|--|-----------|
| 1 General information..... | 13 |
| 1.1 Manual history..... | 13 |
| 1.2 Introduction..... | 16 |
| 1.3 Intended use..... | 16 |
| 1.4 Transport and storage..... | 17 |
| 1.5 Mounting orientation..... | 17 |
| 1.5.1 Inserting and removing I/O modules while the controller is running..... | 17 |
| 1.5.2 Connecting/Disconnecting IF modules while the controller is running..... | 17 |
| 1.6 Operation..... | 18 |
| 1.6.1 Protection against touching electrical parts..... | 18 |
| 1.7 Environmentally friendly disposal..... | 18 |
| 1.7.1 Separation of materials..... | 18 |
| 1.8 Terminology..... | 19 |
| 1.9 Abbreviations..... | 19 |
| 2 Safety guidelines..... | 20 |
| 2.1 Organization of notices..... | 20 |
| 2.2 Protection against electrostatic discharges..... | 20 |
| 2.2.1 Packaging..... | 20 |
| 2.2.2 Guidelines for proper ESD handling..... | 21 |
| 3 System features..... | 22 |
| 3.1 Setting the standards in automation..... | 22 |
| 3.1.1 More than just I/O..... | 22 |
| 3.1.2 3 x 1 = 1..... | 23 |
| 3.2 Optimized design..... | 24 |
| 3.3 Remote backplane..... | 25 |
| 3.4 X20 CPUs..... | 26 |
| 3.4.1 Features..... | 27 |
| 3.4.2 Many CPU series..... | 27 |
| 3.5 For all fieldbuses, integration through standardization..... | 30 |
| 3.6 Complete system..... | 31 |
| 3.6.1 IP67 - then X67..... | 31 |
| 3.6.2 Integrated valve terminal control..... | 31 |
| 3.7 Easy wiring..... | 32 |
| 3.7.1 Install the wires, plug it in, and it's ready to go..... | 32 |
| 3.7.2 Unique terminal numbering..... | 32 |
| 3.8 Sophisticated mechanics..... | 33 |
| 3.9 Diagnostics..... | 34 |
| 3.10 Embedded parameter chip..... | 34 |
| 3.11 Space for options..... | 35 |
| 3.12 Flexibility for options..... | 35 |
| 3.13 Configurable X2X Link address..... | 36 |
| 3.13.1 Bus modules with node number switches..... | 36 |
| 3.14 Universal 1, 2, 3-wire connections..... | 37 |
| 3.15 Coated modules..... | 38 |
| 3.16 Redundancy..... | 38 |
| 3.17 reACTION technology..... | 38 |
| 3.18 X20 system configuration..... | 39 |
| 3.18.1 Fieldbus connection..... | 40 |
| 3.18.2 Connection to X2X Link backplane..... | 41 |
| 4 Mechanical and electrical configuration..... | 42 |
| 4.1 Dimensions..... | 42 |
| 4.1.1 X20 CPUs..... | 42 |
| 4.1.2 X20 CPUs with integrated I/O..... | 42 |
| 4.1.3 Compact/Compact-S CPUs and bus controllers..... | 43 |

| | | |
|--------|---|----|
| 4.1.4 | Fieldbus CPUs and expandable bus controller..... | 43 |
| 4.1.5 | I/O modules..... | 44 |
| 4.1.6 | End cover plates..... | 44 |
| 4.2 | Design support..... | 45 |
| 4.2.1 | CAD support..... | 45 |
| 4.2.2 | Macros for ECAD systems..... | 45 |
| 4.2.3 | Printing support..... | 45 |
| 4.3 | Installation..... | 46 |
| 4.3.1 | Horizontal installation..... | 46 |
| 4.3.2 | Vertical installation..... | 47 |
| 4.3.3 | Oblique installation..... | 48 |
| 4.3.4 | Lying installation..... | 48 |
| 4.3.5 | Installation with increased vibration requirements (4 g)..... | 49 |
| 4.4 | Wiring..... | 50 |
| 4.5 | Stress relief using cable ties..... | 51 |
| 4.6 | Shielding..... | 52 |
| 4.6.1 | Direct shielding connection..... | 52 |
| 4.6.2 | X20 cable shield clamp..... | 53 |
| 4.6.3 | X20 shielding bracket..... | 53 |
| 4.6.4 | Shielding via top-hat rail or bus bar..... | 57 |
| 4.7 | Cabling guidelines for X20 modules with an Ethernet cable..... | 58 |
| 4.8 | The supply concept..... | 59 |
| 4.8.1 | Bus module rack replacement..... | 59 |
| 4.8.2 | X20 system infrastructure..... | 60 |
| 4.8.3 | Bus supply..... | 60 |
| 4.8.4 | Potential groups..... | 60 |
| 4.8.5 | Output modules with supply..... | 61 |
| 4.8.6 | Bus receiver with supply..... | 61 |
| 4.8.7 | Supply module for internal I/O supply..... | 61 |
| 4.8.8 | Power supply module for internal I/O supply and bus supply..... | 61 |
| 4.8.9 | Bus transmitter with supply..... | 61 |
| 4.8.10 | Internal I/O power supply failure (ModuleOk)..... | 61 |
| 4.8.11 | X20 system power supply..... | 61 |
| 4.8.12 | X2X Link supply..... | 62 |
| 4.9 | X20 system protection..... | 64 |
| 4.9.1 | Potential groups..... | 64 |
| 4.9.2 | Supply via bus transmitter..... | 64 |
| 4.10 | Safe cutoff of a potential group..... | 65 |
| 4.10.1 | Description of function..... | 65 |
| 4.10.2 | Scope of application / Standards referenced..... | 65 |
| 4.10.3 | Intended use..... | 66 |
| 4.10.4 | System-specific information..... | 71 |
| 4.10.5 | Safety guidelines..... | 72 |
| 4.11 | Combining X2X Link systems..... | 77 |
| 4.11.1 | Connection overviews..... | 77 |
| 4.11.2 | Connection examples..... | 78 |
| 4.12 | Calculating the power requirements..... | 81 |
| 4.12.1 | Overview of the bus and I/O power supply..... | 82 |
| 4.12.2 | Example: CPU and modules..... | 82 |
| 4.12.3 | Example: Bus controller and modules..... | 83 |
| 4.12.4 | Example: Potential groups..... | 84 |
| 4.13 | Power dissipation of power supply modules..... | 87 |
| 4.13.1 | Power consumption of power supply modules..... | 88 |
| 4.13.2 | Example..... | 89 |
| 4.14 | Calculation of the additional power dissipation resulting from actuators..... | 92 |
| 4.15 | Dimensioning the external 24 VDC power supply..... | 94 |
| 4.15.1 | X20BRx300 bus receivers and X20PS33xx power supply modules..... | 94 |

| | |
|---|------------|
| 4.15.2 Power supply modules X20PS9400 and X20PS9402..... | 94 |
| 4.15.3 CPUs X20CP1483 and X20CPx58x..... | 95 |
| 4.15.4 Compact-S CPUs X20CP04xx..... | 96 |
| 4.15.5 SafeLOGIC controller X20SL81xx..... | 100 |
| 4.16 Power dissipation calculation of I/O modules..... | 101 |
| 4.16.1 Example: Operation of module X20SM1436..... | 101 |
| 4.16.2 Calculation of the power dissipation of I/O modules adjacent to the X20SM1436..... | 102 |
| 5 Mechanical handling..... | 103 |
| 5.1 Solid mechanics..... | 103 |
| 5.2 Number of connection cycles..... | 103 |
| 5.3 Assembling an X20 system..... | 104 |
| 5.3.1 Variant 1..... | 104 |
| 5.3.2 Variant 2..... | 107 |
| 5.4 Installing the X20 system on the top-hat rail..... | 110 |
| 5.5 Removing the X20 system from the top-hat rail..... | 110 |
| 5.5.1 Remove the entire system from the top-hat rail..... | 110 |
| 5.5.2 Removing a block of modules from the top-hat rail..... | 111 |
| 5.6 Expanding an X20 system..... | 113 |
| 5.7 Installing accessories..... | 114 |
| 5.7.1 Additional locking mechanisms..... | 114 |
| 5.7.2 Plain text tag for X20 modules..... | 117 |
| 5.7.3 Plain text tag for X20 CPUs..... | 118 |
| 5.8 Label tags..... | 119 |
| 5.8.1 Labeling the terminal connection..... | 119 |
| 5.8.2 Terminal keying..... | 121 |
| 5.9 Labeling options for the X20 system..... | 123 |
| 5.9.1 Labeling X20 modules..... | 123 |
| 5.9.2 Labeling X20 CPUs..... | 124 |
| 5.9.3 Labeling terminal connections..... | 125 |
| 6 Module overviews..... | 127 |
| 6.1 Standard modules..... | 127 |
| 6.1.1 Module overview: Alphabetically..... | 127 |
| 6.1.2 Module overview: Grouped..... | 134 |
| 6.2 Coated modules..... | 148 |
| 6.2.1 Module overview: Alphabetically..... | 148 |
| 6.2.2 Module overview: Grouped..... | 151 |
| 6.3 B&R ID codes..... | 156 |
| 6.3.1 B&R ID codes sorted by model number..... | 156 |
| 6.3.2 B&R ID codes sorted by ID code..... | 161 |
| 7 Accessories..... | 166 |
| 7.1 Additional equipment for X20 modules and CPUs..... | 166 |
| 7.1.1 Tag holder, terminal locking clip..... | 167 |
| 7.1.2 Plain text tag for X20 modules..... | 167 |
| 7.1.3 Plain text tag for X20 CPUs..... | 167 |
| 7.1.4 Accessory locking clips..... | 167 |
| 7.2 Locking plates..... | 168 |
| 7.3 Cover for interface modules..... | 168 |
| 7.4 Cable shield clamp..... | 168 |
| 7.5 Shielding bracket..... | 169 |
| 7.6 End clamp set..... | 169 |
| 7.7 Shield connection clamp..... | 169 |
| 7.8 Terminal labeling..... | 170 |
| 7.9 Labeling tool..... | 170 |
| 7.10 Screwdriver..... | 170 |

| | |
|---|------------|
| 7.11 Pre-assembled cables..... | 171 |
| 7.11.1 POWERLINK/Ethernet cables..... | 171 |
| 7.11.2 X2X Link cables..... | 175 |
| 8 International and national certifications..... | 178 |
| 8.1 Overview of certifications..... | 179 |
| 8.2 EU directives and standards (CE)..... | 180 |
| 8.2.1 Overview of standards..... | 183 |
| 8.2.2 Requirements for immunity to disturbances..... | 184 |
| 8.2.3 Emission requirements..... | 187 |
| 8.2.4 Mechanical conditions..... | 188 |
| 8.2.5 Electrical safety..... | 189 |
| 8.3 UL / CSA..... | 190 |
| 8.4 Offshore/Maritime..... | 191 |
| 8.5 Other certifications..... | 192 |
| 9 Data sheets..... | 193 |
| 9.1 Analog input modules..... | 193 |
| 9.1.1 Summary..... | 193 |
| 9.1.2 X20(c)AI1744..... | 195 |
| 9.1.3 X20(c)AI1744-3..... | 242 |
| 9.1.4 X20AI1744-10..... | 289 |
| 9.1.5 X20AI2222..... | 318 |
| 9.1.6 X20AI2237..... | 328 |
| 9.1.7 X20AI2322..... | 346 |
| 9.1.8 X20AI2437..... | 357 |
| 9.1.9 X20(c)AI2438..... | 372 |
| 9.1.10 X20AI2622..... | 397 |
| 9.1.11 X20AI2632..... | 408 |
| 9.1.12 X20AI2632-1..... | 433 |
| 9.1.13 X20AI2636..... | 458 |
| 9.1.14 X20AI4222..... | 489 |
| 9.1.15 X20AI4322..... | 499 |
| 9.1.16 X20(c)AI4622..... | 509 |
| 9.1.17 X20(c)AI4632..... | 520 |
| 9.1.18 X20(c)AI4632-1..... | 545 |
| 9.1.19 X20AI4636..... | 570 |
| 9.1.20 X20AI8221..... | 602 |
| 9.1.21 X20AI8321..... | 612 |
| 9.1.22 X20AIA744..... | 622 |
| 9.1.23 X20AIB744..... | 641 |
| 9.1.24 X20(c)AP31xx..... | 660 |
| 9.2 Analog output modules..... | 734 |
| 9.2.1 Summary..... | 734 |
| 9.2.2 X20(c)AO2437..... | 735 |
| 9.2.3 X20(c)AO2438..... | 747 |
| 9.2.4 X20AO2622..... | 773 |
| 9.2.5 X20AO2632..... | 780 |
| 9.2.6 X20AO2632-1..... | 788 |
| 9.2.7 X20(c)AO4622..... | 796 |
| 9.2.8 X20(c)AO4632..... | 805 |
| 9.2.9 X20(c)AO4632-1..... | 814 |
| 9.2.10 X20AO4635..... | 824 |
| 9.3 Bus controllers..... | 832 |
| 9.3.1 Summary..... | 832 |
| 9.3.2 X20BC0043-10..... | 833 |
| 9.3.3 X20BC0053..... | 841 |

| | |

1) Column "Comment" contains only the most important changes in this user's manual. Several updates, corrections and format variations are not included.

1.2 Introduction

Programmable logic controllers, operating/monitoring devices (e.g. industrial PCs, Power Panels, Mobile Panels, etc.) as well as uninterruptible power supplies have all been designed, developed and manufactured by B&R for conventional use or for use with increased safety requirements (safety technology) in industry. They were not designed, developed and manufactured for any use involving serious risks or hazards that could lead to death, injury, serious physical damage or loss of any kind without the implementation of exceptionally stringent safety precautions. In particular, such risks and hazards include the use of these devices to monitor nuclear reactions in nuclear power plants, their use in flight control or flight safety systems as well as in the control of mass transportation systems, medical life support systems or weapons systems.

When using programmable logic controllers or operating/monitoring devices as control systems together with a Soft PLC (e.g. B&R Automation Runtime or comparable product) or Slot PLC (e.g. B&R LS251 comparable product), safety precautions relevant to industrial control systems (e.g. the provision of safety devices such as emergency stop circuits, etc.) must be observed in accordance with applicable national and international regulations. The same applies for all other devices connected to the system, e.g. drives.

All tasks such as the installation, commissioning and servicing of devices are only permitted to be carried out by qualified personnel. Qualified personnel are those familiar with the transport, mounting, installation, commissioning and operation of devices who also have the appropriate qualifications (e.g. IEC 60364-1). National accident prevention regulations must be observed.

The safety notices, connection descriptions (type plate and documentation) and limit values listed in the technical data are to be read carefully before installation and commissioning and must be observed.

1.3 Intended use

Electronic devices are never completely failsafe. If the programmable logic controller, operating/monitoring device or uninterruptible power supply fails, the user is responsible for ensuring that other connected devices such as motors are brought to a safe state.

Modules from B&R are designed as "open equipment" (EN 61131-2) and "open type equipment" (UL). They are therefore designated for installation in an enclosed control cabinet. In all cases, it is necessary to observe and comply with all applicable national and international standards and guidelines, such as machinery directive 2006/42/EC.

1.4 Transport and storage

During transport and storage, devices must be protected against undue stress (mechanical loads, temperature, moisture, corrosive atmospheres, etc.).

Devices contain components sensitive to electrostatic charges that can be damaged by improper handling. It is therefore necessary to provide the required protective measures against electrostatic discharge when installing or removing these devices (see "[Protection against electrostatic discharges](#)" on page 20).

1.5 Mounting orientation

- Installation must be performed according to this documentation using suitable equipment and tools.
- Devices are only permitted to be installed by qualified personnel without voltage applied.
- General safety guidelines and national accident prevention regulations must be observed.
- Electrical installation must be carried out in accordance with applicable guidelines (e.g. line cross sections, fuses, protective ground connections).
- Take the necessary steps to protect against electrostatic discharges (see "[Protection against electrostatic discharges](#)" on page 20).

1.5.1 Inserting and removing I/O modules while the controller is running

I/O modules may be connected and disconnected while the controller is running under the following conditions:

- Connectors are not allowed to carry voltages and must be removed.
- Replacing a module during operation must be supported by the software; otherwise, disconnecting a module will cause an emergency stop of the controller.

1.5.2 Connecting/Disconnecting IF modules while the controller is running

Unlike I/O modules, IF module CANNOT be connected or disconnected while the controller is running.

Warning!

IF modules that are connected or disconnected while the controller is running are not recognized by the CPU or bus controller and will cause the application to behave incorrectly.

1.6 Operation

1.6.1 Protection against touching electrical parts

Danger!

In order to operate programmable logic controllers, operating and monitoring devices and the uninterruptible power supply, it is necessary for certain components to carry dangerous voltages. Touching one of these components can result in a life-threatening electric shock. There is a risk of death, serious injury or damage to property.

Before switching on the programmable logic controllers, operating and monitoring devices and uninterruptible power supply, it must be ensured that the housing is properly connected to ground potential (PE rail). The ground connection must also be made if the operating and monitoring device and uninterruptible power supply are only connected for testing purposes or only operated for a short time!

Before switching on the device, all voltage-carrying components must be securely covered. During operation, all covers must remain closed.

1.7 Environmentally friendly disposal

All B&R control components are designed to inflict as little harm on the environment as possible.

1.7.1 Separation of materials

It is necessary to separate different materials so the device can undergo an environmentally friendly recycling process.

| Component | Disposal |
|---------------------------|---------------------------|
| X20 modules Cables | Electronic recycling |
| Cardboard/paper packaging | Paper/Cardboard recycling |

Table 1: Environmentally friendly separation of materials

Disposal must comply with applicable legal regulations.

1.9 Abbreviations

The following abbreviations appear throughout the user's manual, for example in data tables or descriptions of pinouts.

| Abbreviation | Stands for | Description |
|--------------|-----------------|---|
| NC | Normally closed | Normally closed relay contact. |
| | Not connected | Used in pinout descriptions if a terminal or pin is not connected to a module. |
| ND | Not defined | In data tables, this stands for a value that has not been defined. This may be because a cable manufacturer does not provide certain technical data, for example. |
| NO | Normally open | Normally open relay contact. |
| TBD | To be defined | Used in technical data tables when certain information is not yet available. The value will be provided later. |

2 Safety guidelines

2.1 Organization of notices

Safety notices

Contain **only** information that warns of dangerous functions or situations.

| Signal word | Description |
|-----------------|---|
| Danger! | Failure to observe these safety guidelines and notices will result in death, severe injury or substantial damage to property. |
| Warning! | Failure to observe these safety guidelines and notices can result in death, severe injury or substantial damage to property. |
| Caution! | Failure to observe these safety guidelines and notices can result in minor injury or damage to property. |
| Notice! | Failure to observe these safety guidelines and notices can result in damage to property. |

General notices

Contain **useful** information for users and instructions for avoiding malfunctions.

| Signal word | Description |
|---------------------|--|
| Information: | Useful information, application tips and instructions for avoiding malfunctions. |

2.2 Protection against electrostatic discharges

Electrical components that can be damaged by ESD (**E**lectro**S**tatic **D**ischarges) must be handled properly.

2.2.1 Packaging

- Electrical components with a housing
...do not require special ESD packaging but must be handled properly (see "[Electrical components with a housing](#)" on page 21).
- Electrical components without a housing
...are protected by ESD-suitable packaging.

2.2.2 Guidelines for proper ESD handling

Electrical components with a housing

- Do not touch the male connector contacts on the device (bus data contacts).
- Do not touch the male connector contacts on connected cables
- Do not touch the contact tips on circuit boards

Electrical components without a housing

The following points apply in addition to the points listed under "Electrical components with a housing":

- Any persons handling electrical components or devices with installed electrical components must be grounded.
- Components are only permitted to be touched on their narrow sides or front plate.
- Components must always be placed on or stored in a suitable medium (ESD packaging, conductive foam, etc.).

Information:

Metallic surfaces are not suitable storage surfaces.

- Components must not be subjected to electrostatic discharge (e.g. caused by charged plastics).
- Observe a minimum distance of 10 cm from monitors and television sets.
- Measuring instruments and equipment must be grounded.
- Probe tips of galvanically isolated measuring instruments must be temporarily discharged on suitably grounded surfaces before taking measurements.

Individual components

- ESD protective measures for individual components are thoroughly implemented at B&R (conductive floors, footwear, arm bands, etc.).
- Increased ESD protective measures for individual components are not required for handling B&R products at customer locations.

3 System features

3.1 Setting the standards in automation

There are many different I/O slice systems. With the X20 system, B&R continues to set standards according to its motto "Perfection in Automation". Born from experience gained from applications all over the world, numerous conversations with customers and with the aim for easier, more economical and secure usage, the X20 system is a universal solution for any automated task in machine and system manufacturing.

Figure 1: Each module consists of 3 subcomponents – terminal block, electronics module and bus module.

3.1.1 More than just I/O

With its well thought-out details and a sophisticated ergonomic design, the X20 system is more than a remote I/O system – it's a complete control solution. The X20 system family makes it possible to combine the exact components needed to meet any application requirements.

- The X20 system is the ideal addition to a standard fieldbus and expands the possibilities of conventional control systems. Simply connect it, configure it and you're done.
- Teamed up with other B&R components, the X20 system achieves its full potential and allows the implementation of applications with unimagined performance and flexibility. This type of seamless integration is a major advantage.

3.1.2 3 x 1 = 1

Three basic elements make up one module: Terminal block – Electronic module – Bus module

This modularity results in a system that combines the advantages of both rack and I/O slice systems:

- Prewiring without the module
- Hot pluggable electronics
- Extra bus slots for added options

Figure 2: X20 modules are divided into three parts to guarantee the simplest usability

The X20 system delivers 50% more component density, perfected connection technology and optimal granularity.

- **Added value**
12 channels with a width of 12.5 mm allow a component density never before achieved with optimal terminal ergonomics. As a result, the X20 system offers 50% more channels than conventional slice systems. And this without sacrificing terminal connections.
- **Uniformity**
Consistent implementation of 1-, 2- or 3-wire connections – no additional jumper terminals needed.
- **Granularity**
1-channel and 2-channel modules: Maximum flexibility so you only have to pay for what you really need.

3.2 Optimized design

X20 modules consist of three submodules to provide maximum ease of use throughout their entire life cycle. This division into bus module, electronics module and terminal block has several advantages.

- **Preconfigured for different machine types**

The X20 system bus modules are the basic platform for many machine variations. The design of the machine determines which electronics modules are used. The software recognizes this design automatically and makes sure that the right functions are provided where they are needed. Handling a range of different machine variants couldn't be easier.

- **Industrial control cabinet construction**

X20 system terminal blocks are separate from the electronics module and make it possible to pre-wire the entire control cabinet. This is especially ideal for series-produced machines.

- **Easy maintenance**

X20 modules can be easily exchanged to simplify troubleshooting. The electronic modules can be exchanged without interrupting operation. The wiring remains exactly the same thanks to the separate terminal blocks. Being able to exchange the automation components quickly reduces downtime.

3.3 Remote backplane

The main idea: Remote backplane for a rack system – in other words, the cable is the backplane. All modules are connected to the uniform backplane (X2X Link). Directly connected X20, X67 or XV modules can each be placed at a distance of up to 100 m outside the confines of the control cabinet. X2X Link guarantees the highest possible level of resistance to disturbances based on twisted copper cables.

This not only provides a universal remote backplane which handles the communication between bus modules and via the X2X Link cable, but makes it possible without converters or any loss in performance. A unique feature of the X20 system is the possibility to later integrate machine options on bus modules that are not yet being used without having to change the software addressing.

Remark:

A 100 m X2X Link cable is available from B&R for custom assembly (model number: X67CA0X99.1000).

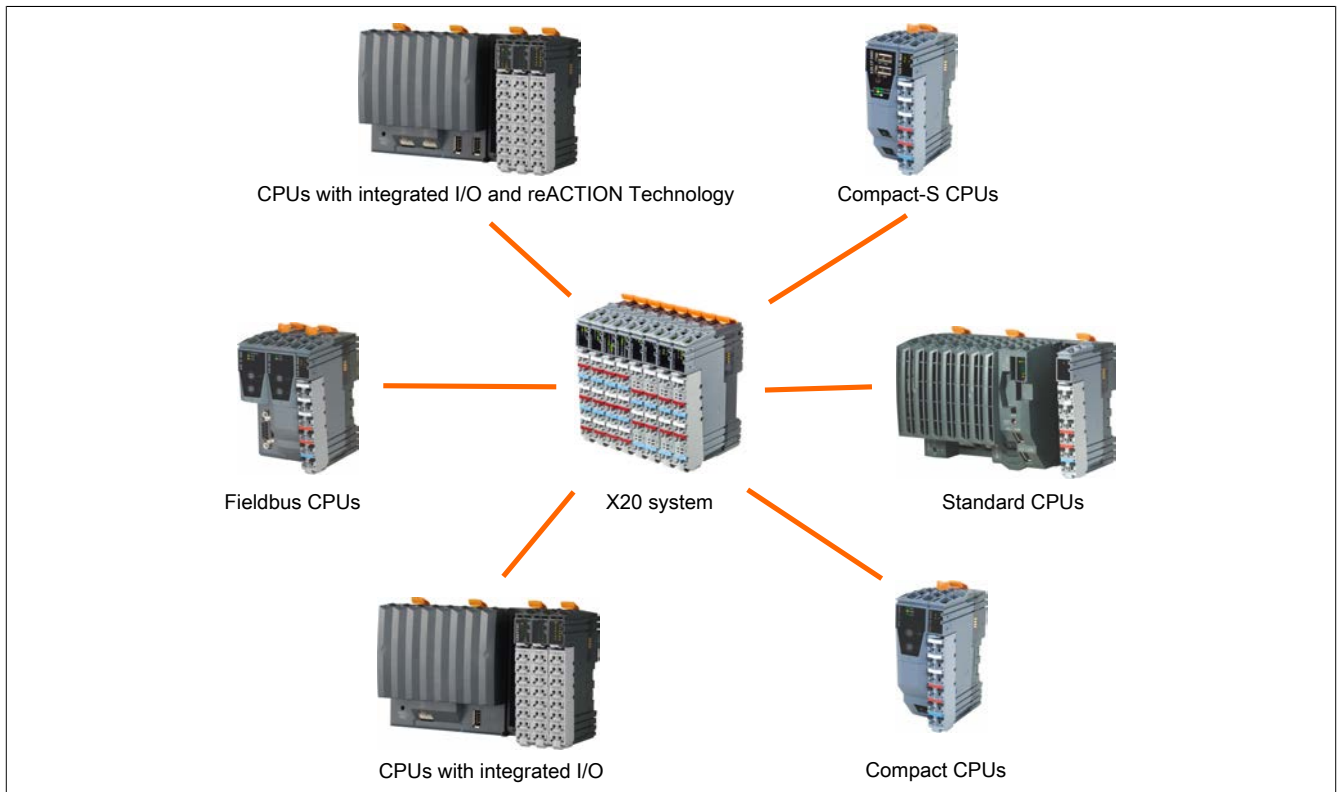

Figure 3: X2X Link - universal backplane based on twisted copper cables

3.4 X20 CPUs

The series of CPUs in the X20 system landscape cover a wide range of requirements. Areas of use include simple applications where cycle times in the millisecond range are sufficient to applications that place the highest demands on performance. In these, even cycle times of 100 μ s can be used effectively.

The design of the CPUs is in line with the X20 system landscape. X20 I/O modules are connected directly to the CPU. Attached seamlessly to the CPU, they allow the entire space-saving system to fit inside the control cabinet. The supply for the CPU, X2X Link network and I/O modules is part of the CPU. No additional power supply modules are required.

CPUs are divided into the following 6 categories:

- Standard CPUs
- Standard CPUs with integrated I/O
- Standard CPUs with integrated I/O and reACTION Technology
- Compact CPUs
- Compact-S CPUs
- Fieldbus CPUs

3.4.1 Features

Remote backplane

A power supply integrated in the CPU with I/O power supply terminals powers the backplane, I/O sensors and actuators, eliminating the need for additional system components. A direct I/O connection to an X20 CPU opens up all of the advantages of a remote backplane, in particular the ability to place as many I/O sections as needed within 100 m using a cable or to add modules with IP67 protection.

Figure 4: X20 CPUs - Direct I/O connection to X20 CPUs and the advantages of the remote backplane

Programming

B&R Automation Studio is the only programming tool needed for all platforms. All relevant IEC 61131-3 languages and C can be used to create the application software.

Depending on the CPU series, integrated HMI, NC / soft CNC functions and web server technologies complete the range of powerful features.

Industrial strength

Covering a broad performance spectrum and equipped with standard interfaces that can be expanded as needed with interface modules, system dimensions still remain extremely compact. The size and shape of the CPU matches that of the X20 modules to prevent unnecessary wasted space in the control cabinet.

None of the processors require a fan, making them virtually maintenance-free.

3.4.2 Many CPU series

To cover a wide range of requirements, X20 CPUs are divided into 6 different series.

Standard CPUs

Based on Intel ATOM processor technology, this CPU series covers a wide spectrum of requirements. Areas of use include standard applications to applications that place the highest demands on performance.

The basic model includes USB, Ethernet, POWERLINK V1/V2 and removable CompactFlash card. The standard Ethernet interface is capable of handling gigabit communication. For even more real-time network performance, the onboard POWERLINK interface supports poll response chaining mode (PRC).

Up to 3 more slots are available for additional interface modules to increase flexibility.

- CPU clock frequency from 100 to 1600 MHz
- Onboard Ethernet, POWERLINK V1/V2 with poll response chaining and USB
- 1 or 3 slots for modular interface expansion
- CompactFlash as removable application memory
- Up to 512 MB DDR2 SRAM according to performance requirements
- CPU redundancy possible
- Fanless

Standard CPUs with integrated I/O

This CPU series is available with processor speeds of 200 MHz and 400 MHz. Depending on the variant, up to 256 MB RAM and up to 32 kB nonvolatile onboard RAM is available. A built-in flash drive is available to store up to 2 GB of application and other data.

All CPUs come equipped with Ethernet, USB and one RS232 interface. In both performance classes, integrated POWERLINK and CAN bus interfaces are also available. If additional fieldbus connections are needed, the CPU can be upgraded with an interface module from the standard X20 product range. These CPUs do not require fans or batteries and are therefore maintenance-free. 30 digital inputs and outputs and 2 analog inputs are integrated in the devices. 1 analog input can be used for PT1000 resistance temperature measurement.

- CPU clock frequency from 200 to 400 MHz
- Onboard Ethernet, POWERLINK with poll response chaining and USB
- 1 slot for modular interface expansion
- 30 digital inputs/outputs and 2 analog inputs integrated in the device
- 1/2 GB onboard flash drive
- 128/256 MB DDR3 SDRAM
- Fanless with no batteries
- Battery-backed real-time clock

Standard CPUs with integrated I/O and reACTION Technology

This CPU series is available with processor speeds of 200 MHz and 400 MHz. Depending on the variant, up to 256 MB RAM and up to 32 kB nonvolatile onboard RAM is available. A built-in flash drive is available to store up to 2 GB of application and other data.

These CPUs come equipped with POWERLINK, Ethernet, CAN bus, 2x USB and one RS232 interface. If additional fieldbus connections are needed, the CPU can be upgraded with an interface module from the standard X20 product range. These CPUs do not require fans or batteries and are therefore maintenance-free. 30 digital inputs and outputs and 2 analog inputs are integrated in the devices. 1 analog input can be used for PT1000 resistance temperature measurement.

The CPUs are equipped with the ultrafast reACTION Technology. All integrated I/O channels are reACTION-capable and can be operated by the reACTION program. These I/O channels are controlled with a response time up to 1 μ s. All of the commands that can be used for reACTION programs are provided as function blocks in special libraries (e.g. AsIORTI). Programming in compliance with IEC 61131-3 requirements takes place in the Function Block Diagram editor in Automation Studio.

- CPU clock frequency from 200 to 400 MHz
- Onboard Ethernet, POWERLINK with poll response chaining and USB
- 1 slot for modular interface expansion
- Onboard reACTION Technology
- 30 digital inputs/outputs and 2 analog inputs integrated in the device
- 1/2 GB onboard flash drive
- 128/256 MB DDR3 SDRAM
- Fanless with no batteries
- Battery-backed real-time clock

Compact CPUs

Compact CPUs are ideal for situations where cycle times in the millisecond range are sufficient and a cost-benefit analysis plays a decisive role. A range of models with CAN and Ethernet can be adapted optimally to meet all requirements.

- Embedded μ P 16 / μ P 25 with additional I/O processor
- 100/750 kB User SRAM
- 1/3 MB User FlashPROM
- X20CP0291 and X20CP0292: Onboard Ethernet
- No battery
- Only 37.5 mm wide

Compact-S CPUs

The CPUs in the X20 Compact-S family are available in 5 different variants. This way, customers get the product that best meets the requirements of the machine – technically and economically.

The processor performance of the compact CPUs ranges from 166 MHz (compatible) to 667 MHz. The most economical variant comes equipped with 128 MB RAM, 8 kB nonvolatile RAM and 256 MB flash drive. The most powerful version of the Compact-S CPUs achieves cycle times down to 400 μ s and has 64 kB nonvolatile RAM as well as 2 GB internal flash drive.

With POWERLINK, Ethernet, USB and RS232, the CPUs offer a wide range of communication options. An optional CAN interface is also available. If the application requires additional interfaces, the CPU can be modularly expanded by one or two X20 interface slots. This allows the entire product range of X20 fieldbus interfaces to be used.

The fanless, battery-free design of Compact-S CPUs means they are completely maintenance-free.

- CPU clock frequency from 166 to 667 MHz
- Depending on the variant: POWERLINK with poll-response chaining
- 2x onboard USB
- Up to 2 slots for modular interface expansions
- 128 to 256 MB DDR3 SDRAM
- 256 MB to 2 GB onboard flash drive
- Fanless with no batteries
- Width
 - Without fieldbus slot: 37.5
 - 1 fieldbus slot: 62.5 mm
 - 2 fieldbus slots: 87.5 mm

Fieldbus CPUs

Fieldbus CPUs are variants of Compact CPUs. In addition to these features, fieldbus modules can be connected to the left side. These CPUs make applications possible in which data preprocessing must take place remotely on the I/O bus interface.

- Embedded μ P 16 / μ P 25 with additional I/O processor
- 100/750 kB User SRAM
- 1/3 MB User FlashPROM
- X20XC0292: Onboard Ethernet
- Up to 2 slots for fieldbus modules
- No battery
- Width
 - 1 fieldbus slot: 62.5 mm
 - 2 fieldbus slots: 87.5 mm

3.5 For all fieldbuses, integration through standardization

The X20 system is ideally suited for expanding existing control systems using standard fieldbus technology.

For example, a bus controller allows the X20 system to be used as a powerful I/O expansion unit. Standardized EDS or GSD description files allow X20 system components to be integrated, configured, and programmed in the programming environment of a non-B&R system.

