value. The NetTime value is therefore also prepared in this format.

For more information about NetTime and timestamps, see ["NetTime Technology" on page 3035](#).

| Data type | Value | Information |
|-----------|---------------------------------|--------------------|
| DINT | -2,147,483,648 to 2,147,483,647 | NetTime in μ s |
| INT | -32,768 to 32,767 | |

9.16.3.11.5.5 Counter for position values

Name:
PosCycle

PosCycle is an integer counter that is incremented as soon as the module has saved a new valid position value.

| Data type | Value |
|-----------|-------------|
| SINT | -128 to 127 |

9.16.3.11.6 Error management

Module-based diagnostics

This module can detect errors on its own and differentiates between 2 different types of error.

- **Encoder supply:**
The encoder voltage supply is below the permitted limit.
- **V_{ss} Sin/Cos:**
The voltage value for the Sin/Cos track violates the configured limit values.
→ See register "[SinCosVssMin](#)" on page 1909 or "[SinCosVssMax](#)" on page 1909

9.16.3.11.6.1 Enabling/disabling error messages

Name:

ErrorEnableID_1710

The individual diagnostics can be separately enabled or disabled in this register.

| Data type | Values | Bus controller default setting |
|-----------|--------------------|--------------------------------|
| USINT | See bit structure. | 255 |

Bit structure

| Bit | Name | Value | Information |
|-------|---|-------|--|
| 0 | Error detection - Encoder supply | 0 | Disabled |
| | | 1 | Enabled (bus controller default setting) |
| 1 | Reserved | - | |
| 2 | Error detection - V _{ss} Sin/Cos | 0 | Disabled |
| | | 1 | Enabled (bus controller default setting) |
| 3 - 7 | Reserved | - | |

9.16.3.11.6.2 Show error messages

Name:

ErrorStateID_1710

EncoderSupplyError

VssCheckError

This register indicates which error or warning is currently active. For the meaning of individual error messages, see "[Error management](#)" on page 1907.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure

| Bit | Name | Value | Information |
|-------|--------------------|-------|--|
| 0 | EncoderSupplyError | 0 | No error |
| | | 1 | Encoder supply error |
| 1 | Reserved | - | |
| 2 | VssCheckError | 0 | No error |
| | | 1 | V _{ss} error on the Sin/Cos track |
| 3 - 7 | Reserved | - | |

9.16.3.11.6.3 Acknowledge error messages

Name:

ErrorQuitID_1710

AckEncoderSupplyError

AckVssCheckError

This register is used to acknowledge an error message that occurred in the "Show error messages" on page 1907 register. For the meaning of individual error messages, see "Error management" on page 1907.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure

| Bit | Name | Value | Information |
|-------|-----------------------|-------|-------------------------|
| 0 | AckEncoderSupplyError | 0 | No error acknowledgment |
| | | 1 | Error acknowledgment |
| 1 | Reserved | - | |
| 2 | AckVssCheckError | 0 | No error acknowledgment |
| | | 1 | Error acknowledgment |
| 3 - 7 | Reserved | - | |

9.16.3.11.7 Sin/Cos - Analog interface configuration

The module is equipped with an analog interface for detecting a differential sine-, cosine- and reference signal.

9.16.3.11.7.1 Format of the SinCos signal

The SinCos signal is represented as a position value in the "Absolute position values" on page 1906 and "SDC position value" on page 1906 registers. The following relationships apply:

- PositionLW and Position are identical in the function.
- PositionHW extends the integer range of PositionLW by adding multi-turn functionality.

| 64-bit register | PositionHW (unsigned) | PositionLW (unsigned) |
|-----------------|----------------------------------|---|
| 32-bit register | - | Position (signed) |
| Format | Integer extension (to 48-bit) | Integer (16-bit) |
| Information | | Decimal places: (with 13-bit resolution) |
| Word/DWord | DWord | Word 1 |

| | | | | | | | | | | | | | | | |
|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| x | x | x | x | x | x | x | x | x | x | x | x | x | 0 | 0 | 0 |

Important: The lower 3 bits always contain the value 0.

Word 0

Relationship between sine curve (red) and decimal places:

9.16.3.11.7.2 Enabling SinCos

Name:

SinCosEnable

This register must always have the value 1 for configuration reasons.

| Data type | Value | Information |
|-----------|-------|---------------------------|
| USINT | 1 | Bus controller default: 1 |

9.16.3.11.7.3 Enabling SinCos reference source

Name:

SinCosRefSource

This register must always have the value 0 for configuration reasons.

| Data type | Value | Information |
|-----------|-------|-----------------------------------|
| USINT | 0 | Bus controller default setting: 0 |

9.16.3.11.7.4 Configuring the lower Vss value

Name:

SinCosVssMin

This register specifies the lower limit value for the peak-to-peak voltage of the sine/cosine track. The incoming signal is monitored in this way. If the incoming value falls below this specified limit, then the module reports the corresponding error.

| Data type | Value | Information |
|-----------|-----------|---|
| UINT | 0 to 1500 | Values in mV Bus controller default: 800 |

9.16.3.11.7.5 Configuring the upper Vss value

Name:

SinCosVssMax

This register specifies the upper limit value for the peak-to-peak voltage of the sine/cosine track. The incoming signal is monitored in this way. If the incoming value exceeds this specified limit, then the module reports the corresponding error.

| Data type | Value | Information |
|-----------|-----------|--|
| UINT | 0 to 1500 | Values in mV Bus controller default: 1200 |

9.16.3.11.7.6 Configuring the delay time after errors

Name:

SinCosQuitTime

If an error is detected on the analog interface, the last correctly read values remain valid. An interval can be defined in this register at which the module begins receiving correct values again after the error state without processing them further internally. Only then will newly sampled correct analog values be recognized as valid.

| Data type | Value | Information |
|-----------|---------------|---|
| UDINT | 0 to 20000000 | Values in μ s Bus controller default: 100000 |

9.16.3.11.8 Additional encoder position

In addition to the basic function, importing position values, the module can also copy an imported position to the reference register. The copy procedure is triggered by a configurable event.

9.16.3.11.8.1 Configuration

The position of the axis being measured is determined by 3 signals. The Z-signal is triggered exactly once during a single full rotation of the axis, which defines the reference point. The sine and cosine values are offset by 90° and undergo twofold evaluation by the module hardware. During "rough interpolation" the analog sine and cosine values are handled like digital signals. This works in the same way as a conventional ABR module. Fine interpolation takes place simultaneously in another part of the module. This is done using module-specific algorithms.

9.16.3.11.8.2 Configuring the copy procedure

Name:

SinCosCompMode

This register is used to determine when the current position should be copied to the reference register. The register is divided into 2 halves. The upper 4 bits determine which of the signal tracks are relevant for the trigger. The lower 4 bits determine which roughly interpolated states the individual signal tracks must demonstrate in order for the copying procedure to take place.

| Data type | Values | Bus controller default setting |
|-----------|--------------------|--------------------------------|
| USINT | See bit structure. | 119 |

Bit structure:

| Bit | Name | Value | Information |
|-----|-----------------------------------|-------|--|
| 0 | Latch - Sine track | 0 | Copy when sine is negative |
| | | 1 | Copy when sine is positive (bus controller default setting) |
| 1 | Latch - Cosine track | 0 | Copy when cosine is negative |
| | | 1 | Copy when cosine is positive (bus controller default setting) |
| 2 | Latch - Reference track (Z-track) | 0 | Copy when reference is negative |
| | | 1 | Copy when reference is positive (bus controller default setting) |
| 3 | Reserved | - | |
| 4 | Sine track | 0 | Irrelevant for latch |
| | | 1 | Relevant for latch (bus controller default setting) |
| 5 | Cosine track | 0 | Irrelevant for latch |
| | | 1 | Relevant for latch (bus controller default setting) |
| 6 | Reference track (Z-track) | 0 | Irrelevant for latch |
| | | 1 | Relevant for latch (bus controller default setting) |
| 7 | Reserved | - | |

Call

The reference registers can be called the same way as the registers for the current position.

9.16.3.11.8.3 Reference position (to 64-bit)

Name:
ReferenceHW
ReferenceLW

This register prepares the value of the encoder position at the time a specific event occurred.

The 64-bit position value is placed in the registers ReferenceHW and ReferenceLW. The upper 32 bits are in the ReferenceHW register and the lower 32 bits in the ReferenceLW register.

| Data type | Values |
|-----------|--------------------|
| UDINT | 0 to 4,294,967,295 |

9.16.3.11.8.4 Reference position (to 32-bit)

Name:
Reference
Reference

Just like the position registers, the lower 32 bits of the reference position can also be addressed separately. The result is interpreted as a signed value.

| Data type | Values |
|-----------|---------------------------------|
| DINT | -2,147,483,648 to 2,147,483,647 |

9.16.3.11.8.5 Counter for reference values

Name:
RefCycle

This register acts as an integer counter that is incremented as soon as the module has determined a new valid reference value.

| Data type | Values |
|-----------|-------------|
| SINT | -128 to 127 |

9.16.3.11.9 DATA_to_SafeDATA

Function DATA_to_SafeDATA determines a safe signal from 2 independent standard signals. For this purpose, the standard data of 2 I/O modules are transferred to the SafeLOGIC controller and compared with each other there. With the functions provided in SafeDESIGNER, the resulting data can be used for applications up to PL d.

Function DATA_to_SafeDATA is enabled and the register calls take place using SafeDESIGNER. For more detailed information about the calls, see library DATA_to_SafeDATA_SF contained in SafeDESIGNER.

9.16.3.11.9.1 Counter state of the encoder

Name:
Position

This register represents the counter value of the encoder. The register is only active if function DATA_to_SafeDATA is enabled.

| Data type | Values |
|-----------|---------------------------------|
| DINT | -2,147,483,648 to 2,147,483,647 |

9.16.3.11.9.2 NetTime of the counter value

Name:
PosTime

This register represents the NetTime of the most recent valid counter value. The register is only active if function DATA_to_SafeDATA is enabled.

For a description of NetTime Technology, see ["NetTime Technology" on page 3035](#).

| Data type | Values |
|-----------|---------------------------------|
| DINT | -2,147,483,648 to 2,147,483,647 |

9.16.3.11.9.3 Displaying the SourceRef address

Name:

DTS_SourceRef

This register cyclically displays the SourceRef address set in the configuration. The register is only active if function DATA_to_SafeDATA is enabled.

| Data type | Values |
|-----------|-----------------|
| INT | -32768 to 32767 |

9.16.3.11.9.4 Checksum

Name:

DTS_CheckSum

This register contains a checksum formed from the 3 cyclic data points [Position](#), [PosTime](#) and [DTS_SourceRef](#). The register is only active if function DATA_to_SafeDATA is enabled.

| Data type | Values |
|-----------|-----------------|
| INT | -32768 to 32767 |

9.16.3.11.9.5 SourceRef address

Name:

CfO_DTS_SourceRef

This register contains the acyclically configurable SourceRef address that is transmitted back by the module as a cyclic data point. The register is only active if function DATA_to_SafeDATA is enabled.

| Data type | Values |
|-----------|-----------------|
| INT | -32768 to 32767 |

9.16.3.11.9.6 Constant cycle register

Name:

CfO_DTS_CycleSelect

This register determines the cycle used internally and is not permitted to be changed.

| Data type | Value |
|-----------|-------|
| USINT | 2 |

9.16.3.11.10 NetTime Technology

For a description of NetTime Technology, see "[NetTime Technology](#)" on page 3035.

9.16.3.11.11 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time |
|--------------------|
| 100 µs |

9.16.3.11.12 Minimum I/O update time

The minimum I/O update time specifies how far the bus cycle can be reduced so that an I/O update is performed in each cycle.

| Minimum I/O update time |
|-------------------------|
| 100 µs |

9.16.4 X20(c)DS1119

Data sheet version: 3.42

9.16.4.1 General information

This module is a multifunction digital signal processor module. It can be used extremely flexibly for a wide variety of tasks involving digital signal processing or digital signal generation. Two primary example applications include controlling stepper output stages with pulse and direction signals or using as encoder emulation. In this application, for example, frequency inverters or servo axes with the speed follow function can follow a real or virtual master axis.

- 3 digital 5 V channels, configurable as inputs or outputs
- 2 digital 24 V input channels
- 1 universal counter pair (2 event counters, AB counters or up/down counters)
- Linear motion generator (A/B, direction/frequency) with one reference pulse
- SSI absolute encoder
- NetTime timestamp: Input data, target position, position change, edge change, counter change

NetTime timestamp

An additional major feature is the module's integrated timestamp function. It allows counter ramps curves to be generated virtually independently of bus cycle times during encoder emulation, for example. Only the target counter value and moment when it should be reached are transferred. The module automatically generates the corresponding counter values at the appropriate time, precisely in microsecond resolution and independently of the bus clock.

9.16.4.2 Coated modules

Coated modules are X20 modules with a protective coating for the electronics component. This coating protects X20c modules from condensation and corrosive gases.

The modules' electronics are fully compatible with the corresponding X20 modules.

For simplification purposes, only images and module IDs of uncoated modules are used in this data sheet.

The coating has been certified according to the following standards:

- Condensation: BMW GS 95011-4, 2x 1 cycle
- Corrosive gas: EN 60068-2-60, method 4, exposure 21 days

9.16.4.2.1 Starting temperature

The starting temperature describes the minimum permissible ambient temperature when the power is switched off at the time the coated module is switched on. This is permitted to be as low as -40°C . During operation, the conditions as specified in the technical data continue to apply.

Information:

It is important to absolutely ensure that there is no forced cooling by air currents in a closed control cabinet, for example using a fan or ventilation slots.

9.16.4.3 Order data

| Model number | Short description | Figure |
|--------------|---|---|
| | Digital signal processing and preparation |  |
| X20DS1119 | X20 multifunction digital signal processor, 3 digital channels 5 V (symmetrical) configurable as inputs or outputs, 2 digital input channels 24 V (asymmetrical), max. 2 event counters, 1 universal counter pair as AB counter or up/down counter, linear movement generator (A/B, direction/frequency) with 1 reference pulse, 1 SSI absolute encoder, NetTime function | |
| X20cDS1119 | X20 multifunction digital signal processor, coated, 3 digital channels 5 V (symmetrical) configurable as inputs or outputs, 2 digital input channels 24 V (asymmetrical), max. 2 event counters, 1 universal counter pair as AB counter or up/down counter, linear movement generator (A/B, direction/frequency) with 1 reference pulse, 1 SSI absolute encoder, NetTime function | |
| | Required accessories | |
| | Bus modules | |
| X20BM11 | X20 bus module, 24 VDC keyed, internal I/O supply continuous | |
| X20BM15 | X20 bus module, with node number switch, 24 VDC keyed, internal I/O supply continuous | |
| X20cBM11 | X20 bus module, coated, 24 VDC keyed, internal I/O supply continuous | |
| | Terminal blocks | |
| X20TB12 | X20 terminal block, 12-pin, 24 VDC keyed | |

9.16.4.11 Differential output

The following diagram shows that the differential output voltage sinks when the output current rises.

9.16.4.12 Register description

9.16.4.12.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section "General data points" on page 3790.

9.16.4.12.2 Function model 0 - Standard

9.16.4.12.3 General

9.16.4.12.3.1 Use with Automation Studio

The module is supported via X2X Link and POWERLINK.

X2X Link supports a maximum of 28 bytes of synchronous cyclic data per module. To optimize use and avoid needless data transfer, data points can be adjusted as needed in Automation Studio, i.e. unnecessary data points can be disabled, and the bit width of data points can be set.

9.16.4.12.3.2 Timestamp function

The timestamp function is based on synchronized timers. If a timestamp event occurs, the module immediately saves the current NetTime. After the respective data is transferred to the CPU, including this precise moment, the CPU can then evaluate the data using its own NetTime (or system time), if necessary.