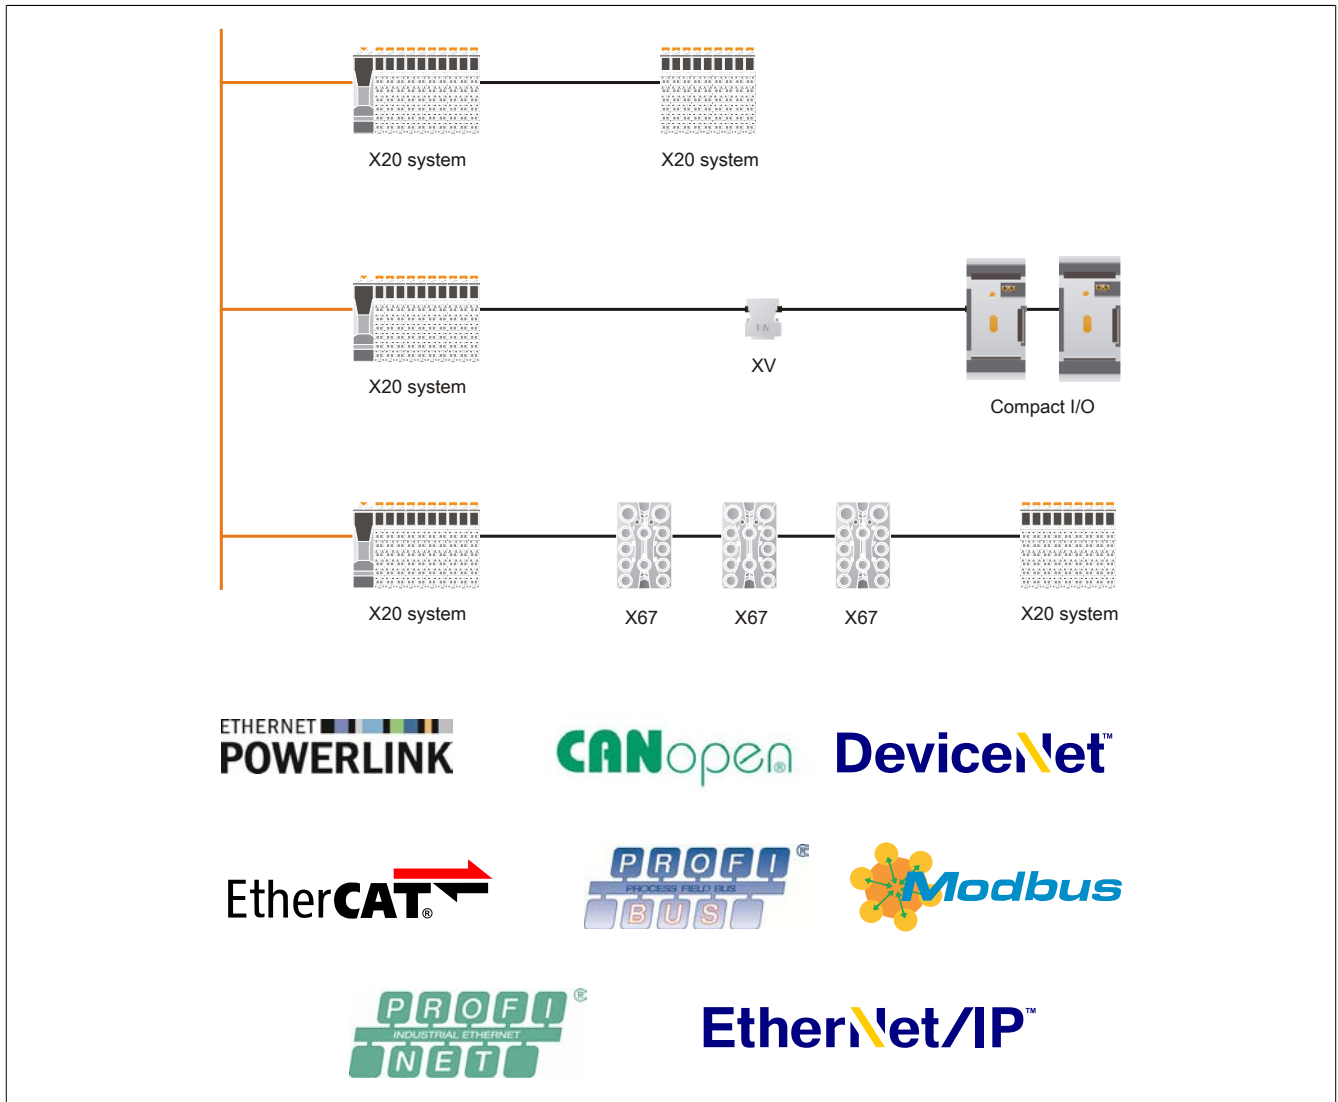

Figure 5: Expansion of existing control systems using standard fieldbuses and the X20 system

3.6 Complete system

3.6.1 IP67 - then X67

The X67 is the robust version of the X20 for use outside the control cabinet. The same basic technology, with an extremely robust housing and 4 to 32 channel modules, guarantees economical solutions in the roughest conditions.

3.6.2 Integrated valve terminal control

The development of the XV system allows for the first time direct and manufacturer-independent control of valve terminals. A complete digital output module in a size and form comparable with a normal DSUB connector. XV allows any valve terminal manufacturer to be selected because it is connected directly to the standardized multiple pin connector on the valve terminal.

Fully integrated in the remote backplane, it rounds off the X20 and X67 for complete automation solutions. One system, several variations - advantages that pay off. You select your automation components and distribute them as needed inside and outside the control cabinet.

Figure 6: X20, X67, XV - variations of a single system

3.7 Easy wiring

Industrial control cabinet construction streamlines production cycles. Prefabricated cable trees enable faster and easier assembly directly on the machine or system. The X20 system supports efficient prewiring of the entire control cabinet using separate terminal blocks. The complete X20 system configuration is mounted in the control cabinet and connected to the prewired cable trees.

The supply of the X20 modules and the supply of the sensors and actuators do not add any requirements for energy distribution. The X20 system reduces manual wiring to a minimum.

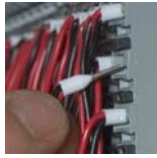

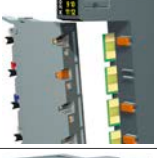

3.7.1 Install the wires, plug it in, and it's ready to go

Simple, tool-free wiring for fast installation. The X20 system terminal blocks use a fully integrated and proven push-in connector system. Each terminal can also handle double wire sleeves up to a diameter of 2x 0.75 mm². The user saves time wiring the system multiple times and distributing the signals.

The wire connections can be removed with a screwdriver. Each terminal also has an access point for a measurement probe.

Notice!

To avoid damaging the terminals, the X20AC0SD1 B&R screwdriver should be used.

| | | | |
|---|--|---|--|
|  | <p>Detached The terminals can be prewired apart from the actual I/O module. This provides many advantages for control cabinet construction. Separate manufacturing, just-in-time logistics and the installation of preassembled systems during start-up become reality.</p> |  | <p>Tool-free Simple, tool-free wiring for fast installation. The X20 system terminals use a fully integrated and proven push-in connector system. Available with 6-pin and extremely compact 12-pin terminals.</p> |
|  | <p>Coded in the system Factory coding prevents dangerous mix-ups. Coding guarantees that only parts which are permitted to be combined can be combined. Intuitively and without additional work.</p> |  | <p>Ergonomic Component density does not have to negatively affect ergonomics. With terminal spacing of more than 5 mm, this was handled optimally on the X20 system. Experience gained in the field - used in the field.</p> |
|  | <p>Coded in the application Incorrectly inserting terminals does not necessarily damage the electronics, but always causes faulty functioning of the system. Application coding prevents this problem.</p> |  | <p>Unmistakable Distinct forms intuitively define various functions, such as clearly assigned latching and unlatching functions for terminals. This prevents errors from the very beginning.</p> |
|  | <p>Labeling Each terminal is clearly labeled, directly in the plastic. Additional label tags are available as system accessories including a printer with ECAD connection.</p> |  | <p>Easy servicing A system's strengths can be seen in its details: In addition to the terminal connector and unlocking mechanism, each terminal has an access point for a test probe. You can easily measure the terminal potential without disconnecting the wire.</p> |

3.7.2 Unique terminal numbering

Each terminal connection is unique and can be identified by the numbers in the plastic. In this way, terminal assignments can be clearly assigned in the planning stage without any danger of mix-up.

- Upper number: Row number 1 or 2
- Lower number: Terminal numbers 1 to 3 (6-pin terminal block), 1 to 6 (12-pin terminal block), 1 to 8 (16-pin terminal block)

3.8 Sophisticated mechanics

The name B&R stands for many years of experience in developing and manufacturing industrial electronics. But it's also the mechanics of the X20 system that have been thought through to the last detail. Its robust design, long guides and strengthened housing guarantee the stability it needs in industrial environments. These features allow the X20 system to be mounted on a top-hat rail with the same ease as a rack system. They also make it just as simple to remove it from the rail.

The sophisticated mechanics of the X20 are needed not just to provide this type of handling, but also to be able to quickly and easily remove I/O slices from the entire system.

Figure 7: Easy mounting on and removal from the top-hat rail

| | | | |
|--|---|--|--|
| | <p>Unlocking mechanism with two positions Closed for secure fit on the top-hat rail.</p> | | <p>Defined open position makes the difference Open to remove a module or the entire system.</p> |
| | <p>Removing a single module from the system Remove or reconnect vertically.</p> | | <p>Mount the entire system as a whole Or just as easily removing the entire system.</p> |

3.9 Diagnostics

Outstanding diagnostic options are needed for errors to be found quickly. The X20 system offers several levels of diagnostics:

- Direct on the module using visual LED displays. Bus status, I/O status and channel states are displayed in direct relationship to the channels or the function. The different states are displayed in different ways, e.g. green for OK, red for error.
For details, see "[Diagnostic LEDs](#)" on page 3787.
- Via software in the cyclic data image. With the X20 system, status data does not result in an additional communication load, which would result in considerable differences between theoretically possible bus speeds and real requirements during operation. All necessary status data is always transferred cyclically, with no exceptions.
- Expanded diagnostic data in acyclic data traffic without loss in performance. If a problem occurs, detailed diagnostic data can be requested from the application by the respective module using an asynchronous channel. This does not result in additional communication load and cycle times remain unchanged.

Figure 8: Visual diagnostics directly on the module using LED indicators

3.10 Embedded parameter chip

Information such as module type, serial number, functionality and version number is contained in the embedded parameter chip of the X20 module. This information is automatically evaluated by the programming environment (Automation Studio) and by the application program. This prevents errors during both commissioning and service. In addition, the system configuration is automated and flexible variations are made possible.

For validated systems, it is becoming increasingly important to have module serial numbers that are unique world-wide – as required by the FDA, for example.

Information:

All modules that require 0.01 W of power on the X2X Link network must be supplied via the internal I/O power supply. If the I/O power supply fails, the module shuts down and communication is lost. In this case, ModuleOk returns the value "False" and data can no longer be read from the "[embedded parameter chip](#)".

3.11 Space for options

The X20 system makes it possible to combine the exact components necessary depending on the user's demands and individual application requirements. This allows machine options to be implemented easily and flexibly. Bus modules provide the base, and are more or less a rack replacement. Depending on the option, the necessary electronics modules are then inserted in the predefined slots.

Addresses are assigned implicitly via the slot. Software that has been developed once is valid for all versions and does not need to be changed. This is even possible for later machine expansion. The I/O modules are simply inserted in the defined bus modules, and assigned to the corresponding potential groups and E-stop groups.

To prevent unwanted expansion, each module can be identified and then enabled using the application software.

3.12 Flexibility for options

The implementation of different machine variations using free bus modules is only one of the many features that the X20 system offers. With the support of Automation Studio, there is an optimized solution using I/O mapping.

In the process, each I/O configuration is created optimally according to the actual requirements. However, the application software is designed to handle all potential options. Only the I/O channels that are actually available are mapped to the application program. If an expansion is required, then the additional hardware needed can be easily connected and the I/O mapping changed. This is possible without having to compile the application software.

It doesn't matter where the I/O mapping list is created:

- Manually in B&R Automation Studio
- With tools, e.g. with a database or a table calculation program
- Directly from an ERP system, just like the parts list for the machine
- Automatically in the application software, depending on the hardware used

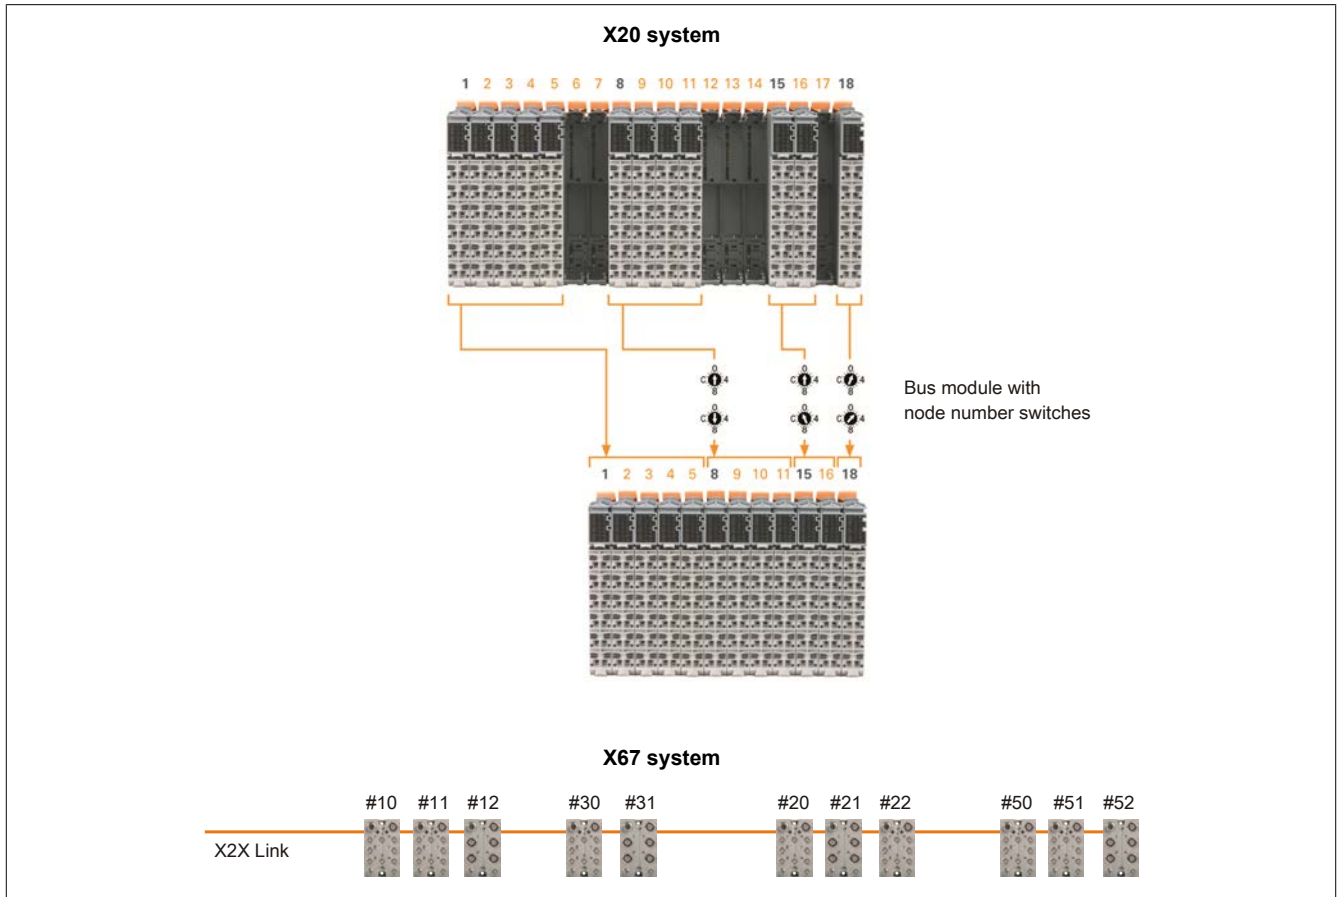

| | |
|---|--|
|  | <p>Machine variation A</p> <p>The possibilities of the X20 system can be best explained using examples. This is a machine constellation with two variations, A and B. All of the necessary electronics modules for machine variation A are shown in the picture to the left. The bus modules needed for variation B are also present, but without electronic modules.</p> |
|  | <p>Machine variation B</p> <p>Variation B shows the necessary electronic modules but the modules necessary for variation A are missing. The distribution of the free bus modules for the variations is also clear: The variable I/O modules can be very easily connected to the required electrically isolated groups and don't need to be attached in the back. The extensive process of taking apart the configuration to expand existing electrically isolated groups is also eliminated. Simply insert the electronic module and attach the terminal block.</p> |
|  | <p>Machine variation A - optimized</p> <p>The features included in Automation Studio can also be used to achieve completely optimized hardware configurations without losing the advantage of comprehensive application software for all variations. As described earlier, simply mapping physical I/O points to the application program makes it extremely easy to optimize the hardware variations without even requiring compilation.</p> |

3.13 Configurable X2X Link address

The remote X2X Link backplane, which connects the individual I/O modules with each other, is set up to be self-addressing. Because of this, it is not necessary to set the node numbers. The module address is assigned according to its position in the X2X Link line.

In certain cases, e.g. when configurations of modular machines change, it is necessary to define specific module groups at a fixed address, regardless of the preceding modules in the line.

For this purpose, there are modules in both the X20 system and the X67 system with node number switches that allow you to set the X2X Link address. All subsequent modules refer to this offset and use it automatically for addressing purposes.

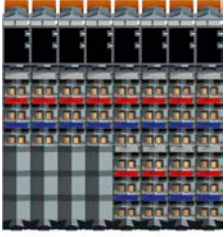

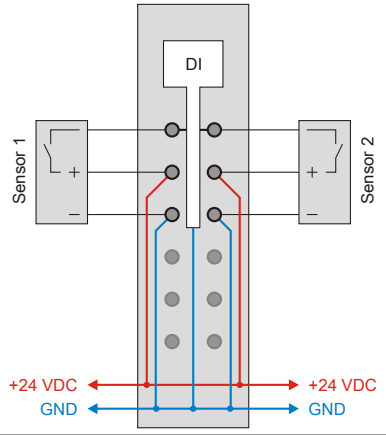

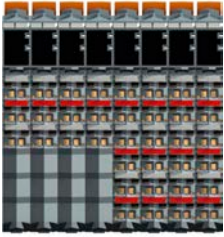

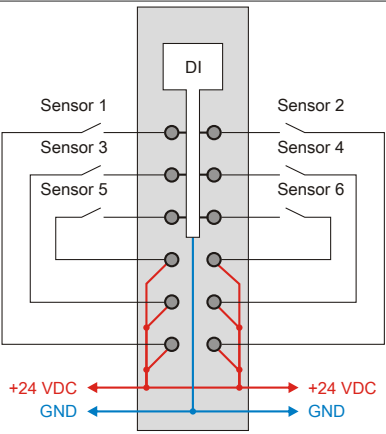

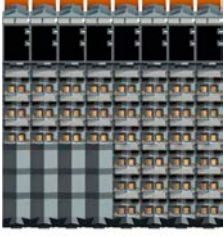

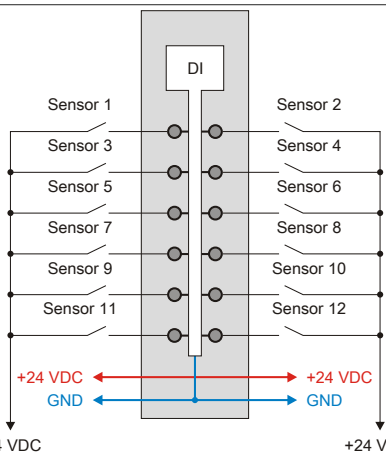

3.13.1 Bus modules with node number switches

Symbols are printed on the locking lever of bus modules with node number switches. This provides a way to see from outside that the X20 system mounted in this slot is using node number switches.

3.14 Universal 1, 2, 3-wire connections

Consistent connection types for all requirements – no additional jumper terminals are needed. All connection types can also be mixed and matched.

| | | |
|--|---|---|
| <p>System-wide 3-wire connections Integrated supply and ground for sensors and actuators.</p> |  |  |
| <p>System-wide 2-wire connections No extra terminals needed.</p> |  |  |
| <p>System-wide 1-wire connections 12 channels - unequaled component density</p> |  |  |

3.15 Coated modules

Coated modules are X20 modules with a protective coating for the electronics component. This coating protects X20c modules from condensation and corrosive gases.

The modules' electronics are fully compatible with the corresponding X20 modules.

The coating has been certified according to the following standards:

- Condensation: BMW GS 95011-4, 2x 1 cycle
- Corrosive gas: EN 60068-2-60, Method 4, Exposure 21 days

Differences between coated and uncoated modules

- Suitable for operation in adverse atmospheric environments
- Suitable for operation in 100% humidity, condensing
- Coated modules have a different Module ID than the corresponding uncoated variants

3.16 Redundancy

The X20 system provides the following forms of redundancy:

- Controller
- Network
- Power supply modules for X20 standalone devices and expandable POWERLINK bus controllers
- X2X Link supply

The first 3 areas are covered in user's manual "Redundancy for control systems". This user's manual is available in the Downloads section under www.br-automation.com.

For a description of the redundant X2X Link power supply, see section "X2X Link supply" on page 62.

3.17 reACTION technology

The X20 Compact CPUs and a number of I/O modules are available featuring ultrafast reACTION technology. This allows the I/O channels integrated in the reACTION module to be controlled with response times down to 1 μ s. This new approach allows extremely time-critical subprocesses to be managed using standard hardware – which lowers hardware costs by reducing the load on the controller and allowing it to be scaled down.

All of the commands that can be used for reACTION programs are provided as function blocks in special libraries (e.g. ASIORTI). Programming using the standard Function Block Diagram (FBD) editor in Automation Studio is compliant with IEC 61131-3.

Documentation for reACTION technology is included in the Automation Studio help system.

3.18 X20 system configuration

The X20 system is designed so that can be connected to standard fieldbuses (with a bus controller) or the remote X2X Link backplane (with a bus receiver). The connection to the next station is made with a bus transmitter. Supply modules and I/O modules are placed between the bus receiver or bus controller and the bus transmitter as needed.

The power supply system used in the X20 systems is described in the section "The supply concept" on page 59.

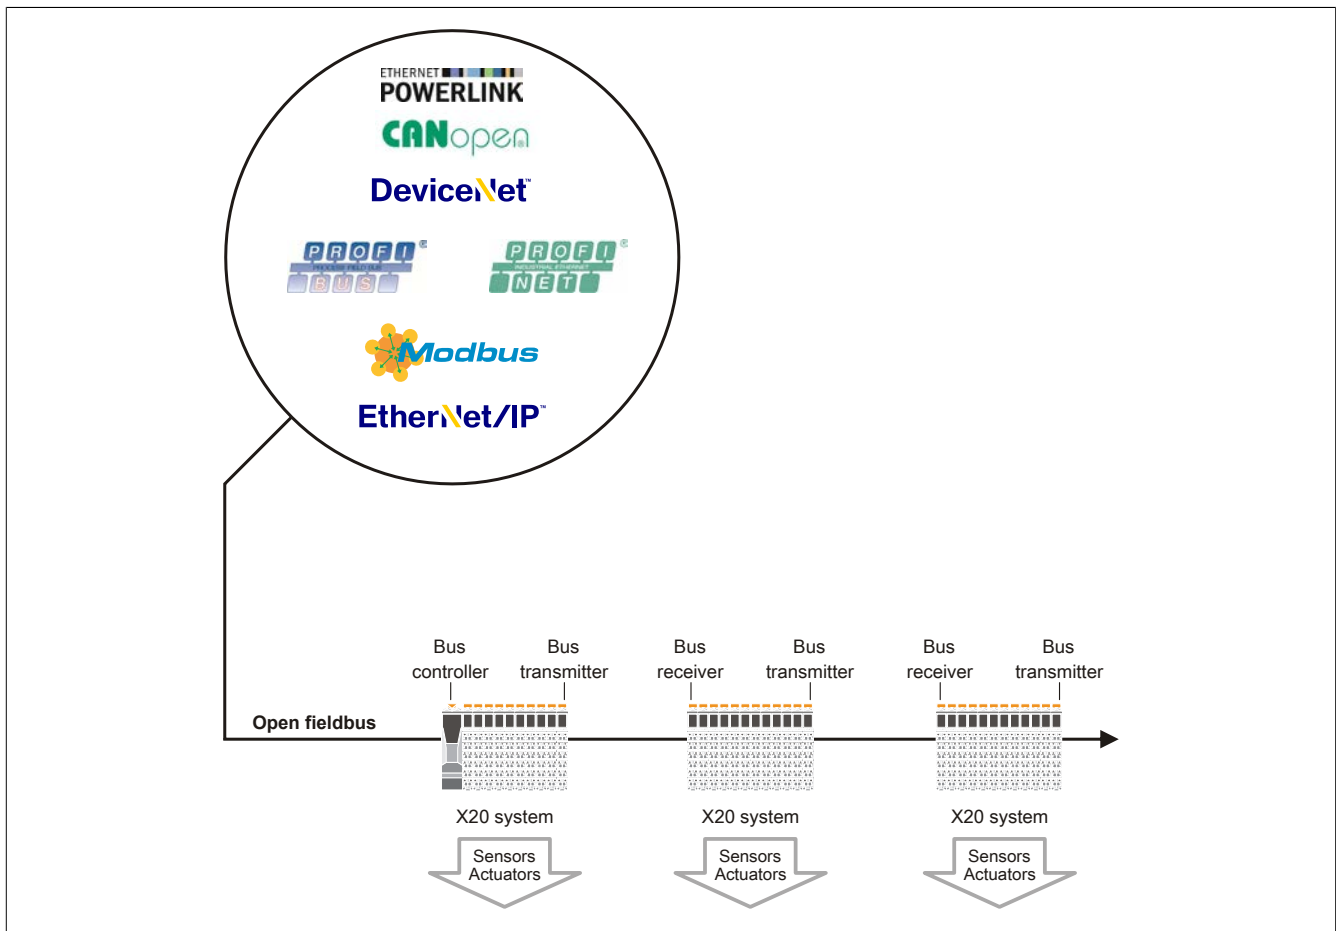

Figure 9: X20 system configuration

3.18.1 Fieldbus connection

Several bus controllers for standard fieldbus technologies like POWERLINK, DeviceNet, PROFIBUS, CANopen, ModbusTCP or EtherNet/IP are available to connect X20 modules to existing control systems. Fieldbus configurators transparently integrate the X20 system into the 3rd-party development environment.

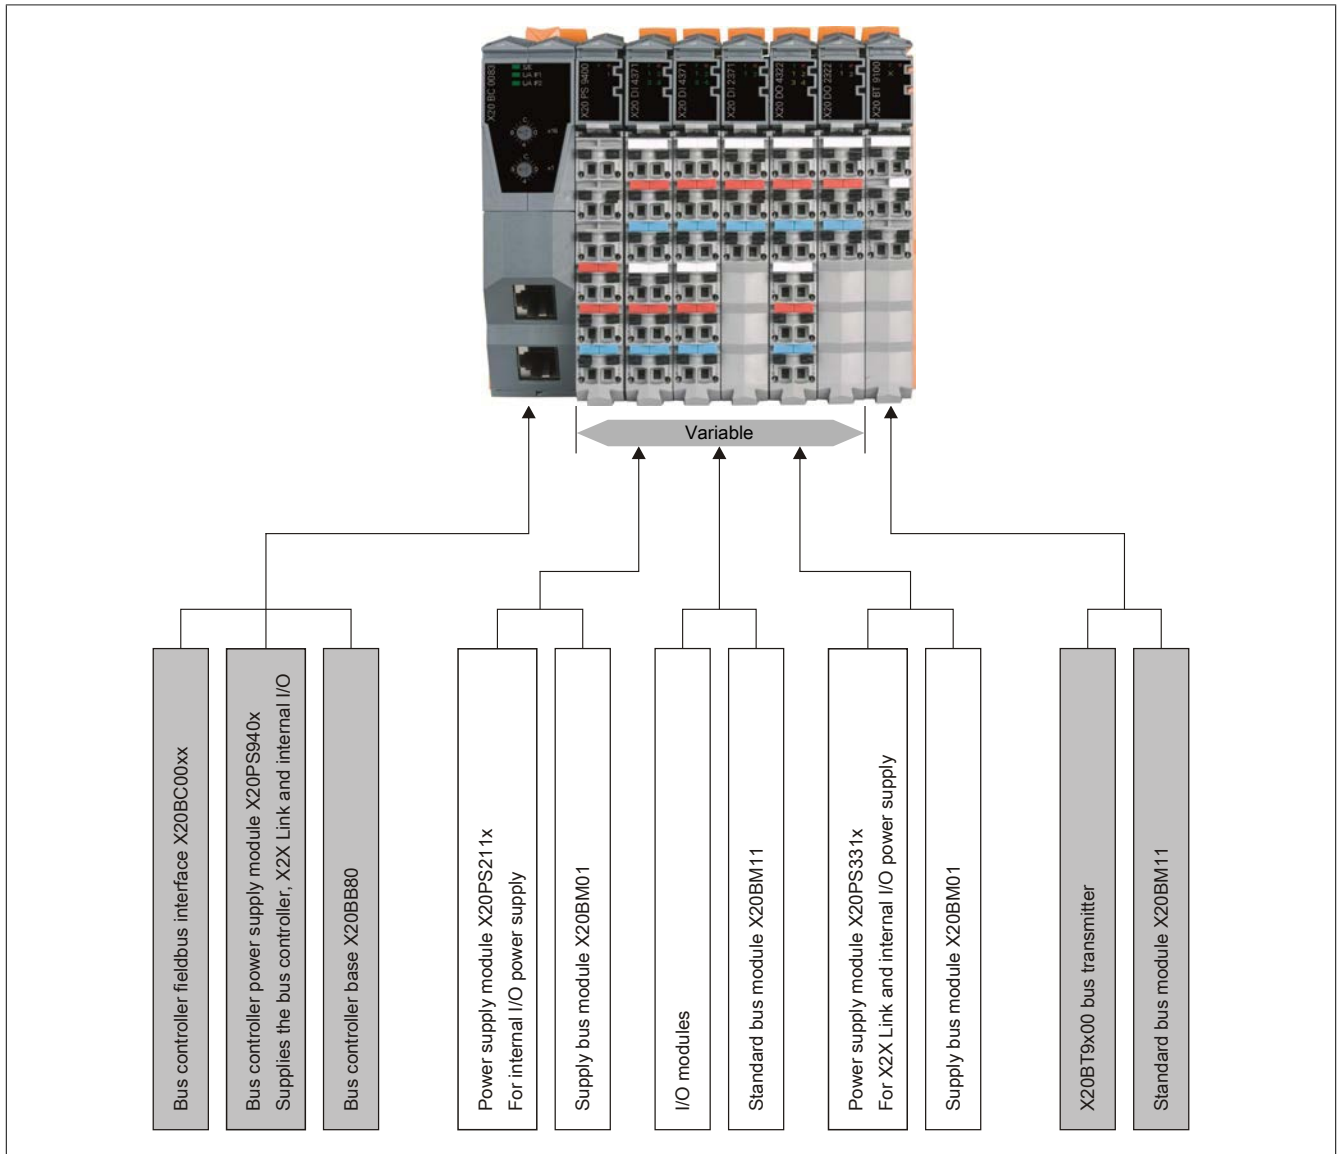

Figure 10: X20 system configurator for fieldbus connection

3.18.2 Connection to X2X Link backplane

The bus receiver X20BR9300 is used to connect the X20 system directly to the remote X2X Link backplane.

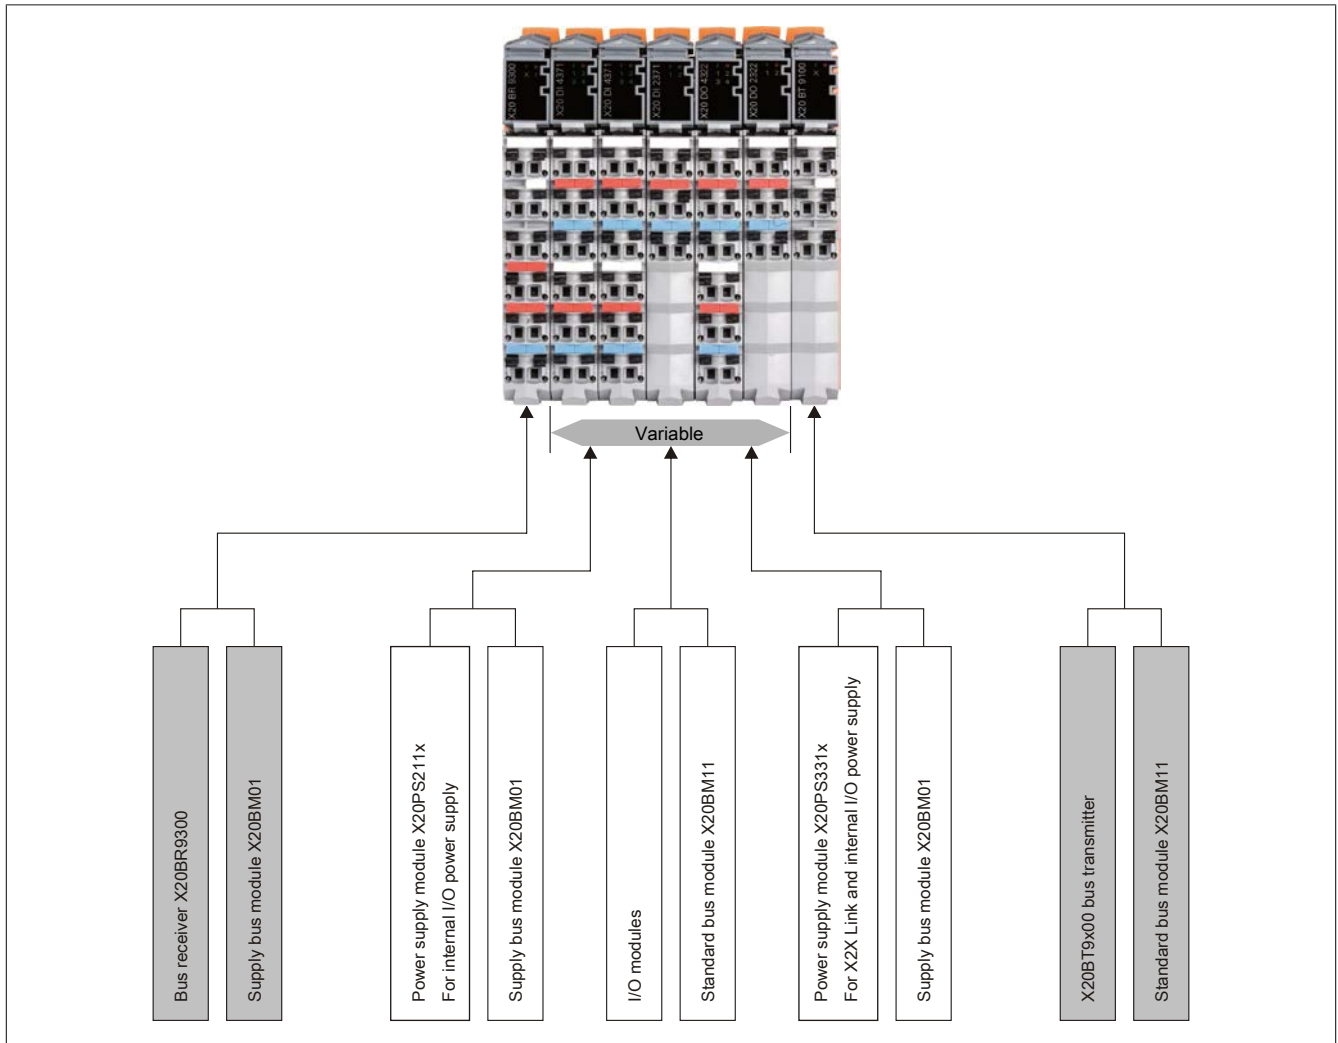

Figure 11: X20 system configurator for connection to X2X Link backplane

4 Mechanical and electrical configuration

4.1 Dimensions

4.1.1 X20 CPUs

CPUs with 1 slot for interface modules

CPUs with 3 slots for interface modules

4.1.2 X20 CPUs with integrated I/O

4.1.3 Compact/Compact-S CPUs and bus controllers

4.1.4 Fieldbus CPUs and expandable bus controller

With 1 additional slot

With 2 additional slots

4.1.5 I/O modules

4.1.6 End cover plates

In addition to the dimensions for CPUs and modules specified in this section, it is possible to add end cover plates on the left and right sides of each module block. The following space must be provided for this:

- **Right side:** 5 mm
- **Left side:** 3.5 mm

4.2 Design support

4.2.1 CAD support

To ensure CAD support, the dimensions are included in the ECAD macros in 2D. STEP data is available to allow 3D viewing.

The STEP data can be downloaded from the B&R website (www.br-automation.com) in the Downloads section for the respective module.

4.2.2 Macros for ECAD systems

The electronics in a machine must be designed in a way that optimizes use of available space and materials. Graphic ECAD systems have proven themselves as the right tool for this job.

Every module in the X20 system is delivered with pre-designed electronic descriptions of the mechanical dimensions, electrical signals and module functions. These macros can be loaded directly to proven ECAD systems. The wiring plans are automatically applied by the configuration and programming system, Automation Studio. Design and changes are immediately reflected at all levels of development. This saves time for the more important tasks and prevents errors right from the start. The accelerated development, programming, maintenance and documentation involved with the X20 system mean lower costs, enhanced quality and increased sales by earlier entry into the market.

4.2.3 Printing support

System printers and standard identification labels are supported by the appropriate printer software. Printing can be done manually from table calculations or directly from ECAD software (all methods are supported). The software and printer systems correspond with the Weidmüller standard.

4.3 Installation

A top-hat rail conforming to the EN 60715 standard (TH35-7.5) is required to mount the PLC. The conductive top-hat rail is fastened to the back wall of the control cabinet.

The complete system including all individual modules is hung in the desired location on the top-hat rail with the unlocking mechanisms open and locked in place by closing the unlocking mechanisms. Finally, the modules are equipped with the prewired terminal blocks.

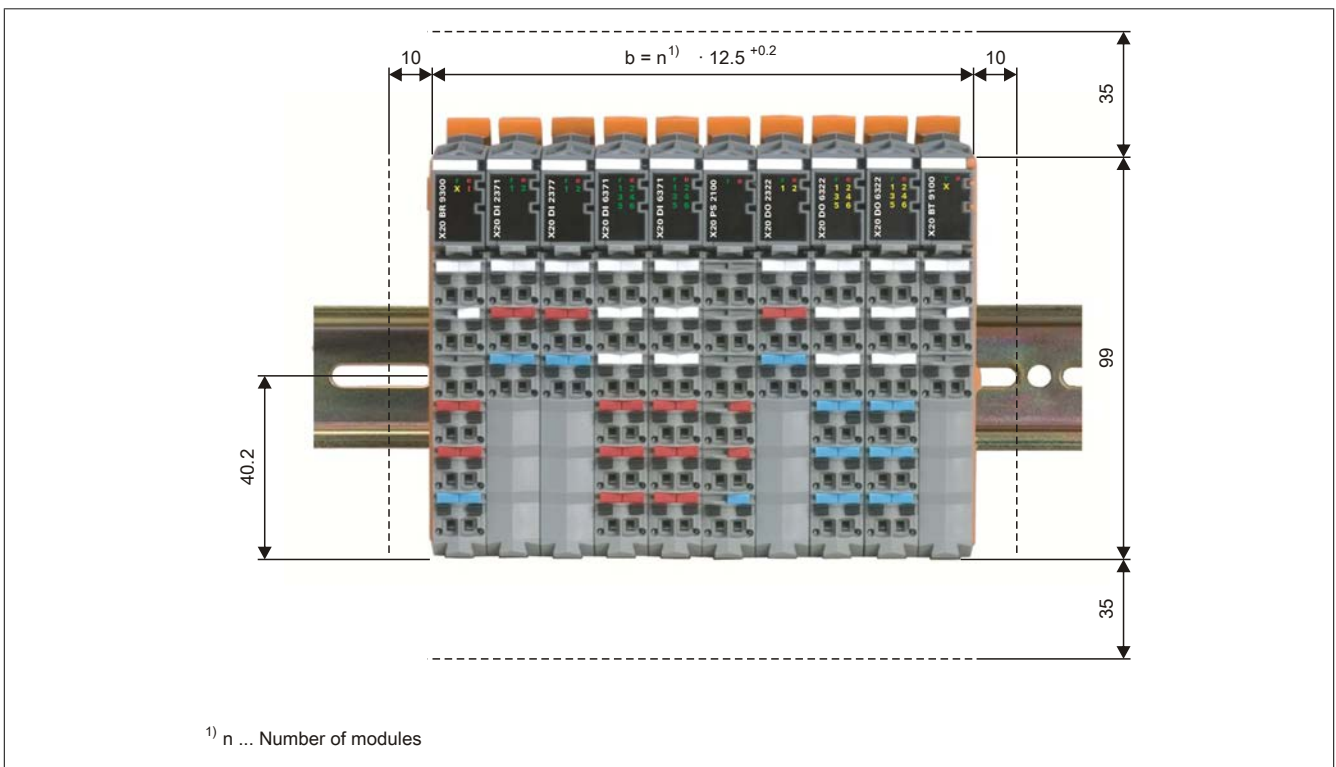

Installation methods

- Vertical installation
- Horizontal installation
- Oblique installation
- Lying installation

Information:

Other installation methods are not permitted.

4.3.1 Horizontal installation

For optimal cooling and air circulation, there must be at least 35 mm free space above the modules. To the left and right of the X20 system, there must be at least 10 mm of free space. Underneath the modules, 35 mm space must be left free for I/O and power supply cabling.

4.3.2 Vertical installation

For optimal cooling and air circulation, there must be at least 35 mm free space to the left of the modules. Above and below the X20 system, there must be at least 10 mm of free space. To the right of the modules, 35 mm space must be left free for I/O and power supply cabling.

The modules must be arranged so that the controller is on the lower end of the system. The temperature range is limited to -25 to 50°C when modules are mounted vertically.

Information:

The controller must be secured against slipping with an [end clamp](#).

When using an overhead bus controller or a CPU, an additional derating of 5°C based on the vertical installation must be observed. The additional derating applies only to the bus controller, CPU and corresponding power supply unit.

4.3.3 Oblique installation

For oblique installation, the derating depends on angle α .

- $\alpha < 70^\circ$: An additional derating of 15°C based on the horizontal installation must be observed (corresponds to [lying installation](#)).
- $\alpha > 70^\circ$: No additional derating (corresponds to [horizontal installation](#))

4.3.4 Lying installation

An additional derating of 15°C based on the horizontal installation must be observed when installing with the top-hat rail at the bottom.

4.3.5 Installation with increased vibration requirements (4 g)

The following additional measures are necessary to fulfill increased vibration requirements regardless of whether X20 modules are installed horizontally or vertically:

1. Apply foam tape along the entire length of the module configuration under the top edge.
2. Use special end clamps to the left and right to provide additional fixation (supplement foam tape as shown in the image).
3. For CPUs with exchangeable battery, foam tape must be applied to the inner side of the battery cover to help hold the battery in place.
4. If slots are free, use dummy housings to ensure that the controller is held effectively in place.
5. Proper strain relief on all wires

Figure 12: X20 system - Installation with increased vibration requirements (4 g) and end clamp

Notice!

The attachable end cover plates for some X20 modules should be removed for "installation with increased vibration requirements (4 g)"!

Figure 13: X20 system - Removing the end cover plates

4.4 Wiring

In order to achieve a secure connection in the terminal blocks, wires must be stripped accordingly.

Figure 14: Wire stripping length for a secure connection

Information:

The wire stripping length is not permitted to be more or less than 7 to 9 mm.

4.5 Stress relief using cable ties

Figure 15: Stress relief using cable ties

The X20 system terminal blocks have slots for the cable ties. If needed, a cable tie can be fed through these slots to reduce the stress on the cable.

Cable tie dimensions: Width \leq 4.0 mm
 Thickness \leq 1.2 mm

Figure 16: Slots through which the cable ties are fed

4.6 Shielding

In principle, the shield must be grounded in all shielded cables:

- Analog signals (inputs and outputs)
- Interface modules
- Counter modules
- X2X Link cables
- Fieldbus connections (PROFIBUS DP, CAN bus, etc.)

In general, the following guidelines apply for shielding:

- The X20 top-hat rail must always be mounted to a conductive backplane.
- Shielded cables must be grounded on both sides.

4.6.1 Direct shielding connection

The shield is twisted and connected to the bus module's ground connection using a cable lug (2.8 x 0.5 mm). The cable is additionally secured to the terminal block using a cable tie (stress relief).

Figure 17: Direct shielding connection

Information:

The ground connection should be made as short and with as little resistance as possible.

4.6.2 X20 cable shield clamp

The X20 cable shield clamp (model number X20AC0SG1) is latched to the terminal block and connected to the bus module's ground connection using a cable lug. Cable ties are used to press the shield against the grounding plate.

Figure 18: Shielding via X20 cable shield clamp

To reduce the EMC emissions most effectively, the cable shield must be as long as possible after the cable tie (see ① in the diagram above).

4.6.3 X20 shielding bracket

Order data

| Model number | Short description |
|----------------|-------------------------------------|
| | Shielding bracket |
| X20AC0SF7.0010 | X20 shielding bracket 66 mm 10 pcs. |
| X20AC0SF9.0010 | X20 shielding bracket 88 mm 10 pcs. |

Table 2: X20AC0SF7.0010, X20AC0SF9.0010 - Order data

The X20 shielding bracket is installed underneath the X20 system. The shield is pressed against the shielding bracket using ground terminals from another manufacturer (e.g. PHOENIX or WAGO) or a cable tie.

2 lengths are available depending on the application:

| Model number | Length | Application |
|----------------|--------|--|
| X20AC0SF7.0010 | 66 mm | <ul style="list-style-type: none"> I/O modules Power supply modules Integrated I/O on X20CP13xx systems Onboard interfaces on CPUs |
| X20AC0SF9.0010 | 88 mm | <ul style="list-style-type: none"> Interface modules Bus controller modules CPUs constructed in the form of an interface module |

Dimensions

4.6.4 Shielding via top-hat rail or bus bar

Figure 21: Shielding via top-hat rail or bus bar

Grounding terminals from other manufacturers (such as GOGATEC) can be used to achieve shielding right on the top-hat rail or on special bus bars directly below the controller.

- B&R recommends always using a grounding terminal via the top-hat rail to connect the X2X Link cable shield directly with the conductive and grounded backplane. This will generally exceed the specified EMC minimal requirements.
- The shielded cables from other modules can be grouped and clamped together. This may also be necessary due to space limitations. A different number of cables can be grounded together with a single terminal depending on the grounding terminals being used.

To reduce the EMC emissions most effectively, the cable shield must be as long as possible after the cable tie (see ① in the diagram above).

4.7 Cabling guidelines for X20 modules with an Ethernet cable

A number of X20 modules are based on Ethernet technology. POWERLINK cables offered by B&R can be used for the necessary wiring.

| Model number | Connection type |
|----------------|--|
| X20CA0E61.xxxx | Connection cable - RJ45 to RJ45 |
| X20CA3E61.xxxx | RJ45 to RJ45 connection cable, can be used in drag chains |
| X67CA0E41.xxxx | Attachment cable - RJ45 to M12 |
| X67CA3E41.xxxx | RJ45 to M12 attachment cable, can be used in cable drag chains |

The following cabling guidelines must be observed:

- Use CAT5 SFTP cables.
- Observe minimum cable bend radius (see data sheet for the cable).
- Secure the cable underneath the bus controller. The cable must be secured vertically under the RJ45 connector on the bus controller.

Information:

Using POWERLINK cables offered by B&R satisfies the EN 61131-2 product standard.

For any further requirements, the customer must take additional measures.

Wiring diagram

Figure 22: Wiring diagram for X20 modules with an Ethernet cable

4.8 The supply concept

Danger!

In order to guarantee a specific supply voltage, a SELV power supply that conforms to EN 60204-1 must be used to supply the bus and I/O.

4.8.1 Bus module rack replacement

Figure 23: The bus module replaces the rack in the X20 system

The bus module is the backbone of the X20 system regarding the bus supply and bus data as well as the I/O supply for the electronics modules. Each bus module is an active bus station, even without an electronics module. There are two variations of the bus module:

- Interconnected I/O supply
- I/O supply isolated to the left (for power supply modules)

4.8.2 X20 system infrastructure

Figure 24: Simple implementation of different potential groups

Different potential groups can be implemented with the appropriate arrangement of supply bus modules, (e.g. for input groups or different emergency stop circuits on the outputs). The I/O power supply is fed by power supply modules.

4.8.3 Bus supply

Because the remote X2X Link backplane and I/O electronics are completely electrically isolated, the X2X Link power supply needs to be fed in at certain intervals. This is initially handled by the bus receiver. A supply module for X2X Link must be added to refresh the supply after approximately 30 modules (for an example calculation, see ["Calculating the power requirements" on page 81](#)). On the same module, a separate feed for the I/O power supply can also be connected.

4.8.4 Potential groups

The I/O supply is connected via the bus modules, and the supply is fed in using corresponding power supply modules. This makes it possible to implement simple potential groups (e.g. for input groups or different output groups). For isolation, the corresponding bus module is also necessary, which provides isolation of the internal I/O supply.

4.8.5 Output modules with supply

Generally, a power supply module is also necessary for current output modules with many channels, such as the 8 channel output module with 2 amp outputs. This is not the case with the X20 system. With this module, the supply is provided directly on the module, thereby saving power supply modules and construction width.

4.8.6 Bus receiver with supply

The X20BR9300 bus receiver for the X20 system is equipped with a supply for X2X Link as well as for the internal I/O supply. This eliminates the need for an additional power supply module.

4.8.7 Supply module for internal I/O supply

The first I/O modules in an X20 system are supplied by the bus receiver. The internal I/O supply is refreshed via the X20PS2100 power supply module.

4.8.8 Power supply module for internal I/O supply and bus supply

The X2X Link is fed by the X20BR9300 bus receiver. After approx. 30 modules (see section "[Calculating the power requirements](#)" on page 81 for a calculation example), the supply must be "refreshed". The X20PS3300 power supply module is used for this. This module is equipped with a feed for X2X Link as well as for the internal I/O power supply.

4.8.9 Bus transmitter with supply

The X20BT9100 bus transmitter has an integrated I/O supply feed. This saves a power supply module for the last potential group.

4.8.10 Internal I/O power supply failure (ModuleOk)

The ModuleOk status for monitoring the X20 modules is made up of different module parameters.

Information:

All modules that require 0.01 W of power on the X2X Link network must be supplied via the internal I/O power supply. If the I/O power supply fails, the module shuts down and communication is lost. In this case, ModuleOk returns the value "False" and data can no longer be read from the "embedded parameter chip".

4.8.11 X20 system power supply

The power supply for the X20 system is provided by B&R 24 VDC power supplies. B&R power supplies ensure that control systems are reliably supplied even when operated at the minimum mains input voltage or when maximum power is output even in the event of temporary power failures (≤ 10 ms).

The power to be provided by the B&R power supply must be calculated (see "[Dimensioning the external 24 VDC power supply](#)" on page 94).

4.8.12 X2X Link supply

The X2X Link remote backplane is supplied separately from the I/O points. This ensures that the remote backplane does not fail if there is a power failure on the I/O side, for example during an emergency stop. After approx. 30 modules, it is necessary to "refresh" with a power supply module for X2X Link.

To achieve increased supply security, it is possible to set up a redundant X2X Link power supply. To do so, the necessary X2X Link power must be determined and then covered by the corresponding quantity plus at least one additional X2X Link power supply module. This guarantees the functionality of the remote backplane even if the X2X Link power supply fails.

Please note the following for the correct calculation:

- To determine the necessary X2X Link power, calculate using 75% of the power supply module's rated power during parallel operation.

Information:

This must be done for all power supply modules at the same time for a non-redundant X2X Link power supply or when completely turning the X2X supply of an X20 module block on/off.

4.8.12.1 Example for extended X2X Link supply

It is possible to set up potential groups through the use of different supplies for the power supply modules.

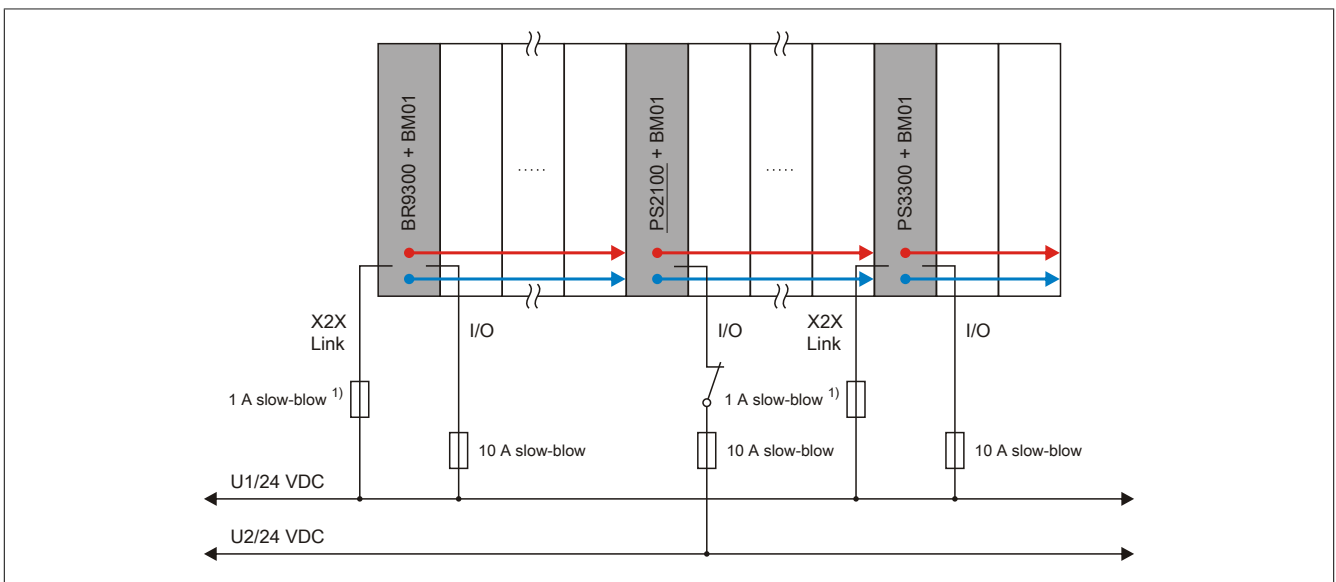

Figure 25: Example for extended X2X Link supply

1) Recommended for line protection.

The X20PS3300 power supply module supplies both the X2X Link and I/O; the X20PS2100 power supply module only supplies the I/O.

4.8.12.2 Example for redundant X2X Link supply

Multiple X20PS3300 power supply modules can be set up in parallel. It is possible to set up potential groups through the use of different supplies.

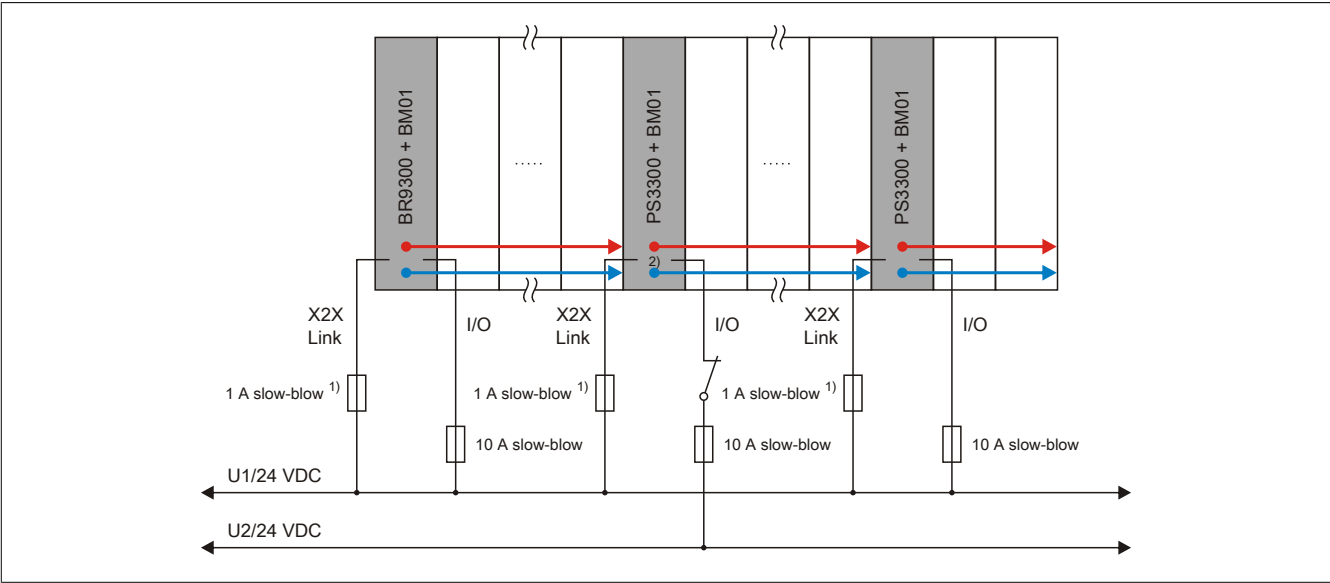

Figure 26: Example for redundant X2X Link supply

- 1) Recommended for line protection.
- 2) With separate supplies, the two reference potentials (GND_1 and GND_2) are combined via the terminal block on the PS3300.

The X20PS3300 power supply module supplies both X2X Link and the I/O.

4.9 X20 system protection

The protection for the X20 system depends on the supply concept.

4.9.1 Potential groups

Using the X20BM01 bus module and organizing the power supply bus modules accordingly allows various potential groups to be implemented (e.g. for input groups or various power circuits for the outputs).

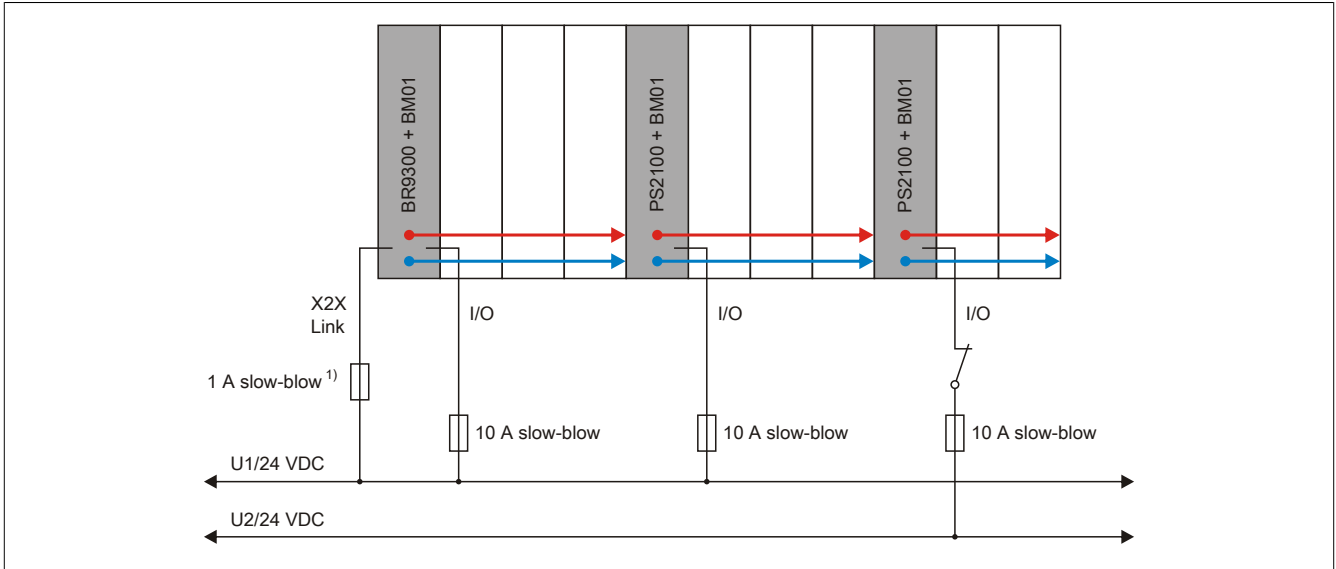

Figure 27: Protecting various potential groups

1) Recommended for line protection.

4.9.2 Supply via bus transmitter

The bus transmitter has an integrated internal I/O supply feed. This saves a power supply module for the last potential group.

Keep in mind: this potential group is separated from the rest of the potential groups by an I/O module with the x20(c)BM01 bus module.

Figure 28: Protection when supplied via bus transmitter

1) Recommended for line protection.

4.10 Safe cutoff of a potential group

Information:

B&R keeps user's manuals as current as possible. From a safety standpoint however, the current certified version of the document must be used.

The current certified document is available for download under [Website > Downloads > Certificates > Safety technology > X20, X67 > Safe cutoff of potential groups](#).

4.10.1 Description of function

The operating principle "Safe cutoff of a potential group" enables the user to execute safety-related functions within a B&R system in combination with an external safety relay.

The safety function is limited to cutting off or interrupting the power to connected actuators.

Functionality

An external safety relay is connected to the I/O power supply for the potential group or an X20SP1130 power supply module is used. When the functional safe state is requested or state "Failsafe" occurs, then this feed cuts off the I/O power supply of the potential group. The power is then also cut off for all actuators connected to this potential group. However, module-internal energy storage devices (e.g. capacitors) remain charged and must be taken into account in the assessment of the safety function.

Figure 29: Functionality with internal energy storage

4.10.2 Scope of application / Standards referenced

The operating principle is confined to machine manufacturing applications and therefore implicitly to the following standards:

- EN ISO 13849-1:2015 / EN ISO 13849-2:2012

Requirements of other standards are not taken into consideration.

4.10.3 Intended use

Danger!

Danger from incorrect use of safety-related products/functions

Proper functionality is only ensured if the products/functions are used in accordance with their intended use by qualified personnel and the provided safety information is taken into account. The aforementioned conditions must be observed or covered by supplementary measures on your own responsibility in order to ensure the specified protective functions.

4.10.3.1 Qualified personnel

Use of safety-related products is restricted to the following persons:

- Qualified personnel who are familiar with relevant safety concepts for automation technology as well as applicable standards and regulations
- Qualified personnel who plan, develop, install and commission safety equipment in machines and systems

Qualified personnel in the context of this manual's safety guidelines are those who, because of their training, experience and instruction combined with their knowledge of relevant standards, regulations, accident prevention guidelines and operating conditions, are qualified to carry out essential tasks and recognize and avoid potentially dangerous situations.

In this regard, sufficient language skills are also required in order to be able to properly understand this manual.

4.10.3.2 Area of application

The safety-related B&R control components described in this manual were designed, developed and manufactured for special applications for machine and personnel protection. They are not suitable for any use involving serious risks or hazards that could lead to the injury or death of several people or serious environmental impact without the implementation of exceptionally stringent safety precautions. In particular, this includes the use of these devices to monitor nuclear reactions in nuclear power plants, flight control systems, air traffic control, the control of mass transport vehicles, medical life support systems and the control of weapon systems.

When using safety-oriented control components, the safety precautions applying to industrial control systems (e.g. the provision of safety devices such as emergency stop circuits, etc.) must be observed in accordance with applicable national and international regulations. The same applies for all other devices connected to the system, e.g. drives or light curtains.

The safety guidelines, information about connection conditions (nameplate and documentation) and limit values specified in the technical data must be read carefully before installation and commissioning and must be strictly observed.

4.10.3.3 Security concept

B&R products communicate via a network interface and were developed for integration into a secure network. The network and B&R products are affected by the following hazards (not a complete list):

- Unauthorized access
- Digital intrusion
- Data leakage
- Data theft
- A variety of other types of IT security breaches

It is the responsibility of the operator to provide and maintain a secure connection between B&R products and the internal network as well as other networks, such as the Internet, if necessary. The following measures and security solutions are suitable for this purpose:

- Segmentation of the network (e.g. separation of the IT and OT networks)
- Firewalls for the secure connection of network segments
- Implementation of a security-optimized user account and password concept
- Intrusion prevention and authentication systems
- Endpoint security solutions with modules for anti-malware, data leakage prevention, etc.
- Data encryption

It is the responsibility of the operator to take appropriate measures and to implement effective security solutions.

B&R Industrial Automation GmbH and its subsidiaries are not liable for damages and/or losses resulting from, for example, IT security breaches, unauthorized access, digital intrusion, data leakage and/or data theft.

Before B&R releases products or updates, they are subjected to appropriate functional testing. Independently of this, the development of customized test processes is recommended in order to be able to check the effects of changes in advance. Such changes include, for example:

- Installation of product updates
- Notable system modifications such as configuration changes
- Import of updates or patches for third-party software (non-B&R software)
- Hardware replacement

These tests should ensure that implemented security measures remain effective and that systems behave as expected.

4.10.3.4 Safety technology disclaimer

The proper use of all B&R products must be guaranteed by the customer through the implementation of suitable training, instruction and documentation measures. The guidelines set forth in system user's manuals must be taken into consideration here as well. B&R has no obligation to provide verification or warnings with regard to the customer's purpose of using the delivered product.

Changes to the devices are not permitted when using safety-related components. Only certified products are permitted to be used. Currently valid product versions in each case are listed in the corresponding certificates. Current certificates are available on the B&R website (www.br-automation.com) in the Downloads section for the respective product. The use of non-certified products or product versions is not permitted.

All relevant information regarding these safety products must be read in the latest version of the related data sheet and the corresponding safety notices observed before the safety products are permitted to be operated. Certified data sheets are available on the B&R website (www.br-automation.com) in the Downloads section for the respective product.

B&R and its employees are not liable for any damages or loss resulting from the incorrect use of these products. The same applies to misuse that may result from specifications or statements made by B&R in connection with sales, support or application activities. It is the sole responsibility of the user to check all specifications and statements made by B&R for proper application as it pertains to safety-related applications. In addition, the user assumes sole responsibility for the proper design of the safety function as it pertains to safety-related applications.

4.10.3.5 Installation notes for X20 safety modules

Products must be protected against impermissible dirt and contaminants. Products are protected from dirt and contaminants up to pollution degree II as specified in the IEC 60664 standard.

Pollution degree II can usually be achieved in an enclosure with IP54 protection, but uncoated modules are NOT permitted to be operated in condensing relative humidity and temperatures under 0°C.

The operation of coated modules is allowed in condensing relative humidity.

Danger!

Pollution levels higher than specified by pollution degree II in standard IEC 60664 can result in dangerous failures. It is extremely important that you ensure a proper operating environment.

Danger!

In order to guarantee a specific voltage supply, a SELV power supply that conforms to IEC 60204 must be used to supply the bus, SafeIO and SafeLOGIC controller. This also applies to all digital signal sources that are connected to the modules.

If the power supply is grounded (PELV system), then only a GND connection is permitted for grounding. Grounding types that have ground connected to +24 VDC are not permitted.

The supply of X20 potential groups must generally be protected using a fuse with a maximum of 10 A. For more information, see chapter "Mechanical and electrical configuration" of the X20 or X67 user's manual.

4.10.3.6 Installation notes for X67 safety modules

Danger!

The following points must be taken into account to ensure IP67 protection:

- The union nuts on female/male connectors must be tightly secured with the specified tightening torque. For the tightening torque, see the X67 system user's manual.
- Female/Male connectors that are not being used must be closed with threaded caps!
 - Threaded caps M8, 50 pcs.: X67AC0M08
 - Threaded caps M12, 50 pcs.: X67AC0M12

Danger!

The shock and vibration resistance values (see chapter "International and national certifications" of the X67 system user's manual) apply if cables are laid solidly.

Danger!

In order to guarantee a specific voltage supply, a SELV power supply that conforms to IEC 60204 must be used to supply the bus, SafeIO and SafeLOGIC controller. This also applies to all digital signal sources that are connected to the modules.

If the power supply is grounded (PELV system), then only a GND connection is permitted for grounding. Grounding types that have ground connected to +24 VDC are not permitted.

Danger!

Unused female connectors must be covered with threaded caps (X67AC0M08 or X67AC0M12 accessory). Otherwise, hazardous conditions may arise if the module fails to function properly.

4.10.3.7 Safe state

If an error is detected by the module (internal or wiring error), the modules enable the safe state. The safe state is structurally designed as a low state or cutoff and cannot be modified.

Applications in which the safe state must actively switch on an actuator cannot be implemented with this module. In these cases, other measures must be taken to meet this safety-related requirement (e.g. mechanical brakes for hanging load that engage on power failure).

4.10.4 System-specific information

The operating principle applies to a potential group.

All potential groups are generally only permitted to be supplied by 1 power supply module. The possible further processing of the power supply on the module is not permitted to result in multiple supply instances.

In the X20 system, only modules of type X20BM01, X20BM23 and X20BM26 that ensure the interruption of the internal I/O power supply to the left are permitted to be used as bus modules for power supply modules.

On modules X20PS9400 and X20PS3300, only the I/O power supply (+24 V I/O) is permitted to be switched with the safety relay. The bus power supply (+24 V BC/X2X L.) must be isolated.

When using module X67PS1300 to supply power to the X67 potential group, only the I/O power supply (+24 V I/O) is permitted to be switched with the safety relay. The bus power supply (+24 V BC/X2X L.) must be isolated.

The operating principle is limited to the modules listed in the following certificate.

Certificate

[Website > Downloads > Certificates > Safety technology > X20, X67 > Safe cutoff of potential groups](#)

4.10.5 Safety guidelines

This section provides a summary of safety notices for the user.

Danger!

Failure of the safety function due to misuse

Observe the following safety guidelines. Failure to observe any of the following notices can lead to the failure of the safety function and may result in serious injury.

- When using the operating principle, it is the user's responsibility to adhere to the relevant standards and safety directives. In addition, the guidelines for proper use must be observed.
- For all potentials supplying the modules, SELV/PELV power supplies must be used.
- The potential groups for which the operating principle is applied are only permitted to contain modules listed from certificate "Safe cutoff of potential groups".
- Uncoated X20 modules in which the operating principle is used are not permitted to be operated in condensing air humidity or at temperatures below 0°C.
- It is not permitted to mix modules from different systems (X20, X67, 7XV) within a potential group.
- It is not permitted to install multiple power supplies in a potential group (particularly with regard to power supply modules that also supply the bus supply).
- Ensure that the upstream safety relay is wired properly.
- Ensure that ALL sensors and actuators connected to the potential group are wired properly.
- Note possible impairments of the safety function due to the internal energy storage devices. If this is sufficient to enable a connected actuator and subsequently leads to a dangerous state, the protection objective is not given and alternatives or supplementary measures must be installed.
- The switch-off time must be verified by a control measurement!
- For modules with isolated I/O potential for sensors and actuators, the upstream safety relay must shut off the supply for both the sensors and actuators.
- The ground connections should be used as functional ground and not as protective ground and must not be connected to the 24 V supply voltage (GND is permitted). In addition, no protective components are permitted to be used between the ground and the 24 V supply voltage.

4.10.5.1 Capacitances within the potential group

The internal capacitances of the module remain charged at the time of shutdown. The total capacitance of the potential group results from the sum of the capacitances of the individual modules, upstream external safety relay and actuator.

$$C_{total} = \sum_{i=1}^n C_i$$

The capacitances of the corresponding B&R modules are listed in the certificate.

Certificate

[Website > Downloads > Certificates > Safety technology > X20, X67 > Safe cutoff of potential groups](#)

At the time a safety function is requested, it is not ensured that the standard outputs are enabled. If an output is disabled at the time of the request, the affected module-internal capacitances remain permanently charged. If the output is enabled by the standard application, an unexpected voltage peak occurs on the output.

In connection with the supply voltage, the total capacitance present in the system results in a charge that must be taken into account during cutoff. In the worst case scenario, it can be assumed that the total capacitance present in the system buffers each output present in the potential group. This behavior is not permitted to lead to a safety-critical state due to actuators in the potential group; alternatives or supplementary corrective measures must be installed.

4.10.5.2 Potential group structure

The potential group is only permitted to be made up of modules listed in the following certificate. Modules not listed in this certificate endanger the "absence of feedback" of the external cutoff and therefore the safety function.

**Certificate**

[Website > Downloads > Certificates > Safety technology > X20, X67 > Safe cutoff of potential groups](#)

To ensure clarity and that the external cutoff is triggered when a fault occurs, installing multiple power supply sources in a potential group is not permitted.