Conversely, the CPU can predefine output events, apply a timestamp and transfer them to the module. The module then executes the predefined action at the precise moment defined by the CPU.

For more information about NetTime and timestamps, see "[NetTime Technology](#)" on page 3035.

The resolution of the timestamp is up to $1/8 \mu\text{s}$ in both directions.

Synchronization jitter

Because the CPU – which specifies the X2X NetTime – and the module have different clocks, the module's internal X2X NetTime must be synchronized with the CPU's NetTime. Due to this synchronization, the module's internal X2X NetTime is corrected by a maximum of $1/8 \mu\text{s}$ per system cycle if necessary. This synchronization jitter becomes noticeable when using the NetTime with $1/8 \mu\text{s}$ resolution (max. $\pm 1/8 \mu\text{s}$).

If a 100% exact $1/8 \mu\text{s}$ resolution without jitter is required, then the "localtime $1/8 \mu\text{s}$ " must be used (see register "[CfO_EdgeDetectUnitMode](#)" on page 1940).

9.16.4.12.4 General registers

9.16.4.12.4.1 Defining the moment for generating synchronous input data

Name:

CfO_SlframeGenID

"SI frame generation" in the Automation Studio I/O configuration.

When the synchronous input data is generated for transfer is defined in this register. This has a decisive effect on the timing of the input data.

Setting "Fast reaction" causes the input data to be available one X2X cycle sooner in the CPU. However, this setting also has a negative effect on the minimum X2X cycle time.

| Data type | Values | Information |
|-----------|--------|---------------------|
| USINT | 9 | X2X cycle optimized |
| | 14 | Fast reaction |

9.16.4.12.4.2 Number of X2X protocol errors

Name:

ProtocolError

This register contains an error counter that specifies the number of X2X protocol errors. In the I/O configuration, parameter "Network information" can be used to help configure a data point for this register with a bit width of 8 or 16 bits in the I/O mapping.

| Data type | Values | Information |
|-----------|------------|------------------------|
| USINT | 0 to 255 | Error counter (8-bit) |
| UINT | 0 to 65535 | Error counter (16-bit) |

9.16.4.12.4.3 Number of X2X sequence violations

Name:

ProtocolSequenceViolation

This register contains an error counter that specifies the number of X2X sequence violations. In the I/O configuration, parameter "Network information" can be used to help configure a data point with a bit width of 8 or 16 bits in the I/O mapping.

| Data type | Values | Information |
|-----------|------------|------------------------|
| USINT | 0 to 255 | Error counter (8-bit) |
| UINT | 0 to 65535 | Error counter (16-bit) |

9.16.4.12.4.4 System clock counter for checking the validity of the data frame

Name:

SDCLifeCount

Counter that is incremented with each system timer cycle. "SDC information" in the Automation Studio I/O configuration can be used to enable this register in the I/O mapping as data point "SDCLifeCount".

The 8-bit counter register is needed for the SDC software package. It is incremented with the system clock to allow the SDC to check the validity of the data frame.

| Data type | Values |
|-----------|-------------|
| SINT | -128 to 127 |

9.16.4.12.5 Error handling

If one of the functions detects an error, then an error bit is set in one of the error state registers. The application is now able to react to this and acknowledge the errors by setting a respective bit in the "Acknowledge error message" registers. This causes the bit to be reset in the error state register. If the error source persists, then the error bit is set again as soon as the error is detected again (i.e. resetting is not possible).

Error acknowledgment has no effect on the functionality of the module. The module resumes processing, automatically if possible, as soon as the error source is eliminated.

If an error occurs (not a warning), this is indicated by the red "e" LED on the module (double flash). This signal is automatically acknowledged as soon as the error source has been eliminated.

9.16.4.12.5.1 Error state - Output data and edge detection

Name:

OutputControlError

OutputCopyError

EdgeDetectError

Data output errors and cycle time setting errors are indicated in this register.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|--------------------|-------|---|
| 0 - 3 | Reserved | - | |
| 4 | OutputControlError | 0 | No error |
| | | 1 | The module did not receive new data in time when "Output control mode = Single", meaning that a bit that has already been output would have been output again by the output control buffer. |
| 5 | OutputCopyError | 0 | No error |
| | | 1 | Oversampling output data could not be copied to the output control buffer (attempted to write to an address outside the oversample output window , for example). |
| 6 | EdgeDetectError | 0 | No error |
| | | 1 | Edge detection cycle time violation: "EdgeDetectPollCycle" must be $\leq 255 \mu\text{s}$. This error is occurs if the cycle set in register "CfO_EdgeDetectPollCycleID" on page 1938 is $> 255 \mu\text{s}$. |
| 7 | Reserved | - | |

9.16.4.12.5.2 Error state - SSI

Name:

SSICycleTimeViolation

SSIParityError

SSI interface errors are indicated in this register.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|-----------------------|-------|---|
| 0 | SSICycleTimeViolation | 0 | No error |
| | | 1 | An error occurred. Possible causes: <ul style="list-style-type: none"> SSI transfer takes longer than the set "update cycle". Monostable multivibrator testing is enabled, and the SSI data line does not take on the defined level at the end of the transfer. |
| 1 | SSIParityError | 0 | No error |
| | | 1 | SSI parity error |
| 2 - 7 | Reserved | - | |

9.16.4.12.5.3 Error state - Motion functions

Name:

MovFifoEmpty

MovFifoFull

MovTargetTimeViolation

MovMaxFrequencyViolation

Motion function errors are indicated in this register.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|--------------------------|-------|---|
| 0 | MovFifoEmpty | 0 | No error |
| | | 1 | The position/timestamp FIFO buffer is empty. |
| 1 | MovFifoFull | 0 | No error |
| | | 1 | The position/timestamp FIFO buffer has overshot the size set in register "FifoSize" on page 1944. |
| 2 | MovTargetTimeViolation | 0 | No error |
| | | 1 | This occurs if the moment set in register "MovTargetTime" on page 1949 is already in the past. |
| 3 | MovMaxFrequencyViolation | 0 | No error |
| | | 1 | The maximum output frequency setpoint has overshot the maximum frequency set in register "CfO_SpeedLimit" on page 1945. |
| 4 - 7 | Reserved | - | |

9.16.4.12.5.4 Acknowledging error messages - Output data and edge detection

Name:

QuitOutputControlError

QuitOutputCopyError

QuitEdgeDetectError

Error messages from register "Error state - Output data and edge detection" on page 1924 can be acknowledged by setting the corresponding bits in this register.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|------------------------|-------|-------------------|
| 0 - 3 | Reserved | - | |
| 4 | QuitOutputControlError | 0 | No change |
| | | 1 | Acknowledge error |
| 5 | QuitOutputCopyError | 0 | No change |
| | | 1 | Acknowledge error |
| 6 | QuitEdgeDetectError | 0 | No change |
| | | 1 | Acknowledge error |
| 7 | Reserved | - | |

9.16.4.12.5.5 Acknowledging error messages - SSI

Name:

SSIQuitCycleTimeViolation

SSIQuitParityError

Error messages from register "Error state - SSI" on page 1925 can be acknowledged by setting the corresponding bits in this register.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|---------------------------|-------|-------------------|
| 0 | SSIQuitCycleTimeViolation | 0 | No change |
| | | 1 | Acknowledge error |
| 1 | SSIQuitParityError | 0 | No change |
| | | 1 | Acknowledge error |
| 2 - 7 | Reserved | - | |

9.16.4.12.5.6 Acknowledging error messages - Motion functions

Name:

MovQuitFifoEmpty

MovQuitFifoFull

MovQuitTargetTimeViolation

MovQuitMaxFrequencyViolation

Error messages from register "Error state - Motion functions" on page 1925 can be acknowledged by setting the corresponding bits in this register.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|------------------------------|-------|-------------------|
| 0 | MovQuitFifoEmpty | 0 | No change |
| | | 1 | Acknowledge error |
| 1 | MovQuitFifoFull | 0 | No change |
| | | 1 | Acknowledge error |
| 2 | MovQuitTargetTimeViolation | 0 | No change |
| | | 1 | Acknowledge error |
| 3 | MovQuitMaxFrequencyViolation | 0 | No change |
| | | 1 | Acknowledge error |
| 4 - 7 | Reserved | - | |

9.16.4.12.6 System timer

The module's individual functions all depend on a system timer. This internal "system cycle time" can be set from 25 to 255 μ s. The functions can also be run using a configurable "prescaled system timer" to minimize the load on the module, thereby making it possible to use the shortest possible X2X cycle time.

The cycle of the "prescaled system timer" (and system timer) is referenced with the X2X Link as soon as the module has been started up and the X2X Link has been initialized. Since the system timer and the module's internal **NetTime** use the same clock, the two run synchronously from that point on. An X2X cycle time that is not a multiple of the system cycle time results in an offset, which can be calculated, however.

The following values apply to the following example:

| | |
|------------------------|-------------|
| X2X cycle | 1 ms |
| System timer | 150 μ s |
| Prescaled system timer | 4 |

9.16.4.12.6.1 Setting the cycle time of the system timer

Name:

CfO_SystemCycleTime

"Cycle time" in the Automation Studio I/O configuration.

The cycle time of the system timer can be set in steps of $1/8 \mu\text{s}$ in this register. The value entered in the Automation Studio I/O configuration is automatically multiplied by 8.

Information:

A setting $<50 \mu\text{s}$ has a negative effect on the minimum X2X cycle time!

| Data type | Values | Information |
|-----------|-------------|--|
| UINT | 200 to 2047 | System timer cycle time in steps of $1/8 \mu\text{s}$ (25 to 255.875 μs) |

9.16.4.12.6.2 Offsetting the synchronization moment of the system cycle

Name:

CfO_SystemCycleOffset

"Cycle offset" in the Automation Studio I/O configuration.

The synchronization moment for the system cycle can be offset in steps of $1/8 \mu\text{s}$ in this register. The value entered in the Automation Studio I/O configuration is automatically multiplied by 8.

| Data type | Values | Information |
|-----------|-----------------|---|
| INT | -32768 to 32767 | Cycle offset in steps of $1/8 \mu\text{s}$ (-4096 to 4095.875 μs) |

9.16.4.12.6.3 Configuration of the cycle prescaler

Name:

CfO_SystemCyclePrescaler

"Cycle prescaler" in the Automation Studio I/O configuration.

The prescaler for setting the [prescaled system timer](#) can be configured in this register. The cycle time of the specified system timer is a product of the system timer multiple set in this register.

The "prescaled system timer" can be used as an alternative time source for the individual functions. This is useful if a function requires a very short system cycle. To reduce the load on the module in such a situation, other functions can be processed in a slow cycle.

| Data type | Values | Information |
|-----------|----------|------------------------------|
| UINT | 2 to 128 | Multiple of the system timer |

9.16.4.12.7 Physical I/O configuration

9.16.4.12.7.1 Configuring the I/O channels

Name:

CfO_PhyIOConfigCh01 to CfO_PhyIOConfigCh05

Each physical I/O channel can be configured individually in these registers.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|-------------------------------|---------|--|
| 0 | Push driver ¹⁾ | 0 | Disabled |
| | | 1 | Enabled, see Output signals . |
| 1 | Pull driver ¹⁾ | 0 | Disabled |
| | | 1 | Enabled, see Output signals . |
| 2 | Input inverted | 0 | Not inverted |
| | | 1 | Inverted |
| 3 | Output inverted ¹⁾ | 0 | Not inverted |
| | | 1 | Inverted, see Output signals . |
| 4 - 7 | Output function ¹⁾ | 0 to 15 | See Overview of output channel functions . |

1) Only available for I/O channels 1 to 3

Overview of output channel functions

| Values of bits 4 to 7 | Output channel 1 | Output channel 2 | Output channel 3 |
|-----------------------|-------------------------------|-------------------------------|-------------------------------|
| 0 | Direct I/O | Direct I/O | Direct I/O |
| 1 | | SSI clock output | |
| 2 | ABR emulation (A) | ABR emulation (B) | ABR emulation (reference) |
| 3 | Up/Down emulation (direction) | Up/Down emulation (frequency) | Up/Down emulation (reference) |
| 4 - 15 | Reserved | | |

Output signals

For I/O channels 1 to 3, output signals can be operated in mode "Push", "Pull" and "Push-Pull". Output inversion is also available. This results in the following possibilities for the output signals of channels 1 to 3 and channels 1\ to 3\:

| Signal to be output | Signal on output channel x or x\ | | | | | |
|----------------------------|----------------------------------|----------|--------------------|----------|-------------------------|----|
| | Push ¹⁾ | | Pull ²⁾ | | Push-Pull ³⁾ | |
| | x | x\ | x | x\ | x | x\ |
| 0 | Tristate | Tristate | 0 | 1 | 0 | 1 |
| 1 | 1 | 0 | Tristate | Tristate | 1 | 0 |
| 0 (inverted) ⁴⁾ | 1 | 0 | Tristate | Tristate | 1 | 0 |
| 1 (inverted) ⁴⁾ | Tristate | Tristate | 0 | 1 | 0 | 1 |

- 1) Bit 0 = 1
- 2) Bit 1 = 1
- 3) Bits 0 and 1 = 1
- 4) Bit 3 = 1

9.16.4.12.8 Direct I/O

Direct I/O makes it possible to use the physical I/Os like normal I/Os. Additionally, the application can only set or reset I/Os (e.g. an output channel is set by the edge generator and manually reset by the application).

9.16.4.12.8.1 Direct operation of the output channel - Reset

Name:

CfO_DirectIOClearMask0_7

"Direct operation of output channel 01" to "Direct operation of output channel 03" in the Automation Studio I/O configuration.

If the bit for the respective channel is set in this register, then the output is reset as soon as its direct I/O output channel (register "DigitalOutput" on page 1929 or "DigitalOutput0x" in the Automation Studio I/O mapping) is reset.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|------------------|-------|---------------|
| 0 | Output channel 0 | 0 | No change |
| | | 1 | Reset channel |
| 1 | Output channel 1 | 0 | No change |
| | | 1 | Reset channel |
| 2 | Output channel 2 | 0 | No change |
| | | 1 | Reset channel |
| 3 - 7 | Reserved | - | |

9.16.4.12.8.2 Direct operation of the output channel - Set

Name:

CfO_DirectIOSetMask0_7

"Direct operation of output channel 01" to "Direct operation of output channel 03" in the Automation Studio I/O configuration.

If the bit for the respective channel is set in this register, then the output is set as soon as its direct I/O output channel (register "[DigitalOutput](#)" on page 1929 or "[DigitalOutput0x](#)" in the Automation Studio I/O mapping) is set.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|------------------|-------|-------------|
| 0 | Output channel 0 | 0 | No change |
| | | 1 | Set channel |
| 1 | Output channel 1 | 0 | No change |
| | | 1 | Set channel |
| 2 | Output channel 2 | 0 | No change |
| | | 1 | Set channel |
| 3 - 7 | Reserved | - | |

9.16.4.12.8.3 Direct operation of the output channel - Moment of data output

Name:

CfO_OutputUpdateCycle

The moment when data is output is set with this register.

| Data type | Values | Information |
|-----------|--------|-----------------------------------|
| USINT | 10 | X2X cycle optimized (jitter-free) |
| | 15 | Fast reaction (with jitter) |

9.16.4.12.8.4 Output state

Name:

DigitalOutput01 to DigitalOutput03

This register contains the bits for controlling the direct I/O output channels. Depending on the configuration of registers "[CfO_DirectIOClearMask0_7](#)" on page 1928 and "[CfO_DirectIOSetMask0_7](#)" on page 1929, the digital outputs are set to the status of the respective bit in this register.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|-----------------|--------|-----------------------------|
| 0 | DigitalOutput01 | 0 or 1 | Output state of the channel |
| 1 | DigitalOutput02 | 0 or 1 | Output state of the channel |
| 2 | DigitalOutput03 | 0 or 1 | Output state of the channel |
| 3 - 7 | Reserved | - | |

9.16.4.12.8.5 Input state

Name:

DigitalInput01 to DigitalInput05

The state of the digital input channels is contained in this register.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|----------------|--------|--------------------------|
| 0 | DigitalInput01 | 0 or 1 | Input state of channel 1 |
| 1 | DigitalInput02 | 0 or 1 | Input state of channel 2 |
| 2 | DigitalInput03 | 0 or 1 | Input state of channel 3 |
| 3 | Reserved | - | |
| 4 | DigitalInput04 | 0 or 1 | Input state of channel 4 |
| 5 | DigitalInput05 | 0 or 1 | Input state of channel 5 |
| 6 - 7 | Reserved | - | |

9.16.4.12.9 Oversampled I/O

"Oversampled I/O" is based on input status buffers and output control buffers. The input data acquisition and output control occur in one sample cycle (one sample cycle corresponds to one bit in the buffer). The precise moment of an input buffer entry is indicated by its position in the buffer and the **NetTime** assigned to the buffer.

When "Output control mode = Single", every output buffer entry is marked as invalid once it has been executed. This ensures that the outputs are not supplied with invalid data. In this mode, the application needs to ensure that the module is always supplied with valid data.

When using "Output control mode = Continuous" the contents of the buffer are output again if the module is not supplied with new oversample output data.

9.16.4.12.9.1 Addressing the output control buffer

The module has one cyclic 256-bit output control buffer for each oversample channel. One bit is output from these buffers to the configured physical output channels in each "sample cycle". When new data is transferred to one of these buffers, the application must define where in the respective buffer the data should be written to. There are 2 possibilities available for this (absolute or relative "Output mode" in the Automation Studio I/O configuration).

Absolute addressing of the output control buffer

With absolute addressing, in each cycle where "OversampleOutputValidate = True", in addition to the oversample output sample data (in the "OversampleOutput0NSample" on page 1937 registers) an address must also be transferred in register "OversampleOutputCycle" on page 1936. This address defines where in the output control buffer the new data should be copied. In order to calculate this address, the contents of register "OversampleInputCycle" on page 1937, which contains the address of the most recently output data, and the transfer time to the module must be taken into account. To help avoid incorrect addressing of the output control buffer, the buffer section that is capable of being written to can be limited using register "OversampleOutputWindow" on page 1934. This window will always be shifted relative to the current sample address. An "OutputCopyError" will be triggered if an attempt is made to write to an address that is outside of this window.

Example

Timing characteristics from the oversample input cycle to the oversample output cycle in absolute output mode ("SI frame generation = Fast reaction", "Output copy cycle = Fast reaction", 8 samples per X2X cycle):

Relative addressing of the output control buffer

When "OversampleOutputValidate = True", then the oversample output sample data is automatically copied to an address relative to the last referenced address at the set output copy cycle moment. Register "OversampleSampleOffset" on page 1936 serves as the offset. The new data cannot start being output immediately at the output copy cycle moment because it takes time to copy the data from the registers to the buffer. This means that an offset of 0 is not allowed. The relative output control buffer address + offset must point to an address within the "oversample output window". The oversample output window is always offset relative to the current sample address. An OutputCopyError is triggered if an attempt is made to write to an address that is outside of this window.

9.16.4.12.9.2 Configuring the output control buffers

Name:

CfO_OversampleMode

"Output mode" in the Automation Studio I/O configuration

"Output control mode" in the Automation Studio I/O configuration

The output control buffer can be configured globally for all channels in this register.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|---|-------|--|
| 0 | Addressing the output control buffer "Output mode" | 0 | Absolute addressing of the output control buffer |
| | | 1 | Relative addressing of the output control buffer |
| 1 | Cyclic output control "Output control mode" | 0 | One-time Output control buffer entry is marked invalid after execution. |
| | | 1 | Continuous Output control buffer entry is not changed. |
| 2 - 7 | Reserved | - | |

Cyclic output control

If cyclic output control is enabled, then all data in the output control buffer is marked invalid as soon as it is output ("Output control mode = Single"). An [OutputControlError](#) is generated if the module does not receive data in time, thereby causing a situation in which a bit that has already been output would be output in the buffer again. In this type of error situation, the output takes on the "Output default state" configured in register "[CfO_OversampleConfigOutput](#)" on page 1935.

If cyclic output control is disabled, then the data is output again if the output control buffer overflows ("Output control mode = Continuous").

Information:

All 256 bits of the output control buffer are always output.

9.16.4.12.9.3 Configuration of the source for the sample cycle

Name:

CfO_OversampleSampleCycleID

"Sample cycle" in the Automation Studio I/O configuration.

The source for the sample cycle is configured in this register. During each sample cycle, one bit from the output control buffers of the oversampled I/O channels is output to the configured physical output, and the status of the configured inputs is read into one bit of the respective input status buffer.

| Data type | Values | Information |
|-----------|--------|---|
| USINT | 2 | System timer The value set in register " CfO_SystemCycleTime " on page 1927 is used as the sample cycle. |
| | 3 | Prescaled system timer The "prescaled system timer" is used as sample cycle. |
| | 10 | AOAI The sample cycle is clocked with the AOAI interrupt of the X2X cycle. |
| | 14 | SOSI The sample cycle is clocked with the SOSI interrupt of the X2X cycle. |

9.16.4.12.9.4 Configuration of the source for the user interface reference cycle

Name:

CfO_OversampleRelativeCycleID

"Reference cycle" in the Automation Studio I/O configuration.

The source for the user interface reference cycle is configured in this register.

- The input data is referenced at the moment of the reference cycle. The referenced data is then copied to the "oversample input sample register" on page 1938 at the moment of SI frame generation, taking into account the oversample input window.
- With relative addressing of the output control buffer, the new sample data is copied to an address relative to the output control buffer address current to the "reference cycle".
- The reference cycle is also used to reference the sample cycle and thus the output data production and input data acquisition (e.g. to the X2X cycle).

| Data type | Values | Information |
|-----------|--------|--|
| USINT | 2 | System timer The value set in register "CfO_SystemCycleTime" on page 1927 is used as the reference cycle. |
| | 3 | Prescaled system timer The prescaled system timer is used as sample cycle. |
| | 10 | AOAI The sample cycle is referenced with the AOAI interrupt of the X2X cycle. |
| | 14 | SOSI The sample cycle is referenced with the SOSI interrupt of the X2X cycle. |

9.16.4.12.9.5 Defining the moment for copying the data to the output control buffer

Name:

CfO_OversampleConsumeCycleID

"Output copy cycle" in the Automation Studio I/O configuration.

At the time of the output copy cycle, data is copied from the "OversampleOutput0NSample" on page 1937 registers into the output control buffer.

When "Output copy cycle = Fast reaction", it is not possible to determine when the data is copied to the output control buffer in either of the two addressing modes. The copy cycles will experience a certain degree of jitter depending on the module load. However, this only affects the moment of the internal copy procedures and therefore the moment of the earliest possible output sample. This will not affect the quality of the output signal. However, "Output copy cycle = Fast reaction" also has a negative effect on the minimum X2X cycle time.

When using the setting "Output copy cycle = X2X cycle optimized", be aware that the sample data cannot start being output immediately at the "Output copy cycle" time due to the internal copy cycle to the output control buffers.

| Data type | Values | Information |
|-----------|--------|---|
| USINT | 10 | X2X cycle optimized The output data is copied to the output control buffer with the AOAI interrupt of the X2X cycle. |
| | 15 | Fast reaction The output data is copied to the output control buffer immediately after being received. |

9.16.4.12.9.6 Number of output bits to be transferred

Name:

CfO_OversampleOutputBits

"User interface size" in the Automation Studio I/O configuration.

Specifies how many bits are transferred from the "OversampleOutput0NSample" on page 1937 registers to the output control buffers at the output copy cycle moment.

| Data type | Values | Information |
|-----------|---------|-------------|
| USINT | 1 to 64 | Output bits |

9.16.4.12.9.7 Number of input bits to be transferred

Name:

CfO_OversampleInputBits

"User interface size" in the Automation Studio I/O configuration.

Specifies how many bits are transferred from the input status buffer to the "OversampleInput0NSample" on page 1938 registers during SI frame generation.

| Data type | Values | Information |
|-----------|---------|-------------|
| USINT | 1 to 64 | Input bits |

9.16.4.12.9.8 Write area in the output control buffer

Name:

CfO_OversampleOutputWindow

"Output control mode" in the Automation Studio I/O configuration.

Defines the area in the output control buffer to which data is permitted to be written. The window is always offset relative to the current sample position. (a value of 128, for example, means that the 128 bits following the current sample cycle can be written to). An [OutputCopyError](#) is triggered if an attempt is made to write output sample data to a location outside of this window.

In Automation Studio, the value for this register is set to 128 bits with "Output control mode = Single" and to 255 bits with "Output control mode = Continuous".

| Data type | Values | Information |
|-----------|----------|---------------|
| USINT | 0 to 255 | Output window |

9.16.4.12.9.9 Defining the moment for referencing input data

Name:

CfO_OversampleInputWindow

"Input mode" in the Automation Studio I/O configuration.

The "oversample input window" defines when the input data is referenced. It is located chronologically before [SI frame generation](#). If the reference moment ("reference cycle" on page 1933) is within this window, then the referenced data from the input status buffer is copied to register "OversampleInput0NSample" on page 1938. If the moment at which the reference occurs is outside the "oversample input window" then the data that is most recent at the moment of "SI frame generation" is copied from the input status buffer to register "OversampleInput0NSample" on page 1938.

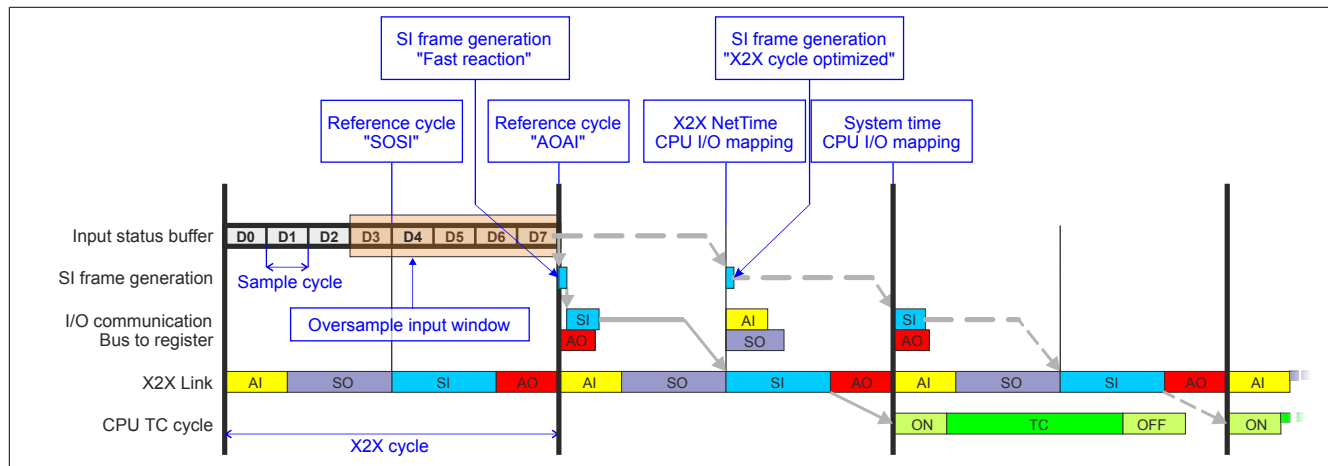

This register is limited internally to the value from register "CfO_OversampleInputBits" on page 1933.

Information:

As a result, the [oversample input time](#) and [oversample input cycle](#) are set either at the reference time or at the moment of "SI frame generation".

In Automation Studio, the value for this register is set to 63 with "Input mode = Referenced values" and to 0 with "Input mode = Most recent values".

| Data type | Values | Information |
|-----------|---------|--------------|
| USINT | 0 to 63 | Input window |

9.16.4.12.9.10 Configuring the outputs of the oversampling channels

Name:

CfO_OversampleConfigOutput

"Oversample I/O 01 → Output" to "Oversample I/O 04 → Output" in the Automation Studio I/O configuration

"Oversample I/O 01 → Output control" to "Oversample I/O 04 → Output control" in the Automation Studio I/O configuration

"Oversample I/O 01 → Output default value" to "Oversample I/O 04 → Output default value" in der Automation Studio I/O configuration

This register helps configure the outputs of the individual oversample channels.

The "Output default state" bits define which level the respective output takes on before oversampling is started. In addition, the output is set to the defined "Output default state" in the event of an error.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|---|-------|---|
| 0 - 3 | Number of the physical output channel "Oversample I/O 0x → Output" | 0 | Output channel 1 |
| | | 1 | Output channel 2 |
| | | 2 | Output channel 3 |
| 4 | Output: Clear "Oversample I/O 0x → Output control" | 0 | Output cannot be reset by the oversample channel. |
| | | 1 | Output can be reset by the oversample channel. |
| 5 | Output: Set "Oversample I/O 0x → Output control" | 0 | Output cannot be set by the oversample channel. |
| | | 1 | Output can be set by the oversample channel. |
| 6 | Default output state: Clear "Oversample I/O 0x → Output default value" | 0 | Output not cleared by default |
| | | 1 | Output cleared by default |
| 7 | Default output state: Set "Oversample I/O 0x → Output default value" | 0 | Output not set by default |
| | | 1 | Output set by default |

9.16.4.12.9.11 Assigning between the physical input channel and oversample I/O input

Name:

CfO_OversampleConfigInput

"Oversample I/O 01 → Input" to "Oversample I/O 04 → Input" in the Automation Studio I/O configuration.

Which physical input channel an oversample I/O input should be linked to is defined in this register.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|--------------------------------------|-------|-----------------|
| 0 - 3 | Number of the physical input channel | 0 | Input channel 1 |
| | | 1 | Input channel 2 |
| | | 2 | Input channel 3 |
| | | 3 | Reserved |
| | | 4 | Input channel 4 |
| | | 5 | Input channel 5 |
| 4 - 7 | Reserved | - | |

9.16.4.12.9.12 Oversampling configuration

Name:

OversampleEnable

OversampleOutputValidate

The oversampling and copy process for the output buffer can be configured in this register.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|--------------------------|-------|--|
| 0 | OversampleEnable | 0 | Disables oversampling (with the next reference cycle) |
| | | 1 | Enables oversampling (with the next reference cycle) |
| 1 | OversampleOutputValidate | 0 | Disable the copy procedure to the output control buffer. |
| | | 1 | Enables the copy procedure to the output control buffer. <ul style="list-style-type: none"> Used to synchronize the oversampling procedure at startup. This makes it possible to prevent new data from being transferred to the "OversampleOutput0NSample" on page 1937 registers in each X2X cycle. |
| 2 - 7 | Reserved | - | |

9.16.4.12.9.13 Address of the new output sampling data in the output control buffer

Name:

OversampleOutputCycle

When absolute addressing of the output control buffer is being used, this register specifies the address from which the new output sample data should be copied to the output control buffer.

| Data type | Values | Information |
|-----------|----------|--------------------------------------|
| USINT | 0 to 255 | Address of the output control buffer |

9.16.4.12.9.14 Offset of new output sample data

Name:

OversampleSampleOffset

When relative addressing of the output control buffer is being used, this register serves as the offset for the new output sample data. (Sample address at the time of the [reference cycle](#) + Offset = Address to which the new output sample data is copied in the output control buffer).

| Data type | Values | Information |
|-----------|----------|------------------------------|
| USINT | 0 to 255 | Offset of output sample data |

9.16.4.12.9.15 Oversample output sample data

Name:

OversampleOutput01Sample1_8 to OversampleOutput04Sample1_8
 OversampleOutput01Sample9_16 to OversampleOutput04Sample9_16
 OversampleOutput01Sample17_24 to OversampleOutput04Sample17_24
 OversampleOutput01Sample25_32 to OversampleOutput04Sample25_32
 OversampleOutput01Sample33_40 to OversampleOutput04Sample33_40
 OversampleOutput01Sample41_48 to OversampleOutput04Sample41_48
 OversampleOutput01Sample49_56 to OversampleOutput04Sample49_56
 OversampleOutput01Sample57_64 to OversampleOutput04Sample57_64

Contains the oversample output sample data. Up to 64 samples (8 bytes) for each oversample I/O channel can be synchronously transferred with a X2X cycle. This data is copied to the specified address (absolute or relative) in the output control buffer at the set [output copy cycle](#). 1 bit of this data is then output during each "sample cycle" to the physical output that is assigned to the oversample I/O channel.