SELV/PELV power supplies must be used for both the bus supply (X2X) and the I/O power supply; otherwise, safety-related malfunctions can occur due to overvoltages.

For modules with isolated I/O potential for sensors and actuators, the upstream safety relay must shut off the supply for both the sensors and actuators; otherwise, feedback cannot be excluded.

4.10.5.3 Circuit examples

Single-channel without feedback

The following example shows a load being cutoff using the emergency stop safety function. Only safe actuators such as motors or input "Enable" of an ACOPOS/ACOPOSmulti drive are permitted to be used as the load in this case.

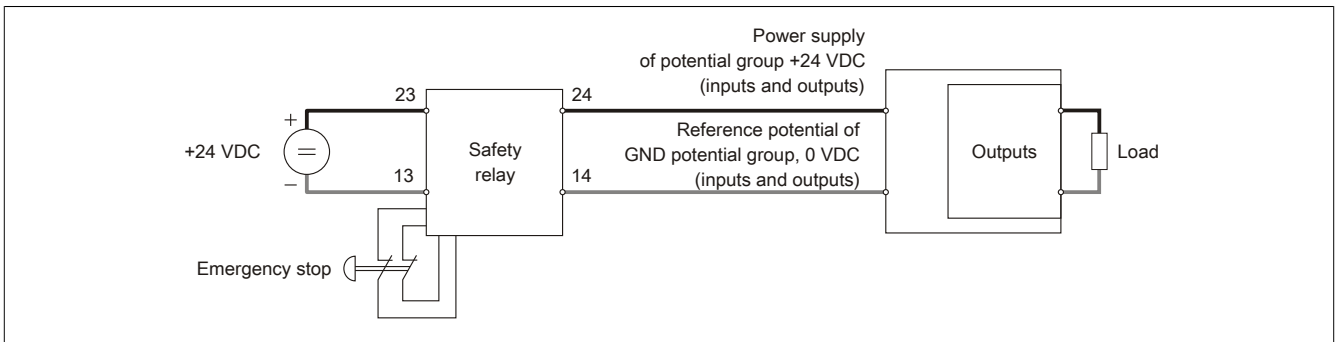

Figure 30: Circuit example: 1-channel without feedback

Provided that the external components being used (emergency stop switch, safety relay, load) satisfy the respective requirements, this example can achieve PL e (performance level as specified in EN ISO 13849-1:2015).

Dual-channel with feedback

The following example shows a load being cutoff using the emergency stop safety function. Feedback allows errors in the actuator to also be detected, and a cutoff is also possible if a fault event occurs due to the full dual-channel design. Whether or not 2 fully isolated potential groups – as shown in the example – are necessary depends on the application and how the safety solution is designed.

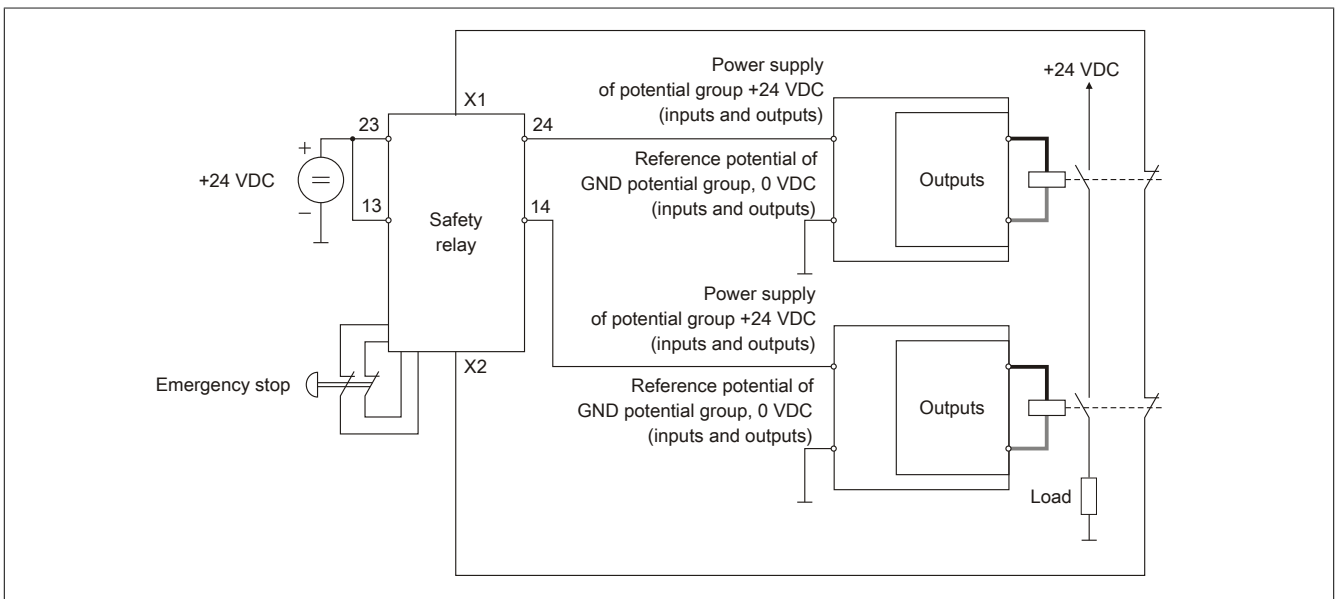

Figure 31: Circuit example: 2-channel with feedback

Provided that the external components being used (emergency stop switch, safety relay, load) satisfy the respective requirements, this example can achieve PL e.

Example with power supply module X20SP1130

The following examples show a load being cut off using safe power supply module X20SP1130 along with safe input module X20SI4100 and the "emergency stop" safety function.

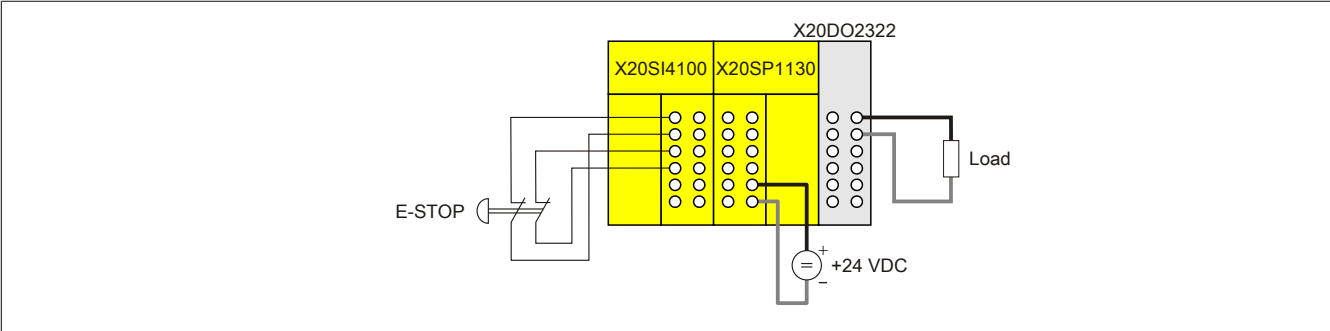

Figure 32: Circuit example with power supply module X20SP1130

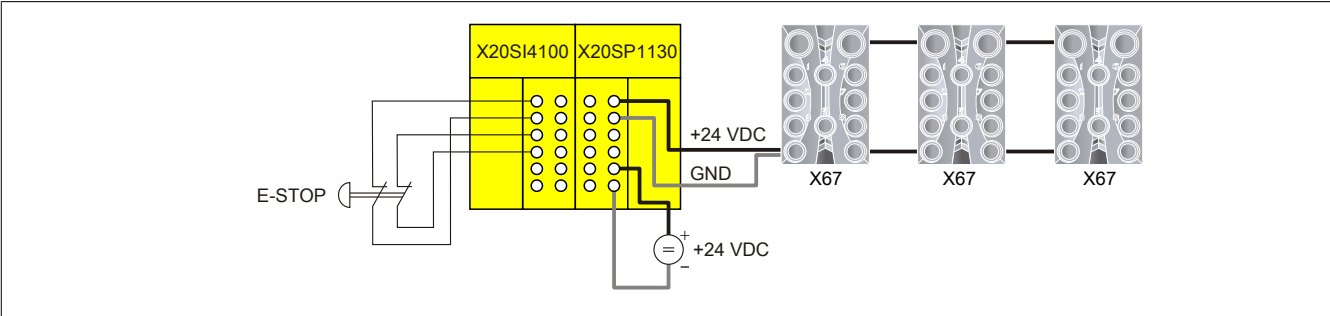

Figure 33: Circuit example with power supply module X20SP1130 and X67

Provided that the external components being used (emergency stop switch, load) satisfy the respective requirements, these examples can achieve PL e.

4.10.5.4 Wiring information

The operating principle "Safe cutoff of a potential group" only applies to the B&R modules being used. All other parts of the safety chain such as the application, upstream sensors or downstream actuators are NOT included in this principle.

For this reason, it is important to take the following points into consideration:

- Ensure proper wiring of the safety relay with the I/O supply. A short circuit between the output of the safety relay and an external 24 V voltage source can cause an unintended supply of 24 V to the internal supply voltage of the potential group. As a result, the safety function can no longer be guaranteed, which means that **ALL** of the channels in the potential group can no longer be cut off by the upstream safety relay.
- Make sure that **ALL** of the potential group's input and output channels and the connected sensors and actuators are wired properly. A short circuit between an input or output of the potential group and an external 24 V voltage source can cause the unintended feedback of 24 V to the internal supply voltage of the potential group. As a result, the safety function can no longer be guaranteed, which means that **ALL** of the output channels in the potential group can no longer be cut off by the upstream safety relay.
- In accordance with EN ISO 13849-2:2012, appendix D.2, table D.4, a short circuit between any 2 conductors can be excluded, provided that:
 - They are permanently installed and protected against external damage (e.g. using a cable duct or armored conduit)
 - OR they are in separate plastic-sheathed cables
 - OR they are installed within an electrical enclosure. This requires that the wiring as well as the area for electrical equipment meet the respective requirements [see EN 60204-1]
 - OR they are individually shielded with a ground connection

4.11 Combining X2X Link systems

The X2X Link provides a complete remote backplane, which is used for communicating between bus modules and over the X2X Link cable. Systems based on X2X Link can be combined with one another as needed.

4.11.1 Connection overviews

The following connection overviews illustrate combinations of different systems that are based on X2X Link. The model numbers indicate which standard cables available from B&R can be used to connect with one another.

Combining X20, X67 and compact I/O system

Combining X20, X67 and valve terminal connections

4.11.1.1 Combining X20, X67 and compact I/O system

4.11.1.2 Combining X20, X67 and valve terminal connections

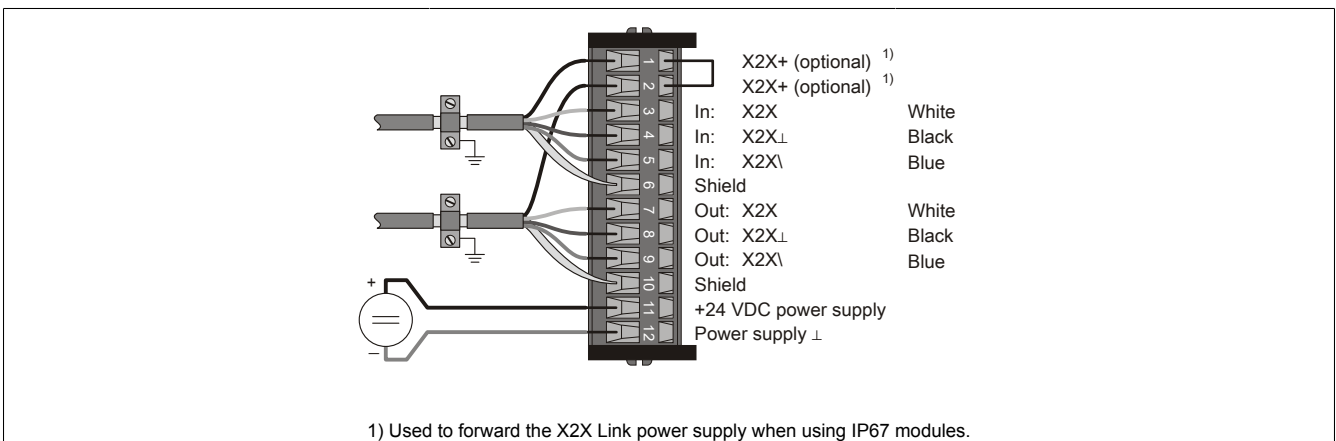

4.11.2 Connection examples

4.11.2.1 X20 system

Connection examples are listed in the module description:

- X20BR9300 bus receiver: "Connection examples" on page 975
- X20BT9100 bus transmitter: "Connection examples" on page 982

4.11.2.2 Compact I/O system

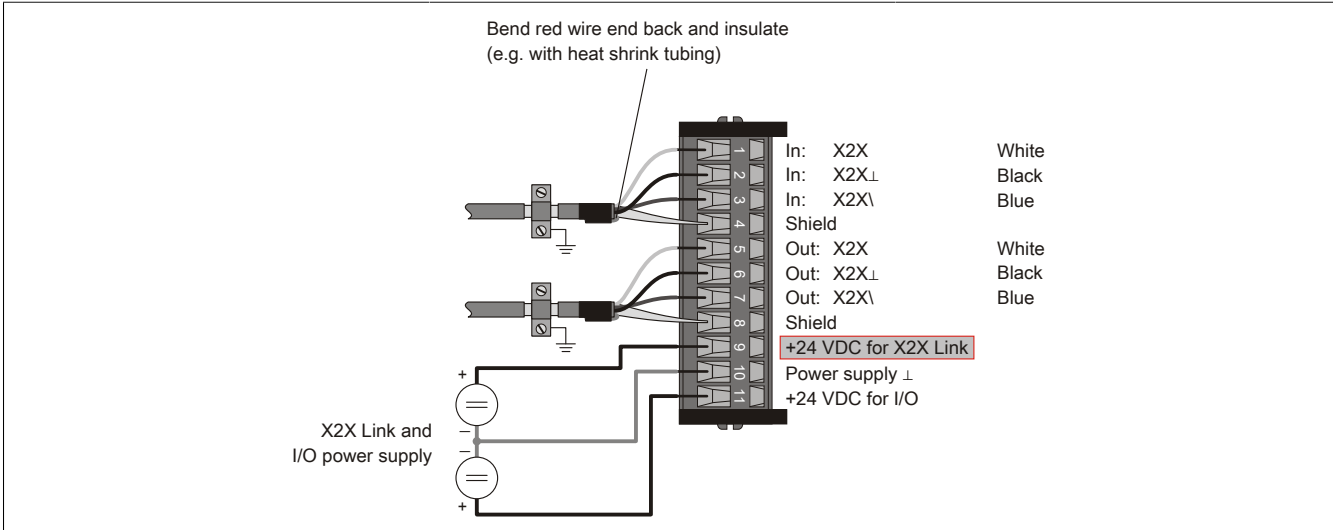

| Signal | Cable type | Model number |
|-----------------|---------------------------------|----------------|
| X2X Link In | Open-ended cables ¹⁾ | X67CA0X41.xxxx |
| | | X67CA0X51.xxxx |
| X2X Link Out | Attachment cables ¹⁾ | X67CA0X21.xxxx |
| | | X67CA0X31.xxxx |
| X2X Link in/out | Cable for custom assembly | X67CA0X99.1000 |

1) Bridge for X2X+ in connection with X67 modules.

4.11.2.3 Valve connection

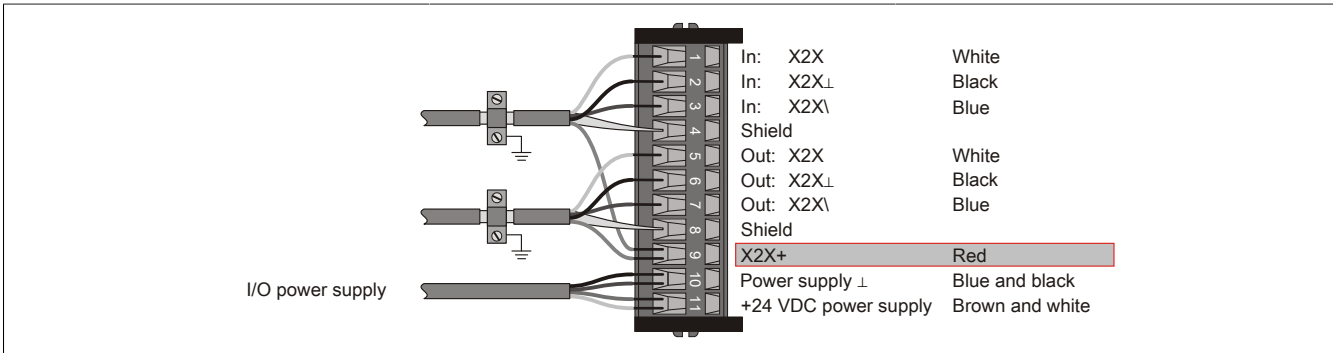

Connection example with 7XVxxx.xx-11/-12

| Signal | Cable type | Model number |
|-----------------|---------------------------------|----------------|
| X2X Link In | Open-ended cables ¹⁾ | X67CA0X41.xxxx |
| | | X67CA0X51.xxxx |
| X2X Link Out | Attachment cables ¹⁾ | X67CA0X21.xxxx |

4.12 Calculating the power requirements

The power requirements are calculated based on the power consumption of the individual modules listed in the respective data sheets. Due to the separate power supplies, the power requirements of the **X2X Link power supply** and **I/O power supply** must be calculated independently of one another.

For the power consumption of both areas, see the technical data. This makes it possible to quickly yet clearly establish the power requirements for a certain hardware configuration. The power consumption values of individual modules should then be subtracted from the power provided by the power supply module. The sum is not permitted to be less than zero.

The following entries in the technical data are used for the calculation:

X2X Link power supply

- **General information - Power consumption - Bus**
This entry refers to the power consumption needed to operate the X2X Link network. The power consumption of the I/O modules and bus base modules are taken into account in the calculation.

I/O power supply

- **General information - Power consumption - Internal I/O**
This entry refers to the power consumption needed to operate the actual I/O module as well as the inputs and outputs.
- **Sensor power supply - Power consumption**
This entry contains the power consumption needed by the I/O module to provide power to connected sensors, for example.
- **Actuator power supply - Power consumption**
This entry contains the power consumption needed by the I/O module to provide power to connected actuators, for example.

The power consumption of I/O modules whose power is supplied externally does not need to be taken into account.

Information:

All modules that require 0.01 W of power on the X2X Link network must be supplied via the internal I/O power supply. If the I/O power supply fails, the module shuts down and communication is lost. In this case, ModuleOk returns the value "False" and data can no longer be read from the "embedded parameter chip".

Information:

The I/O power actually needed can vary depending on the application. In order to properly calculate the power requirements for the respective application, additional specifications such as simultaneity of the outputs, actual required output current, etc. must be taken into account.

4.12.1 Overview of the bus and I/O power supply

The power necessary to operate the X20 system is provided by the power supplied modules, X20 CPUs, bus receivers and bus transmitters.

| Module | Power supplied to internal I/O | Power supplied to bus |
|-------------------------|--------------------------------|------------------------|
| X20CP1483, X20CPx58x | +240 W | +7 W |
| X20CP13xx, X20CP13xx-RT | +240 W | +2 W |
| X20BR7300 | +240 W | +2 W |
| X20BR9300 | +240 W | +7 W |
| X20PS2100 | +240 W | (-0.2 W) ¹⁾ |
| X20PS2110 | +144 W | (-0.2 W) ¹⁾ |
| X20PS3300 | +240 W | +7 W |
| X20PS3310 | +144 W | +7 W |
| X20PS9xxx | +240 W | +7 W |
| X20SP1130 | +240 W | (-0.2 W) ¹⁾ |

1) This module does not provide extra power to the bus (X2X Link) but requires power itself for operation.

Bus transmitter

When calculating the power balance for bus transmitters, it is important to know whether they are only being used as such or are also being used as an I/O power supply module.

| Material number | Power supplied to internal I/O | | Bus power |
|-----------------|------------------------------------|--|------------------------|
| | When operated as a bus transmitter | When operated as a bus transmitter and I/O power supply module | |
| X20BT9100 | (-0.1 W) | +240 W | (-0.5 W) ¹⁾ |
| X20BT9400 | (-0.1 W) | +240 W | (-0.5 W) ¹⁾ |

1) This module does not provide extra power to the bus (X2X Link) but requires power itself for operation.

Information:

If the bus or I/O power consumption of the connected modules exceeds the available power, additional power supply modules must be added (see "[X20 system infrastructure](#)" on page 60).

4.12.2 Example: CPU and modules

Calculating the power balance for the bus and I/O power supply of a module block with X20 CPU.

Power supplied by the CPU

| Module | Power supplied to bus | Power supplied to the I/O power supply |
|-----------|-----------------------|--|
| X20CP3585 | +7 W | +240 W |

Power requirements of the modules

| Module | Bus power supply requirements | | I/O power supply requirements | |
|---------------------------------|-------------------------------|-------------|-------------------------------|--|
| | Bus modules | I/O modules | Internal I/O | Sensor/Actuator power supply |
| X20CP3585 ¹⁾ | - | - | -0.60 W | - |
| X20BM11 + X20DI9371 | -0.13 W | -0.18 W | 0.00 W | 0.00 W |
| X20BM33 + X20SI9100 | -0.13 W | -0.40 W | -1.60 W | 0.00 W |
| X20BM11 + X20AI4622 | -0.13 W | -0.01 W | -1.10 W | 0.00 W |
| X20BM11 + X20AO2622 | -0.13 W | -0.01 W | -1.10 W | 0.00 W |
| X20BM33 + X20SI4100 | -0.13 W | -0.32 W | -1.25 W | 0.00 W |
| X20BM11 + X20DO4322 | -0.13 W | -0.16 W | -0.49 W | Max. -12 W (actuator power supply) Max. -48 W (digital outputs) ²⁾ |
| X20BM11 + X20DI4371 | -0.13 W | -0.14 W | -0.59 W | Max. -12 W (sensor power supply) |
| Subtotal | -0.91 W | -1.22 W | -6.73 W | Max. -72 W |
| Total power requirements | -2.13 W | | -78.73 W | |

1) The power requirements of the power supply module (CPU) do not have to be taken into account in this calculation.

2) Nominal power at 24 VDC and 2 A.

Calculating the power balance

| | Bus power supply | I/O power supply |
|---------------------------|------------------|------------------|
| Power supplied by the CPU | +7 W | +240 W |
| Total power requirements | -2.13 W | -78.73 W |
| Remaining power | +4.87 W | +161.27 W |

The power comparison indicates that the power provided by the CPU power supply module is sufficient. Additional power supply modules are not necessary.

4.12.3 Example: Bus controller and modules

Calculating the power balance for the bus and I/O power supply of a module block with bus controller.

Power supplied by the power supply module

| Module | Power supplied to bus | Power supplied to the I/O power supply |
|-----------|-----------------------|--|
| X20PS9400 | +7 W | +240 W |

Power requirements of the modules

| Module | Bus power supply requirements | | I/O power supply requirements | |
|------------------------------------|-------------------------------|--------------------|-------------------------------|---|
| | Bus modules | I/O modules | Internal I/O | Sensor/Actuator power supply |
| X20PS9400 ¹⁾ | - | - | -0.60 W | - |
| X20BB81 + X20BC8083 + X20HB2880 | -0.50 W | -2.00 W -1.17 W | - | 0.00 W |
| X20BM33 + X20SI9100 | -0.13 W | -0.40 W | -1.60 W | 0.00 W |
| X20BM11 + X20AI4622 | -0.13 W | -0.01 W | -1.10 W | 0.00 W |
| X20BM11 + X20AO2622 | -0.13 W | -0.01 W | -1.10 W | 0.00 W |
| X20BM33 + X20SO2530 | -0.13 W | -0.26 W | -1.15 W | 0.00 W |
| X20BM33 + X20SO4120 | -0.13 W | -0.25 W | -1.30 W | Max. -120 W (digital outputs) ²⁾ |
| X20BM33 + X20DO8322 | -0.13 W | -0.26 W | -0.80 W | Max. -96 W (digital outputs) ³⁾ |
| X20BM11 + X20DI2371 | -0.13 W | -0.12 W | -0.29 W | Max. -12 W (sensor power supply) |
| Subtotal | -1.41 W | -4.48 W | -7.94 W | Max. -228 W |
| Total power requirements | -5.89 W | | -235.94 W | |

- 1) The power requirements of the power supply module do not have to be taken into account in this calculation.
- 2) Nominal power at 24 VDC and 5 A.
- 3) Nominal power at 24 VDC and 4 A.

Calculating the power balance

| | Bus power supply | I/O power supply |
|---|------------------|------------------|
| Power supplied by the power supply module | +7 W | +240 W |
| Total power requirements | -5.89 W | -235.94 |
| Remaining power | +1.11 W | +4.06 |

The power comparison indicates that the power provided by the power supply module is sufficient. Additional power modules are not necessary.

4.12.4 Example: Potential groups

With a large number of I/O modules, the power provided by a power supply module is insufficient to operate all of the modules. In this case, the modules must be divided into potential groups.

Example of module group on bus receiver X20BR9300.

Power supplied by the bus receiver

A power supply module is already integrated in the bus receiver.

| Module | Power supplied to bus | Power supplied to the I/O power supply |
|-----------|-----------------------|--|
| X20BR9300 | +7 W | +240 W |

Power requirements of the entire module group

| Module | Bus power supply requirements | | I/O power supply requirements | |
|-----------------------------------|-------------------------------|-------------|-------------------------------|--|
| | Bus modules | I/O modules | Internal I/O | Sensor/Actuator power supply |
| X20BM01 + X20BR9300 ¹⁾ | -0.13 W | - | -0.60 W | - |
| X20BM11 + X20DI9371 | -0.13 W | -0.18 W | 0.00 W | 0.00 W |
| X20BM33 + X20SI9100 | -0.13 W | -0.40 W | -1.60 W | 0.00 W |
| X20BM11 + X20AI4622 | -0.13 W | -0.01 W | -1.10 W | 0.00 W |
| X20BM11 + X20AO2622 | -0.13 W | -0.01 W | -1.10 W | 0.00 W |
| X20BM33 + X20SI4100 | -0.13 W | -0.32 W | -1.25 W | 0.00 W |
| X20BM11 + X20DO4322 | -0.13 W | -0.16 W | -0.49 W | Max. -12 W (actuator power supply) Max. -48 W (digital outputs) ²⁾ |
| X20BM11 + X20DI4371 | -0.13 W | -0.14 W | -0.59 W | Max. -12 W (sensor power supply) |
| X20BM33 + X20SI9400 | -0.13 W | 0.40 W | -1.60 W | 0.00 W |
| X20BM11 + X20AI4622 | -0.13 W | -0.01 W | -1.10 W | 0.00 W |
| X20BM11 + X20AO2622 | -0.13 W | -0.01 W | -1.10 W | 0.00 W |
| X20BM33 + X20SO2530 | -0.13 W | -0.26 W | -1.15 W | 0.00 W |
| X20BM33 + X20SO4120 | -0.13 W | -0.25 W | -1.30 W | Max. -120 W (digital outputs) ³⁾ |
| X20BM11 + X20DO8322 | -0.13 W | -0.26 W | -0.80 W | Max. -96 W (digital outputs) ⁴⁾ |
| X20BM11 + X20DI2371 | -0.13 W | -0.12 W | -0.29 W | Max. -12 W (sensor power supply) |
| Subtotal | -1.95 W | -2.53 W | -14.06 W | Max. -300 W |
| Total power requirements | -4.48 W | | -314.06 W | |

1) The power requirements of the bus receiver do not have to be taken into account in this calculation.

2) Nominal power at 24 VDC and 2 A.

3) Nominal power at 24 VDC and 5 A.

4) Nominal power at 24 VDC and 4 A.

Calculating the power balance

| | Bus power supply | I/O power supply |
|------------------------------------|------------------|------------------|
| Power supplied by the bus receiver | +7 W | +240 W |
| Total power requirements | -4.48 W | -314.06 W |
| Remaining power | +2.52 W | -74.06 W |

The power comparison indicates that the power provided by the bus receiver is insufficient. As additional power supply module is necessary to ensure the missing 74.06 W for the I/O power supply.

For this reason, the module group is divided into 2 potential groups.

Potential group 1

Power supplied by the bus receiver

A power supply module is already integrated in the bus receiver.

| Module | Power supplied to bus | Power supplied to the I/O power supply |
|-----------|-----------------------|--|
| X20BR9300 | +7 W | +240 W |

Power requirements of the modules

| Module | Bus power supply requirements | | I/O power supply requirements | |
|-----------------------------------|-------------------------------|-------------|-------------------------------|--|
| | Bus modules | I/O modules | Internal I/O | Sensor/Actuator power supply |
| X20BM01 + X20BR9300 ¹⁾ | -0.13 W | - | -0.60 W | - |
| X20BM11 + X20DI9371 | -0.13 W | -0.18 W | 0.00 W | 0.00 W |
| X20BM33 + X20SI9100 | -0.13 W | -0.40 W | -1.60 W | 0.00 W |
| X20BM11 + X20AI4622 | -0.13 W | -0.01 W | -1.10 W | 0.00 W |
| X20BM11 + X20AO2622 | -0.13 W | -0.01 W | -1.10 W | 0.00 W |
| X20BM11 + X20DO4322 | -0.13 W | -0.16 W | -0.49 W | Max. -12 W (actuator power supply) Max. -48 W (digital outputs) ²⁾ |
| X20BM11 + X20DI4371 | -0.13 W | -0.14 W | -0.59 W | Max. -12 W (sensor power supply) |
| X20BM11 + X20AI4622 | -0.13 W | -0.01 W | -1.10 W | 0.00 W |
| X20BM11 + X20AO2622 | -0.13 W | -0.01 W | -1.10 W | 0.00 W |
| X20BM11 + X20DO8322 | -0.13 W | -0.26 W | -0.80 W | Max. -96 W (digital outputs) ³⁾ |
| X20BM11 + X20DI2371 | -0.13 W | -0.12 W | -0.29 W | Max. -12 W (sensor power supply) |
| Subtotal | -1.43 W | -1.30 W | -8.77 W | Max. -180 W |
| Total power requirements | -2.73 W | | -188.77 W | |

- 1) The power requirements of the bus receiver do not have to be taken into account in this calculation.
- 2) Nominal power at 24 VDC and 2 A.
- 3) Nominal power at 24 VDC and 4 A.

Potential group 2

Power supplied by the power supply module

| Module | Power supplied to bus | Power supplied to the I/O power supply |
|-----------|-----------------------|--|
| X20SP1130 | - | +240 W |

Power requirements of the modules

| Module | Bus power supply requirements | | I/O power supply requirements | |
|-----------------------------------|-------------------------------|-------------|-------------------------------|---|
| | Bus modules | I/O modules | Internal I/O | Sensor/Actuator power supply |
| X20BM23 + X20SP1130 ¹⁾ | -0.13 W | -0.2 W | -1.50 W | - |
| X20BM33 + X20SI4100 | -0.13 W | -0.32 W | -1.25 W | 0.00 W |
| X20BM33 + X20SI9100 | -0.13 W | -0.40 W | -1.60 W | 0.00 W |
| X20BM33 + X20SO2530 | -0.13 W | -0.26 W | -1.15 W | 0.00 W |
| X20BM33 + X20SO4120 | -0.13 W | -0.25 W | -1.30 W | Max. -120 W (digital outputs) ²⁾ |
| Subtotal | -0.65 W | -1.43 W | -6.80 W | Max. -120 W |
| Total power requirements | -2.08 W | | -126.80 W | |

- 1) The power requirements of the power supply module do not have to be taken into account in this calculation.
- 2) Nominal power at 24 VDC and 5 A.

Power balance for the bus power supply

| | Bus power supply |
|------------------------------------|-------------------------|
| Power supplied by the bus receiver | +7 W |
| Power balance of potential group 1 | -2.73 W |
| Power balance of potential group 2 | -2.08 W |
| Remaining power | +2.19 W |

The power comparison indicates that the power provided by the bus receiver is sufficient. Additional power supply modules for the bus power supply are not necessary.

Power balance for the I/O power supply

Potential group 1

| | I/O power supply |
|------------------------------------|-------------------------|
| Power supplied by the bus receiver | +240 W |
| Total power requirements | -188.77 W |
| Remaining power | +51.23 W |

Potential group 2

| | I/O power supply |
|---|-------------------------|
| Power supplied by the power supply module | +240 W |
| Total power requirements | -126.80 W |
| Remaining power | +113.20 W |

The power comparison indicates that the power provided by the power supply modules is now sufficient for both potential groups.

4.13 Power dissipation of power supply modules

Power supply modules are used to supply power to an X20 system. The power supply modules are either a separate module or part of a CPU or bus controller.

The power consumed by the power supply modules is passed on to the X20 system, taking into consideration its own power requirements and the effectiveness of the power supplies. The data sheets for the power supply modules list their own power requirements and power dissipation (as maximum power consumption). With the formulas in the following sections, the exact power consumption can also be calculated. This calculation is explained using an example.

The following image shows where the power supply module uses power for its own requirements. It also shows where the power supply module uses power to supply the system and where power dissipation occurs.

Figure 34: Power supply modules draw power at up to 3 supply points

4.13.1 Power consumption of power supply modules

The following table provides an overview of the power consumed by the power supply modules. The exact power requirement can be calculated using the specified formulas.

| Module | Bus | | | Power consumption - I/O-internal [W] |
|--|-----------------------|--|--|---|
| | Power consumption [W] | Power consumption - X2X Link (internal) [W] | Power consumption - Total [W] | |
| X20PS3300, X20PS9400, X20PS9500, X20PS9600, X20CP1483, X20CP1483-1, X20CP158x, X20CP358x | 0.2 | $0.8 + \frac{0.06 \cdot \sum P_{X2X_{X20}}}{n}$ | $1.42 \geq 0.2 + 0.8 + \frac{0.06 \cdot \sum P_{X2X_{X20}}}{n}$ | $0.6 \geq 0.1 + I_{IO}^2 \times 0.005$ |
| X20PS3310 | 0.2 | $0.8 + \frac{0.06 \cdot \sum P_{X2X_{X20}}}{n}$ | $1.42 \geq 0.2 + 0.8 + \frac{0.06 \cdot \sum P_{X2X_{X20}}}{n}$ | $0.82 \geq 0.1 + I_{IO}^2 \times 0.02$ |
| X20BR9300 | 0.4 | $0.8 + \frac{0.06 \cdot \sum P_{X2X_{X20}}}{n}$ | $1.62 \geq 0.4 + 0.8 + \frac{0.06 \cdot \sum P_{X2X_{X20}}}{n}$ | $0.6 \geq 0.1 + I_{IO}^2 \times 0.005$ |
| X20PS9402, X20PS9502, X20PS9602 | 0.2 | $0.6 + \frac{0.12 \cdot \sum P_{X2X_{X20}}}{n=1}$ | $1.64 \geq 0.2 + 0.6 + \frac{0.12 \cdot \sum P_{X2X_{X20}}}{n=1}$ | $0.6 \geq 0.1 + I_{IO}^2 \times 0.005$ |
| X20PS2100 | 0.2 | - | 0.2 | $0.6 \geq 0.1 + I_{IO}^2 \times 0.005$ |
| X20PS2110 | 0.2 | - | 0.2 | $0.82 \geq 0.1 + I_{IO}^2 \times 0.02$ |
| X20BT9100 | 0.5 | - | 0.5 | $0.6 \geq 0.1 + I_{IO}^2 \times 0.005$ |
| X20BT9400 | 0.5 | $0.5 + \frac{0.147 \cdot \sum P_{X2X_{X67}}}{n=1}$ | $1.88 \geq 0.5 + 0.5 + \frac{0.147 \cdot \sum P_{X2X_{X67}}}{n=1}$ | $0.6 \geq 0.1 + I_{IO}^2 \times 0.005$ |
| X20PS8002 | - | $0.5 + \frac{0.12 \cdot P_{Out}}{n=1}$ | $1.34 \geq 0.5 + \frac{0.12 \cdot P_{Out}}{n=1}$ | - |
| X20PD2113 | 0.12 | - | 0.12 | $1.15 \geq 0.28 + I_{IO}^2 \times 0.02$ |

$\sum P_{X2X_{X20}}$... Sum of the bus power consumption of all modules in the X20 system (Compact-S CPU, Compact CPU, Fieldbus CPU, BC, BR, I/O, BM, BT)

$\sum P_{X2X_{X67}}$... Sum of the bus power consumption of all I/O modules in the X67 system

P_{Out} ... Sum of the power consumption of all modules (HB) supplied by the power supply module

n ... Number of all power supply modules in the X20 system with X2X Link power supply, including X20BR9300

I_{IO} ... I/O summation current of all I/O modules supplied by this power supply module (max. 10 A)

X20PS2110 and X20PS3110:

The summation current of these modules is not permitted to exceed 6 A.

X20PD2113:

If the module is used as a power supply module for the I/O power supply, I_{IO} corresponds to the summation current of all I/O modules supplied by the X20PD2113 (max. 10 A).

4.13.2 Example

Calculation of the total internal power consumption of bus receiver X20BR9300 using the following hardware configuration:

| Module | Bus module - Power | Bus power [W] | I/O-internal power [W] |
|------------|--------------------|---------------|------------------------|
| X20BR9300 | | 0 | 0 |
| X20DI4371 | 0.13 | 0.14 | 0.59 |
| X20DI2371 | 0.13 | 0.12 | 0.29 |
| X20DO4322 | 0.13 | 0.16 | 0.49 |
| X20DO4322 | 0.13 | 0.16 | 0.49 |
| X20BT9100 | 0.13 | 0.50 | 0.10 |
| Sum | 0.65 | 1.08 | 1.96 |

2 power values have to be calculated in order to determine the entire internal power consumption of the bus receiver.

- Internal X2X Link power consumption of the X20BR9300
- Internal I/O power consumption of the X20BR9300

4.13.2.1 Calculating the internal X2X Link power consumption of the X20BR9300

Bus power consumption of all modules in the X20 system

In order to calculate the internal X2X Link power consumption of the X20BR9300, the sum of the bus power consumption of all modules in the X20 system is required.

The sum for the example configuration is calculated using the following formula: The bus module of the X20BR9300 does not have to be taken into account in the calculation. The power consumption of the bus module is already included with a factor of 0.8 (see formula below).

A power consumption of 0.13 W for each bus module must be included in the calculation for the 4 I/O modules and the bus transmitter.

$$\sum P_{X2X_{X20}} = P_{X2X_{Bus_{BR9300}}} + \sum P_{X2X_{Bus_{IOMod}}} + \sum P_{X2X_{Bus_{Busmod}}} = 0.4 + 1.08 + 5 \cdot 0.13 = 2.13 \text{ W}$$

Internal X2X Link power consumption of the X20BR9300

The internal X2X Link power consumption of the X20BR9300 is calculated using the following formula. Since X2X Link is only supplied by the X20BR9300 bus receiver, the factor is $n = 1$:

$$P_{X2X_{int.BR9300}} = 0.8 + \frac{0.06 \cdot \sum P_{X2X_{X20}}}{n} = 0.8 + \frac{0.06 \cdot 2.13}{1} = 0.8 + 0.13 = 0.93 \text{ W}$$

4.13.2.2 Calculating the internal I/O power consumption of the X20BR9300

The I/O summation current of all I/O modules supplied by the X20BR9300 is needed to calculate the internal I/O power consumption. The I/O summation current is composed of 3 parts:

- Internal power consumption of the I/O modules
- Sum of the output currents
- Sum of the actuator currents

Internal power consumption of the I/O modules

The current that results from the internal consumption of the I/O modules is calculated according to the following formula:

$$I_{IO_{int.}} = \frac{P_{IO_{int.}}}{U} = \frac{1.96}{24} = 0.082 A$$

Sum of output and actuator currents

Two X20DO4322 modules are included in the example configuration. The following images show which outputs are wired and how high the output current and actuator current are per channel.

Connections and currents of the first X20DO4322:

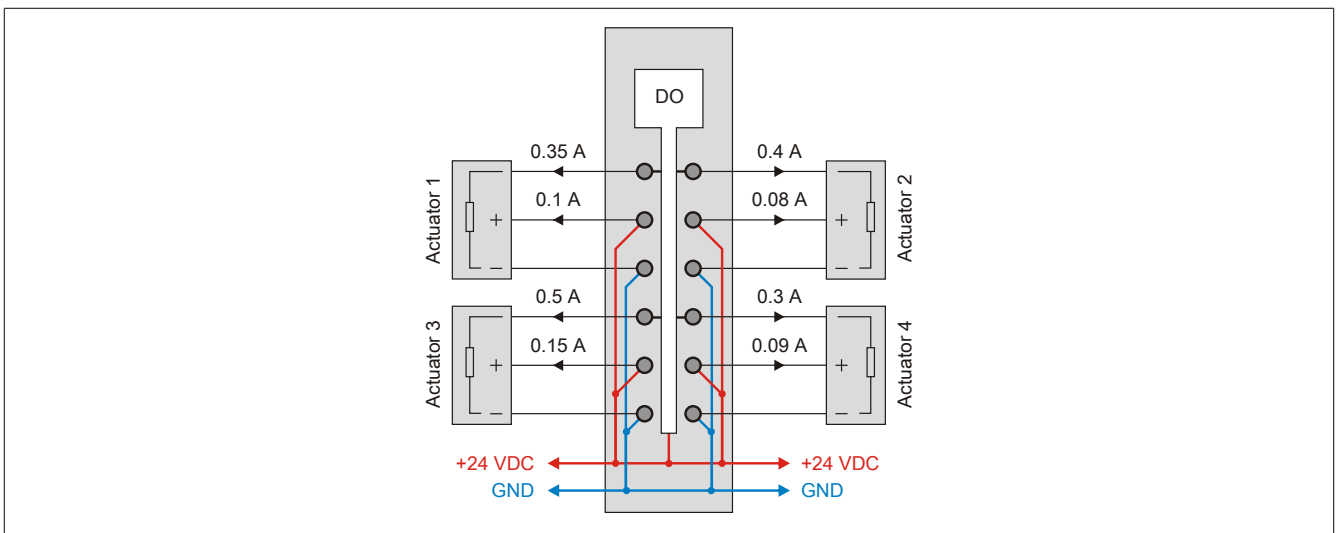

Figure 35: Connections and currents of the first X20DO4322

Connections and currents of the second X20DO4322:

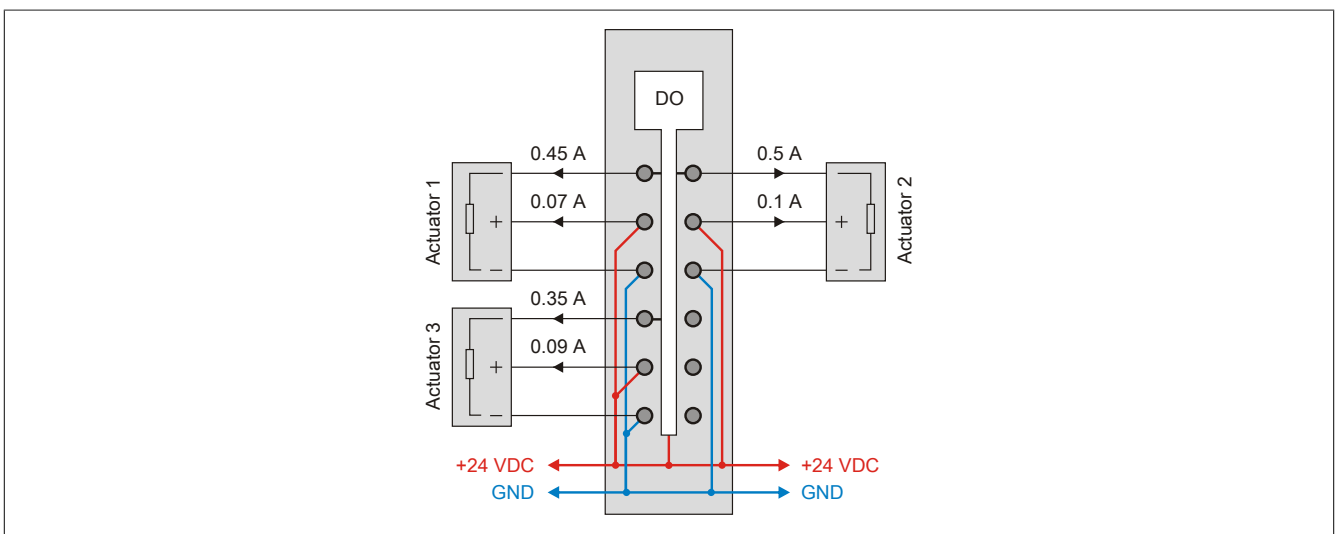

Figure 36: Connections and currents of the second X20DO4322

Calculating the sum of the output currents:

$$I_{DO} = I_{DO_1} + I_{DO_2} = 0.35 + 0.4 + 0.5 + 0.3 + 0.45 + 0.5 + 0.35 = 2.85 \text{ A}$$

Calculating the sum of the actuator currents:

$$I_{Actuator} = I_{Actuator_1} + I_{Actuator_2} = 0.1 + 0.08 + 0.15 + 0.09 + 0.07 + 0.1 + 0.09 = 0.68 \text{ A}$$

Calculating the I/O summation current

The I/O summation current is calculated from the sum of all 3 partial currents.

$$I_{IO} = I_{IO_{int.}} + I_{DO} + I_{Actuator} = 0.082 + 2.85 + 0.68 = 3.612 \text{ A}$$

Calculating the internal I/O power consumption of the X20BR9300

The internal I/O power consumption is calculated using the following formula:

$$P_{IO_{int.}BR9300} = 0.1 + I_{IO}^2 \cdot 0.005 = 0.1 + 3.612^2 \cdot 0.005 = 0.17 \text{ W}$$

4.13.2.3 Total internal power consumption of the X20BR9300

The following 3 power values must be added together to calculate the total internal power consumption of the X20BR9300:

- Power consumption - Bus
- Power consumption - X2X Link (internal)
- Power consumption - I/O-internal

$$P_{BR9300_{int.}Tot} = P_{X2X_{Bus}BR9300} + P_{X2X_{int.}BR9300} + P_{IO_{int.}BR9300} = 0.4 + 0.93 + 0.17 = 1.5 \text{ W}$$

4.14 Calculation of the additional power dissipation resulting from actuators

Calculation of power dissipation when specifying $R_{DS(on)}$

Explaining output load with an X20DO4332 example

Figure 37: Calculation of power dissipation when specifying $R_{DS(on)}$

Theoretically highest power dissipation resulting from actuators:

Number of outputs * $R_{DS(on)}$ * nominal output current² = power dissipation

$$4 * 140 \text{ m}\Omega * 2 \text{ A}^2 = 2.24 \text{ W}$$

Power dissipation resulting from actuators in this example:

$$140 \text{ m}\Omega * (1 \text{ A}^2 + 0.6 \text{ A}^2 + 1.2 \text{ A}^2 + 1 \text{ A}^2) = 0.532 \text{ W}$$

Power dissipation calculation when specifying the residual voltage

Explaining output load with an X20DO4623 example

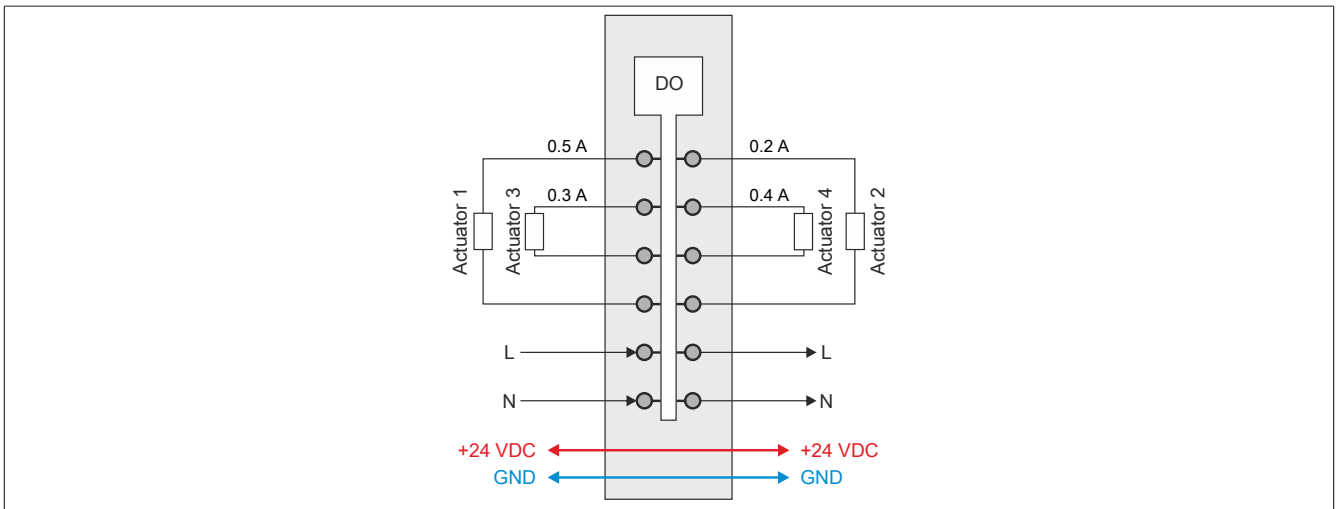

Figure 38: Power dissipation calculation when specifying the residual voltage

Theoretically highest power dissipation resulting from actuators:

Number of outputs * residual voltage * nominal output current = power dissipation

$$4 * 1.6 \text{ V} * 0.5 \text{ A} = 3.2 \text{ W}$$

Power dissipation resulting from actuators in this example:

$$1.6 \text{ V} * (0.5 \text{ A} + 0.2 \text{ A} + 0.3 \text{ A} + 0.4 \text{ A}) = 2.24 \text{ W}$$

Power dissipation calculation when specifying the contact resistance

Explaining output load with an X20DO4649 example

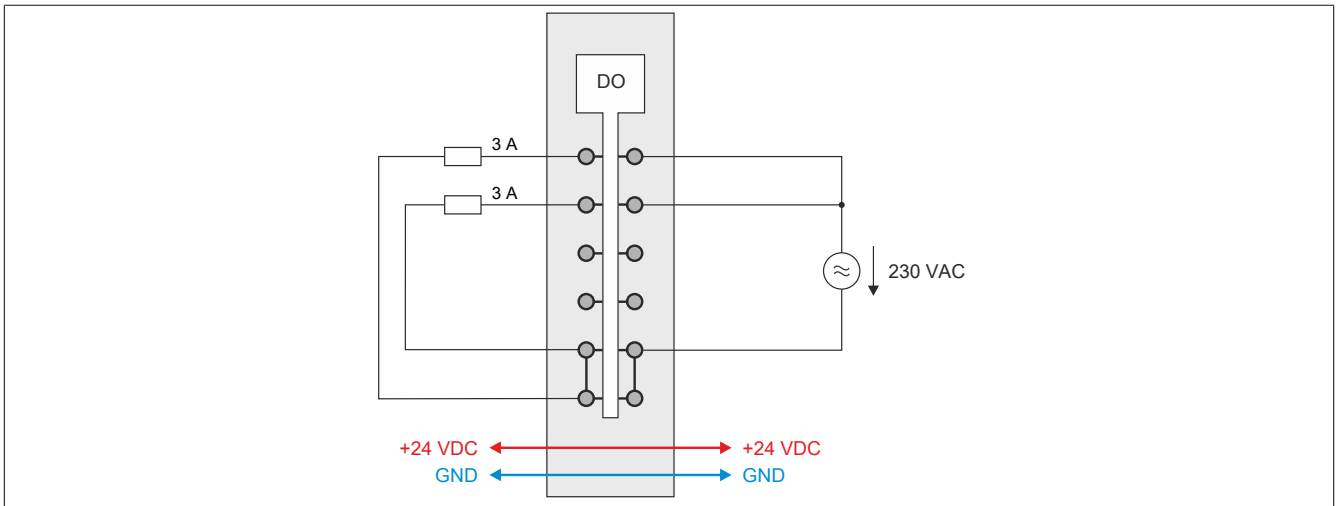

Figure 39: Power dissipation calculation when specifying the contact resistance

Theoretically highest power dissipation resulting from actuators:

Number of outputs * contact resistance * nominal output current² = power dissipation

$$4 * 100 \text{ m}\Omega * 5 \text{ A}^2 = 10 \text{ W}$$

Power dissipation resulting from actuators in this example:

$$100 \text{ m}\Omega * (3 \text{ A}^2 + 3 \text{ A}^2) = 1.8 \text{ W}$$

4.15 Dimensioning the external 24 VDC power supply

X20 systems are provided with external 24 VDC power supplies. The following examples illustrate how to determine the power to be provided.

4.15.1 X20BRx300 bus receivers and X20PS33xx power supply modules

Calculation example with bus receiver X20BR9300

For dimensioning the external 24 VDC power supply, the following power values are included in the calculation:

| Power | Description | Bus power supply | I/O power supply |
|--|--|------------------|------------------|
| Power consumption of the bus and I/O modules | Example for calculating the power requirements: See "Example: Potential groups" on page 84. | 2.73 W | 188.77 W |
| Power consumption of the X20BR9300 | For the value, see the technical data in the data sheet: General information - Power consumption of the X2X Link power supply | 1.62 W | - |
| Subtotal | | 4.35 W | 188.77 W |
| Total power requirements | | 193.12 W | |

The external 24 VDC power supply must provide 193.12 W.

4.15.2 Power supply modules X20PS9400 and X20PS9402

Calculation example with X20PS9400, X20BC0083 and X20BB80

For dimensioning the external 24 VDC power supply, the following power values are included in the calculation:

| Power | Description | Bus power supply | I/O power supply |
|--|--|------------------|------------------|
| Power consumption of the bus and I/O modules | Example for calculating the power requirements: See "Example: Bus controller and modules" on page 83. In the example for calculating the power requirements, expandable bus controller X20BC8083 is used with 1-hub expansion module X20HB2880. If X20BC0083 is used, there is no need for a 1-hub expansion module and the following values are included in the calculation: <ul style="list-style-type: none"> X20BB80: -0.25 W X20BC0083: -2 W | 4.47 W | 235.94 W |
| Power consumption of the X20PS9400 | For the value, see the technical data in the data sheet: General information - Power consumption of the X2X Link power supply | 1.42 W | - |
| Subtotal | | 5.89 W | 235.94 W |
| Total power requirements | | 241.83 W | |

The external 24 VDC power supply must provide 241.83 W.

Calculation example with X20PS9400, X20BC8083, X20HB2880 and X20BB81

For dimensioning the external 24 VDC power supply, the following power values are included in the calculation:

| Power | Description | Bus power supply | I/O power supply |
|--|--|------------------|------------------|
| Power consumption of the bus and I/O modules | Example for calculating the power requirements: See "Example: Bus controller and modules" on page 83. | 5.89 W | 235.94 W |
| Power consumption of the X20PS9400 | For the value, see the technical data in the data sheet: General information - Power consumption of the X2X Link power supply | 1.42 W | - |
| Subtotal | | 7.31 W | 235.94 W |
| Total power requirements | | 243.25 W | |

The external 24 VDC power supply must provide 243.25 W.

4.15.3 CPUs X20CP1483 and X20CPx58x

Calculation example with X20CP3585 and 3 interface modules

For dimensioning the external 24 VDC power supply, the following power values are included in the calculation:

| Power | Description | Bus power supply | I/O power supply |
|---|---|------------------|------------------|
| Power consumption of the bus and I/O modules | Example for calculating the power requirements: See " Example: CPU and modules " on page 82. | 2.13 W | 78.73 W |
| Power consumption of X20CP3585 without interface module and USB | For the value, see the technical data in the data sheet: General information - Power consumption without interface module and USB | 8.8 W | - |
| Power consumption for generating the X2X Link power supply | For the value, see the technical data in the data sheet: General information - Power consumption of the X2X Link power supply | 1.42 W | - |
| 2x USB interface | 3 W must be taken into account for each USB interface used | 6 W | - |
| Power consumption of the X20IF1091 | For the value, see the technical data in the data sheet: General information - Power consumption | 0.97 W | - |
| Power consumption of the X20IF10E1-1 | | 2 W | - |
| Power consumption of the X20IF10E3-1 | | 2 W | - |
| Power consumption of X20CP3585 per interface module | The CPU consumes 0.6 W per interface module. The power consumption of 3 interface modules is: $3 \times 0.6 \text{ W} = 1.8 \text{ W}$ | 1.8 W | - |
| Subtotal | | 25.12 W | 78.73 W |
| Total power requirements | | 103.85 W | |

The external 24 VDC power supply must provide 103.85 W.

4.15.4 Compact-S CPUs X20CP04xx

4.15.4.1 Compact-S CPU without an interface module

The first part of this example shows the calculation of the power requirements for the bus and I/O power supply of a Compact-S CPU without an interface module. Dimensioning the external 24 VDC power supply is explained in the second part.

Power supplied by the power supply module

| Module | Power supplied to the bus | Power supplied to the I/O power supply |
|-----------|---------------------------|--|
| X20PS9600 | +7 W | +240 W |

Power requirements of the Compact-S CPU

| Module | Bus power supply requirements | I/O power supply requirements |
|---------------------------------|-------------------------------|-------------------------------|
| X20PS9600 | - | -0.6 W |
| X20BB52 | -0.55 W | - |
| X20CP0410 | -2.2 W | - |
| 2x USB interface | -2 W ¹⁾ | - |
| Total power requirements | -4.75 W | -0.6 W |

1) $2 \times 5 \text{ V} \times 0.2 \text{ A} = 2 \text{ W}$

Power balance for the bus supply

The power requirements of the Compact-S CPU are completely covered by the bus power supply. In a power balance, it must be checked whether the power supply module covers the power requirements of the Compact-S CPU.

| | Bus power supply |
|---|------------------|
| Power supplied by the power supply module | +7 W |
| Total power requirements | -4.75 W |
| Remaining power | +2.25 W |

The power comparison indicates that the power provided by the power supply module is sufficient. Additional power supply modules are not necessary.

External 24 VDC power supply

For dimensioning the external 24 VDC power supply, the following power values are included in the calculation:

| Power | Description | Bus power supply | I/O power supply |
|--|---|------------------|------------------|
| Power consumption of the bus and I/O modules | Examples for calculating the power requirements: See "Calculating the power requirements" on page 81. The following values are assumed for this example: <ul style="list-style-type: none"> Bus power supply: 3.67 W I/O power supply: 192.51 W | 3.67 W | 192.51 W |
| Power consumption of the X20PS9600 | For the values, see the technical data in the data sheet: General information - Power consumption of the X2X Link power supply | 1.42 W | 0.6 W |
| Power requirements of the Compact-S CPU | The values calculated in section "Power requirements of the Compact-S CPU" on page 96 are used for the bus and I/O power supply. | 4.75 W | - |
| Subtotal | | 9.84 W | 193.11 W |
| Total power requirements | | 202.95 W | |

The external 24 VDC power supply must provide 202.95 W.

4.15.4.2 Compact-S CPU with 1 interface module

The first part of this example shows the calculation of the power requirements for the bus and I/O power supply of a Compact-S CPU with an interface module. Dimensioning the external 24 VDC power supply is explained in the second part.

Power supplied by the power supply module

| Module | Power supplied to the bus | Power supplied to the I/O power supply |
|-----------|---------------------------|--|
| X20PS9600 | +7 W | +240 W |

Power requirements of the Compact-S CPU

| Module | Bus power supply requirements | I/O power supply requirements |
|---------------------------------|-------------------------------|-------------------------------|
| X20PS9600 | - | -0.6 W |
| X20BB62 | -0.94 W | - |
| X20CP0410 | -2.2 W | - |
| 2x USB interface | -2 W ¹⁾ | - |
| X20IF1063-1 | -1.8 W | - |
| Total power requirements | -6.94 W | -0.6 W |

1) $2 \times 5 \text{ V} \times 0.2 \text{ A} = 2 \text{ W}$

Power balance for the bus supply

The power requirements of the Compact-S CPU are completely covered by the bus power supply. In a power balance, it must be checked whether the power supply module covers the power requirements of the Compact-S CPU.

| | Bus power supply |
|---|------------------|
| Power supplied by the power supply module | +7 W |
| Total power requirements | -6.94 W |
| Remaining power | +0.06 W |

The power comparison indicates that the power provided by the power supply module is sufficient. Additional power supply modules are not necessary.

External 24 VDC power supply

For dimensioning the external 24 VDC power supply, the following power values are included in the calculation:

| Power | Description | Bus power supply | I/O power supply |
|--|---|------------------|------------------|
| Power consumption of the bus and I/O modules | Examples for calculating the power requirements: See "Calculating the power requirements" on page 81. The following values are assumed for this example: <ul style="list-style-type: none"> • Bus power supply: 3.67 W • I/O power supply: 192.51 W | 3.67 W | 192.51 W |
| Power consumption of the X20PS9600 | For the values, see the technical data in the data sheet: General information - Power consumption of the X2X Link power supply | 1.42 W | 0.6 W |
| Power requirements of the Compact-S CPU | The values calculated in section "Power requirements of the Compact-S CPU" on page 97 are used for the bus and I/O power supply. | 6.94 W | - |
| Subtotal | | 12.03 W | 193.11 W |
| Total power requirements | | 205.14 W | |

The external 24 VDC power supply must provide 205.14 W.

4.15.4.3 Compact-S CPU with 2 interface modules

Calculating the power requirements for the bus and I/O power supply of a Compact-S CPU with 2 interface modules is shown in the first part of this example. Dimensioning the external 24 VDC power supply is explained in the second part.

Power supplied by the power supply module

| Module | Power supplied to the bus | Power supplied to the I/O power supply |
|-----------|---------------------------|--|
| X20PS9600 | +7 W | +240 W |

Power requirements of the Compact-S CPU

| Module | Bus power supply requirements | I/O power supply requirements |
|---------------------------------|-------------------------------|-------------------------------|
| X20PS9600 | - | -0.6 W |
| X20BB72 | -1.17 W | - |
| X20CP0410 | -2.2 W | - |
| 2x USB interface | -2 W ¹⁾ | - |
| X20IF1043-1 | -1.1 W | - |
| X20IF1063-1 | -1.8 W | - |
| Total power requirements | -8.27 W | -0.6 W |

1) $2 \times 5 \text{ V} \times 0.2 \text{ A} = 2 \text{ W}$

Power balance for the bus supply

The power requirements of the Compact-S CPU are completely covered by the bus power supply. In a power balance, it must be checked whether the power supply module covers the power requirements of the Compact-S CPU.

| | Bus power supply |
|---|------------------|
| Power supplied by the power supply module | +7 W |
| Total power requirements | -8.27 W |
| Remaining power | -1.27 W |

The power comparison indicates that the power provided by the power supply module is insufficient. An additional X20PS3300 power supply module is required (see "[Hardware configuration](#)" on page 99).

External 24 VDC power supply

For dimensioning the external 24 VDC power supply, the following power values are included in the calculation:

| Power | Description | Bus power supply | I/O power supply |
|--|---|------------------|------------------|
| Power consumption of the bus and I/O modules | Examples for calculating the power requirements: See " Calculating the power requirements " on page 81. The following values are assumed for this example: <ul style="list-style-type: none"> Bus power supply: 3.67 W I/O power supply: 192.51 W | 3.67 W | 192.51 W |
| Power consumption of the X20PS9600 | For the values, see the technical data in the data sheet: General information - Power consumption of the X2X Link power supply | 1.42 W | 0.6 W |
| Power requirements of the Compact-S CPU | The values calculated in section " Power requirements of the Compact-S CPU " on page 98 are used for the bus and I/O power supply. | 8.27 W | - |
| Subtotal | | 13.36 W | 193.11 W |
| Total power requirements | | 206.47 W | |

The external 24 VDC power supply must provide 206.47 W.

Hardware configuration

To provide sufficient power for the bus power supply, X20PS3300 power supply modules can be connected in parallel via bus module X20BM11. It is important to note that in order to determine the necessary bus power supply in parallel operation, 75% of the nominal power of the power supply modules must be calculated.

Example for calculating the bus power for 1 X20PS9600 and 1 X20PS3300:

$$\text{Bus power} = 2 \times 7 \text{ W} \times 0.75 = 10.5 \text{ W}$$

Connection example for power supply modules

X20PS9600

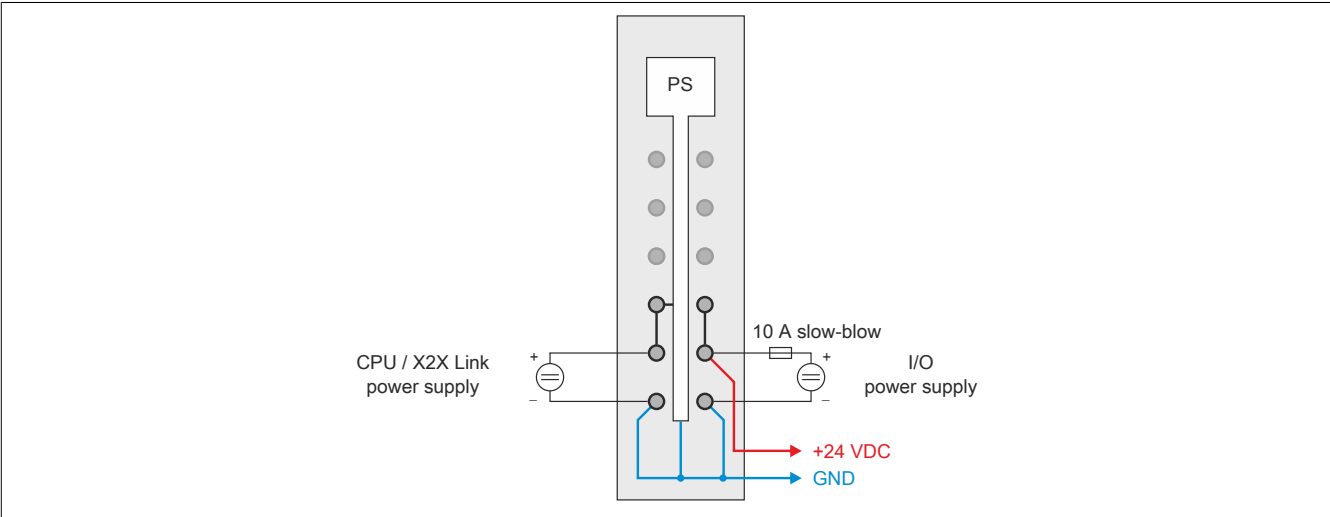

Figure 40: The X20PS9600 is connected as usual.

X20PS3300

Power supply module X20PS3300 is operated with bus module X20BM11. Only the CPU / X2X Link power supply is connected. By using bus module X20BM11, the I/O power supply of power supply module X20PS9600 is connected through to the I/O modules.

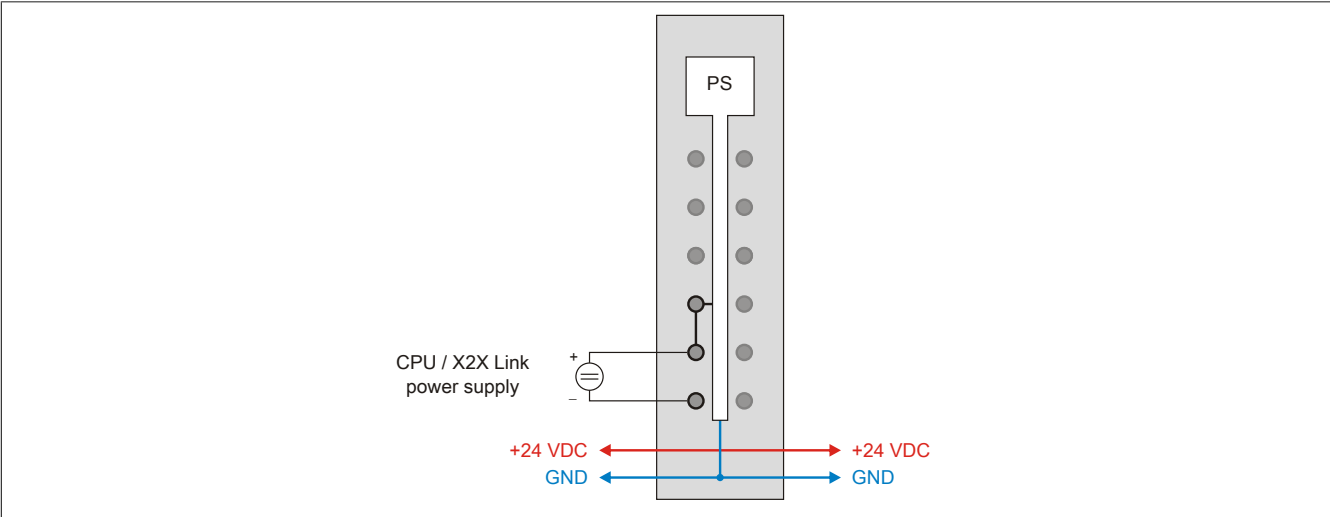

Figure 41: Only the CPU / X2X Link power supply is connected for the X20PS3300.

4.15.5 SafeLOGIC controller X20SL81xx

4.15.5.1 SafeLOGIC controller X20SL8100

For dimensioning the external 24 VDC power supply, only the power consumption of the SafeLOGIC controller must be taken into account.

| Power | Description | Requirements |
|--------------------------------|---|--------------|
| Power consumption of X20SL8100 | For the value, see the technical data in the data sheet: General information - Power consumption | 4.3 W |

The external 24 VDC power supply must provide 4.3 W.

4.15.5.2 SafeLOGIC controller X20SL8110

Calculation example with interface module X20IF10E3-1

For dimensioning the external 24 VDC power supply, the following power values are included in the calculation:

| Power | Description | Requirements |
|---|---|--------------|
| Power consumption of X20SL8110 | For the value, see the technical data in the data sheet: General information - Power consumption | 3.9 W |
| Power consumption of the X20IF10E3-1 | For the value, see the technical data in the data sheet: General information - Power consumption | 2 W |
| Power consumption of the X20SL8110 for the interface module | The CPU consumes 0.6 W for the operation of the interface module. | 0.6 W |
| Total power requirements | | 6.5 W |

The external 24 VDC power supply must provide 6.5 W.

4.15.5.3 SafeLOGIC controller X20SL8101

For dimensioning the external 24 VDC power supply, the following power values are included in the calculation:

| Power | Description | Bus power supply | I/O power supply |
|--|--|------------------|------------------|
| Power consumption of the bus and I/O modules | Example for calculating the power requirements: See " Example: CPU and modules " on page 82 | 2.13 W | 78.73 W |
| Power consumption of X20SL8101 | For the value, see the technical data in the data sheet: General information - Power consumption | 5.3 W | - |
| Power consumption for generating the X2X Link power supply | For the value, see the technical data in the data sheet: General information - Power consumption of the X2X Link power supply | 1.42 W | - |
| Subtotal | | 8.85 W | 78.73 W |
| Total power requirements | | 87.58 W | |

The external 24 VDC power supply must provide 87.58 W.

4.16 Power dissipation calculation of I/O modules

Some modules require that neighboring modules are not permitted to exceed a certain power dissipation during operation.