Bit 0 of "OversampleOutputSample8_1" is copied to the output control buffer first, meaning that it is the first bit that is output. "OversampleOutputSample64_57" bit 7 is the last bit to be output.

| Data type | Values | Information |
|-----------|----------|--------------------|
| USINT | 0 to 255 | Output sample data |

Example

Assignment of "OversampleOutputSample" register data to output signal

9.16.4.12.9.16 X2X NetTime of the input data

Name:

OversampleInputTime

This register contains the 2 low-order bytes of the X2X NetTime from the moment at which the oversample input data was referenced. This provides an easy way to accurately calculate the moment of each individual input sample.

For more information about NetTime and timestamps, see ["NetTime Technology"](#) on page 3035.

| Data type | Values | Information |
|-----------|-----------------|---|
| INT | -32768 to 32767 | X2X NetTime of the input data in microseconds |

9.16.4.12.9.17 Input status buffer address of the input sample data

Name:

OversampleInputCycle

This register contains the input status buffer address of the input sample data.

In addition, the value in this register can be used to reference an absolute addressing of the output control buffer.

| Data type | Values | Information |
|-----------|----------|-----------------------------|
| USINT | 0 to 255 | Input status buffer address |

9.16.4.12.9.18 Input sample data

Name:

OversampleInput01Sample8_1 to OversampleInput04Sample8_1
 OversampleInput01Sample16_9 to OversampleInput04Sample16_9
 OversampleInput01Sample24_17 to OversampleInput04Sample24_17
 OversampleInput01Sample32_25 to OversampleInput04Sample32_25
 OversampleInput01Sample40_33 to OversampleInput04Sample40_33
 OversampleInput01Sample48_41 to OversampleInput04Sample48_41
 OversampleInput01Sample56_49 to OversampleInput04Sample56_49
 OversampleInput01Sample64_57 to OversampleInput04Sample64_57

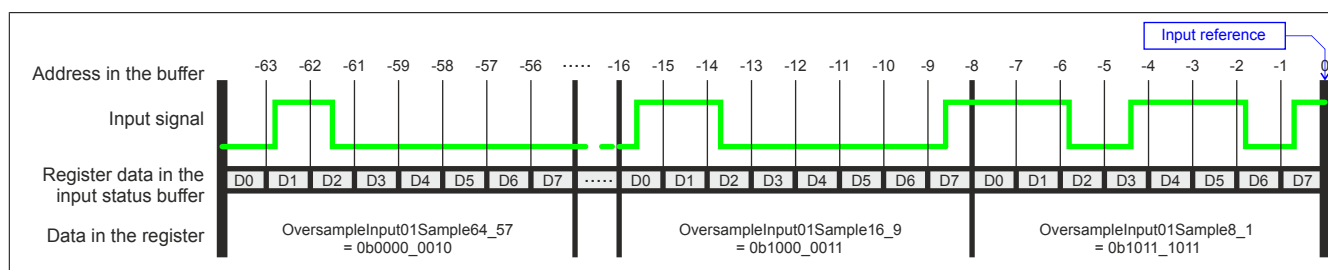

The data of the 4 oversample input status buffers are copied to this register at the moment of **SI frame generation**. A maximum of 64 samples (8 bytes) per oversample I/O channel can be synchronously retrieved from the oversample input status buffer with each X2X cycle.

The most recent input sample bit is stored in "OversampleInputSample8_1" bit 7. The oldest input sample is stored in "OversampleInputSample64_57" bit 0.

| Data type | Values | Information |
|-----------|----------|-------------------|
| USINT | 0 to 255 | Input sample data |

Example

Input signal and resulting data in "OversampleInputSample"

9.16.4.12.10 Edge detection

The module's edge detection function allows edges to be measured with microsecond precision. The concept is based on a maximum of 4 units. One master and one slave edge can be configured for each unit.

At the moment of each master edge, the **NetTime** of the master edge and the **NetTime** of a previous slave edge (if present) are logged. A "master counter" and a "slave counter" can always be used to determine how many edges have been detected since the last X2X cycle.

9.16.4.12.10.1 Configuring the source for the polling cycle

Name:

CfO_EdgeDetectPollCycleID

"Polling cycle" in the Automation Studio I/O configuration.

The source for the polling cycle can be configured in this register.

Information:

The polling cycle must be $\leq 255 \mu\text{s}$. If the configured cycle $> 255 \mu\text{s}$, **EdgeDetectError** occurs.

| Data type | Values | Information |
|-----------|--------|---|
| USINT | 2 | System timer The time set in register "CfO_SystemCycleTime" on page 1927 is used for the polling cycle. |
| | 3 | Prescaled system timer The time set in register "CfO_SystemCyclePrescaler" on page 1927 is used for the polling cycle. |

9.16.4.12.10.2 Edge detection mode

Name:

CfO_EdgeDetectEventEnable

"Edge detection mode" in the Automation Studio I/O configuration.

The bits in this register define on which edges of the individual input channels an interrupt should be triggered for edge detection.

In the Automation Studio I/O configuration, this register is initialized with 0x00000000 when "Edge detection mode = Polling" and with 0xFFFFFFFF when "Edge detection mode = Event-triggered".

In mode "Event-triggered", the [NetTime](#) of each edge is recorded as an interrupt immediately when the edge occurs. However, an extremely large amount of interrupts within a short amount of time can prevent the module from being able to process any other operations in time!

In mode "Polling", only the [NetTime](#) of the first edge that occurs within a polling cycle is recorded. This ensures that the module is not overloaded by too many edges.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|---------|------------------|-------|--|
| 0 | Physical input 1 | 0 | No interrupt triggered on falling edge |
| | | 1 | Interrupt triggered on falling edge |
| 1 | Physical input 2 | 0 | No interrupt triggered on falling edge |
| | | 1 | Interrupt triggered on falling edge |
| 2 | Physical input 3 | 0 | No interrupt triggered on falling edge |
| | | 1 | Interrupt triggered on falling edge |
| 3 | Reserved | - | |
| 4 | Physical input 4 | 0 | No interrupt triggered on falling edge |
| | | 1 | Interrupt triggered on falling edge |
| 5 | Physical input 5 | 0 | No interrupt triggered on falling edge |
| | | 1 | Interrupt triggered on falling edge |
| 6 - 15 | Reserved | - | |
| 16 | Physical input 1 | 0 | No interrupt triggered on rising edge |
| | | 1 | Interrupt triggered on rising edge |
| 17 | Physical input 2 | 0 | No interrupt triggered on rising edge |
| | | 1 | Interrupt triggered on rising edge |
| 18 | Physical input 3 | 0 | No interrupt triggered on rising edge |
| | | 1 | Interrupt triggered on rising edge |
| 19 | Reserved | - | |
| 20 | Physical input 4 | 0 | No interrupt triggered on rising edge |
| | | 1 | Interrupt triggered on rising edge |
| 21 | Physical input 5 | 0 | No interrupt triggered on rising edge |
| | | 1 | Interrupt triggered on rising edge |
| 22 - 31 | Reserved | - | |

9.16.4.12.10.3 Setting the time base, slave edge and master edge

Name:

CfO_EdgeDetectUnit01Mode to CfO_EdgeDetectUnit04Mode

"Time base" in the Automation Studio I/O configuration

"Slave edge" in the Automation Studio I/O configuration

"Master edge" in the Automation Studio I/O configuration

When using a time base with 1/8 μ s resolution, keep in mind that the timestamps produced also have a resolution of exactly 1/8 μ s. The respective conversions must be made for calculating in combination with the CPU system time or X2X NetTime.

In addition, synchronization jitter also plays a role when using "Time base = Nettime resolution 1/8 usec" (see "Synchronization jitter" on page 1922). This means that exactly identical input edges can cause slight differences in the results. If 100% exact 1/8 μ s resolution is required, then "Local resolution 1/8 usec" must be used.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|---------------|-------|---|
| 0 - 1 | "Time base" | 0 | Local time 1/8 μ s (Automation Studio: Local resolution 1/8 usec) |
| | | 1 | Local time 1 μ s (Automation Studio: Local resolution 1 usec) |
| | | 2 | NetTime 1/8 μ s (Automation Studio: Nettime resolution 1/8 usec) |
| | | 3 | NetTime 1 μ s (Automation Studio: Nettime resolution 1 usec) |
| 2 - 5 | Reserved | - | |
| 6 | "Slave edge" | 0 | Disabled |
| | | 1 | Enabled |
| 7 | "Master edge" | 0 | Disabled |
| | | 1 | Enabled |

9.16.4.12.10.4 Load position of the slave time from the FIFO buffer

Name:

CfO_EdgeDetectUnit01Leading to CfO_EdgeDetectUnit04Leading

"Slave leading" in the Automation Studio I/O configuration.

When a slave edge occurs, the current NetTime is always saved within the module. A FIFO buffer is provided inside the module that always stores the last 256 slave stamps (even when a master edge occurs).

This value defines the position from which the slave time should be retrieved from the FIFO buffer when a master edge occurs. This can be used to measure average periodic signals over multiple cycles.

| Data type | Values | Information |
|-----------|----------|---|
| USINT | 0 to 255 | Position in the FIFO buffer for slave edges |

9.16.4.12.10.5 Source of the master edge per edge detection unit

Name:

CfO_EdgeDetectUnit01Master to CfO_EdgeDetectUnit01Master

"Master edge" in the Automation Studio I/O configuration.

Defines the source of the master edge for the respective "edge detection unit".

| Data type | Values | Information |
|-----------|--------|----------------------------------|
| USINT | 0 | Rising edge on physical input 1 |
| | 1 | Rising edge on physical input 2 |
| | 2 | Rising edge on physical input 3 |
| | 4 | Rising edge on physical input 4 |
| | 5 | Rising edge on physical input 5 |
| | 16 | Falling edge on physical input 1 |
| | 17 | Falling edge on physical input 2 |
| | 18 | Falling edge on physical input 3 |
| | 20 | Falling edge on physical input 4 |
| | 21 | Falling edge on physical input 5 |

9.16.4.12.10.6 Source of the slave edge per edge detection unit

Name:

CfO_EdgeDetectUnit01Slave to CfO_EdgeDetectUnit04Slave

"Slave edge" in the Automation Studio I/O configuration.

Defines the source of the slave edge for the respective "edge detection unit".

| Data type | Values | Information |
|-----------|--------|----------------------------------|
| USINT | 0 | Rising edge on physical input 1 |
| | 1 | Rising edge on physical input 2 |
| | 2 | Rising edge on physical input 3 |
| | 4 | Rising edge on physical input 4 |
| | 5 | Rising edge on physical input 5 |
| | 16 | Falling edge on physical input 1 |
| | 17 | Falling edge on physical input 2 |
| | 18 | Falling edge on physical input 3 |
| | 20 | Falling edge on physical input 4 |
| | 21 | Falling edge on physical input 5 |

9.16.4.12.10.7 Number of detected master edges

Name:

EdgeDetect01Mastercount to EdgeDetect04Mastercount

Detected master edges are counted in this register.

| Data type | Values | Information |
|-----------|-----------------|--|
| SINT | -128 to 127 | Number of detected master edges (8-bit) |
| INT | -32768 to 32767 | Number of detected master edges (16-bit) |

9.16.4.12.10.8 Number of detected slave edges

Name:

EdgeDetect01Slavecount to EdgeDetect04Slavecount

Continuously counts the detected slave edges. The contents of this register are only updated on a master edge. This counter can detect if several slave edges occur before a master edge.

| Data type | Values | Information |
|-----------|-----------------|---|
| SINT | -128 to 127 | Number of detected slave edges (8-bit) |
| INT | -32768 to 32767 | Number of detected slave edges (16-bit) |

9.16.4.12.10.9 Difference between master and slave edge

Name:

EdgeDetect01Difference to EdgeDetect04Difference

This register contains the time difference between a master edge and the last slave edge addressed by "Slave leading" on page 1940.

| Data type | Values | Information |
|-----------|---------------------------------|---|
| INT | -32768 to 32767 | Slave edge / Master edge time difference (16-bit) |
| DINT | -2,147,483,648 to 2,147,483,647 | Slave edge / Master edge time difference (32-bit) |

9.16.4.12.10.10 NetTime when a master edge occurs

Name:

EdgeDetect01Mastertime to EdgeDetect04Mastertime

The exact NetTime is copied to this register when a master edge occurs.

For more information about NetTime and timestamps, see "NetTime Technology" on page 3035.

| Data type | Values | Information |
|-----------|---------------------------------|--|
| INT | -32768 to 32767 | NetTime master edge in microseconds (16-bit) |
| DINT | -2,147,483,648 to 2,147,483,647 | NetTime master edge in microseconds (32-bit) |

9.16.4.12.10.11 NetTime when a slave edge occurs

Name:

EdgeDetect01Slavetime to EdgeDetect04Slavetime

When a master edge occurs, the exact NetTime of any slave edge that may have occurred prior to the master edge and addressed by "Slave leading" on page 1940 is copied to this register. If multiple slave edges occur before a master edge, then only the NetTime of the last edge that was not ignored by "Slave leading" is stored. The occurrence of multiple edges can be determined by register "EdgeDetectSlavecount" on page 1941.

For more information about NetTime and timestamps, see "NetTime Technology" on page 3035.

| Data type | Values | Information |
|-----------|---------------------------------|---|
| INT | -32768 to 32767 | NetTime slave edge in microseconds (16-bit) |
| DINT | -2,147,483,648 to 2,147,483,647 | NetTime slave edge in microseconds (32-bit) |

9.16.4.12.11 Motion functions

Encoder emulation can be used to generate up/down counters (direction/frequency) and ABR encoder signals. The following conditions must be met to achieve an exact match of the position of the module with the remote station:

- Up/Down counter: The remote station must evaluate both rising and falling edges.
- ABR encoder: The remote station must employ 4x evaluation.

The motion function can be operated in 2 different operating modes:

- "Mode "Position control"" on page 1942
- "Mode "Speed control"" on page 1943

Minimizing jitter

Depending on the configuration of the module, unfavorable system-related jitter times can result in every motion function. In order to increase the smooth running of the motor, however, the flank switching times and thus the unfavorable jitter can be minimized using register "CfO_ResolPosition" on page 1947.

9.16.4.12.11.1 Mode "Position control"

Each time register "MovTargetTime" on page 1949 changes, a new position setpoint is transferred from register "MovPosition" on page 1949 to the FIFO buffer. The time/position data in the FIFO buffer is then processed in such a manner that the positions are always reached at the moment of the respective timestamps. This means that the module internally ensures that the positions are reached by the set timestamps (number/frequency of the pulses is calculated automatically). The timestamps can be based on the X2X NetTime, the system time of the CPU or register "MovCurrentTime" on page 1950. Timestamps that are set in a manner that does not allow the required position change to be reached before the timestamp (output frequency of the pulse would exceed "CfO_SpeedLimit" on page 1945) cause a `MovMaxFrequencyViolation` error.