4.16.1 Example: Operation of module X20SM1436

The power dissipation of the immediate neighboring modules of the SM module is not permitted to exceed 1 W. A maximum power dissipation of 1.8 W is permitted for the next modules.

| | | | | | | |
|--|--|--|---|--|--|--|
| | X20 module Power dissipation ≤ 1.8 W | Neighboring module Power dissipation ≤ 1 W | SM1436 Operation with current derating (3.0 A) | Neighboring module Power dissipation ≤ 1 W | X20 module Power dissipation ≤ 1.8 W | |
|--|--|--|---|--|--|--|

4.16.2 Calculation of the power dissipation of I/O modules adjacent to the X20SM1436

The power dissipation of I/O modules consists of the following power values:

- Power consumption - Bus module
- Power consumption - Bus
- Power consumption - I/O-internal
- Power consumption - I/O-external
- Additional power dissipation caused by actuators (resistive)

Immediate neighboring modules

The table describes the calculation of the power dissipation of I/O modules that can be operated directly next to the SM module. The power dissipation of these modules is not permitted to exceed 1 W.

| Power value | X20AI2622 | X20AT2402 | X20DI2653 | X20DO4322 |
|--|-----------|-----------|-----------|-----------|
| Power consumption - Bus module [W] | 0.13 | 0.13 | 0.13 | 0.13 |
| Power consumption - Bus [W] | 0.01 | 0.01 | 0.14 | 0.16 |
| Power consumption - I/O-internal [W] | 0.8 | 0.72 | - | 0.49 |
| Power consumption - I/O-external [W] | - | - | 0.55 | - |
| Additional power dissipation caused by actuators (resistive) [W] | - | - | - | 0.21 |
| Power dissipation of the I/O module [W] | 0.94 | 0.86 | 0.82 | 0.99 |

All modules have a power dissipation ≤ 1 W and can therefore be operated directly next to module X20SM1436.

Modules in the 2nd row

The table describes the calculation of the power dissipation of I/O modules that can be operated in the 2nd row next to the SM module. The power dissipation of these modules is not permitted to exceed 1.8 W.

| Power value | X20AI4632 | X20AT4222 | X20DI8371 | X20DO6322 |
|--|-----------|-----------|-----------|-----------|
| Power consumption - Bus module [W] | 0.13 | 0.13 | 0.13 | 0.13 |
| Power consumption - Bus [W] | 0.01 | 0.01 | 0.18 | 0.18 |
| Power consumption - I/O-internal [W] | 1.5 | 1.1 | - | 0.71 |
| Power consumption - I/O-external [W] | - | - | 1.2 | - |
| Additional power dissipation caused by actuators (resistive) [W] | - | - | - | 0.31 |
| Power dissipation of the I/O module [W] | 1.64 | 1.24 | 1.51 | 1.33 |

All modules have a power dissipation ≤ 1.8 W and can therefore be operated in the 2nd row next to module X20SM1436.

5 Mechanical handling

5.1 Solid mechanics

With all the advantages that the three-part modularity of the X20 system offers, one emphasis has always been solid mechanical design.

Its robust design, long guides and strengthened housing guarantee the stability it needs in industrial environments. These features allow the X20 system to be mounted on a top-hat rail with the same ease as a rack system. They also make it just as simple to remove it from the rail.

The following sections describe the mechanical handling of the X20 system step-by-step with the aid of pictures.

5.2 Number of connection cycles

The modules of the X20 system are divided into three parts. A module is made up of three basic elements:

- Bus module
- Electronic module
- Terminal block

The number of connection cycles between the respective basic elements is specified at 50.

| Basic element | Number of connection cycles |
|------------------------------------|-----------------------------|
| Bus module ↔ Bus module | 50 |
| Bus module ↔ Electronic module | |
| Electronic module ↔ Terminal block | |

Table 5: Number of connection cycles between the respective basic elements

5.3 Assembling an X20 system

There are several ways to assemble an X20 system. Two methods are described below:

| Assembling an X20 system | Description |
|--------------------------|--|
| Variant 1 | The X20 system is completely assembled and then installed on the top-hat rail. |
| Variant 2 | The X20 system is installed and assembled directly on the top-hat rail. |

Table 6: Two of the several methods for assembling an X20 system

Information:

- Store X20 modules in the protective packaging until immediately before assembly.
- Only touch X20 modules on the housing.
- Take necessary protective measures against electrostatic discharge (see also [Protection against electrostatic discharges](#)).

5.3.1 Variant 1

The X20 system is completely assembled and then installed on the top-hat rail.

1. Remove X20 modules from protective packaging. Check modules for obvious mechanical damages.
2. Insert electronic module in the guides on the bus module.

3. Push the electronic module and the bus module flush together.

4. Hang the bottom edge of the terminal block in its place on the bus module.

5. Rotate the terminal block up into place.

6. The terminal block latch must close with an audible click. If the latch does not catch, the lever must be pushed up.

7. Individual X20 modules should be assembled from left to right (viewed from front) to form the complete X20 system. To do this, connect the right module from behind to the guides for the left bus module.

8. Slide the right module forward until the two modules fit flush together.
 9. Proceed like this until the second to last module.
 10. For the last module, only insert the bus module in the guides of the left bus module.
 11. Slide the right bus module forward until the two bus modules fit flush together.

12. Insert the right locking plate into the guides on the bus module from the front and push it all the way in.

13. Insert the electronic module into the bus module and push firmly so that the two modules fit flush together.

14. Hang the bottom of the terminal block in its place on the bus module and push it up into place. The terminal block latch must close with an audible click.

15. Lay the left locking plate on the left module and insert it in the guides. Finally, slide the locking plate forward.

16. The procedure for hanging the X20 system on the top-hat rail is described in section ["Installing the X20 system on the top-hat rail"](#) on page 110.

5.3.2 Variant 2

The X20 system is installed and assembled directly on the top-hat rail.

1. Remove X20 modules from protective packaging. Check modules for obvious mechanical damages.
2. Push the locking lever all the way up on all of the bus modules. This opens the locking mechanism for top-hat rail installation.

3. Hang the first bus module in the desired position on the top-hat rail and close the locking mechanism by pushing the lever down.
4. Insert the next bus module in the guides of the previously mounted bus module.

5. Slide the bus module in against the top-hat rail and secure it by pushing down the locking lever.
6. Proceed like this with the rest of the bus modules.
7. Insert the corresponding electronic module in the guides on the leftmost bus module.

8. Push the electronic module and the bus module flush together.

9. Proceed like this until the second to last electronic module.

10. Insert the right locking plate into the guides from the front and push it in all the way.

11. Insert the electronic module into the bus module and push firmly so that the two modules fit flush together.

12. Hang the terminal block in its place on the leftmost bus module.

13. Rotate the terminal block up into place.

14. The terminal block latch must close with an audible click. If the latch does not catch, the lever must be pushed up.

15. Proceed like this with the rest of the terminal blocks.

16. Lay the left locking plate on the left module and insert it in the guides. Finally, slide the locking plate forward.

5.4 Installing the X20 system on the top-hat rail

Complete the following steps to install an assembled X20 system on the top-hat rail.

1. Push the locking lever all the way up on all of the bus modules. This opens the locking mechanism for top-hat rail installation.

2. Hang the X20 system in the desired position on the top-hat rail and close the locking mechanism by pushing the lever down.

5.5 Removing the X20 system from the top-hat rail

5.5.1 Remove the entire system from the top-hat rail

1. Push the locking lever all the way up on all of the bus modules. This opens the locking mechanism for top-hat rail installation.

2. Remove the X20 system from the top-hat rail.

5.5.2 Removing a block of modules from the top-hat rail

1. Push the locking lever all the way up on all of the modules that you wish to remove from the top-hat rail. This opens the locking mechanism for top-hat rail installation.

2. The terminal block must be removed from the module to the left of the module block that is to be removed. To do this, push down on the locking lever on the terminal block ① and rotate the terminal block out and down ②.

3. Remove the module block from the top-hat rail.

4. Put the removed terminal block back on the module. To do this, hang the bottom in place in the bus module.

5. Rotate the terminal block up into place.

6. The terminal block latch must close with an audible click. If the latch does not catch, the lever must be pushed up.

5.6 Expanding an X20 system

If you want to expand an existing X20 system to the right, the right locking plate must be removed.

1. Remove the terminal block from the rightmost module. To do this, push down on the locking lever on the terminal block ① and rotate the terminal block out and down ②.

2. Push down on the electronic module's locking lever ① and remove the electronic module ②.

3. Use a screwdriver to lift the locking lever of the right locking plate and pull the locking plate off of the bus module.

4. Additional modules can now also be installed as described in assembly method 2 (see ["Variant 2" on page 107](#)).

5.7 Installing accessories

5.7.1 Additional locking mechanisms

Some specific areas require additional locking mechanisms to prevent accidental release of the mechanical components.

5.7.1.1 Accessory locking clips

The accessory locking clip attaches the electronic module to the bus module. The locking clip is inserted in the appropriate opening on the module and pushed down.

5.7.1.2 Terminal locking clip

The terminal locking clip attaches the terminal block securely to the electronic module.

1. Set the terminal locking clip on the terminal block locking lever as shown.

2. Push down and hold the terminal locking clip and the locking lever with your index finger ①. Finally, slide the terminal locking clip forward with your thumb ②.

3. Hang the bottom edge of the terminal block in its place on the bus module.

4. Rotate the terminal block up into place.

5. Secure the terminal block in the electronic module by pushing in the terminal locking clip.

6. Installed terminal locking clip.

7. To remove the terminal block, pull the terminal locking clip out again.

5.7.2 Plain text tag for X20 modules

Tags are available for X20 modules into which plain text slide-in labels can be inserted. The tags are attached to the terminal locking clips.

1. Hold the plain text tag at a 90° angle to the terminal locking clip.
2. Push the plain text tag into the terminal locking clip's slot until it clicks into place.

5.7.3 Plain text tag for X20 CPUs

Tags are available for X20 CPUs into which plain text slide-in labels can be inserted. The tags are placed on the housing of the CPU.

Installation

1. Place the plain text tag on the housing so that the outer clips rest on raised edges.

2. Press the plain text tag down until the clips latch into place.

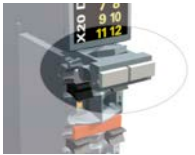

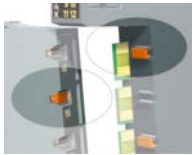

Removal

1. Pinch the clips together ① to release them while lifting the tag off of the housing ②.

5.8 Label tags

Label tags can serve the following purposes:

| | | | |
|---|----------------------------------|---|------------------------|
|  | Labeling the terminal connection |  | Labeling the module |
|  | Labeling the terminal blocks |  | Labeling the terminals |

The labeling tool is needed to attach the label tags.

5.8.1 Labeling the terminal connection

This section explains how to label the terminal connection. The terminal connection, terminal blocks and modules are labeled in a similar manner.

1. Grip the desired label tags with the double-width cutters of the labeling tool.

2. Press with the labeling tool to separate the label tags.

3. Center the label tags over the slot on the terminal block.

4. Hold the labeling tool at approximately an 80° angle to the terminal block.

5. Press with the labeling tool to insert the feet of the label tags into the slot.

6. Inserted label tag.

5.8.2 Terminal keying

To prevent errors, X20 terminal blocks can be keyed. This prevents terminal blocks from being connected to an unrelated electronics module.

Information:

Terminal keying is not possible for double-width modules (e.g. X20CM4810)!

1. Remove a label tag with the single blade of the labeling tool (see "[Labeling the terminal connection](#)" on page 119).
2. Center the label tag over the slot on the electronic module.

3. Hold the labeling tool at a 90° angle to the electronic module and press to insert the label's feet into the slot.
4. Remove a label tag with the single-width cutter of the labeling tool.
5. Set the label tag in the slot on the back of the terminal block as shown.

6. Use the labeling tool to push the left feet of the label into the slot.

7. With the labeling tool, press the right feet of the label into the slot.

8. Inserted label for terminal coding.

5.9 Labeling options for the X20 system

The following components can be individually labeled for the X20 system:

- X20 modules
- X20 CPUs
- Terminal connections

5.9.1 Labeling X20 modules

The following components are required for labeling X20 modules:

- Tag holder
- Plain text tag for X20 modules
- Slide-in labels

Tag holder

The plain text tags are put on the tag holders. The tag holders are also used for terminal locking.

| Order number | Short description | Figure |
|----------------|---|---|
| | Tag holder, terminal locking clip |  |
| X20AC0SC1 | X20 terminal locking clip and tag holder for plain text tag | |
| X20AC0SC1.0100 | X20 terminal locking clip and tag holder for plain text tag, 100 pcs. per package | |

Plain text tags and slide-in labels

Slide-in labels are available for the plain text tags. A template file is available on the B&R website in the "Downloads" tab under the model number for the X20 slide-in labels, X20AC0LB2.0100. This template is in Excel format and allows you to enter the desired texts for the slide-in labels.

| Model number | Short description | Figure |
|----------------|---|---|
| | Plain text cover |  |
| X20AC0SH1 | X20 plain text tag | |
| X20AC0SH1.0100 | X20 plain text tag, 100 pcs. per package | |
| | X20 legend strips | |
| X20AC0LB2.0100 | X20 slide-in labels for X20 plain text tags, paper, white, perforated, 88 strips on A4 sheets, 100 sheets per package | |

Example photo

5.9.2 Labeling X20 CPUs

Plain text tag

The plain text tag is labeled with commercially available adhesive labels. The adhesive labels are not available as accessories.

| Model number | Short description | Figure |
|----------------|-------------------------|--------|
| | X20 CPU Label | |
| X20AC0SH2.0010 | X20 CPU labels, 10 pcs. | |

Example photo

5.9.3 Labeling terminal connections

The following components are required for labeling terminal connections:

- Terminal label
- Labeling tool

Terminal label

Each terminal connection is identified clearly directly on the terminal. Label tags can also be installed to label terminals individually.

The labeling tool is needed for the installation.

Example photo

Printing terminal labels

Assembly order

B&R offers the assembly of the X20 system as a service. Based on an assembly order, the X20 system is completely assembled at B&R and shipped to the customer. If requested by the customer, the labels are printed and the terminal connections are marked accordingly.

Print by yourself

You can also print the labels by yourself. The "PrintJet PRO" printer from Weidmüller can be used for this purpose.

6 Module overviews

6.1 Standard modules

6.1.1 Module overview: Alphabetically

| Order number | Short description | Page |

| X20AI4632-1 | X20 analog input module, 4 inputs, ± 11 V or 0 to 22 mA, 16-bit converter resolution, configurable input filter, oscilloscope functions | 545 |
| X20AI4636 | X20 analog input module, 4 inputs, ± 10 V or 0 to 20 mA, 16-bit converter resolution, configurable input filter, oversampling functions | 570 |
| X20AI8221 | X20 analog input module, 8 inputs, ± 10 V, 13-bit converter resolution | 602 |
| X20AI8321 | X20 analog input module, 8 inputs, 0 to 20 mA, 12-bit converter resolution | 612 |
| X20AIA744 | X20 analog input module, 2 full-bridge strain inputs, 24-bit converter resolution, 2.5 kHz input filter | 622 |
| X20AIB744 | X20 analog input module, 4 full-bridge strain inputs, 24-bit converter resolution, 2.5 kHz input filter | 641 |
| X20AO2437 | X20 analog output module, 2 outputs, 4 to 20 mA / 0 to 20 mA or 0 to 24 mA, 16-bit converter resolution, single channel electrically isolated | 735 |
| X20AO2438 | X20 analog output module, 2 outputs, 4 to 20 mA / 0 to 20 mA or 0 to 24 mA, 16-bit converter resolution, single-channel isolation, supports the HART protocol, NetTime function | 748 |
| X20AO2622 | X20 analog output module, 2 outputs, 10 V or 0 to 20 mA / 4 to 20 mA, 13-bit converter resolution | 773 |
| X20AO2632 | X20 analog output module, 2 outputs, ± 10 V or 0 to 20 mA, 16-bit converter resolution, NetTime function | 780 |
| X20AO2632-1 | X20 analog output module, 2 outputs, ± 11 V or 0 to 22 mA, 16-bit converter resolution, NetTime function | 788 |
| X20AO4622 | X20 analog output module, 4 outputs, ± 10 V or 0 to 20 mA / 4 to 20 mA, 13-bit converter resolution | 796 |
| X20AO4632 | X20 analog output module, 4 outputs, ± 10 V or 0 to 20 mA, 16-bit converter resolution | 805 |
| X20AO4632-1 | X20 analog output module, 4 outputs, ± 11 V or 0 to 22 mA, 16-bit converter resolution, NetTime function | 815 |
| X20AO4635 | X20 analog output module, 4 outputs, ± 10 V or 0 to 20 mA, 16-bit converter resolution, low temperature drift | 824 |
| X20AP3111 | X20 energy metering module, 3 analog inputs, 480 VAC, 50/60 Hz, 4 analog inputs, 20 mA AC, calculates effective, reactive and apparent power/energy, calculates RMS values, 240 V keyed, NetTime function | 661 |
| X20AP3121 | X20 energy metering module, 3 analog inputs, 480 VAC, 50/60 Hz, 4 analog inputs, 1 A AC, calculates effective, reactive and apparent power/energy, calculates RMS values, 240 V keyed, NetTime function | 661 |
| X20AP3122 | X20 energy metering module, 3 analog inputs, 480 VAC, 50/60 Hz, 4 analog inputs, 1 A AC, groundable, calculates effective, reactive and apparent power/energy, calculates RMS values, 240 V keyed, NetTime function | 661 |
| X20AP3131 | X20 energy metering module, 3 analog inputs, 480 VAC, 50/60 Hz, 4 analog inputs, 5 A AC, calculates effective, reactive and apparent power/energy, calculates RMS values, 240 V keyed, NetTime function | 661 |
| X20AP3132 | X20 energy metering module, 3 analog inputs, 480 VAC, 50/60 Hz, 4 analog inputs, 5 A AC, groundable, calculates effective, reactive and apparent power/energy, calculates RMS values, 240 V keyed, NetTime function | 661 |
| X20AP3161 | X20 energy metering module, 3 analog inputs, 480 VAC, 50/60 Hz, 4 analog inputs, 333 mV AC, calculates effective, reactive and apparent power/energy, calculates RMS values, 240 V keyed, NetTime function | 661 |
| X20AP3171 | X20 energy metering module, 3 analog inputs, 480 VAC, 50/60 Hz, 4 analog inputs, Rogowski adjustable ($\mu\text{V/A}$), max. 52 mV, calculates effective, reactive and apparent power/energy, calculates RMS values, 240 V keyed, NetTime function | 661 |
| X20AT2222 | X20 temperature input module, 2 inputs for resistance measurement, PT100, PT1000, resolution 0.1°C, 3-wire connections | 3649 |
| X20AT2311 | X20 temperature input module, 2 resistance measurement inputs, PT100, resolution 0.001°C, 4-wire connections | 3659 |
| X20AT2402 | X20 temperature input module, 2 thermocouple inputs, Type J, K, N, S, B, R, resolution 0.1°C | 3667 |
| X20AT4222 | X20 temperature input module, 4 inputs for resistance measurement, PT100, PT1000, resolution 0.1°C, 3-wire connections | 3679 |
| X20AT4232 | X20 temperature input module, 4 inputs for resistance measurement, NTC 10 k Ω , resolution 0.1°C, 2-wire connections | 3689 |
| X20AT6402 | X20 temperature input module, 6 thermocouple inputs, Type J, K, N, S, B, R, resolution 0.1°C | 3698 |
| X20ATA312 | X20 temperature input module, 2 resistance measurement inputs, PT100, resolution 0.01°C, 4-wire connections, NetTime function | 3710 |

| Order number | Short description | Page |
|--------------|---|------|
| X20ATA492 | X20 temperature input module, 2 thermocouple inputs, type J, K, N, S, B, R, E, C, T, single-channel isolation, NetTime function, 2x PT1000 integrated in terminal block X20TB1E for temperature compensation, order terminal block separately. | 3723 |
| X20ATB312 | X20 temperature input module, 4 resistance measurement inputs, PT100, resolution 0.01°C, 4-wire connections, NetTime function | 3742 |
| X20ATC402 | X20 temperature input module, 6 thermocouple inputs, type J, K, N, S, B, R, E, C, T, NetTime function, 2x PT1000 integrated in terminal block X20TB1E for temperature compensation, order terminal block separately. | 3755 |
| X20BB22 | X20 compact CPU base, for compact CPU and compact CPU power supply module, base for integrated RS232 interface, X20 connection, X20 locking plates (left and right) X20AC0SL1/X20AC0SR1 included | 1001 |
| X20BB27 | X20 compact CPU base, for compact CPU and compact CPU power supply module, base for integrated RS232 and CAN bus interface, X20 connection, X20 locking plates (left and right) X20AC0SL1/X20AC0SR1 included | 1003 |
| X20BB32 | X20 Fieldbus CPU base, for Fieldbus CPU and Compact CPU power supply module, base for integrated RS232 interface, slot for X20 interface module, X20 connection, X20 end cover plates (left and right) X20AC0SL1/X20AC0SR1 included | 2253 |
| X20BB37 | X20 Fieldbus CPU base, for Fieldbus CPU and Compact CPU power supply module, base for integrated RS232 and CAN bus interface, slot for X20 interface module, X20 connection, X20 end cover plates (left and right) X20AC0SL1/X20AC0SR1 included | 2255 |
| X20BB42 | X20 fieldbus CPU base, for fieldbus CPU and compact CPU power supply module, base for integrated RS232 interface, 2 slots for X20 interface modules, X20 connection, X20 locking plates (left and right) X20AC0SL1/X20AC0SR1 included | 2258 |
| X20BB47 | X20 fieldbus CPU base, for fieldbus CPU and compact CPU power supply module, base for integrated RS232 and CAN bus interface, 2 slots for X20 interface modules, X20 connection, X20 locking plates (left and right) X20AC0SL1/X20AC0SR1 included | 2260 |
| X20BB52 | X20 Compact-S bus base, for Compact-S CPU and Compact-S CPU power supply module, base for integrated RS232 interface, X20 connection, X20 end cover plates (left and right) X20AC0SL1/X20AC0SR1 included | 1035 |
| X20BB57 | X20 Compact-S bus base, for Compact-S CPU and Compact-S CPU power supply module, base for integrated RS232 and CAN bus interface, X20 connection, X20 end cover plates (left and right) X20AC0SL1/X20AC0SR1 included | 1037 |
| X20BB62 | X20 Compact-S bus base, for Compact-S CPU and Compact-S CPU power supply module, base for integrated RS232 interface, slots for X20 interface module, X20 connection, X20 end cover plates (left and right) X20AC0SL1/X20AC0SR1 included | 1039 |
| X20BB67 | X20 Compact-S bus base, for Compact-S CPU and Compact-S CPU power supply module, base for integrated RS232 and CAN bus interface, slot for X20 interface module, X20 connection, X20 end cover plates (left and right) X20AC0SL1/X20AC0SR1 included | 1041 |
| X20BB72 | X20 Compact-S bus base, for Compact-S CPU and Compact-S CPU power supply module, base for integrated RS232 interface, 2 slots for X20 interface modules, X20 connection, X20 end cover plates (left and right) X20AC0SL1/X20AC0SR1 included | 1043 |
| X20BB77 | X20 Compact-S bus base, for Compact-S CPU and Compact-S CPU power supply module, base for integrated RS232 and CAN bus interface, 2 slots for X20 interface modules, X20 connection, X20 end cover plates (left and right) X20AC0SL1/X20AC0SR1 included | 1045 |
| X20BB80 | X20 bus base, for X20 base module (BC, HB, etc.) and X20 power supply module, X20 end plates (left and right) X20AC0SL1/X20AC0SR1 included | 922 |
| X20BB81 | X20 bus base, for X20 base module (BC, HB, etc.) and X20 power supply module, with one expansion slot for an X20 add-on module (IF, HB, etc.), X20 locking plates (left and right) X20AC0SL1/X20AC0SR1 included | 2234 |
| X20BB82 | X20 bus base, for X20 base module (BC, HB, etc.) and X20 power supply module, with 2 expansion slots for 2 X20 add-on modules (IF, HB, etc.), X20 locking plates (left and right) X20AC0SL1/X20AC0SR1 included | 2237 |
| X20BC0043-10 | X20 bus controller, 1 CANopen interface, order 1x terminal block TB2105 separately! Order bus base, power supply module and terminal block separately! | 834 |
| X20BC0053 | X20 bus controller, 1 DeviceNet interface, order 1x TB2105 terminal block separately Order bus base, power supply module and terminal block separately | 841 |
| X20BC0063 | X20 bus controller, 1 PROFIBUS DP interface, 9-pin DSUB connection, order bus base, power supply module and terminal block separately | 847 |
| X20BC0073 | X20 bus controller, 1 CAN I/O interface, order 1x TB2105 terminal block separately Order bus base, power supply module and terminal block separately | 851 |
| X20BC0083 | X20 bus controller, 1 POWERLINK interface, integrated 2-port hub, 2x RJ45, order bus base, power supply module and terminal block separately! | 859 |
| X20BC0087 | X20 bus controller, 1 Modbus TCP or Modbus UDP interface, integrated 2-port switch, 2x RJ45, order bus base, power supply module and terminal block separately. | 864 |
| X20BC0087-10 | X20 bus controller, 1 Modbus TCP or Modbus UDP interface, producer mode feature (via UDP), integrated switch, 2x RJ45, order bus base, power supply module and terminal block separately. | 870 |
| X20BC0088 | X20 bus controller, 1 EtherNet/IP interface, integrated switch, web interface, 2x RJ45, order bus base, power supply module and terminal block separately! | 877 |
| X20BC008U | X20 bus controller, 1 OPC UA Ethernet interface, integrated 2-port switch, 2x RJ45, order bus base, power supply module and terminal block separately. | 882 |
| X20BC00E3 | X20 bus controller, 1 PROFINET IO interface, integrated 2-port switch, 2x RJ45, order bus base, power supply module and terminal block separately! | 904 |
| X20BC00G3 | X20 bus controller, 1 EtherCAT interface, 2x RJ45, order bus base, power supply module and terminal block separately. | 910 |
| X20BC0143-10 | X20 bus controller, 1 CANopen interface, 9-pin DSUB, Order 1x connector 7AC911.9 separately! Order bus base, power supply module and terminal block separately! | 914 |
| X20BC1083 | X20 bus controller, 1 POWERLINK interface, integrated 2-port hub, supports X20 interface module expansions, 2 RJ45, order bus base, power supply module and terminal block separately | 2213 |
| X20BC8083 | X20 bus controller, 1 POWERLINK interface, integrated 2-port hub, supports expansion with X20 hub modules, 2 RJ45, order bus base, power supply module and terminal block separately. | 2220 |
| X20BC8084 | X20 bus controller, 1 POWERLINK interface, 1x link selector for POWERLINK cable redundancy, supports expansion with enabled X20 hub modules, 2x RJ45, order bus base, power supply module and terminal block separately! | 2227 |
| X20BM01 | X20 power supply bus module, 24 VDC keyed, internal I/O supply interrupted to the left | 939 |
| X20BM05 | X20 power supply bus module, with node number switch, 24 VDC keyed, internal I/O supply interrupted to the left | 942 |
| X20BM11 | X20 bus module, 24 VDC keyed, internal I/O supply continuous | 945 |
| X20BM12 | X20 bus module, 240 VAC keyed, internal I/O power supply connected through | 948 |
| X20BM15 | X20 bus module, with node number switch, 24 VDC keyed, internal I/O supply continuous | 951 |
| X20BM21 | X20 power supply bus module, for double-width modules, 24 VDC keyed, internal I/O supply interrupted to the left | 954 |
| X20BM31 | X20 bus module for double-width modules, 24 VDC keyed, internal I/O supply continuous | 956 |
| X20BM32 | X20 bus module for double-width modules, 240 VAC keyed, internal I/O supply continuous | 959 |
| X20BR7300 | X20 bus receiver, CAN I/O, supply for X2X Link and internal I/O power supply, X20 end cover plates (left and right) X20AC0SL1/X20AC0SR1 included | 964 |

| Order number | Short description | Page |
|--------------|--|------|
| X20BR9300 | X20 bus receiver, X2X Link, supply for X2X Link and internal I/O power supply, X20 end cover plates (left and right) X20AC0SL1/X20AC0SR1 included | 973 |
| X20BT9100 | X20 bus transmitter, X2X Link, supply for internal I/O supply | 980 |
| X20BT9400 | X20 bus transmitter X2X Link, feed for internal I/O supply, X2X Link supply for X67 modules, reverse polarity protection, short circuit protection, overload protection, parallel connection possible, redundancy operation possible | 986 |
| X20CM0985 | X20 digital and analog mixed module, multi-measurement transducer/ synchronization module, 5 digital outputs, 24 VDC, 0.5 A source, 1 relay, 1 A, changeover contact, 8 analog inputs, ± 480 V / 120 V, 16-bit converter resolution, 3 analog inputs 5 A / 1 A AC, 16-bit converter resolution, order terminal blocks 0TB3102-7011, 0TB3104-7011, 0TB3102-7012, 0TB3104-7012 and 2x TB12 separately. | 2803 |
| X20CM0985-02 | X20 digital and analog mixed module, multi-measurement transducer / synchronization module, 5 digital outputs, 24 VDC, 0.5 A, source, 1 relay, 1 A, 8 analog inputs, ± 480 V / 120 V, 16-bit converter resolution, 3 analog inputs, 5 A / 1 A AC, 16-bit converter resolution, additional software functionalities, adapted to VDE guidelines (2018), order terminal blocks 0TB3102-7011, 0TB3104-7011, 0TB3102-7012, 0TB3104-7012 and 2x X20TB12 separately! | 2846 |
| X20CM0985-1 | X20 digital and analog mixed module, multi-measurement transducer / synchronization module, 5 digital outputs, 24 VDC, 0.5 A, source, 1 relay, 1 A, 8 analog inputs, ± 480 V / 120 V, 16-bit converter resolution, 3 analog inputs, 5 A / 1 A AC, 16-bit converter resolution, additional software functionalities, order terminal blocks 0TB3102-7011, 0TB3104-7011, 0TB3102-7012, 0TB3104-7012 and 2x X20TB12 separately! | 2921 |
| X20CM1201 | X20 combination module, 1 AB incremental encoder, 24 V, 4 digital inputs 24 V, 4 channels 24 V configurable as inputs or outputs, flexible digital controller logic | 1875 |
| X20CM1941 | X20 resolver module, 14-bit resolver input, converter up to 12-bit ABR output | 1063 |
| X20CM4323 | X20 PWM module, 4 digital outputs for switching electromechanical loads, 24 VDC, oversampling output functions, time-triggered output functions, NefTime function | 2992 |
| X20CM4800X | X20 analog input module, vibration measurement, 4 IEPE analog inputs, 50 kHz sampling frequency, 24-bit converter resolution | 3021 |
| X20CM4810 | X20 analog input module, for vibration measurement and analysis of condition monitoring tasks, 4 IEPE analog inputs, 51.5625 kHz sampling frequency, 24-bit converter resolution | 3039 |
| X20CM6209 | X20 diode array module, 1 A, 40 V reverse voltage, no module status data | 3174 |
| X20CM8281 | X20 universal mixed module, 4 digital inputs, 24 VDC, sink, 1-wire connections, 2 digital outputs, 0.5 A, source, 1-wire connections, 1 analog input, ± 10 V or 0 to 20 mA / 4 to 20 mA, 12-bit converter resolution, 1 analog output, ± 10 V / 0 to 20 mA, 12-bit converter resolution, 2 counters as event counters or gate measurement | 3178 |
| X20CM8323 | X20 PWM module, 8 digital outputs for switching electromechanical loads, 0.6 A continuous current, 2 A peak current, current monitoring, switching time detection | 3197 |
| X20CMR010 | X20 cabinet monitoring module, integrated temperature and humidity sensor, production data acquisition, 512 kB flash memory for user data | 3216 |
| X20CMR100 | X20 cabinet monitoring module, integrated temperature and humidity sensor, production data acquisition, integrated Technology Guard | 3230 |
| X20CMR111 | X20 cabinet monitoring module, integrated temperature sensor, moisture sensor and accelerometer, production data acquisition, 2 inputs for external PT1000, 2 digital inputs 24 V, 1 digital output 24 V, 0.5 A, 512 kB flash memory for user data, integrated Technology Guard | 3242 |
| X20CP0201 | X20 compact CPU, μ P 16, 100 kB SRAM, 1 MB FlashPROM, support of RS232, CAN bus according to compact CPU base, order bus base, power supply module and terminal block separately | 994 |
| X20CP0291 | X20 compact CPU, μ P 16, 100 kB SRAM, 1 MB FlashPROM, support of RS232, CAN bus according to compact CPU base, 1 Ethernet interface 100 Base-T, order bus base, power supply module and terminal block separately | 994 |
| X20CP0292 | X20 compact CPU, μ P 25, 100 kB SRAM, 1 MB FlashPROM, support of RS232, CAN bus according to compact CPU base, 3 Ethernet interface 750 Base-T, order bus base, power supply module and terminal block separately | 994 |
| X20CP0410 | X20 Compact-S CPU, ARM Cortex-A9-166 (compatible), 128 MB DDR3 RAM, 8 kB FRAM, 256 MB onboard flash drive, 2 USB interfaces, 1 RS232 interface, 1 Ethernet interface 10/100BASE-T. Order bus base, power supply module and terminal block separately! | 1019 |
| X20CP0411 | X20 Compact-S CPU, ARM Cortex-A9-240, 128 MB DDR3 RAM, 16 kB FRAM, 512 MB onboard flash drive, 2 USB interfaces, 1 RS232 interface, 1 Ethernet interface 10/100BASE-T. Order bus base, power supply module and terminal block separately! | 1019 |
| X20CP0420 | X20 Compact-S CPU, ARM Cortex-A9-166 (compatible), 128 MB DDR3 RAM, 8 kB FRAM, 256 MB onboard flash drive, 2 USB interfaces, 1 RS232 interface, 2 Ethernet interfaces 10/100BASE-T (switch). Order bus base, power supply module and terminal block separately! | 1019 |
| X20CP0482 | X20 Compact-S CPU, ARM Cortex-A9-300, 128 MB DDR3 RAM, 16 kB FRAM, 1 GB onboard flash drive, 2 USB interfaces, 1 RS232 interface, 1 POWERLINK interface, 1 Ethernet interface 10/100BASE-T, can be expanded with X20 interface slot. Order bus base, power supply module and terminal block separately! | 1019 |
| X20CP0483 | X20 Compact-S CPU, ARM Cortex-A9-500, 256 MB DDR3 RAM, 32 kB FRAM, 1 GB onboard flash drive, 2 USB interfaces, 1 RS232 interface, 1 POWERLINK interface, 1 Ethernet interface 10/100BASE-T, can be expanded with X20 interface slot. Order bus base, power supply module and terminal block separately! | 1019 |
| X20CP0484 | X20 Compact-S CPU, ARM Cortex-A9-667, 256 MB DDR3 RAM, 64 kB FRAM, 2 GB onboard flash drive, 2 USB interfaces, 1 RS232 interface, 1 POWERLINK interface, 1 Ethernet interface 10/100BASE-T, can be expanded with X20 interface slot. Order bus base, power supply module and terminal block separately! | 1019 |
| X20CP0484-1 | X20 Compact-S CPU, ARM Cortex-A9-667, 512 MB DDR3 RAM, 64 kB FRAM, 2 GB onboard flash drive, 2 USB interfaces, 1 RS232 interface, 1 POWERLINK interface, 1 Ethernet interface 10/100BASE-T, can be expanded with X20 interface slot. Order bus base, power supply module and terminal block separately! | 1019 |
| X20CP1301 | X20 CPU, with integrated I/O, x86-200, 128 MB DDR3 RAM, 16 kB FRAM, 1 GB onboard flash drive, 1 insert slot for X20 interface modules, 1 USB interface, 1 RS232 interface, 1 Ethernet interface 10/100BASE-T, 14 digital inputs, 24 VDC, sink, 4 digital inputs, 2 μ s, 24 VDC, sink, 4 digital outputs, 24 VDC, 0.5 A, source, 4 digital outputs, 2 μ s, 24 VDC, 0.2 A, 4 digital inputs/outputs, 24 VDC, 0.5 A, 2 analog inputs ± 10 V or 0 to 20 mA / 4 to 20 mA, 1 PT1000 instead of an analog input, includes power supply module, 3x terminal block X20TB1F, slot cover and X20 end cover plate X20AC0SR1 (right) included | 1324 |
| X20CP1381 | X20 CPU, with integrated I/O, x86-200, 128 MB DDR3 RAM, 16 kB FRAM, 1 GB onboard flash drive, 1 insert slot for X20 interface modules, 2 USB interfaces, 1 RS232 interface, 1 CAN bus interface, 1 POWERLINK interface, 1 Ethernet interface 10/100BASE-T, 14 digital inputs, 24 VDC, sink, 4 digital inputs, 2 μ s, 24 VDC, sink, 4 digital outputs, 24 VDC, 0.5 A, source, 4 digital outputs, 2 μ s, 24 VDC, 0.2 A, 4 digital inputs/outputs, 24 VDC, 0.5 A, 2 analog inputs ± 10 V or 0 to 20 mA / 4 to 20 mA, 1 PT1000 instead of an analog input, includes power supply module, 3x terminal block X20TB1F, slot cover and X20 end cover plate X20AC0SR1 (right) included | 1324 |
| X20CP1381-RT | X20 CPU, with integrated I/O, x86-200, 128 MB DDR3 RAM, 16 kB FRAM, 1 GB onboard flash drive, 1 insert slot for X20 interface modules, 2 USB interfaces, 1 RS232 interface, 1 CAN bus interface, 1 POWERLINK interface, 1 Ethernet interface 10/100BASE-T, reACTION Technology, 14 digital inputs, 24 VDC, sink, 4 digital inputs, 2 μ s, 24 VDC, sink, 4 digital outputs, 24 VDC, 0.5 A, source, 4 digital outputs, 2 μ s, 24 VDC, 0.2 A, 4 digital inputs/outputs, 24 VDC, 0.5 A, 2 analog inputs ± 10 V or 0 to 20 mA / 4 to 20 mA, 1 PT1000 instead of an analog input, includes power supply module, 3x terminal block X20TB1F, slot cover and X20 end cover plate X20AC0SR1 (right) included | 3382 |

Module overviews

| Order number | Short description | Page |
|--------------|---|------|
| X20CP1382 | X20 CPU, with integrated I/O, x86-400, 256 MB DDR3 RAM, 32 kB FRAM, 2 GB onboard flash drive, 1 insert slot for X20 interface modules, 2 USB interfaces, 1 RS232 interface, 1 CAN bus interface, 1 POWERLINK interface, 1 Ethernet interface 10/100BASE-T, 14 digital inputs, 24 VDC, sink, 4 digital outputs, 24 VDC, 0.5 A, source, 4 digital outputs, 2 μ s, 24 VDC, 0.2 A, 4 digital inputs/outputs, 24 VDC, 0.5 A, 2 analog inputs \pm 10 V or 0 to 20 mA / 4 to 20 mA, 1 PT1000 instead of an analog input, includes power supply module, 3x terminal block X20TB1F, slot cover and X20 end cover plate X20AC0SR1 (right) included | 1324 |
| X20CP1382-RT | X20 CPU, with integrated I/O, x86-400, 256 MB DDR3 RAM, 32 kB FRAM, 2 GB onboard flash drive, 1 insert slot for X20 interface modules, 2 USB interfaces, 1 RS232 interface, 1 CAN bus interface, 1 POWERLINK interface, 1 Ethernet interface 10/100BASE-T, reACTION Technology, 14 digital inputs, 24 VDC, sink, 4 digital outputs, 2 μ s, 24 VDC, sink, 4 digital outputs, 24 VDC, 0.5 A, source, 4 digital outputs, 2 μ s, 24 VDC, 0.2 A, 4 digital inputs/outputs, 24 VDC, 0.5 A, 2 analog inputs \pm 10 V or 0 to 20 mA / 4 to 20 mA, 1 PT1000 instead of an analog input, includes power supply module, 3x terminal block X20TB1F, slot cover and X20 end cover plate X20AC0SR1 (right) included | 3382 |
| X20CP1483 | X20 CPU, x86 100 MHz Intel compatible, 32 MB DRAM, 128 kB SRAM, removable application memory: CompactFlash, 1 insert slot for X20 interface modules, 2 USB interfaces, 1 RS232 interface, 1 Ethernet interface 10/100BASE-T, 1 POWERLINK interface, including power supply module, 1x terminal block X20TB12, slot cover and X20 end cover plate X20AC0SR1 (right) included, order application memory separately! | 1380 |
| X20CP1483-1 | X20 CPU, x86 100 MHz Intel compatible, 64 MB DRAM, 128 kB SRAM, removable application memory: CompactFlash, 1 insert slot for X20 interface modules, 2 USB interfaces, 1 RS232 interface, 1 Ethernet interface 10/100BASE-T, 1 POWERLINK interface, including power supply module, 1x terminal block X20TB12, slot cover and X20 end cover plate X20AC0SR1 (right) included, order application memory separately! | 1380 |
| X20CP1583 | X20 CPU, Atom 333 MHz Intel compatible, 128 MB DDR2 RAM, 1 MB SRAM, removable application memory: CompactFlash, 1 insert slot for X20 interface modules, 2 USB interfaces, 1 RS232 interface, 1 Ethernet interface 10/100/1000BASE-T, 1 POWERLINK interface, including power supply module, 1x terminal block X20TB12, slot cover and X20 end cover plate X20AC0SR1 (right) included, order application memory separately! | 1397 |
| X20CP1584 | X20 CPU, Atom 0.6 GHz, 256 MB DDR2 RAM, 1 MB SRAM, removable application memory: CompactFlash, 1 insert slot for X20 interface modules, 2 USB interfaces, 1 RS232 interface, 1 Ethernet interface 10/100/1000BASE-T, 1 POWERLINK interface, including power supply module, 1x terminal block X20TB12, slot cover and X20 end cover plate X20AC0SR1 (right) included, order application memory separately! | 1397 |
| X20CP1585 | X20 CPU, Atom 1.0 GHz, 256 MB DDR2 RAM, 1 MB SRAM, removable application memory: CompactFlash, 1 insert slot for X20 interface modules, 2 USB interfaces, 1 RS232 interface, 1 Ethernet interface 10/100/1000BASE-T, 1 POWERLINK interface, including power supply module, 1x terminal block X20TB12, slot cover and X20 end cover plate X20AC0SR1 (right) included, order application memory separately! | 1397 |
| X20CP1586 | X20 CPU, Atom 1.6 GHz, 512 MB DDR2 RAM, 1 MB SRAM, removable application memory: CompactFlash, 1 insert slot for X20 interface modules, 2 USB interfaces, 1 RS232 interface, 1 Ethernet interface 10/100/1000BASE-T, 1 POWERLINK interface, including power supply module, 1x terminal block X20TB12, slot cover and X20 end cover plate X20AC0SR1 (right) included, order application memory separately! | 1397 |
| X20CP1684 | X20 CPU, Atom 0.4 GHz (compatible), 512 MB DDR4 RAM, 1 MB SRAM, 1 GB onboard flash drive, removable application memory: CompactFlash, 1 insert slot for X20 interface modules, 2 USB interfaces, 1 RS232 interface, 1 Ethernet interface (TSN) 10/100/1000BASE-T, 1 POWERLINK interface module, including supply module. 1x terminal block X20TB12, slot cover and X20 end cover plate X20AC0SR1 (right) included. Order CompactFlash separately! | 1418 |
| X20CP1685 | X20 CPU, Atom 0.8 GHz, 512 MB DDR4 RAM, 1 MB SRAM, 1 GB onboard flash drive, removable application memory: CompactFlash, 1 insert slot for X20 interface modules, 2 USB interfaces, 1 RS232 interface, 1 Ethernet interface (TSN) 10/100/1000BASE-T, 1 POWERLINK interface module, including supply module. 1x terminal block X20TB12, slot cover and X20 end cover plate X20AC0SR1 (right) included. Order CompactFlash separately! | 1418 |
| X20CP1686X | X20 CPU, Atom 1.3 GHz, 1 GB DDR4 RAM, 1 MB SRAM, 2 GB onboard flash drive, removable application memory: CompactFlash, 1 insert slot for X20 interface modules, 2 USB interfaces, 1 RS232 interface, 1 Ethernet interface (TSN) 10/100/1000BASE-T, 1 POWERLINK interface module, including supply module. 1x terminal block X20TB12, slot cover and X20 end cover plate X20AC0SR1 (right) included. Order CompactFlash separately! | 1418 |
| X20CP3583 | X20 CPU, Atom 333 MHz Intel compatible, 128 MB DDR2 RAM, 1 MB SRAM, removable application memory: CompactFlash, 3 insert slots for X20 interface modules, 2 USB interfaces, 1 RS232 interface, 1 Ethernet interface 10/100/1000BASE-T, 1 POWERLINK interface, including power supply module, 1x terminal block X20TB12, slot covers and X20 end cover plate X20AC0SR1 (right) included, order application memory separately! | 1401 |
| X20CP3584 | X20 CPU, Atom 0.6 GHz, 256 MB DDR2 RAM, 1 MB SRAM, removable application memory: CompactFlash, 3 insert slots for X20 interface modules, 2 USB interfaces, 1 RS232 interface, 1 Ethernet interface 10/100/1000BASE-T, 1 POWERLINK interface, including power supply module, 1x terminal block X20TB12, slot covers and X20 end cover plate X20AC0SR1 (right) included, order application memory separately! | 1401 |
| X20CP3585 | X20 CPU, Atom 1.0 GHz, 256 MB DDR2 RAM, 1 MB SRAM, removable application memory: CompactFlash, 3 insert slots for X20 interface modules, 2 USB interfaces, 1 RS232 interface, 1 Ethernet interface 10/100/1000BASE-T, 1 POWERLINK interface, including power supply module, 1x terminal block X20TB12, slot covers and X20 end cover plate X20AC0SR1 (right) included, order application memory separately! | 1401 |
| X20CP3586 | X20 CPU, Atom 1.6 GHz, 512 MB DDR2 RAM, 1 MB SRAM, removable application memory: CompactFlash, 3 insert slots for X20 interface modules, 2 USB interfaces, 1 RS232 interface, 1 Ethernet interface 10/100/1000BASE-T, 1 POWERLINK interface, including power supply module, 1x terminal block X20TB12, slot covers and X20 end cover plate X20AC0SR1 (right) included, order application memory separately! | 1401 |
| X20CP3684 | X20 CPU, Atom 0.4 GHz (compatible), 512 MB DDR4 RAM, 1 MB SRAM, 1 GB onboard flash drive, removable application memory: CompactFlash, 3 insert slots for X20 interface modules, 2 USB interfaces, 1 RS232 interface, 1 Ethernet interface (TSN) 10/100/1000BASE-T, 1 POWERLINK interface module, including supply module. 1x terminal block X20TB12, slot covers and X20 end cover plate X20AC0SR1 (right) included. Order CompactFlash separately! | 1422 |
| X20CP3685 | X20 CPU, Atom 0.8 GHz, 512 MB DDR4 RAM, 1 MB SRAM, 1 GB onboard flash drive, removable application memory: CompactFlash, 3 insert slots for X20 interface modules, 2 USB interfaces, 1 RS232 interface, 1 Ethernet interface (TSN) 10/100/1000BASE-T, 1 POWERLINK interface module, including supply module. 1x terminal block X20TB12, slot covers and X20 end cover plate X20AC0SR1 (right) included. Order CompactFlash separately! | 1422 |
| X20CP3686X | X20 CPU, Atom 1.3 GHz, 1 GB DDR4 RAM, 1 MB SRAM, 2 GB onboard flash drive, removable application memory: CompactFlash, 3 insert slots for X20 interface modules, 2 USB interfaces, 1 RS232 interface, 1 Ethernet interface (TSN) 10/100/1000BASE-T, 1 POWERLINK interface module, including supply module. 1x terminal block X20TB12, slot covers and X20 end cover plate X20AC0SR1 (right) included. Order CompactFlash separately! | 1422 |
| X20CP3687X | X20 CPU, Atom 1.6 GHz, 2 GB DDR4 RAM, 1 MB SRAM, 2 GB onboard flash drive, removable application memory: CompactFlash, 3 insert slots for X20 interface modules, 2 USB interfaces, 1 RS232 interface, 1 Ethernet interface (TSN) 10/100/1000BASE-T, 1 POWERLINK interface module, including supply module. 1x terminal block X20TB12, slot covers and X20 end cover plate X20AC0SR1 (right) included. Order CompactFlash separately! | 1422 |
| X20CS1011 | X20 interface module, 1 Moeller SmartWire interface | 2101 |
| X20CS1012 | X20 interface module, 1 M-Bus master interface, integrated slave supply | 2116 |
| X20CS1013 | X20 interface module, 1 DALI master interface | 2136 |
| X20CS1020 | X20 interface module, 1 RS232 interface, max. 115.2 kbit/s | 2147 |

| Order number | Short description | Page |
|--------------|---|------|
| X20CS1030 | X20 interface module, 1 RS422/485 interface, max. 115.2 kbit/s | 2162 |
| X20CS1070 | X20 interface module, 1 CAN bus interface, max. 1 Mbit/s, object buffers in both send and receive directions | 2177 |
| X20CS2770 | X20 interface module, 2 CAN bus interfaces, max. 1 Mbit/s, object buffers in both send and receive directions | 2194 |
| X20DC1073 | X20 digital counter module, 1x SinCos, 1 Vss, 400 kHz input frequency, encoder monitoring, NetTime function | 1899 |
| X20DC1176 | X20 digital counter module, 1 ABR incremental encoder, 5 V, 600 kHz input frequency, 4x evaluation, encoder monitoring, Net-Time function | 1071 |
| X20DC1178 | X20 digital counter module, 1 SSI absolute encoder, 5 V, 1 Mbit/s, 32-bit, encoder monitoring, NetTime function | 1087 |
| X20DC1196 | X20 digital counter module, 1 ABR incremental encoders, 5 V, 600 kHz input frequency, 4x resolution | 1105 |
| X20DC1198 | X20 digital counter module, 1 SSI absolute encoder, 5 V, 1 Mbit/s, 32-bit | 1115 |
| X20DC11A6 | X20 digital counter module, 1 ABR incremental encoder, 5 V, 5 MHz input frequency, 4x evaluation, encoder monitoring, Net-Time function | 1122 |
| X20DC1376 | X20 digital counter module, 1 ABR incremental encoder, 24 V, 100 kHz input frequency, 4x evaluation, encoder monitoring, NetTime function | 1137 |
| X20DC137A | X20 digital counter module, 1 ABR incremental encoder, 24 V (differential), 300 kHz input frequency, 4x evaluation, encoder monitoring, NetTime function | 1153 |
| X20DC1396 | X20 digital counter module, 1 ABR incremental encoders, 24 V, 100 kHz input frequency, 4x evaluation | 1169 |
| X20DC1398 | X20 digital counter module, 1 SSI absolute encoder, 24 V, 125 kbit/s, 32-bit | 1179 |
| X20DC1976 | X20 digital counter module, 1 ABR incremental encoder, 5 V (single-ended), 250 kHz input frequency, 4x evaluation, encoder monitoring, NetTime function | 1186 |
| X20DC2190 | X20 digital counter module, ultrasonic transducer module, interfaces: EP start/stop, DPI/IP, 2 transducer rods, 4-position detection | 1202 |
| X20DC2395 | X20 digital counter module, 1 SSI absolute encoder, 24 V, 1 ABR incremental encoder, 24 V, 2 AB incremental encoders, 24 V, 4 event counters or 2 PWM, local time measurement function | 1216 |
| X20DC2396 | X20 digital counter module, 2 ABR incremental encoders, 24 V, 100 kHz input frequency, 4x evaluation | 1256 |
| X20DC2398 | X20 digital counter module, 2 SSI absolute encoder, 24 V, 125 kbit/s, 32-bit | 1267 |
| X20DC4395 | X20 digital counter module, 2 SSI absolute encoders, 24 V, 2 ABR incremental encoders, 24 V, 4 AB incremental encoders, 24 V, 8 event counters or 4 PWM, local time measurement functions | 1275 |
| X20DI0471 | X20 digital input module, 10 inputs, 5-48 VDC, sink, configurable input filter, 1-wire connections | 1439 |
| X20DI2371 | X20 digital input module, 2 inputs, 24 VDC, sink, configurable input filter, 3-wire connections | 1446 |
| X20DI2372 | X20 digital input module, 2 inputs, 24 VDC, source, configurable input filter, 3-wire connections | 1452 |
| X20DI2377 | X20 digital input module, 2 inputs, 24 VDC, sink, configurable input filter, 2 event counters 50 kHz, 3-wire connections | 1458 |
| X20DI2653 | X20 digital input module, 2 inputs, 100 to 240 VAC, 240 V keyed, 3-wire connections | 1467 |
| X20DI4371 | X20 digital input module, 4 inputs, 24 VDC, sink, configurable input filter, 3-wire connections | 1473 |
| X20DI4372 | X20 digital input module, 4 inputs, 24 VDC, source, configurable input filter, 3-wire connections | 1480 |
| X20DI4375 | X20 digital input module, 4 inputs, 24 VDC, sink, configurable input filter, open-circuit and short-circuit detection, 3-wire connections | 1486 |
| X20DI4653 | X20 digital input module, 4 inputs, 100 to 240 VAC, 240 V keyed, 2-wire connections | 1499 |
| X20DI4760 | X20 digital input module, 4 NAMUR inputs, 8.05 V | 1505 |
| X20DI6371 | X20 digital input module, 6 inputs, 24 VDC, sink, configurable input filter, 2-wire connections | 1514 |
| X20DI6372 | X20 digital input module, 6 inputs, 24 VDC, source, configurable input filter, 2-wire connections | 1520 |
| X20DI6373 | X20 digital input module, 6 inputs, 24 VDC, sink/source, all inputs floating, configurable input filter, 2-wire connections | 1526 |
| X20DI6553 | X20 digital input module, 6 inputs, 100 to 120 VAC, 240 V keyed, 1-wire connections | 1532 |
| X20DI8371 | X20 digital input module, 8 inputs, 24 VDC, sink, configurable input filter, 1-wire connections | 1538 |
| X20DI9371 | X20 digital input module, 12 inputs, 24 VDC, sink, configurable input filter, 1-wire connections | 1544 |
| X20DI9372 | X20 digital input module, 12 inputs, 24 VDC, source, configurable input filter, 1-wire connections | 1551 |
| X20DID371 | X20 digital input module, 8 inputs, 24 VDC, sink, configurable input filter, 2-wire connections | 1558 |
| X20DIF371 | X20 digital input module, 16 inputs, 24 VDC, sink, configurable input filter, 1-wire connections | 1564 |
| X20DM9324 | X20 digital mixed module, 8 inputs, 24 VDC, sink, configurable input filter, 4 outputs, 24 VDC, 0.5 A, source 1-wire connections | 1572 |
| X20DO2321 | X20 digital output module, 2 outputs, 24 VDC, 0.5 A, sink, 3-wire connections | 1581 |
| X20DO2322 | X20 digital output module, 2 outputs, 24 VDC, 0.5 A, source, 3-wire connections | 1590 |
| X20DO2623 | X20 digital output module, 2 outputs, 100 to 240 VAC, 1 A, source, 240 V keyed, 3-wire connections | 1599 |
| X20DO2633 | X20 digital output module, 2 triac outputs, 48 to 240 VAC, 2 A, L-switching, phase angle control, 240 V keyed | 1610 |
| X20DO2649 | X20 digital output module, 2 relays, changeover contacts, 240 VAC / 5 A, 24 VDC / 5 A | 1626 |
| X20DO4321 | X20 digital output module, 4 outputs, 24 VDC, 0.5 A, sink, 3-wire connections | 1632 |
| X20DO4322 | X20 digital output module, 4 outputs, 24 VDC, 0.5 A, source, 3-wire connections | 1641 |
| X20DO4331 | X20 digital output module, 4 outputs, 24 VDC, 2 A, sink, 3-wire connections | 1649 |
| X20DO4332 | X20 digital output module, 4 outputs, 24 VDC, 2 A, source, 3-wire connections | 1659 |
| X20DO4332-1 | X20 digital output module, 4 outputs, 24 VDC, 2 A, source, 3-wire connections, PWM output | 1669 |
| X20DO4529 | X20 digital output module, 4 relays, changeover contacts, 115 VAC / 0.5 A, 24 VDC / 1 A | 1679 |
| X20DO4613 | X20 digital output module, 4 triac coupler outputs, 48 to 240 VAC, 50 mA, zero-crossing detection, 240 V keyed | 1686 |
| X20DO4623 | X20 digital output module, 4 outputs, 100 to 240 VAC, 0.5 A, source, 240 V keyed, 2-wire connections | 1699 |
| X20DO4633 | X20 digital output module, 4 triac outputs, 48 to 240 VAC, 1 A, L-switching, phase angle control, 240 V keyed | 1709 |
| X20DO4649 | X20 digital output module, 4 relays, N.O. contacts, 240 VAC / 5 A | 1726 |
| X20DO4F49 | X20 digital output module, 4 relays, 2x normally open contacts, 2x changeover contacts, 240 VAC / 2 A, 250 VDC / 0.28 A | 1732 |
| X20DO6321 | X20 digital output module, 6 outputs, 24 VDC, 0.5 A, sink, 2-wire connections | 1739 |
| X20DO6322 | X20 digital output module, 6 outputs, 24 VDC, 0.5 A, source, 2-wire connections | 1746 |
| X20DO6325 | X20 digital output module, 6 outputs, 24 VDC, 0.5 A, source, open line and overload detection, 2-wire connections | 1755 |
| X20DO6529 | X20 digital output module, 6 relays, normally open contacts, 115 VAC / 0.5 A, 30 VDC / 1 A | 1766 |
| X20DO6639 | X20 digital output module, 6 relays, normally open contacts, 240 VAC / 2 A, 30 VDC / 2 A | 1773 |
| X20DO8232 | X20 digital output module, 8 outputs, 12 VDC, 2 A, source, supply directly on module, 1-wire connections | 1779 |
| X20DO8322 | X20 digital output module, 8 outputs, 24 VDC, 0.5 A, source, 1-wire connections | 1791 |
| X20DO8323 | X20 digital output module, 8 outputs, 12 to 24 V, 0.5 A, sink/source, 1-wire connections, full bridge, half bridge, thermal overload protection | 1799 |
| X20DO8331 | X20 digital output module, 8 outputs, 24 VDC, 2 A, sink, supply directly on module, 1-wire connections | 1808 |
| X20DO8332 | X20 digital output module, 8 outputs, 24 VDC, 2 A, source, supply directly on module, 1-wire connections | 1820 |

Module overviews

| Order number | Short description | Page |
|--------------|---|------|
| X20DO8332-1 | X20 digital output module, 8 outputs, 24 VDC, 2 A, source, optimized for inductive loads, power supply directly on module, 1-wire connections | 1832 |
| X20DO9321 | X20 digital output module, 12 outputs, 24 VDC, 0.5 A, sink, 1-wire connections | 1843 |
| X20DO9322 | X20 digital output module, 12 outputs, 24 VDC, 0.5 A, source, 1-wire connections | 1851 |
| X20DOD322 | X20 digital output module, 8 outputs, 24 VDC, 0.5 A, source, 2-wire connections | 1859 |
| X20DOF322 | X20 digital output module, 16 output, 24 VDC, 0.5 A, source, 1-wire connections | 1866 |
| X20DS1119 | X20 multifunction digital signal processor, 3 digital channels 5 V (symmetrical) configurable as inputs or outputs, 2 digital input channels 24 V (asymmetrical), max. 2 event counters, 1 universal counter pair as AB counter or up/down counter, linear movement generator (A/B, direction/frequency) with 1 reference pulse, 1 SSI absolute encoder, NetTime function | 1914 |
| X20DS1319 | X20 multifunction digital signal processor, 4 digital input channels, 4 digital channels configurable as inputs or outputs, 2 event counters 1 universal counter pair as AB counter or up/down counter, linear movement generator (A/B, direction/frequency) with max. 2 reference pulses, SSI absolute encoder, NetTime function | 1957 |
| X20DS1828 | X20 digital signal module, 1 HIPERFACE interface, NetTime function | 1999 |
| X20DS1928 | X20 digital signal module, 1 EnDat 2.1/2.2 interface, NetTime function | 2031 |
| X20DS4387 | X20 digital signal module, 4x IO-Link master, 4 digital channels configurable as inputs or outputs, 3-wire connections | 3269 |
| X20DS4389 | X20 digital signal module, 4 digital inputs, 24 VDC, 4 digital outputs, 24 VDC, 0.1 A, oversampling I/O functions, time-triggered I/O functions, NetTime function | 2056 |
| X20DS438A | X20 digital signal module, 4x IO-Link master V1.1, 4 digital channels configurable as inputs or outputs, 3-wire connections, Net-Time function | 3287 |
| X20ET8819 | X20 Ethernet analysis tool, can be expanded with active hub modules, 2x RJ45 | 2468 |
| X20HB1881 | X20 hub expansion module, integrated 1-port hub, for multimode fiber optic cable | 3619 |
| X20HB1882 | X20 hub expansion module, integrated 1-port hub, for monomode fiber optic cables | 3623 |
| X20HB2880 | X20 hub expansion module, integrated 2-port hub, 2x RJ45 | 3627 |
| X20HB2881 | X20 hub expansion module, integrated 2-port hub, for fiber optic cable | 3632 |
| X20HB2885 | X20 hub expansion module, integrated active 2-port hub, 2x RJ45 | 3641 |
| X20HB2886 | X20 hub expansion module, integrated active 2-port hub, 2 fiber optic interfaces | 3644 |
| X20HB8815 | X20 POWERLINK - TCP/IP gateway, can be expanded with active hub modules, 2x RJ45 | 2480 |
| X20HB8880 | X20 base hub module, integrated 2-port hub, 2x RJ45 | 2490 |
| X20HB8884 | X20 compact link selector, 2x RJ45, order bus base, power supply module and terminal block separately. | 3614 |
| X20IF0000 | X20 dummy interface module (non-functional) | 2092 |
| X20IF1020 | X20 interface module, 1 RS232 interface, max. 115.2 kbit/s, electrically isolated | 2268 |
| X20IF1030 | X20 interface module, 1 RS422/485 interface, max. 115.2 kbit/s, electrically isolated | 2271 |
| X20IF1041-1 | X20 interface module, for DTM configuration, 1 CANopen master interface, electrically isolated, order 1x TB2105 terminal block separately | 2274 |
| X20IF1043-1 | X20 interface module, for DTM configuration, 1 CANopen slave interface, electrically isolated, order 1x TB2105 terminal block separately | 2288 |
| X20IF1051-1 | X20 interface module, for DTM configuration, 1 DeviceNet scanner (master) interface, electrically isolated, order 1x terminal block TB2105 separately! | 2302 |
| X20IF1053-1 | X20 interface module, for DTM configuration, 1 DeviceNet adapter (slave) interface, electrically isolated, order 1x terminal block TB2105 separately! | 2315 |
| X20IF1061-1 | X20 interface module for DTM configuration, 1 PROFIBUS DP V0/V1 master interface, electrically isolated | 2328 |
| X20IF1063 | X20 interface module, 1 PROFIBUS DP V0 slave interface, max. 12 Mbit/s, electrically isolated | 2339 |
| X20IF1063-1 | X20 interface module, for DTM configuration, 1 PROFIBUS DP V1 slave interface, electrically isolated | 2342 |
| X20IF1072 | X20 interface module, 1 CAN bus interface, max. 1 Mbit/s, electrically isolated, order 1x TB2105 terminal block separately | 2353 |
| X20IF1074 | X20 interface module, for SGC, 1 CAN bus interface, max. 1 Mbit/s, electrically isolated, order 1x TB2105 terminal block separately | 2263 |
| X20IF1082 | X20 interface module, 1 POWERLINK interface, managing or controlled node, integrated 2-port hub, ring redundancy function | 2357 |
| X20IF1082-2 | X20 interface module, 1 POWERLINK interface, managing or controlled node, integrated 2-port hub, ring redundancy function PRC function | 2363 |
| X20IF1086-2 | X20 interface module, 1 POWERLINK interface, managing or controlled node, PRC function, 1 fiber optic connection | 2369 |
| X20IF1091 | X20 interface module, 1 X2X Link master interface, electrically isolated, order 1x TB704 terminal block separately | 2375 |
| X20IF1091-1 | X20 interface module, for expandable bus controller, 1 X2X Link master interface, electrically isolated, order 1x TB704 terminal block separately | 2240 |
| X20IF10A1-1 | X20 interface module, for DTM configuration, 1 ASi master interface, electrically isolated, order 1x terminal block TB704 separately! | 2378 |
| X20IF10D1-1 | X20 interface module, for DTM configuration, 1 EtherNet/IP scanner (master) interface, electrically isolated | 2392 |
| X20IF10D3-1 | X20 interface module, for DTM configuration, 1 EtherNet/IP adapter (slave) interface, electrically isolated | 2402 |
| X20IF10E1-1 | X20 interface module, for DTM configuration, 1 PROFINET IO controller (master) interface, electrically isolated | 2413 |
| X20IF10E3-1 | X20 interface module, for DTM configuration, 1 PROFINET IO device (slave) interface module, electrically isolated | 2424 |
| X20IF10G3-1 | X20 interface module for DTM configuration, 1 EtherCAT slave interface, electrically isolated | 2434 |
| X20IF10X0 | X20 interface module, 1 redundancy link interface 1000BASE-SX, CPU-CPU data synchronization module for controller redundancy | 2447 |
| X20IF2181-2 | X20 interface module, 1x link selector for POWERLINK cable redundancy, POWERLINK functions: - Managing node - Controlled node for iCN operation - Redundant managing node for controller redundancy - Ring redundancy - 2x hub - Multi ASend - PRC function 2x RJ45 | 2452 |
| X20IF2772 | X20 interface module, 2 CAN bus interfaces, max. 1 Mbit/s, electrically isolated, order 2x TB2105 terminal block separately | 2458 |
| X20IF2792 | X20 interface module, 1 CAN bus interface, max. 1 Mbit/s, electrically isolated, 1 X2X Link master interface, electrically isolated, order 1x terminal block TB2105 and 1x terminal block TB704 separately! | 2462 |
| X20MM2436 | X20 PWM motor module, 24 to 39 VDC $\pm 25\%$, 2 PWM motor bridges, 3 A continuous current, 3.5 A peak current, 4 digital inputs 24 VDC, sink, configurable as incremental encoder | 2496 |
| X20MM3332 | X20 digital motor module, 24 VDC, 3 digital outputs, full bridge (H bridge), 3 A continuous current, 5 A peak current | 2523 |
| X20MM4331 | X20 digital motor module, 24 VDC, 4 digital outputs, half bridge, 3 A continuous current, 5 A peak current | 2538 |
| X20MM4455 | X20 PWM motor module, 24 to 48 VDC $\pm 25\%$, 4 PWM motor bridges, 6 A continuous current, 10 A peak current, 4x 3 digital inputs 5 VDC single-ended, source, configurable as incremental encoder | 2551 |
| X20MM4456 | X20 PWM motor module, 24 to 48 VDC $\pm 25\%$, 4 PWM motor bridges, 6 A continuous current, 10 A peak current, 4x 4 digital inputs 24 VDC, sink, configurable as incremental encoder | 2577 |
| X20PD0011 | X20 potential distributor module, 12x GND, integrated microfuse | 3327 |
| X20PD0012 | X20 potential distributor module, 12x 24 VDC, integrated microfuse | 3332 |

| Order number | Short description | Page |
|--------------|---|------|
| X20PD0016 | X20 potential distributor module, 5x GND, 5x 24 VDC, each with 1x floating feed, integrated microfuse | 3337 |
| X20PD2113 | X20 potential distributor module, 6x GND, 6x 24 VDC, with feed option, integrated microfuse | 3343 |
| X20PS2100 | X20 power supply module, for internal I/O supply | 3356 |
| X20PS2110 | X20 power supply module, for internal I/O power supply, integrated microfuse | 3361 |
| X20PS3300 | X20 power supply module, for X2X Link and internal I/O power supply | 3367 |
| X20PS3310 | X20 power supply module, for X2X Link and internal I/O power supply, integrated microfuse | 3373 |
| X20PS4951 | X20 power supply module, for potentiometers, 4x ± 10 V for potentiometer supply | 3349 |
| X20PS8002 | X20 power supply module for standalone hub and compact link selector | 3636 |
| X20PS9400 | X20 power supply module, for bus controller and internal I/O power supply, X2X Link power supply | 926 |
| X20PS9402 | X20 power supply module, for bus controller and internal I/O power supply, X2X Link power supply, supply not electrically isolated | 932 |
| X20PS9500 | X20 power supply module for Compact and Fieldbus CPUs and internal I/O power supply, X2X Link power supply | 1006 |
| X20PS9502 | X20 power supply module, for Compact and Fieldbus CPUs and internal I/O power supply, X2X Link power supply, supply not electrically isolated | 1012 |
| X20PS9600 | X20 power supply module, for Compact-S CPU and internal I/O power supply, X2X Link power supply | 1047 |
| X20PS9602 | X20 power supply module, for Compact-S CPU and internal I/O power supply, X2X Link power supply, power supply not electrically isolated | 1055 |
| X20RT8001 | X20 reACTION module, 4 digital inputs, 24 VDC, $< 1 \mu\text{s}$, 4 digital channels, 24 VDC, 0.1 A, $< 1 \mu\text{s}$, configurable as inputs or outputs, reACTION Technology module | 3448 |
| X20RT8201 | X20 reACTION module, 4 digital inputs, 24 VDC, $< 1 \mu\text{s}$, 4 digital channels, 24 VDC, 0.1 A, $< 1 \mu\text{s}$, configurable as inputs or outputs, 2 analog inputs ± 10 V, 500 kHz sampling frequency, 13-bit converter resolution including sign, configurable input filter, reACTION Technology module | 3477 |
| X20RT8202 | X20 reACTION module, 4 digital inputs, 24 VDC, $< 1 \mu\text{s}$, 4 digital channels, 24 VDC, 0.1 A, $< 1 \mu\text{s}$, configurable as inputs or outputs, 2 analog outputs ± 10 V, 2 μs , 13-bit converter resolution including sign, reACTION Technology module | 3511 |
| X20RT8381 | X20 reACTION module, real computing function, 4 digital inputs, 24 VDC, $< 1 \mu\text{s}$, 4 digital channels, 24 VDC, 0.1 A, $< 1 \mu\text{s}$, configurable as inputs or outputs, 2 analog inputs ± 10 V, 500 kHz sampling frequency, 13-bit converter resolution including sign, configurable input filter, 1 analog output ± 10 V, 2 μs , 13-bit converter resolution including sign, reACTION Technology module | 3543 |
| X20RT8401 | X20 reACTION module, 4 digital inputs, 24 VDC, $< 1 \mu\text{s}$, 4 digital channels, 24 VDC, 0.1 A, $< 1 \mu\text{s}$, configurable as inputs or outputs, 1 analog input ± 10 V, 500 kHz sampling frequency, 13-bit converter resolution including sign, configurable input filter, 1 analog output ± 10 V, 2 μs , 13-bit converter resolution including sign, reACTION Technology module | 3577 |
| X20SM1426 | X20 stepper motor module, 1 motor connection, 1 A continuous current, 1.2 A peak current, 4 digital inputs 24 VDC, sink, configurable as incremental encoder, NetTime function | 2603 |
| X20SM1436 | X20 stepper motor module, module power supply 24 to 39 VDC $\pm 25\%$, 1 motor connection, 3 A continuous current, 3.5 A peak current, 4 digital inputs 24 VDC, sink, configurable as incremental encoder, NetTime function | 2652 |
| X20SM1436-1 | X20 stepper motor module, with current reduction function, module power supply 24 to 48 VDC $\pm 25\%$, 1 motor connection, 2.5 A continuous current, 3.5 A peak current, 4 digital inputs 24 VDC, sink, configurable as incremental encoder, NetTime function | 2700 |
| X20SM1446-1 | X20 stepper motor module, module power supply 24 to 48 VDC $\pm 25\%$, with current reduction function, 1 motor connection, 5 A continuous current, 10 A peak current, 4 digital inputs 24 VDC, sink, configurable as incremental encoder, NetTime function, double-width module | 2751 |
| X20TB06 | X20 terminal block, 6-pin, 24 VDC keyed | 3775 |
| X20TB12 | X20 terminal block, 12-pin, 24 VDC keyed | 3775 |
| X20TB1E | X20 terminal block, 12-pin, 24 VDC keyed, 2x PT1000 integrated for terminal temperature compensation | 3778 |
| X20TB1F | X20 terminal block, 16-pin, 24 VDC keyed | 3781 |
| X20TB32 | X20 terminal block, 12-pin, 240 VAC keyed | 3784 |
| X20XC0201 | X20 fieldbus CPU, μP 16, 100 kB SRAM, 1 MB FlashPROM, support of RS232, CAN bus and interface module according to fieldbus CPU base, order power supply module, bus base and terminal block separately | 2245 |
| X20XC0202 | X20 fieldbus CPU, μP 25, 750 kB SRAM, 3 MB FlashPROM, support of RS232, CAN bus and interface module according to fieldbus CPU base, order power supply module, bus base and terminal block separately | 2245 |
| X20XC0292 | X20 fieldbus CPU, μP 25 750 kB SRAM, 3 MB FlashPROM, support of RS232, CAN bus and interface module, according to fieldbus CPU base, 1 Ethernet interface 100 Base-T, order bus base, power supply module and terminal block separately | 2245 |
| X20ZF0000 | Dummy X20 module (non-functional) | 2094 |
| X20ZF0002 | X20 dummy module (no function), 240 VAC coded | 2096 |
| X20ZF000F | Dummy X20 module (non-functional) | 2098 |