For more information about NetTime and timestamps, see "NetTime Technology" on page 3035.

Selected values for the example "Timing of movement":

| | |
|--|-------------------------------|
| Timestamp A = <code>MovTimeValid</code> + 40,000 | Position for timestamp A = 0 |
| Timestamp B = Timestamp A + 40,000 | Position for timestamp B = 10 |
| Timestamp C = Timestamp B + 25,000 | Position for timestamp C = 10 |
| Timestamp D = Timestamp C + 70,000 | Position for timestamp D = 20 |
| Timestamp E = Timestamp D + 15,000 | Position for timestamp E = 20 |
| Timestamp F = Timestamp E + 40,000 | Position for timestamp F = 0 |

Configuration: Reference pulse = Starting and end position, Starting position = 15, End position = 17

9.16.4.12.11.2 Mode "Speed control"

In mode "Speed control", the application only specifies the speed setpoint. The module returns the current position in register "MovPosition (32-bit)" on page 1950.

The default setting ($\text{resolSpeed} = 24$) is designed in such a way that a value of 16,777,216 (0x01000000) in register "MovSpeed" on page 1950 results in exactly one increment per "control period".

First, an internal speed value must be calculated:

$$v_{Intern} = v_{Out} * 2^{\text{resolPos}}$$

This results in the following correlation for a 32-bit speed specification (data format of the speed values = 32-bit):

$$\text{MovSpeed} = v_{Intern} * 2^{\text{resolSpeed}} * \text{period}$$

Atypically to other registers, when writing to register "MovSpeed (16-bit)", the 2 higher-order bytes of "MovSpeed (32-bit)" are written. This results in the following correlation for direct calculation with "MovSpeed (16-bit)".

$$\text{MovSpeed} = \frac{v_{Intern} * 2^{\text{resolSpeed}} * \text{period}}{2^{16}}$$

| Variable | Description | Unit |
|---|---|-------|
| MovSpeed | Value for register "MovSpeed" (16- or 32-bit) | |
| vIntern | Internally calculated speed value. | Inc/s |
| vOut | Desired output speed. Each edge (rising or falling) counts as an increment. | Inc/s |
| resolPos | Configured value of register "CfO_ResolPosition" on page 1947 | |
| resolSpeed | Configured value of register "CfO_ResolSpeed" on page 1948 | Bits |
| period | Configured value of register "CfO_SpeedCycleTime_32Bit" on page 1947 | s |
| <p>Information:</p> <p>Must be set in microseconds in Automation Studio. The calculation is performed in s, however.</p> | | |

9.16.4.12.11.3 Performing a movement in mode "Position control"

Several things must be kept in mind when operating the module in order to perform a movement without errors and avoid error messages.

Information:

The specified time/position pairs are not "movement commands", but position data that is continuously processed by the module.

- To allow the module to calculate movement pulses, the first time/position data pair (t, x) is interpreted as the home position. In this case, "t" represents the starting moment and "x" the current position. A movement is not yet performed.
- As long as bit 0 "MovEnable - For position control" on page 1949 is set to "1", time/position data pairs must be continuously transmitted to the module. As soon as the last data pair has been processed and the module does not find another data pair in the FIFO buffer, error message MovFifoEmpty is sent (see "Error state - Motion functions" on page 1925). In addition, error message MovTargetTimeViolation occurs because no "future moment" for another movement was found.
- To enable a standstill, the time/position data pairs must be specified with an unchanged position but future moments in time.
- Ending the movement with bit 0 = "0" "MovEnable - For position control" on page 1949
This only stops filling the FIFO buffer and subsequently suppresses error message MovFifoEmpty. All entries in the FIFO buffer are still processed. The last specified position is applied as the reference position. As soon as bit 0 = "1" again, all movements are performed relative to this position.
- Ending the movement with bit 7 = "1" "MovReset - Movement reset (immediate stop)" on page 1949
This stops the movement immediately. No more pulses are output. To restart the movement, bit 7 must be set to "0" and bit 0 must be set to "0" for a short time and then back to "1".

9.16.4.12.11.4 FIFO buffer size

Name:

FifoSize

"Number of FIFO buffer entries" in the Automation Studio I/O configuration.

Determines the size of the FIFO buffer for "MovTargetTime" on page 1949 and "MovTargetPosition" on page 1949. One timestamp and one position that should be reached by the timestamp can be transferred to the FIFO buffer per X2X cycle.

| Data type | Values | Information |
|-----------|--------|-----------------------|
| USINT | 0 | FIFO buffer disabled |
| | 3 | 8 entries (2^3) |
| | 4 | 16 entries (2^4) |
| | 5 | 32 entries (2^5) |
| | 6 | 64 entries (2^6) |
| | 7 | 128 entries (2^7) |
| | 8 | 256 entries (2^8) |

9.16.4.12.11.5 Motion function mode

Name:

CfO_Mode

The mode of the motion functions can be configured in this register.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|---|-------|---|
| 0 | Must be enabled when working without timestamps. Enabled in Automation Studio if: <ul style="list-style-type: none"> "Movement = Speed control" "Movement = Position control" and "Data format / Mode of the preset time value = Local time" | 0 | Disabled |
| | | 1 | Enabled |
| 1 | If this function is enabled, repositioning is triggered as soon as the value in register "MovPosition" on page 1949 changes. Enabled in Automation Studio if: <ul style="list-style-type: none"> "Movement = Position control" and "Data format / Mode of the preset time value = Local time" | 0 | No position control (speed control) |
| | | 1 | Position control enabled (position control) |
| 2 | Reference mode "Configuration of reference pulse #1" in the Automation Studio I/O configuration. | 0 | Starting/End position |
| | | 1 | Starting position and span |
| 3 - 7 | Reserved | - | |

9.16.4.12.11.6 Maximum output frequency

Name:

CfO_SpeedLimit

"Max. movement frequency" in the Automation Studio I/O configuration.

Configures the maximum permissible output frequency and the maximum internal computing frequency. The higher internal computing frequencies of 2, 4, 8, 16, 32 and 64 MHz can only be achieved by configuring n bits as decimal places (see register "CfO_ResolPosition" on page 1947).

| Data type | Values | Max. increment frequency | Max. frequency for frequency output channel | Max. frequency for A/B output channel |
|-----------|---------|--------------------------|---|---------------------------------------|
| USINT | 253 | 64 MHz | 500 kHz | 250 kHz |
| | 254 | 32 MHz | | |
| | 255 | 16 MHz | | |
| | 0 | 8 MHz | | |
| | 1 | 4 MHz | | |
| | 2 | 2 MHz | | |
| | 3 | 1 MHz (default) | | |
| | 4 | 500 kHz | 250 kHz | 125 kHz |
| | 5 | 250 kHz | 125 kHz | 62.5 kHz |
| 6 | 125 kHz | 62.5 kHz | 31.25 kHz | |

Information:

In Mode "Position control", increment frequencies 16, 32 and 64 MHz are not permitted to be used when 29-bit timestamps are set (see register "CfO_TimeStampRange" on page 1946) due to an internal range overrun.

9.16.4.12.11.7 Number of absolute bits that can be output

Name:

CfO_FormatAdjust

The number of bits that can be output absolutely on the signal output are determined in this register (e.g. for a direction/frequency signal, the least significant bit can be output directly on the frequency output; for an AB signal, 2 bits are possible).

| Data type | Values | Information |
|-----------|--------|--|
| USINT | 1 to 2 | Number of absolute bits (default value in Automation Studio = 1) |

9.16.4.12.11.8 Width of the transferred timestamp data

Name:

CfO_TimeStampRange

"Data format / Mode of the preset time value" in the Automation Studio I/O configuration.

The width of the transferred **timestamp data** in the module is configured in this register.**Information:**

Since the module works internally with 1/8 μ s resolution, timestamp data is processed internally with a maximum width of 29 bits.

| Data type | Values | Information |
|-----------|--------|--|
| SINT | 16 | 16-bit timestamp (selection "16-bit" in the Automation Studio I/O configuration) |
| | 24 | 24-bit timestamp (selection "Local time" or movement "Speed control" in the Automation Studio I/O configuration) |
| | 29 | 29-bit timestamp (selection "29-bit" in the Automation Studio I/O configuration) |

9.16.4.12.11.9 Number of bits for position control

Name:

CfO_PositionsRange

"Target position range" in the Automation Studio I/O configuration.

The number of bits for position control are configured in this register. "PositionRange" must be reduced if the motion function should follow the absolute value of a 12-bit SSI encoder, for example. In this case, the bit width of the movement position must also be limited to the number of bits of the encoder; otherwise, the movement position would not be overrun if the encoder overflows. In this case, the module would attempt (in the opposite direction) to reach the position of an encoder that had just overflow.

Example

The 12-bit SSI encoder overflows from 2047 to -2048. The module would generate 4096 negative increments if more than 12 bits were set for "CfO_PositionRange" in order to reach position -2048 from the position 2047.

Information:

If the 16-bit value of register **"MovPosition"** on page 1950 is used, then the number of bits of the position must also be limited to ≤ 16 ; otherwise, this would also result in incorrect overflow behavior.

| Data type | Values | Information |
|-----------|---------|-------------------------------------|
| SINT | 8 to 32 | Number of bits for position control |

9.16.4.12.11.10 Number of bits for reference position comparison

Name:

CfO_ReferenceRange

"Reference range" in the Automation Studio I/O configuration.

The number of bits used for the reference position comparison are configured in this register. This makes it possible to generate a reference pulse every 2^n increments.

Information:

The number of bits set in this register is not permitted to exceed the number of bits of registers **"MovReferenceStart"** on page 1948 and **"MovReferenceStopMargin"** on page 1949.

| Data type | Values | Information |
|-----------|---------|--|
| SINT | 4 to 32 | Number of bits for position comparison |

9.16.4.12.11.11 Timestamp delay

Name:

CfO_TimeStampDelay

"Default time delay" in the Automation Studio I/O configuration.

All **timestamps** are delayed by the value set in this register in microseconds.**Information:**

When setting to "Local time" in register "**CfO_TimeStampRange**" on page 1946, a value at least 2x the X2X cycle time in microseconds must be entered here.

| Data type | Values | Information |
|-----------|--------------|---------------------------------|
| DINT | 0 to 1000000 | Timestamp delay in microseconds |

9.16.4.12.11.12 Control period for mode "Speed control"

Name:

CfO_SpeedCycleTime_32Bit

"Control period" in the Automation Studio I/O configuration.

The control period for mode "Speed control" can be configured in 1/8 µs steps in this register.

Information:

The value set in the Automation Studio I/O configuration under "Control period" is automatically multiplied by 8 and then used as **CfO_SpeedCycleTime_32bit**.

| Data type | Values | Information |
|-----------|--------------|---|
| UDINT | 400 to 40000 | Control period for mode "Speed control" |

9.16.4.12.11.13 Minimizing jitter for the position

Name:

CfO_ResolPosition

"Position resolution" in the Automation Studio I/O configuration.

This register contains the number of bits as decimal place for jitter reduction. Internally, the module adds 2^n (n = number of decimal places) to the frequency, which results in edge switching times with a higher resolution. The output switching frequency is not increased from a hardware perspective, but the edge moment is more precise.

| Data type | Values | Information |
|-----------|---------|-------------------------------------|
| SINT | 0 | Default, no decimal places |
| | 1 to 14 | Selection of bits as decimal places |

Information:

It is important to note that each configured decimal place also limits the maximum number range by that number of bits.

For example: 0 decimal places → Maximum position range = 29-bit

3 decimal places → Maximum position range = 26-bit

It is also important to note that parameter "**CfO_SpeedLimit**" on page 1945 must be adjusted for these higher computing frequencies according to the number of configured decimal places.

9.16.4.12.11.14 Minimizing jitter for the speed

Name:

CfO_ResolSpeed

"Speed resolution" in the Automation Studio I/O configuration.

This register contains the number of bits for minimizing the jitter of the speed value as decimal places. Within the module, a 2^n (n = number of decimal places) higher frequency is calculated, resulting in speed values with higher resolution.

A 16-bit or 32-bit speed value is basically configured in the Automation Studio I/O configuration due to the bit limitation. Since the internal calculation is always based on a 32-bit configuration, offset 16 must always be added to the desired decimal places for 16-bit configurations.

| Data type | Values | Information |
|-----------|---------|---|
| SINT | 0 to 31 | Selection of bits as decimal places. Default value in Automation Studio = 24 |

Information:

It is important to note that each configured decimal place also limits the maximum number range by that number of bits.

9.16.4.12.11.15 Acceleration value

Name:

CfO_AccelDataInt

MovAcceleration

"Acceleration value" in the Automation Studio I/O configuration.

The acceleration value in increments per **control period**² is contained in this register.

- 32-bit: 16777216 (0x01000000) corresponds to 1 increment per control period²
- 16-bit: 256 (0x0100) corresponds to 1 increment per control period²

| Data type | Values | Information |
|-----------|--------------------|-----------------------------|
| UINT | 0 to 65535 | Acceleration value (16-bit) |
| UDINT | 0 to 4,294,967,296 | Acceleration value (32-bit) |

9.16.4.12.11.16 Starting position of the reference pulses

Name:

CfO_Reference0Start

MovReferenceStart

"Starting position" in the Automation Studio I/O configuration.

The starting position for the reference pulses is contained in these registers.

If the direction is positive, the output (R) is set when the starting position is reached. In the negative direction, the output is reset as soon as the starting position is undershot.

| Data type | Values | Information |
|-----------|------------------------------------|----------------------------|
| INT | -32768 to 32767 | Starting position (16-bit) |
| DINT | -2,147,483,648 to 2,147,483,647 | Starting position (32-bit) |

9.16.4.12.11.17 End position or range of the reference pulse output

Name:

CfO_Reference0StopMargin

MovReferenceStopMargin

"End position or range" in the Automation Studio I/O configuration.

The end position or range in which the reference pulse is output can be configured in these registers.

If setting "Reference mode = Starting/End position" is used in register "CfO_Mode" on page 1945, the output (R) is reset when the end position is reached if the direction is positive. In the negative direction, the output is set as soon as the end position is undershot.

When using "Reference mode = Starting position and span", the contents of this register are added to the starting position and the resulting sum is used as the end position.

| Data type | Values | Information |
|-----------|---------------------------------|-----------------------|
| INT | -32768 to 32767 | End position (16-bit) |
| DINT | -2,147,483,648 to 2,147,483,647 | End position (32-bit) |

9.16.4.12.11.18 Enabling position and speed control

Name:

MovEnable

MovEnable

MovReset

This register can be used to enable position and speed control.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|--|-------|---------------------------|
| 0 | MovEnable - For position control | 0 | Position control disabled |
| | | 1 | Position control enabled |
| 1 | MovEnable - For speed control | 0 | Speed control disabled |
| | | 1 | Speed control enabled |
| 2 - 6 | Reserved | - | |
| 7 | MovReset - Movement reset (immediate stop) | 0 | No function |
| | | 1 | Reset active |

9.16.4.12.11.19 Timestamp data of the target position

Name:

MovTargetTime

The **timestamp data** is contained in this register. Each time this register changes, the new position data ("**MovTargetPosition**" on page 1949) and timestamp data are transferred to the FIFO buffer. If bit 1 for speed control "**MovEnable = True**", the module calculates the output speed (frequency) so that "**MovTargetPosition**" is reached based on "**MovTargetTime**".

| Data type | Values | Information |
|-----------|---------------------------------|------------------------------------|
| INT | -32768 to 32767 | Timestamp in microseconds (16-bit) |
| DINT | -2,147,483,648 to 2,147,483,647 | Timestamp in microseconds (32-bit) |

Information:

Only 29 bits are processed internally by this register.

9.16.4.12.11.20 Data of the target position

Name:

MovTargetPosition

The position data is contained in this register.

| Data type | Values | Information |
|-----------|---------------------------------|-------------------|
| INT | -32768 to 32767 | Position (16-bit) |
| DINT | -2,147,483,648 to 2,147,483,647 | Position (32-bit) |

9.16.4.12.11.21 Velocity setpoint

Name:

MovSpeed

The speed setpoint for mode "Speed control" in increments per [control period](#) is contained in this register.

- 32-bit: 16,777,216 (0x01000000) corresponds to 1 increment per control period
- 16-bit: 256 (0x0100) corresponds to 1 increment per control period

| Data type | Values | Information |
|-----------|------------------------------------|-------------------------|
| INT | -32768 to 32767 | Speed setpoint (16-bit) |
| DINT | -2,147,483,648 to 2,147,483,647 | Speed setpoint (32-bit) |

9.16.4.12.11.22 NetTime of the current position

Name:

MovTimeValid

The NetTime of the current position is contained in this register.

For more information about NetTime and timestamps, see "[NetTime Technology](#)" on page 3035.

| Data type | Values | Information |
|-----------|------------------------------------|--|
| INT | -32768 to 32767 | NetTime of the current position in microseconds (16-bit) |
| DINT | -2,147,483,648 to 2,147,483,647 | NetTime of the current position in microseconds (32-bit) |

9.16.4.12.11.23 Current position

Name:

MovPosition

The current position is contained in this register.

| Data type | Values | Information |
|-----------|------------------------------------|---------------------------|
| INT | -32768 to 32767 | Current position (16-bit) |
| DINT | -2,147,483,648 to 2,147,483,647 | Current position (32-bit) |

9.16.4.12.12 Synchronous Serial Interface

Synchronous Serial Interface makes it possible to receive data from SSI absolute encoders.

2 cables are required for data exchange:

SSI clock: Generated by the module on output 2 (if configured)
 SSI data: With each clock pulse, one data bit is transferred from the encoder to the module (input 1 can be used as the SSI input).

9.16.4.12.12.1 Procedure for SSI transfer

On the first edge on the SSI clock, a monostable multivibrator is triggered in the encoder and the value currently present in parallel is latched to the shift register (the low level of the monostable multivibrator prevents the transfer of additional values to the shift register during data transfer).

On the next edge, the most significant bit is transferred to the module.

With each additional clock pulse, the next least significant bit is transferred. The clocks constantly retrigger the monostable multivibrator, which prevents its output from accepting new data.

If the number of data bits set in register "[CfO_DataBits](#)" on page 1952 have been received, the clock sequence is ended.

The monostable multivibrator is no longer triggered; after a time dependent on the encoder, the output of the monostable multivibrator accepts the output level again, thus allowing parallel data to be transferred to the encoder's shift register.

With monostable multivibrator testing, the data line is queried for the configured level before starting a new transfer. This makes it possible to ensure that the monostable multivibrator has really returned before a new transfer is started.

Transferring using Synchronous Serial Interface

Processing the measured value

- 1) Start bit ... The measured value is saved.
- 2) Output of the first data bit
- 3) All data bits are transferred; the monostable multivibrator time starts to run.
- 4) The monostable multivibrator returns to its initial state; a new transfer can be started.

9.16.4.12.12.2 Update cycle - Starting SSI transfer

Name:

CfO_CycleSelect

"Update cycle" in the Automation Studio I/O configuration.

SSI transfer is started at the update cycle. The clock sequence is generated on the SSI clock output. The first edge of the clock signal triggers the monoflop in the encoder and latches the current position. At the same time, the current [NetTime](#) is also logged in register "[SSITimeValid](#)" on page 1952. As soon as all bits have been transferred via the SSI, the position is passed on with the next "[SIframeGenCycle](#)" via the X2X Link. A [SSICycleTimeViolation](#) error is reported if the SSI transfer is not completed within the SSI update cycle (e.g. system timer as update cycle). The SSI transfer is still fully completed and then started again with the next update cycle.

| Data type | Values | Information |
|-----------|--------|------------------------|
| USINT | 2 | System timer |
| | 3 | Prescaled system timer |
| | 10 | AOAI |
| | 14 | SOSI |

9.16.4.12.12.3 Configuring the SSI interface

Name:

CfO_PhysicalMode

"Parity bit" in the Automation Studio I/O configuration

"Monostable multivibrator testing" in the Automation Studio I/O configuration

"Data format" in the Automation Studio I/O configuration

"Clock frequency" in the Automation Studio I/O configuration

The SSI interface is configured in this register.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|---|-------|--|
| 0 - 1 | "Parity bit" ⁽¹⁾ | 00 | Disabled |
| | | 01 | Even parity |
| | | 10 | Odd parity |
| | | 11 | Ignore (the parity bit is transferred but not evaluated) |
| 2 - 3 | "Monostable multivibrator testing" ⁽²⁾ | 00 | Disabled |
| | | 01 | Low level (the data signal is checked for a low level after the monostable multivibrator has returned to its stable state) |
| | | 10 | High level (data signal is checked for high level after the monostable multivibrator has returned to its stable state) |
| | | 11 | Ignore (the necessary clock is triggered but not evaluated) |
| 4 | "Data format" | 0 | Encoder with binary data output |
| | | 1 | Encoder with Gray code. The position data is converted into binary format by the module. |
| 5 | Reserved | - | |
| 6 - 7 | "Clock frequency" | 00 | 1 MHz |
| | | 01 | 500 kHz |
| | | 10 | 250 kHz |
| | | 11 | 125 kHz |

- 1) If the parity bit is not correct, `SSIParityError` is generated and the position data is not applied to register "`SSIPosition`" on page 1953.
- 2) As long as the data signal has not reached the level defined for monostable multivibrator testing after the transfer, no new SSI transfer is started. This will trigger error `SSICycleTimeViolation`.

9.16.4.12.12.4 Valid number of SSI data bits

Name:

CfO_DataBits

"Valid number of SSI data bits" in the Automation Studio I/O configuration.

Determines the number of valid data bits to be transferred via SSI. The valid data bits are used for "`SSIPosition`" on page 1953.

| Data type | Values | Information |
|-----------|---------|---------------------------|
| USINT | 1 to 32 | Number of valid data bits |

9.16.4.12.12.5 Number of leading zero bits

Name:

CfO_NullBits

"Number of leading zero bits" in the Automation Studio I/O configuration.

The number of leading zero bits can be configured in this register. The leading zero bits may be required before the valid data bits.

| Data type | Values | Information |
|-----------|---------|-----------------------------|
| USINT | 0 to 31 | Number of leading zero bits |

9.16.4.12.12.6 NetTime of the current position

Name:

SSITimeValid

The NetTime of the current position is contained in this register.

For more information about NetTime and timestamps, see "[NetTime Technology](#)" on page 3035.

| Data type | Values | Information |
|-----------|---------------------------------|--|
| INT | -32768 to 32767 | NetTime of the current position in microseconds (16-bit) |
| DINT | -2,147,483,648 to 2,147,483,647 | NetTime of the current position in microseconds (32-bit) |

9.16.4.12.12.7 NetTime of the last position change

Name:

SSITimeChanged

The NetTime at which the last position change took place is contained in this register.

For more information about NetTime and timestamps, see "[NetTime Technology](#)" on page 3035.

| Data type | Values | Information |
|-----------|---------------------------------|--|
| INT | -32768 to 32767 | NetTime of the last position change in microseconds (16-bit) |
| DINT | -2,147,483,648 to 2,147,483,647 | NetTime of the last position change in microseconds (32-bit) |

9.16.4.12.12.8 Current position

Name:

SSIPosition

The current position transferred via the SSI interface is contained in this register.

| Data type | Values | Information |
|-----------|---------------------------------|---------------------------|
| INT | -32768 to 32767 | Current position (16-bit) |
| UDINT | 0 to 4,294,967,295 | Current position (32-bit) |
| DINT | -2,147,483,648 to 2,147,483,647 | |

9.16.4.12.13 Counter

The universal counter pair can be used in 3 different modes. Signals up to 600 kHz are reliably detected, depending on the system timer. Up to 4 latch inputs can be configured in all modes. If required, the enabled latch inputs are negated and linked to a latch condition with a logical AND operator. If the latch condition is met, the current counter value is saved to a separate register.

Inputs

Depending on the function model, the physical inputs are permanently configured for the counter.

| Mode | Input 1 | Input 2 | Input 3 | Input 4 |
|----------------------|--|--|--------------------|--------------------|
| Edge counter | Counter input for counter 1 Latch input 1 | Counter input for counter 2 Latch input 2 | - Latch input 3 | - Latch input 4 |
| Up/Down counter | Counting direction Latch input 1 | Counter frequency Latch input 2 | - Latch input 3 | - Latch input 4 |
| Incremental encoders | A Latch input 1 | B Latch input 2 | - Latch input 3 | - Latch input 4 |

Latch function

As latch inputs, inputs 1 to 4 can each be queried for a high or low level.

With "Latch mode = Continuous", the counters are latched once as soon as "[LatchEnable](#) = True" and the configured latch condition is met. When the latch condition is met again, the counter content is latched again (i.e. a latch event is triggered on every rising edge of the output of the AND operator of all latch inputs).

With "Latch mode = Single", the counters are latched once as soon as "[LatchEnable](#) = True" and the configured latch condition is met. When the latch condition is met again, the counter content is not automatically recopied. Another latch event can only be processed after "[LatchEnable](#) = False" and another "[LatchEnable](#) = True".

9.16.4.12.13.1 Update cycle for counter values

Name:

CfO_CounterCycleSelect

"Update cycle" in the Automation Studio I/O configuration.

The update cycle for the counter values is configured in this register.

Information:

The maximum counting frequency depends on this cycle. The module can process a maximum of 200 increments (edges) within one counter cycle.

| Data type | Values | Information |
|-----------|--------|----------------------------|
| USINT | 2 | System timer |
| | 3 | Prescaled system timer |
| | 10 | AOAI moment from X2X cycle |
| | 14 | SOSI moment from X2X cycle |

9.16.4.12.13.2 Counter mode

Name:

CfO_CounterMode

"Counter mode" in the Automation Studio I/O configuration.

The counter mode is configured in this register.

| Data type | Values | Information |
|-----------|--------|---|
| USINT | 0 | Edge counter The two counters serve as edge counters in this mode. The counter input of counter 1 is permanently connected to input 1; the counter input of the second counter is permanently connected to input 2. Both rising and falling edges are counted. |
| | 2 | Up/Down counter The up/down counter works according to the direction/frequency principle. Input 1 sets the counting direction (LOW = positive, HIGH = negative); input 2 is used as the counter frequency input. Both rising and falling edges on the counter frequency input are counted. |
| | 3 | Incremental encoder (AB counter) When configured as an AB counter, input 1 is used as the A channel and input 2 is used as the B channel. All edges are evaluated (4x evaluation). |

9.16.4.12.13.3 Latch mode

Name:

CfO_LatchMode

"Latch mode" in the Automation Studio I/O configuration.

The latch mode is configured in this register.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|-------------|-------|-------------|
| 0 | LatchMode | 0 | One-time |
| | | 1 | Continuous |
| 1 - 7 | Reserved | - | |

9.16.4.12.13.4 Latch comparators for counter inputs

Name:

CfO_LatchComparator

"Latch level channel 01" to "Latch level channel 04" in the Automation Studio I/O configuration.

The latch comparators for the counter inputs are configured in this register.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-----|--|-------|-------------|
| 0 | Comparison level for the latch comparator on input 1 | 0 | Low |
| | | 1 | High |
| ... | | ... | |
| 3 | Comparison level for the latch comparator on input 4 | 0 | Low |
| | | 1 | High |
| 4 | Enables the latch comparator on input 1 | 0 | Disabled |
| | | 1 | Enabled |
| ... | | ... | |
| 7 | Enables the latch comparator on input 4 | 0 | Disabled |
| | | 1 | Enabled |

9.16.4.12.13.5 Clearing counter values and enabling latching

Name:

CounterReset

LatchEnable

Counter values can be deleted or the latch enabled using this register.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|--------------|-------|----------------|
| 0 | CounterReset | 0 | No action |
| | | 1 | Delete counter |
| 1 | LatchEnable | 0 | Disabled |
| | | 1 | Enabled |
| 2 - 7 | Reserved | - | |

9.16.4.12.13.6 Counter for latch events

Name:

LatchCount

Latch events that occur are counted in this register. This counter can be used to detect whether a new value has been latched, for example.

| Data type | Values | Information |
|-----------|-------------|---------------|
| SINT | -128 to 127 | Latch counter |

9.16.4.12.13.7 NetTime of the current counter value

Name:

CounterTimeValid

The X2X NetTime of the current counter value is contained in this register.

For more information about NetTime and timestamps, see ["NetTime Technology" on page 3035](#).

| Data type | Values | Information |
|-----------|---------------------------------|---|
| INT | -32768 to 32767 | NetTime of the current counter value in microseconds (16-bit) |
| DINT | -2,147,483,648 to 2,147,483,647 | NetTime of the current counter value in microseconds (32-bit) |

9.16.4.12.13.8 NetTime of the last counter value change

Name:

Counter01TimeChanged to Counter02TimeChanged

The NetTime at which the last change of the respective counter took place is contained in this register.

For more information about NetTime and timestamps, see ["NetTime Technology" on page 3035](#).

| Data type | Values | Information |
|-----------|---------------------------------|---|
| INT | -32768 to 32767 | NetTime of the last change of the respective counter in microseconds (16-bit) |
| DINT | -2,147,483,648 to 2,147,483,647 | NetTime of the last change of the respective counter in microseconds (32-bit) |

9.16.4.12.13.9 Current counter value

Name:

CounterValue01 to CounterValue02

The current counter value of the respective counter is contained in this register.

| Data type | Values | Information |
|-----------|---------------------------------|--|
| INT | -32768 to 32767 | Counter value of the respective counter (16-bit) |
| DINT | -2,147,483,648 to 2,147,483,647 | Counter value of the respective counter (32-bit) |

9.16.4.12.13.10 Latch counter

Name:

CounterLatch01 to CounterLatch02

As soon as the latch conditions set in register "[CfO_LatchComparator](#)" on page 1954 are met, the content of the relevant "[CounterValue register](#)" on page 1955 is copied to this register.

| Data type | Values | Information |
|-----------|------------------------------------|------------------------|
| INT | -32768 to 32767 | Latch counter (16-bit) |
| DINT | -2,147,483,648 to 2,147,483,647 | Latch counter (32-bit) |

9.16.4.12.13.11 Counter value relative to the last latch

Name:

CounterRel01 to CounterRel02

In this register, the counter value of the respective counter is calculated relative to the last latch of the respective counter.

| Data type | Values | Information |
|-----------|------------------------------------|---|
| INT | -32768 to 32767 | Counter value relative to the last latch (16-bit) |
| DINT | -2,147,483,648 to 2,147,483,647 | Counter value relative to the last latch (32-bit) |

9.16.4.12.14 NetTime Technology

For a description of NetTime Technology, see "[NetTime Technology](#)" on page 3035.

9.16.4.12.15 Minimum X2X cycle time

The minimum X2X cycle time is strongly dependent on the configured functions and the resulting load on the module. Setting "Fast reaction" and a very short system cycle (<50 μ s) generally have a negative effect on the minimum X2X cycle time. This can result in error behavior with short X2X cycle times.

9.16.5 X20DS1319

Data sheet version: 3.31

9.16.5.1 General information

This module is a multifunction digital signal processor module. It can be used extremely flexibly for a wide variety of tasks involving digital signal processing or digital signal generation. Two primary example applications include controlling stepper output stages with pulse and direction signals or using as encoder emulation. In this application, for example, frequency inverters or servo axes with the speed follow function can follow a real or virtual master axis.

- 4 digital input channels
- 4 digital channels, configurable as inputs or outputs
- 1 universal counter pair (2 event counters, AB counters or up/down counters)
- Linear movement generator (A/B, direction/frequency) with up to 2 reference pulses
- SSI absolute encoder
- NetTime timestamp: Input data, target position, position change, edge change, counter change

NetTime timestamp

An additional essential feature is the module's integrated timestamp function. It allows counter ramps curves to be generated virtually independently of bus cycle times during encoder emulation, for example. Only the target counter value and moment when it should be reached are transferred. The module automatically generates the corresponding counter values at the appropriate time, precisely in microsecond resolution and independently of the bus clock.

9.16.5.2 Order data

| Model number | Short description | Figure |
|--------------|---|---|
| | Digital signal processing and preparation |  |
| X20DS1319 | X20 multifunction digital signal processor, 4 digital input channels, 4 digital channels configurable as inputs or outputs, 2 event counters 1 universal counter pair as AB counter or up/down counter, linear movement generator (A/B, direction/frequency) with max. 2 reference pulses, SSI absolute encoder, NetTime function | |
| | Required accessories | |
| | Bus modules | |
| X20BM11 | X20 bus module, 24 VDC keyed, internal I/O supply continuous | |
| X20BM15 | X20 bus module, with node number switch, 24 VDC keyed, internal I/O supply continuous | |
| | Terminal blocks | |
| X20TB12 | X20 terminal block, 12-pin, 24 VDC keyed | |
| | | |
| | | |

Table 365: X20DS1319 - Technical data

9.16.5.4 LED status indicators

For a description of the various operating modes, see "Diagnostic LEDs" on page 3787.

| Figure | LED | Color | Status | Description |
|---|-------|-------|--------------|---|
|  | r | Green | Off | No power to module |
| | | | Single flash | Mode RESET |
| | | | Double flash | Mode BOOT (during firmware update) ¹⁾ |
| | | | Blinking | Mode PREOPERATIONAL |
| | | | On | Mode RUN |
| | e | Red | Off | Module not supplied with power or everything OK |
| | | | Single flash | I/O error. Possible causes: • SSI error ²⁾ |
| | | | Double flash | System error. Possible causes: • Motion function error ³⁾ • I/O oversampling error ⁴⁾ • Edge detection error ⁴⁾ |
| | | | Triple flash | I/O error and system error occur together |
| | | | On | Error or reset state |
| | 1 - 8 | Green | | State of the corresponding digital signal |

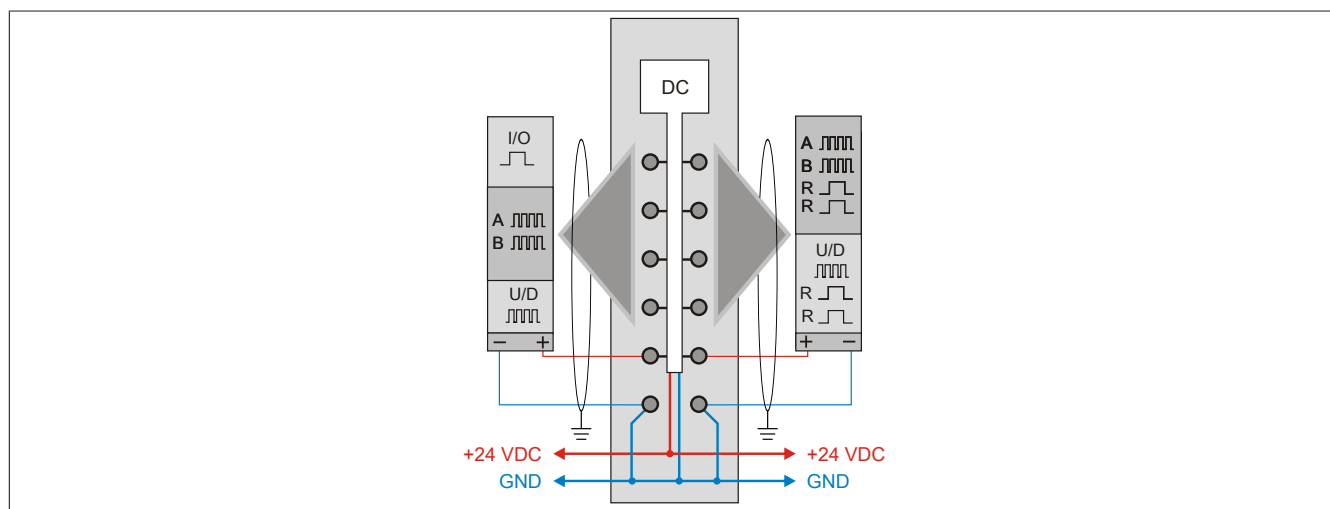

- 1) Depending on the configuration, a firmware update can take up to several minutes.
- 2) See register "Error state - SSI" on page 1969 for the exact error description.
- 3) See register "Error state - Motion functions" on page 1969 for the exact error description.
- 4) See register "Error state - Output data and edge detection" on page 1968 for the exact error description.

9.16.5.5 Pinout

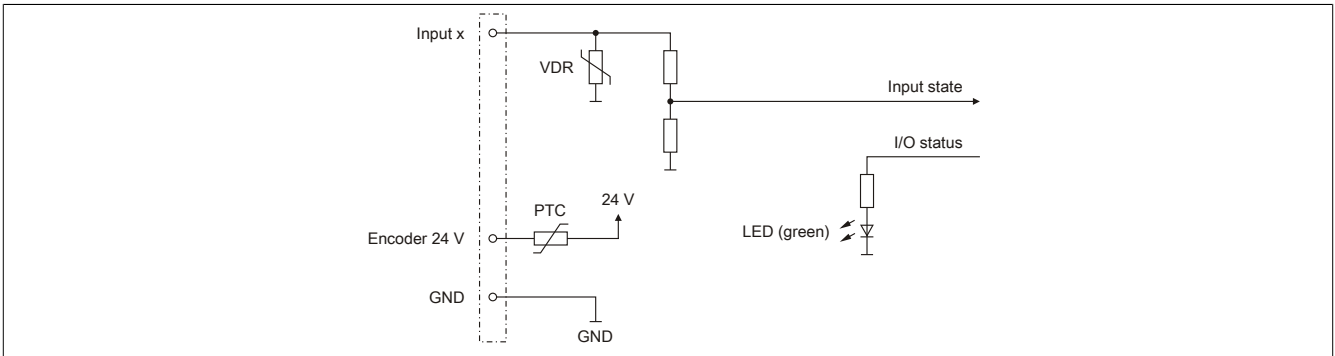

Shielded cables must be used for all signal lines.

9.16.5.11 Register description

9.16.5.11.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section "General data points" on page 3790.

9.16.5.11.2 Function model 0 - Standard

9.16.5.11.3 General

9.16.5.11.3.1 Use with Automation Studio

The module is supported via X2X Link and POWERLINK.

X2X Link supports a maximum of 28 bytes of synchronous cyclic data per module. To optimize use and avoid needless data transfer, data points can be adjusted as needed in Automation Studio, i.e. unnecessary data points can be disabled, and the bit width of data points can be set.

9.16.5.11.3.2 Timestamp function

The timestamp function is based on synchronized timers. If a timestamp event occurs, the module immediately saves the current NetTime. After the respective data is transferred to the CPU, including this precise moment, the CPU can then evaluate the data using its own NetTime (or system time), if necessary.

Conversely, the CPU can predefine output events, apply a timestamp and transfer them to the module. The module then executes the predefined action at the precise moment defined by the CPU.

For more information about NetTime and timestamps, see "[NetTime Technology](#)" on page 3035.

The resolution of the timestamp is up to $1/8 \mu\text{s}$ in both directions.

Synchronization jitter

Because the CPU – which specifies the X2X NetTime – and the module have different clocks, the module's internal X2X NetTime must be synchronized with the CPU's NetTime. Due to this synchronization, the module's internal X2X NetTime is corrected by a maximum of $1/8 \mu\text{s}$ per system cycle if necessary. This synchronization jitter becomes noticeable when using the NetTime with $1/8 \mu\text{s}$ resolution (max. $\pm 1/8 \mu\text{s}$).

If a 100% exact $1/8 \mu\text{s}$ resolution without jitter is required, then the "localtime $1/8 \mu\text{s}$ " must be used (see register "[CfO_EdgeDetectUnitMode](#)" on page 1982).

9.16.5.11.4 General registers

9.16.5.11.4.1 Defining the moment for generating synchronous input data

Name:

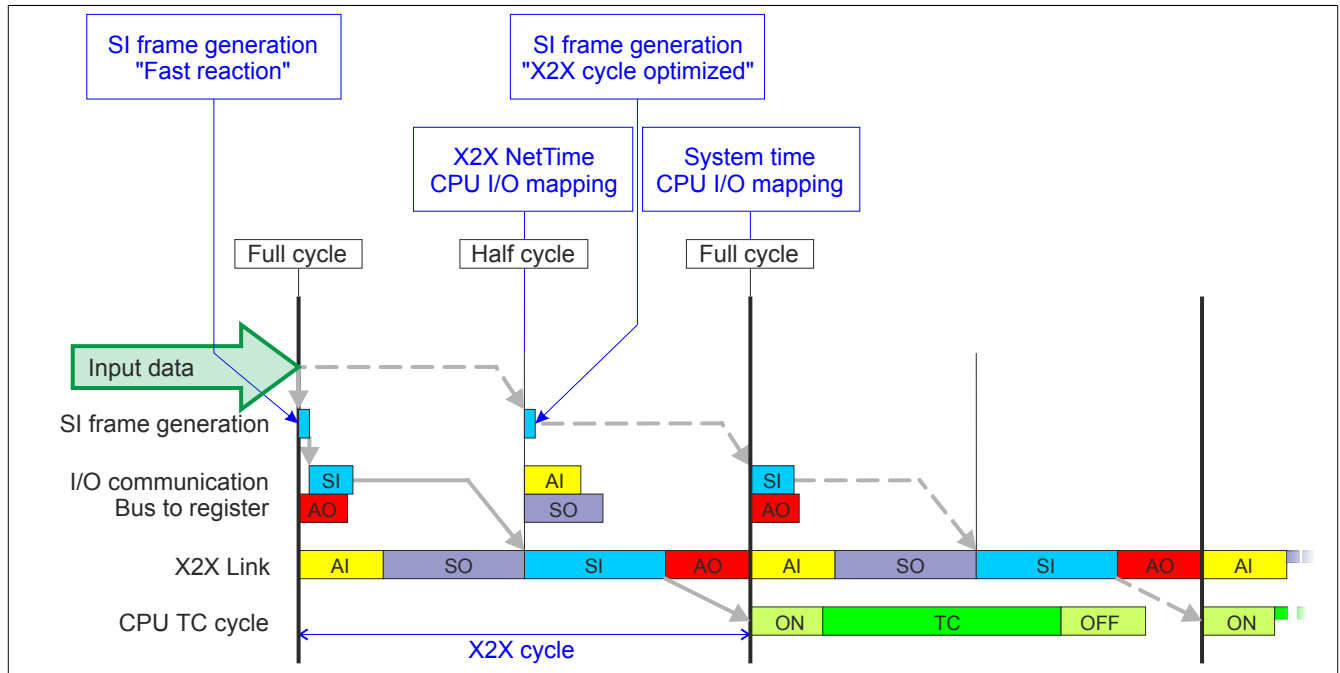

CfO_SlframeGenID

"SI frame generation" in the Automation Studio I/O configuration.

When the synchronous input data is generated for transfer is defined in this register. This has a decisive effect on the timing of the input data.

Setting "Fast reaction" causes the input data to be available one X2X cycle sooner in the CPU. However, this setting also has a negative effect on the minimum X2X cycle time.

| Data type | Values | Information |
|-----------|--------|---------------------|
| USINT | 9 | X2X cycle optimized |
| | 14 | Fast reaction |

9.16.5.11.4.2 Number of X2X protocol errors

Name:

ProtocolError

This register contains an error counter that specifies the number of X2X protocol errors. In the I/O configuration, parameter "Network information" can be used to help configure a data point for this register with a bit width of 8 or 16 bits in the I/O mapping.

| Data type | Values | Information |
|-----------|------------|------------------------|
| USINT | 0 to 255 | Error counter (8-bit) |
| UINT | 0 to 65535 | Error counter (16-bit) |

9.16.5.11.4.3 Number of X2X sequence violations

Name:

ProtocolSequenceViolation

This register contains an error counter that specifies the number of X2X sequence violations. In the I/O configuration, parameter "Network information" can be used to help configure a data point with a bit width of 8 or 16 bits in the I/O mapping.

| Data type | Values | Information |
|-----------|------------|------------------------|
| USINT | 0 to 255 | Error counter (8-bit) |
| UINT | 0 to 65535 | Error counter (16-bit) |

9.16.5.11.4 System clock counter for checking the validity of the data frame

Name:

SDCLifeCount

Counter that is incremented with each system timer cycle. "SDC information" in the Automation Studio I/O configuration can be used to enable this register in the I/O mapping as data point "SDCLifeCount".

The 8-bit counter register is needed for the SDC software package. It is incremented with the system clock to allow the SDC to check the validity of the data frame.

| Data type | Values |
|-----------|-------------|
| SINT | -128 to 127 |

9.16.5.11.5 Error handling

If one of the functions detects an error, then an error bit is set in one of the error state registers. The application is now able to react to this and acknowledge the errors by setting a respective bit in the "Acknowledge error message" registers. This causes the bit to be reset in the error state register. If the error source persists, then the error bit is set again as soon as the error is detected again (i.e. resetting is not possible).

Error acknowledgment has no effect on the functionality of the module. The module resumes processing, automatically if possible, as soon as the error source is eliminated.

If an error occurs (not a warning), this is indicated by the red "e" LED on the module (double flash). This signal is automatically acknowledged as soon as the error source has been eliminated.

9.16.5.11.5.1 Error state - Output data and edge detection

Name:

OutputControlError

OutputCopyError

EdgeDetectError

Data output errors and cycle time setting errors are indicated in this register.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|--------------------|-------|---|
| 0 - 3 | Reserved | - | |
| 4 | OutputControlError | 0 | No error |
| | | 1 | The module did not receive new data in time when "Output control mode = Single", meaning that a bit that has already been output would have been output again by the output control buffer. |
| 5 | OutputCopyError | 0 | No error |
| | | 1 | Oversampling output data could not be copied to the output control buffer (attempted to write to an address outside the oversample output window , for example). |
| 6 | EdgeDetectError | 0 | No error |
| | | 1 | Edge detection cycle time violation: "EdgeDetectPollCycle" must be $\leq 255 \mu\text{s}$. This error is occurs if the cycle set in register "CfO_EdgeDetectPollCycleID" on page 1981 is $> 255 \mu\text{s}$. |
| 7 | Reserved | - | |

9.16.5.11.5.2 Error state - SSI

Name:

SSICycleTimeViolation

SSIParityError

SSI interface errors are indicated in this register.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|-----------------------|-------|---|
| 0 | SSICycleTimeViolation | 0 | No error |
| | | 1 | An error occurred. Possible causes: <ul style="list-style-type: none"> SSI transfer takes longer than the set "update cycle". Monostable multivibrator testing is enabled, and the SSI data line does not take on the defined level at the end of the transfer. |
| 1 | SSIParityError | 0 | No error |
| | | 1 | SSI parity error |
| 2 - 7 | Reserved | - | |

9.16.5.11.5.3 Error state - Motion functions

Name:

MovFifoEmpty

MovFifoFull

MovTargetTimeViolation

MovMaxFrequencyViolation

Motion function errors are indicated in this register.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|--------------------------|-------|---|
| 0 | MovFifoEmpty | 0 | No error |
| | | 1 | The position/timestamp FIFO buffer is empty. |
| 1 | MovFifoFull | 0 | No error |
| | | 1 | The position/timestamp FIFO buffer has overshot the size set in register "FifoSize" on page 1987. |
| 2 | MovTargetTimeViolation | 0 | No error |
| | | 1 | This occurs if the moment set in register "MovTargetTime" on page 1992 is already in the past. |
| 3 | MovMaxFrequencyViolation | 0 | No error |
| | | 1 | The maximum output frequency setpoint has overshot the maximum frequency set in register "CfO_SpeedLimit" on page 1988. |
| 4 - 7 | Reserved | - | |

9.16.5.11.5.4 Acknowledging error messages - Output data and edge detection

Name:

QuitOutputControlError

QuitOutputCopyError

QuitEdgeDetectError

Error messages from register "[Error state - Output data and edge detection](#)" on page 1968 can be acknowledged by setting the corresponding bits in this register.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|------------------------|-------|-------------------|
| 0 - 3 | Reserved | - | |
| 4 | QuitOutputControlError | 0 | No change |
| | | 1 | Acknowledge error |
| 5 | QuitOutputCopyError | 0 | No change |
| | | 1 | Acknowledge error |
| 6 | QuitEdgeDetectError | 0 | No change |
| | | 1 | Acknowledge error |
| 7 | Reserved | - | |

9.16.5.11.5.5 Acknowledging error messages - SSI

Name:

SSIQuitCycleTimeViolation

SSIQuitParityError

Error messages from register "Error state - SSI" on page 1969 can be acknowledged by setting the corresponding bits in this register.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|---------------------------|-------|-------------------|
| 0 | SSIQuitCycleTimeViolation | 0 | No change |
| | | 1 | Acknowledge error |
| 1 | SSIQuitParityError | 0 | No change |
| | | 1 | Acknowledge error |
| 2 - 7 | Reserved | - | |

9.16.5.11.5.6 Acknowledging error messages - Motion functions

Name:

MovQuitFifoEmpty

MovQuitFifoFull

MovQuitTargetTimeViolation

MovQuitMaxFrequencyViolation

In this register, error messages from register "Error state - Motion functions" on page 1969 can be acknowledged by setting the corresponding bits.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|------------------------------|-------|-------------------|
| 0 | MovQuitFifoEmpty | 0 | No change |
| | | 1 | Acknowledge error |
| 1 | MovQuitFifoFull | 0 | No change |
| | | 1 | Acknowledge error |
| 2 | MovQuitTargetTimeViolation | 0 | No change |
| | | 1 | Acknowledge error |
| 3 | MovQuitMaxFrequencyViolation | 0 | No change |
| | | 1 | Acknowledge error |
| 4 - 7 | Reserved | - | |

9.16.5.11.6 System timer

The module's individual functions all depend on a system timer. This internal "system cycle time" can be set from 25 to 255 μ s. The functions can also be run using a configurable "prescaled system timer" to minimize the load on the module, thereby making it possible to use the shortest possible X2X cycle time.

The cycle of the "prescaled system timer" (and system timer) is referenced with the X2X Link as soon as the module has been started up and the X2X Link has been initialized. Since the system timer and the module's internal **NetTime** use the same clock, the two run synchronously from that point on. An X2X cycle time that is not a multiple of the system cycle time results in an offset, which can be calculated, however.

The following values apply to the following example:

| | |
|------------------------|-------------|
| X2X cycle | 1 ms |
| System timer | 150 μ s |
| Prescaled system timer | 4 |

9.16.5.11.6.1 Setting the cycle time of the system timer

Name:

CfO_SystemCycleTime

"Cycle time" in the Automation Studio I/O configuration.

The cycle time of the system timer can be set in steps of $1/8 \mu\text{s}$ in this register. The value entered in the Automation Studio I/O configuration is automatically multiplied by 8.

Information:

A setting $<50 \mu\text{s}$ has a negative effect on the minimum X2X cycle time!

| Data type | Values | Information |
|-----------|-------------|--|
| UINT | 200 to 2047 | System timer cycle time in steps of $1/8 \mu\text{s}$ (25 to 255.875 μs) |

9.16.5.11.6.2 Offsetting the synchronization moment of the system cycle

Name:

CfO_SystemCycleOffset

"Cycle offset" in the Automation Studio I/O configuration.

The synchronization moment for the system cycle can be offset in steps of $1/8 \mu\text{s}$ in this register. The value entered in the Automation Studio I/O configuration is automatically multiplied by 8.

| Data type | Values | Information |
|-----------|-----------------|---|
| INT | -32768 to 32767 | Cycle offset in steps of $1/8 \mu\text{s}$ (-4096 to 4095.875 μs) |

9.16.5.11.6.3 Configuration of the cycle prescaler

Name:

CfO_SystemCyclePrescaler

"Cycle prescaler" in the Automation Studio I/O configuration.

The prescaler for setting the [prescaled system timer](#) can be configured in this register. The cycle time of the specified system timer is a product of the system timer multiple set in this register.

The "prescaled system timer" can be used as an alternative time source for the individual functions. This is useful if a function requires a very short system cycle. To reduce the load on the module in such a situation, other functions can be processed in a slow cycle.

| Data type | Values | Information |
|-----------|----------|------------------------------|
| UINT | 2 to 128 | Multiple of the system timer |

9.16.5.11.7 Physical I/O configuration

9.16.5.11.7.1 Configuring the I/O channels

Name:

CfO_PhylIOConfigCh01 to CfO_PhylIOConfigCh08

Each physical I/O channel can be configured individually in these registers.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|-------------------------------|---------|---|
| 0 | Push driver ¹⁾ | 0 | Disabled |
| | | 1 | Enabled |
| 1 | Pull driver ¹⁾ | 0 | Disabled |
| | | 1 | Enabled |
| 2 | Input inverted | 0 | Not inverted |
| | | 1 | Inverted |
| 3 | Output inverted ¹⁾ | 0 | Not inverted |
| | | 1 | Inverted |
| 4 - 7 | Output function ¹⁾ | 0 to 15 | See "Overview of output channel functions". |

1) Only available for I/O channels 3, 4, 7 and 8

Overview of output channel functions

| Values of bits 4 to 7 | Output channel 3 | Output channel 4 | Output channel 7 | Output channel 8 |
|-----------------------|-------------------------------|-------------------------------|---------------------------------|---------------------------------|
| 0 | Direct I/O | | | |
| 1 | | | | SSI clock output |
| 2 | ABR emulation (A) | ABR emulation (B) | ABR emulation (reference 1) | ABR emulation (reference 2) |
| 3 | Up/Down emulation (direction) | Up/Down emulation (frequency) | Up/Down emulation (reference 1) | Up/Down emulation (reference 2) |
| 4 - 15 | Reserved | | | |

9.16.5.11.8 Direct I/O

Direct I/O makes it possible to use the physical I/Os like normal I/Os. Additionally, the application can only set or reset I/Os (e.g. an output channel is set by the edge generator and manually reset by the application).

9.16.5.11.8.1 Direct operation of the output channel - Reset

Name:

CfO_DirectIOClearMask0_7

"Direct operation of output channel 03" to "Direct operation of output channel 08" in the Automation Studio I/O configuration.

If the bit for the respective channel is set in this register, then the output is reset as soon as its direct I/O output channel (register "[DigitalOutput](#)" on page 1973 or "DigitalOutput0x" in the Automation Studio I/O mapping) is reset.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|------------------|-------|---------------|
| 0 - 1 | Reserved | - | |
| 2 | Output channel 3 | 0 | No change |
| | | 1 | Reset channel |
| 3 | Output channel 4 | 0 | No change |
| | | 1 | Reset channel |
| 4 - 5 | Reserved | - | |
| 6 | Output channel 7 | 0 | No change |
| | | 1 | Reset channel |
| 7 | Output channel 8 | 0 | No change |
| | | 1 | Reset channel |

9.16.5.11.8.2 Direct operation of the output channel - Set

Name:

CfO_DirectIOSetMask0_7

"Direct operation of output channel 03" to "Direct operation of output channel 08" in the Automation Studio I/O configuration.

If the bit for the respective channel is set in this register, then the output is set as soon as its direct I/O output channel (register "DigitalOutput" on page 1973 or "DigitalOutput0x" in the Automation Studio I/O mapping) is set.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|------------------|-------|-------------|
| 0 - 1 | Reserved | - | |
| 2 | Output channel 3 | 0 | No change |
| | | 1 | Set channel |
| 3 | Output channel 4 | 0 | No change |
| | | 1 | Set channel |
| 4 - 5 | Reserved | - | |
| 6 | Output channel 7 | 0 | No change |
| | | 1 | Set channel |
| 7 | Output channel 8 | 0 | No change |
| | | 1 | Set channel |

9.16.5.11.8.3 Direct operation of the output channel - Moment of data output

Name:

CfO_OutputUpdateCycle

The moment when data is output is set with this register.

| Data type | Values | Information |
|-----------|--------|-----------------------------------|
| USINT | 10 | X2X cycle optimized (jitter-free) |
| | 15 | Fast reaction (with jitter) |

9.16.5.11.8.4 Output state

Name:

DigitalOutput03 and DigitalOutput04, DigitalOutput07 and DigitalOutput08

This register contains the bits for controlling the direct I/O output channels. Depending on the configuration of registers "CfO_DirectIOClearMask0_7" on page 1972 and "CfO_DirectIOSetMask0_7" on page 1973, the digital outputs are set to the status of the respective bit in this register.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|-----------------|--------|---------------------------|
| 0 - 1 | Reserved | - | |
| 2 | DigitalOutput03 | 0 or 1 | Output state of channel 3 |
| 3 | DigitalOutput04 | 0 or 1 | Output state of channel 4 |
| 4 - 5 | Reserved | - | |
| 6 | DigitalOutput07 | 0 or 1 | Output state of channel 7 |
| 7 | DigitalOutput08 | 0 or 1 | Output state of channel 8 |

9.16.5.11.8.5 Input state

Name:

DigitalInput01 to DigitalInput08

The state of the digital input channels is contained in this register.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-----|----------------|--------|--------------------------|
| 0 | DigitalInput01 | 0 or 1 | Input state of channel 1 |
| ... | ... | ... | |
| 7 | DigitalInput08 | 0 or 1 | Input state of channel 8 |

9.16.5.11.9 Oversampled I/O

"Oversampled I/O" is based on input status buffers and output control buffers. The input data acquisition and output control occur in one sample cycle (one sample cycle corresponds to one bit in the buffer). The precise moment of an input buffer entry is indicated by its position in the buffer and the **NetTime** assigned to the buffer.

When "Output control mode = Single", every output buffer entry is marked as invalid once it has been executed. This ensures that the outputs are not supplied with invalid data. In this mode, the application needs to ensure that the module is always supplied with valid data.

When using "Output control mode = Continuous" the contents of the buffer are output again if the module is not supplied with new oversample output data.

9.16.5.11.9.1 Addressing the output control buffer

The module has one cyclic 256-bit output control buffer for each oversample channel. One bit is output from these buffers to the configured physical output channels in each "sample cycle". When new data is transferred to one of these buffers, the application must define where in the respective buffer the data should be written to. There are 2 possibilities available for this (absolute or relative "Output mode" in the Automation Studio I/O configuration).

Absolute addressing of the output control buffer

With absolute addressing, in each cycle where "OversampleOutputValidate = True", in addition to the oversample output sample data (in the "OversampleOutput0NSample" on page 1980 registers) an address must also be transferred in register "OversampleOutputCycle" on page 1980. This address defines where in the output control buffer the new data should be copied. In order to calculate this address, the contents of register "OversampleInputCycle" on page 1981, which contains the address of the most recently output data, and the transfer time to the module must be taken into account. To help avoid incorrect addressing of the output control buffer, the buffer section that is capable of being written to can be limited using register "OversampleOutputWindow" on page 1978. This window will always be shifted relative to the current sample address. An "OutputCopyError" will be triggered if an attempt is made to write to an address that is outside of this window.

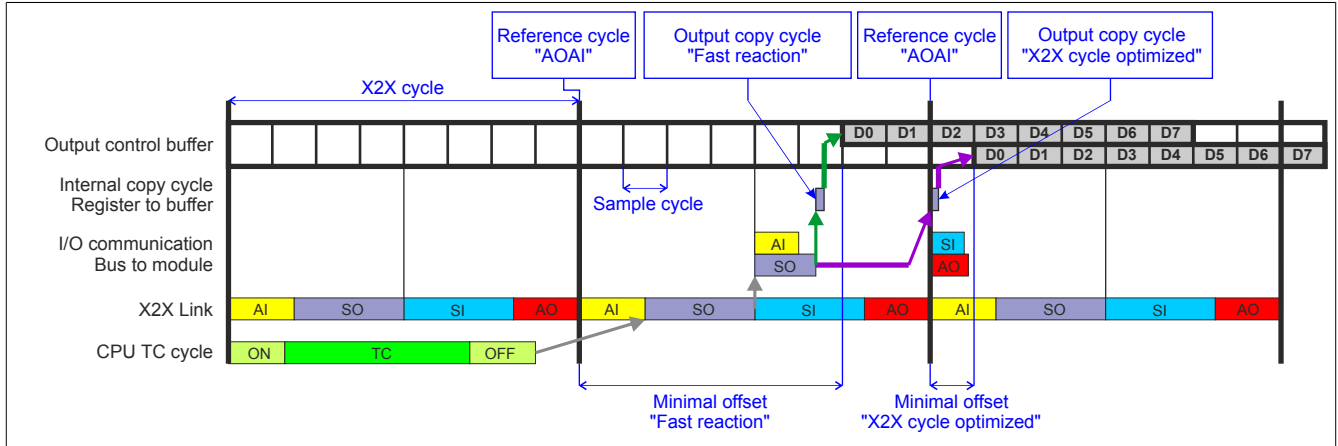

Example

Timing characteristics from the oversample input cycle to the oversample output cycle in absolute output mode ("SI frame generation = Fast reaction", "Output copy cycle = Fast reaction", 8 samples per X2X cycle):

Relative addressing of the output control buffer

When "OversampleOutputValidate = True", then the oversample output sample data is automatically copied to an address relative to the last referenced address at the set output copy cycle moment. Register "OversampleSampleOffset" on page 1980 serves as the offset. The new data cannot start being output immediately at the output copy cycle moment because it takes time to copy the data from the registers to the buffer. This means that an offset of 0 is not allowed. The relative output control buffer address + offset must point to an address within the "oversample output window". The oversample output window is always offset relative to the current sample address. An OutputCopyError is triggered if an attempt is made to write to an address that is outside of this window.

9.16.5.11.9.2 Configuration of the output control buffer

Name:

CfO_OversampleMode

"Output mode" in the Automation Studio I/O configuration

"Output control mode" in the Automation Studio I/O configuration

The output control buffer can be configured globally for all channels in this register.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|---|-------|---|
| 0 | Addressing the output control buffer "Output mode" | 0 | Absolute addressing of the output control buffer |
| | | 1 | Relative addressing of the output control buffer |
| 1 | Cyclic output control "Output control mode" | 0 | Single - Output control buffer entry is marked invalid after execution. |
| | | 1 | Continuous - Output control buffer entry is not changed. |
| 2 - 7 | Reserved | - | |

Cyclic output control

If cyclic output control is enabled, then all data in the output control buffer is marked invalid as soon as it is output ("Output control mode = Single"). An [OutputControlError](#) is generated if the module does not receive data in time, thereby causing a situation in which a bit that has already been output would be output in the buffer again. In this type of error situation, the output takes on the "Output default state" configured in register "[CfO_OversampleConfigOutput](#)" on page 1979.

If cyclic output control is disabled, then the data is output again if the output control buffer overflows ("Output control mode = Continuous").

Information:

All 256 bits of the output control buffer are always output.

9.16.5.11.9.3 Configuration of the source for the sample cycle

Name:

CfO_OversampleSampleCycleID

"Sample cycle" in the Automation Studio I/O configuration.