6.1.2 Module overview: Grouped

6.1.2.1 CPUs

Standard CPU

| Order number | Short description | Page |
|--------------|---|------|
| X20CP1301 | X20 CPU, with integrated I/O, x86-200, 128 MB DDR3 RAM, 16 kB FRAM, 1 GB onboard flash drive, 1 insert slot for X20 interface modules, 1 USB interface, 1 RS232 interface, 1 Ethernet interface 10/100BASE-T, 14 digital inputs, 24 VDC, sink, 4 digital inputs, 2 μ s, 24 VDC, sink, 4 digital outputs, 24 VDC, 0.5 A, source, 4 digital outputs, 2 μ s, 24 VDC, 0.2 A, 4 digital inputs/outputs, 24 VDC, 0.5 A, 2 analog inputs \pm 10 V or 0 to 20 mA / 4 to 20 mA, 1 PT1000 instead of an analog input, includes power supply module, 3x terminal block X20TB1F, slot cover and X20 end cover plate X20AC0SR1 (right) included | 1324 |
| X20CP1381 | X20 CPU, with integrated I/O, x86-200, 128 MB DDR3 RAM, 16 kB FRAM, 1 GB onboard flash drive, 1 insert slot for X20 interface modules, 2 USB interfaces, 1 RS232 interface, 1 CAN bus interface, 1 POWERLINK interface, 1 Ethernet interface 10/100BASE-T, 14 digital inputs, 24 VDC, sink, 4 digital inputs, 2 μ s, 24 VDC, sink, 4 digital outputs, 24 VDC, 0.5 A, source, 4 digital outputs, 2 μ s, 24 VDC, 0.2 A, 4 digital inputs/outputs, 24 VDC, 0.5 A, 2 analog inputs \pm 10 V or 0 to 20 mA / 4 to 20 mA, 1 PT1000 instead of an analog input, includes power supply module, 3x terminal block X20TB1F, slot cover and X20 end cover plate X20AC0SR1 (right) included | 1324 |
| X20CP1382 | X20 CPU, with integrated I/O, x86-400, 256 MB DDR3 RAM, 32 kB FRAM, 2 GB onboard flash drive, 1 insert slot for X20 interface modules, 2 USB interfaces, 1 RS232 interface, 1 CAN bus interface, 1 POWERLINK interface, 1 Ethernet interface 10/100BASE-T, 14 digital inputs, 24 VDC, sink, 4 digital inputs, 2 μ s, 24 VDC, sink, 4 digital outputs, 24 VDC, 0.5 A, source, 4 digital outputs, 2 μ s, 24 VDC, 0.2 A, 4 digital inputs/outputs, 24 VDC, 0.5 A, 2 analog inputs \pm 10 V or 0 to 20 mA / 4 to 20 mA, 1 PT1000 instead of an analog input, includes power supply module, 3x terminal block X20TB1F, slot cover and X20 end cover plate X20AC0SR1 (right) included | 1324 |
| X20CP1483 | X20 CPU, x86 100 MHz Intel compatible, 32 MB DRAM, 128 kB SRAM, removable application memory: CompactFlash, 1 insert slot for X20 interface modules, 2 USB interfaces, 1 RS232 interface, 1 Ethernet interface 10/100BASE-T, 1 POWERLINK interface, including power supply module, 1x terminal block X20TB12, slot cover and X20 end cover plate X20AC0SR1 (right) included, order application memory separately! | 1380 |
| X20CP1483-1 | X20 CPU, x86 100 MHz Intel compatible, 64 MB DRAM, 128 kB SRAM, removable application memory: CompactFlash, 1 insert slot for X20 interface modules, 2 USB interfaces, 1 RS232 interface, 1 Ethernet interface 10/100BASE-T, 1 POWERLINK interface, including power supply module, 1x terminal block X20TB12, slot cover and X20 end cover plate X20AC0SR1 (right) included, order application memory separately! | 1380 |
| X20CP1583 | X20 CPU, Atom 333 MHz Intel compatible, 128 MB DDR2 RAM, 1 MB SRAM, removable application memory: CompactFlash, 1 insert slot for X20 interface modules, 2 USB interfaces, 1 RS232 interface, 1 Ethernet interface 10/100/1000BASE-T, 1 POWERLINK interface, including power supply module, 1x terminal block X20TB12, slot cover and X20 end cover plate X20AC0SR1 (right) included, order application memory separately! | 1397 |
| X20CP1584 | X20 CPU, Atom 0.6 GHz, 256 MB DDR2 RAM, 1 MB SRAM, removable application memory: CompactFlash, 1 insert slot for X20 interface modules, 2 USB interfaces, 1 RS232 interface, 1 Ethernet interface 10/100/1000BASE-T, 1 POWERLINK interface, including power supply module, 1x terminal block X20TB12, slot cover and X20 end cover plate X20AC0SR1 (right) included, order application memory separately! | 1397 |
| X20CP1585 | X20 CPU, Atom 1.0 GHz, 256 MB DDR2 RAM, 1 MB SRAM, removable application memory: CompactFlash, 1 insert slot for X20 interface modules, 2 USB interfaces, 1 RS232 interface, 1 Ethernet interface 10/100/1000BASE-T, 1 POWERLINK interface, including power supply module, 1x terminal block X20TB12, slot cover and X20 end cover plate X20AC0SR1 (right) included, order application memory separately! | 1397 |
| X20CP1586 | X20 CPU, Atom 1.6 GHz, 512 MB DDR2 RAM, 1 MB SRAM, removable application memory: CompactFlash, 1 insert slot for X20 interface modules, 2 USB interfaces, 1 RS232 interface, 1 Ethernet interface 10/100/1000BASE-T, 1 POWERLINK interface, including power supply module, 1x terminal block X20TB12, slot cover and X20 end cover plate X20AC0SR1 (right) included, order application memory separately! | 1397 |
| X20CP1684 | X20 CPU, Atom 0.4 GHz (compatible), 512 MB DDR4 RAM, 1 MB SRAM, 1 GB onboard flash drive, removable application memory: CompactFlash, 1 insert slot for X20 interface modules, 2 USB interfaces, 1 RS232 interface, 1 Ethernet interface (TSN) 10/100/1000BASE-T, 1 POWERLINK interface module, including supply module. 1x terminal block X20TB12, slot cover and X20 end cover plate X20AC0SR1 (right) included. Order CompactFlash separately! | 1418 |
| X20CP1685 | X20 CPU, Atom 0.8 GHz, 512 MB DDR4 RAM, 1 MB SRAM, 1 GB onboard flash drive, removable application memory: CompactFlash, 1 insert slot for X20 interface modules, 2 USB interfaces, 1 RS232 interface, 1 Ethernet interface (TSN) 10/100/1000BASE-T, 1 POWERLINK interface module, including supply module. 1x terminal block X20TB12, slot cover and X20 end cover plate X20AC0SR1 (right) included. Order CompactFlash separately! | 1418 |
| X20CP1686X | X20 CPU, Atom 1.3 GHz, 1 GB DDR4 RAM, 1 MB SRAM, 2 GB onboard flash drive, removable application memory: CompactFlash, 1 insert slot for X20 interface modules, 2 USB interfaces, 1 RS232 interface, 1 Ethernet interface (TSN) 10/100/1000BASE-T, 1 POWERLINK interface module, including supply module. 1x terminal block X20TB12, slot cover and X20 end cover plate X20AC0SR1 (right) included. Order CompactFlash separately! | 1418 |
| X20CP3583 | X20 CPU, Atom 333 MHz Intel compatible, 128 MB DDR2 RAM, 1 MB SRAM, removable application memory: CompactFlash, 3 insert slots for X20 interface modules, 2 USB interfaces, 1 RS232 interface, 1 Ethernet interface 10/100/1000BASE-T, 1 POWERLINK interface, including power supply module, 1x terminal block X20TB12, slot covers and X20 end cover plate X20AC0SR1 (right) included, order application memory separately! | 1401 |
| X20CP3584 | X20 CPU, Atom 0.6 GHz, 256 MB DDR2 RAM, 1 MB SRAM, removable application memory: CompactFlash, 3 insert slots for X20 interface modules, 2 USB interfaces, 1 RS232 interface, 1 Ethernet interface 10/100/1000BASE-T, 1 POWERLINK interface, including power supply module, 1x terminal block X20TB12, slot covers and X20 end cover plate X20AC0SR1 (right) included, order application memory separately! | 1401 |
| X20CP3585 | X20 CPU, Atom 1.0 GHz, 256 MB DDR2 RAM, 1 MB SRAM, removable application memory: CompactFlash, 3 insert slots for X20 interface modules, 2 USB interfaces, 1 RS232 interface, 1 Ethernet interface 10/100/1000BASE-T, 1 POWERLINK interface, including power supply module, 1x terminal block X20TB12, slot covers and X20 end cover plate X20AC0SR1 (right) included, order application memory separately! | 1401 |
| X20CP3586 | X20 CPU, Atom 1.6 GHz, 512 MB DDR2 RAM, 1 MB SRAM, removable application memory: CompactFlash, 3 insert slots for X20 interface modules, 2 USB interfaces, 1 RS232 interface, 1 Ethernet interface 10/100/1000BASE-T, 1 POWERLINK interface, including power supply module, 1x terminal block X20TB12, slot covers and X20 end cover plate X20AC0SR1 (right) included, order application memory separately! | 1401 |

| Order number | Short description | Page |
|--------------|---|------|
| X20CP3684 | X20 CPU, Atom 0.4 GHz (compatible), 512 MB DDR4 RAM, 1 MB SRAM, 1 GB onboard flash drive, removable application memory: CompactFlash, 3 insert slots for X20 interface modules, 2 USB interfaces, 1 RS232 interface, 1 Ethernet interface (TSN) 10/100/1000BASE-T, 1 POWERLINK interface module, including supply module. 1x terminal block X20TB12, slot covers and X20 end cover plate X20AC0SR1 (right) included. Order CompactFlash separately! | 1422 |
| X20CP3685 | X20 CPU, Atom 0.8 GHz, 512 MB DDR4 RAM, 1 MB SRAM, 1 GB onboard flash drive, removable application memory: CompactFlash, 3 insert slots for X20 interface modules, 2 USB interfaces, 1 RS232 interface, 1 Ethernet interface (TSN) 10/100/1000BASE-T, 1 POWERLINK interface module, including supply module. 1x terminal block X20TB12, slot covers and X20 end cover plate X20AC0SR1 (right) included. Order CompactFlash separately! | 1422 |
| X20CP3686X | X20 CPU, Atom 1.3 GHz, 1 GB DDR4 RAM, 1 MB SRAM, 2 GB onboard flash drive, removable application memory: CompactFlash, 3 insert slots for X20 interface modules, 2 USB interfaces, 1 RS232 interface, 1 Ethernet interface (TSN) 10/100/1000BASE-T, 1 POWERLINK interface module, including supply module. 1x terminal block X20TB12, slot covers and X20 end cover plate X20AC0SR1 (right) included. Order CompactFlash separately! | 1422 |
| X20CP3687X | X20 CPU, Atom 1.6 GHz, 2 GB DDR4 RAM, 1 MB SRAM, 2 GB onboard flash drive, removable application memory: CompactFlash, 3 insert slots for X20 interface modules, 2 USB interfaces, 1 RS232 interface, 1 Ethernet interface (TSN) 10/100/1000BASE-T, 1 POWERLINK interface module, including supply module. 1x terminal block X20TB12, slot covers and X20 end cover plate X20AC0SR1 (right) included. Order CompactFlash separately! | 1422 |

Compact CPU

| Order number | Short description | Page |
|--------------|---|------|
| X20CP0201 | X20 compact CPU, μ P 16, 100 kB SRAM, 1 MB FlashPROM, support of RS232, CAN bus according to compact CPU base, order bus base, power supply module and terminal block separately | 994 |
| X20CP0291 | X20 compact CPU, μ P 16, 100 kB SRAM, 1 MB FlashPROM, support of RS232, CAN bus according to compact CPU base, 1 Ethernet interface 100 Base-T, order bus base, power supply module and terminal block separately | 994 |
| X20CP0292 | X20 compact CPU, μ P 25, 100 kB SRAM, 1 MB FlashPROM, support of RS232, CAN bus according to compact CPU base, 3 Ethernet interface 750 Base-T, order bus base, power supply module and terminal block separately | 994 |

Compact-S CPU

| Order number | Short description | Page |
|--------------|---|------|
| X20CP0410 | X20 Compact-S CPU, ARM Cortex-A9-166 (compatible), 128 MB DDR3 RAM, 8 kB FRAM, 256 MB onboard flash drive, 2 USB interfaces, 1 RS232 interface, 1 Ethernet interface 10/100BASE-T. Order bus base, power supply module and terminal block separately! | 1019 |
| X20CP0411 | X20 Compact-S CPU, ARM Cortex-A9-240, 128 MB DDR3 RAM, 16 kB FRAM, 512 MB onboard flash drive, 2 USB interfaces, 1 RS232 interface, 1 Ethernet interface 10/100BASE-T. Order bus base, power supply module and terminal block separately! | 1019 |
| X20CP0420 | X20 Compact-S CPU, ARM Cortex-A9-166 (compatible), 128 MB DDR3 RAM, 8 kB FRAM, 256 MB onboard flash drive, 2 USB interfaces, 1 RS232 interface, 2 Ethernet interfaces 10/100BASE-T (switch). Order bus base, power supply module and terminal block separately! | 1019 |
| X20CP0482 | X20 Compact-S CPU, ARM Cortex-A9-300, 128 MB DDR3 RAM, 16 kB FRAM, 1 GB onboard flash drive, 2 USB interfaces, 1 RS232 interface, 1 POWERLINK interface, 1 Ethernet interface 10/100BASE-T, can be expanded with X20 interface slot. Order bus base, power supply module and terminal block separately! | 1019 |
| X20CP0483 | X20 Compact-S CPU, ARM Cortex-A9-500, 256 MB DDR3 RAM, 32 kB FRAM, 1 GB onboard flash drive, 2 USB interfaces, 1 RS232 interface, 1 POWERLINK interface, 1 Ethernet interface 10/100BASE-T, can be expanded with X20 interface slot. Order bus base, power supply module and terminal block separately! | 1019 |
| X20CP0484 | X20 Compact-S CPU, ARM Cortex-A9-667, 256 MB DDR3 RAM, 64 kB FRAM, 2 GB onboard flash drive, 2 USB interfaces, 1 RS232 interface, 1 POWERLINK interface, 1 Ethernet interface 10/100BASE-T, can be expanded with X20 interface slot. Order bus base, power supply module and terminal block separately! | 1019 |
| X20CP0484-1 | X20 Compact-S CPU, ARM Cortex-A9-667, 512 MB DDR3 RAM, 64 kB FRAM, 2 GB onboard flash drive, 2 USB interfaces, 1 RS232 interface, 1 POWERLINK interface, 1 Ethernet interface 10/100BASE-T, can be expanded with X20 interface slot. Order bus base, power supply module and terminal block separately! | 1019 |

Fieldbus CPU

| Order number | Short description | Page |
|--------------|--|------|
| X20XC0201 | X20 fieldbus CPU, μ P 16, 100 kB SRAM, 1 MB FlashPROM, support of RS232, CAN bus and interface module according to fieldbus CPU base, order power supply module, bus base and terminal block separately | 2245 |
| X20XC0202 | X20 fieldbus CPU, μ P 25, 750 kB SRAM, 3 MB FlashPROM, support of RS232, CAN bus and interface module according to fieldbus CPU base, order power supply module, bus base and terminal block separately | 2245 |
| X20XC0292 | X20 fieldbus CPU, μ P 25 750 kB SRAM, 3 MB FlashPROM, support of RS232, CAN bus and interface module, according to fieldbus CPU base, 1 Ethernet interface 100 Base-T, order bus base, power supply module and terminal block separately | 2245 |

reACTION Technology CPU

| Order number | Short description | Page |
|------------------------------|---|------|
| X20CP1381-RT | X20 CPU, with integrated I/O, x86-200, 128 MB DDR3 RAM, 16 kB FRAM, 1 GB onboard flash drive, 1 insert slot for X20 interface modules, 2 USB interfaces, 1 RS232 interface, 1 CAN bus interface, 1 POWERLINK interface, 1 Ethernet interface 10/100BASE-T, reACTION Technology, 14 digital inputs, 24 VDC, sink, 4 digital inputs, 2 µs, 24 VDC, sink, 4 digital outputs, 24 VDC, 0.5 A, source, 4 digital outputs, 2 µs, 24 VDC, 0.2 A, 4 digital inputs/outputs, 24 VDC, 0.5 A, 2 analog inputs ±10 V or 0 to 20 mA / 4 to 20 mA, 1 PT1000 instead of an analog input, includes power supply module, 3x terminal block X20TB1F, slot cover and X20 end cover plate X20AC0SR1 (right) included | 3382 |
| X20CP1382-RT | X20 CPU, with integrated I/O, x86-400, 256 MB DDR3 RAM, 32 kB FRAM, 2 GB onboard flash drive, 1 insert slot for X20 interface modules, 2 USB interfaces, 1 RS232 interface, 1 CAN bus interface, 1 POWERLINK interface, 1 Ethernet interface 10/100BASE-T, reACTION Technology, 14 digital inputs, 24 VDC, sink, 4 digital inputs, 2 µs, 24 VDC, sink, 4 digital outputs, 24 VDC, 0.5 A, source, 4 digital outputs, 2 µs, 24 VDC, 0.2 A, 4 digital inputs/outputs, 24 VDC, 0.5 A, 2 analog inputs ±10 V or 0 to 20 mA / 4 to 20 mA, 1 PT1000 instead of an analog input, includes power supply module, 3x terminal block X20TB1F, slot cover and X20 end cover plate X20AC0SR1 (right) included | 3382 |

6.1.2.2 Module overview: Grouped

Analog outputs

| Order number | Short description | Page |
|--------------|--|------|
| X20AO2437 | X20 analog output module, 2 outputs, 4 to 20 mA / 0 to 20 mA or 0 to 24 mA, 16-bit converter resolution, single channel electrically isolated | 735 |
| X20AO2438 | X20 analog output module, 2 outputs, 4 to 20 mA / 0 to 20 mA or 0 to 24 mA, 16-bit converter resolution, single-channel isolation, supports the HART protocol, NetTime function | 748 |
| X20AO2622 | X20 analog output module, 2 outputs, 10 V or 0 to 20 mA / 4 to 20 mA, 13-bit converter resolution | 773 |
| X20AO2632 | X20 analog output module, 2 outputs, ± 10 V or 0 to 20 mA, 16-bit converter resolution, NetTime function | 780 |
| X20AO2632-1 | X20 analog output module, 2 outputs, ± 11 V or 0 to 22 mA, 16-bit converter resolution, NetTime function | 788 |
| X20AO4622 | X20 analog output module, 4 outputs, ± 10 V or 0 to 20 mA / 4 to 20 mA, 13-bit converter resolution | 796 |
| X20AO4632 | X20 analog output module, 4 outputs, ± 10 V or 0 to 20 mA, 16-bit converter resolution | 805 |
| X20AO4632-1 | X20 analog output module, 4 outputs, ± 11 V or 0 to 22 mA, 16-bit converter resolution, NetTime function | 815 |
| X20AO4635 | X20 analog output module, 4 outputs, ± 10 V or 0 to 20 mA, 16-bit converter resolution, low temperature drift | 824 |
| X20CM8281 | X20 universal mixed module, 4 digital inputs, 24 VDC, sink, 1-wire connections, 2 digital outputs, 0.5 A, source, 1-wire connections, 1 analog input, ± 10 V or 0 to 20 mA / 4 to 20 mA, 12-bit converter resolution, 1 analog output, ± 10 V / 0 to 20 mA, 12-bit converter resolution, 2 counters as event counters or gate measurement | 3178 |
| X20RT8202 | X20 reACTION module, 4 digital inputs, 24 VDC, <1 μ s, 4 digital channels, 24 VDC, 0.1 A, <1 μ s, configurable as inputs or outputs, 2 analog outputs ± 10 V, 2 μ s, 13-bit converter resolution including sign, reACTION Technology module | 3511 |
| X20RT8401 | X20 reACTION module, 4 digital inputs, 24 VDC, <1 μ s, 4 digital channels, 24 VDC, 0.1 A, <1 μ s, configurable as inputs or outputs, 1 analog input ± 10 V, 500 kHz sampling frequency, 13-bit converter resolution including sign, configurable input filter, 1 analog output ± 10 V, 2 μ s, 13-bit converter resolution including sign, reACTION Technology module | 3577 |

Analog inputs

| Order number | Short description | Page |
|--------------|---|------|
| X20AI1744 | X20 analog input module, 1 full-bridge strain gauge input, 24-bit converter resolution, 5 kHz input filter | 196 |
| X20AI1744-3 | X20 analog input module, 1 full-bridge strain gauge input, 24-bit converter resolution, 5 Hz input filter | 243 |
| X20AI1744-10 | X20 analog input module, 1 full-bridge strain input 10 V, 24-bit converter resolution, 5 kHz input filter | 289 |
| X20AI2222 | X20 analog input module, 2 inputs, ± 10 V, 13-bit converter resolution, configurable input filter | 318 |
| X20AI2237 | X20 analog input module, 2 inputs, ± 10 V, 16-bit converter resolution, single-channel isolation with separate sensor power supply, NetTime function | 328 |
| X20AI2322 | X20 analog input module, 2 inputs, 0-20 mA / 4-20 mA, 12-bit converter resolution, configurable input filter | 346 |
| X20AI2437 | X20 analog input module, 2 inputs, 4 to 20 mA, 16-bit converter resolution, single-channel isolation with separate sensor power supply, NetTime function | 357 |
| X20AI2438 | X20 analog input module, 2 inputs, 4 to 20 mA, 16-bit converter resolution, single-channel isolation with separate sensor power supply, supports the HART protocol, NetTime function | 373 |
| X20AI2622 | X20 analog input module, 2 inputs, ± 10 V or 0 to 20 mA / 4 to 20 mA, 13-bit converter resolution, configurable input filter | 397 |
| X20AI2632 | X20 analog input module, 2 inputs, ± 10 V or 0 to 20 mA, 16-bit converter resolution, configurable input filter, oscilloscope functions | 408 |
| X20AI2632-1 | X20 analog input module, 2 inputs, ± 11 V or 0 to 22 mA, 16-bit converter resolution, configurable input filter | 433 |
| X20AI2636 | X20 analog input module, 2 inputs, ± 10 V or 0 to 20 mA, 16-bit converter resolution, configurable input filter, oversampling functions | 458 |
| X20AI4222 | X20 analog input module, 4 inputs, ± 10 V, 13-bit converter resolution, configurable input filter | 489 |
| X20AI4322 | X20 analog input module, 4 inputs, 0-20 mA / 4-20 mA, 12-bit converter resolution, configurable input filter | 499 |
| X20AI4622 | X20 analog input module, 4 inputs, ± 10 V or 0 to 20 mA / 4 to 20 mA, 13-bit converter resolution, configurable input filter | 509 |
| X20AI4632 | X20 analog input module, 4 inputs, ± 10 V or 0 to 20 mA, 16-bit converter resolution, configurable input filter, oscilloscope functions | 520 |
| X20AI4632-1 | X20 analog input module, 4 inputs, ± 11 V or 0 to 22 mA, 16-bit converter resolution, configurable input filter, oscilloscope functions | 545 |
| X20AI4636 | X20 analog input module, 4 inputs, ± 10 V or 0 to 20 mA, 16-bit converter resolution, configurable input filter, oversampling functions | 570 |
| X20AI8221 | X20 analog input module, 8 inputs, ± 10 V, 13-bit converter resolution | 602 |
| X20AI8321 | X20 analog input module, 8 inputs, 0 to 20 mA, 12-bit converter resolution | 612 |
| X20AIA744 | X20 analog input module, 2 full-bridge strain inputs, 24-bit converter resolution, 2.5 kHz input filter | 622 |
| X20AIB744 | X20 analog input module, 4 full-bridge strain inputs, 24-bit converter resolution, 2.5 kHz input filter | 641 |
| X20AP3111 | X20 energy metering module, 3 analog inputs, 480 VAC, 50/60 Hz, 4 analog inputs, 20 mA AC, calculates effective, reactive and apparent power/energy, calculates RMS values, 240 V keyed, NetTime function | 661 |
| X20AP3121 | X20 energy metering module, 3 analog inputs, 480 VAC, 50/60 Hz, 4 analog inputs, 1 A AC, calculates effective, reactive and apparent power/energy, calculates RMS values, 240 V keyed, NetTime function | 661 |
| X20AP3122 | X20 energy metering module, 3 analog inputs, 480 VAC, 50/60 Hz, 4 analog inputs, 1 A AC, groundable, calculates effective, reactive and apparent power/energy, calculates RMS values, 240 V keyed, NetTime function | 661 |
| X20AP3131 | X20 energy metering module, 3 analog inputs, 480 VAC, 50/60 Hz, 4 analog inputs, 5 A AC, calculates effective, reactive and apparent power/energy, calculates RMS values, 240 V keyed, NetTime function | 661 |
| X20AP3132 | X20 energy metering module, 3 analog inputs, 480 VAC, 50/60 Hz, 4 analog inputs, 5 A AC, groundable, calculates effective, reactive and apparent power/energy, calculates RMS values, 240 V keyed, NetTime function | 661 |
| X20AP3161 | X20 energy metering module, 3 analog inputs, 480 VAC, 50/60 Hz, 4 analog inputs, 333 mV AC, calculates effective, reactive and apparent power/energy, calculates RMS values, 240 V keyed, NetTime function | 661 |
| X20AP3171 | X20 energy metering module, 3 analog inputs, 480 VAC, 50/60 Hz, 4 analog inputs, Rogowski adjustable (μ V/A), max. 52 mV, calculates effective, reactive and apparent power/energy, calculates RMS values, 240 V keyed, NetTime function | 661 |
| X20CM0985 | X20 digital and analog mixed module, multi-measurement transducer/ synchronization module, 5 digital outputs, 24 VDC, 0.5 A source, 1 relay, 1 A, changeover contact, 8 analog inputs, ± 480 V / 120 V, 16-bit converter resolution, 3 analog inputs 5 A / 1 A AC, 16-bit converter resolution, order terminal blocks 0TB3102-7011, 0TB3104-7011, 0TB3102-7012, 0TB3104-7012 and 2x TB12 separately. | 2803 |
| X20CM0985-1 | X20 digital and analog mixed module, multi-measurement transducer / synchronization module, 5 digital outputs, 24 VDC, 0.5 A, source, 1 relay, 1 A, 8 analog inputs, ± 480 V / 120 V, 16-bit converter resolution, 3 analog inputs, 5 A / 1 A AC, 16-bit converter resolution, additional software functionalities, order terminal blocks 0TB3102-7011, 0TB3104-7011, 0TB3102-7012, 0TB3104-7012 and 2x X20TB12 separately! | 2921 |
| X20CM8281 | X20 universal mixed module, 4 digital inputs, 24 VDC, sink, 1-wire connections, 2 digital outputs, 0.5 A, source, 1-wire connections, 1 analog input, ± 10 V or 0 to 20 mA / 4 to 20 mA, 12-bit converter resolution, 1 analog output, ± 10 V / 0 to 20 mA, 12-bit converter resolution, 2 counters as event counters or gate measurement | 3178 |
| X20RT8201 | X20 reACTION module, 4 digital inputs, 24 VDC, < 1 μ s, 4 digital channels, 24 VDC, 0.1 A, < 1 μ s, configurable as inputs or outputs, 2 analog inputs ± 10 V, 500 kHz sampling frequency, 13-bit converter resolution including sign, configurable input filter, reACTION Technology module | 3477 |
| X20RT8401 | X20 reACTION module, 4 digital inputs, 24 VDC, < 1 μ s, 4 digital channels, 24 VDC, 0.1 A, < 1 μ s, configurable as inputs or outputs, 1 analog input ± 10 V, 500 kHz sampling frequency, 13-bit converter resolution including sign, configurable input filter, 1 analog output ± 10 V, 2 μ s, 13-bit converter resolution including sign, reACTION Technology module | 3577 |

Dummy modules

| Order number | Short description | Page |
|--------------|---|------|
| X20IF0000 | X20 dummy interface module (non-functional) | 2092 |
| X20ZF0000 | Dummy X20 module (non-functional) | 2094 |
| X20ZF0002 | X20 dummy module (no function), 240 VAC coded | 2096 |
| X20ZF000F | Dummy X20 module (non-functional) | 2098 |

Bus controller

| Order number | Short description | Page |
|--------------|---|------|
| X20BC0043-10 | X20 bus controller, 1 CANopen interface, order 1x terminal block TB2105 separately! Order bus base, power supply module and terminal block separately! | 834 |
| X20BC0053 | X20 bus controller, 1 DeviceNet interface, order 1x TB2105 terminal block separately Order bus base, power supply module and terminal separately | 841 |
| X20BC0063 | X20 bus controller, 1 PROFIBUS DP interface, 9-pin DSUB connection, order bus base, power supply module and terminal block separately | 847 |
| X20BC0073 | X20 bus controller, 1 CAN I/O interface, order 1x TB2105 terminal block separately Order bus base, power supply module and terminal separately | 851 |
| X20BC0083 | X20 bus controller, 1 POWERLINK interface, integrated 2-port hub, 2x RJ45, order bus base, power supply module and terminal block separately! | 859 |
| X20BC0087 | X20 bus controller, 1 Modbus TCP or Modbus UDP interface, integrated 2-port switch, 2x RJ45, order bus base, power supply module and terminal block separately. | 864 |
| X20BC0087-10 | X20 bus controller, 1 Modbus TCP or Modbus UDP interface, producer mode feature (via UDP), integrated switch, 2x RJ45, order bus base, power supply module and terminal block separately. | 870 |
| X20BC0088 | X20 bus controller, 1 EtherNet/IP interface, integrated switch, web interface, 2x RJ45, order bus base, power supply module and terminal block separately! | 877 |
| X20BC008U | X20 bus controller, 1 OPC UA Ethernet interface, integrated 2-port switch, 2x RJ45, order bus base, power supply module and terminal block separately. | 882 |
| X20BC00E3 | X20 bus controller, 1 PROFINET IO interface, integrated 2-port switch, 2x RJ45, order bus base, power supply module and terminal block separately! | 904 |
| X20BC00G3 | X20 bus controller, 1 EtherCAT interface, 2x RJ45, order bus base, power supply module and terminal block separately. | 910 |
| X20BC0143-10 | X20 bus controller, 1 CANopen interface, 9-pin DSUB, Order 1x connector 7AC911.9 separately! Order bus base, power supply module and terminal block separately! | 914 |

Bus receivers and bus transmitters

| Order number | Short description | Page |
|--------------|--|------|
| X20BR7300 | X20 bus receiver, CAN I/O, supply for X2X Link and internal I/O power supply, X20 end cover plates (left and right) X20AC0SL1/X20AC0SR1 included | 964 |
| X20BR9300 | X20 bus receiver, X2X Link, supply for X2X Link and internal I/O power supply, X20 end cover plates (left and right) X20AC0SL1/X20AC0SR1 included | 973 |
| X20BT9100 | X20 bus transmitter, X2X Link, supply for internal I/O supply | 980 |
| X20BT9400 | X20 bus transmitter X2X Link, feed for internal I/O supply, X2X Link supply for X67 modules, reverse polarity protection, short circuit protection, overload protection, parallel connection possible, redundancy operation possible | 986 |

Bus modules

| Order number | Short description | Page |
|--------------|--|------|
| X20BM01 | X20 power supply bus module, 24 VDC keyed, internal I/O supply interrupted to the left | 939 |
| X20BM05 | X20 power supply bus module, with node number switch, 24 VDC keyed, internal I/O supply interrupted to the left | 942 |
| X20BM11 | X20 bus module, 24 VDC keyed, internal I/O supply continuous | 945 |
| X20BM12 | X20 bus module, 240 VAC keyed, internal I/O power supply connected through | 948 |
| X20BM15 | X20 bus module, with node number switch, 24 VDC keyed, internal I/O supply continuous | 951 |
| X20BM21 | X20 power supply bus module, for double-width modules, 24 VDC keyed, internal I/O supply interrupted to the left | 954 |
| X20BM31 | X20 bus module for double-width modules, 24 VDC keyed, internal I/O supply continuous | 956 |
| X20BM32 | X20 bus module for double-width modules, 240 VAC keyed, internal I/O supply continuous | 959 |

Digital outputs

| Order number | Short description | Page |
|--------------|---|------|
| X20CM0985 | X20 digital and analog mixed module, multi-measurement transducer/ synchronization module, 5 digital outputs, 24 VDC, 0.5 A source, 1 relay, 1 A, changeover contact, 8 analog inputs, ± 480 V / 120 V, 16-bit converter resolution, 3 analog inputs 5 A / 1 A AC, 16-bit converter resolution, order terminal blocks 0TB3102-7011, 0TB3104-7011, 0TB3102-7012, 0TB3104-7012 and 2x TB12 separately. | 2803 |
| X20CM0985-1 | X20 digital and analog mixed module, multi-measurement transducer / synchronization module, 5 digital outputs, 24 VDC, 0.5 A, source, 1 relay, 1 A, 8 analog inputs, ± 480 V / 120 V, 16-bit converter resolution, 3 analog inputs, 5 A / 1 A AC, 16-bit converter resolution, additional software functionalities, order terminal blocks 0TB3102-7011, 0TB3104-7011, 0TB3102-7012, 0TB3104-7012 and 2x X20TB12 separately! | 2921 |
| X20CM0985-02 | X20 digital and analog mixed module, multi-measurement transducer / synchronization module, 5 digital outputs, 24 VDC, 0.5 A, source, 1 relay, 1 A, 8 analog inputs, ± 480 V / 120 V, 16-bit converter resolution, 3 analog inputs, 5 A / 1 A AC, 16-bit converter resolution, additional software functionalities, adapted to VDE guidelines (2018), order terminal blocks 0TB3102-7011, 0TB3104-7011, 0TB3102-7012, 0TB3104-7012 and 2x X20TB12 separately! | 2846 |
| X20CM1201 | X20 combination module, 1 AB incremental encoder, 24 V, 4 digital inputs 24 V, 4 channels 24 V configurable as inputs or outputs, flexible digital controller logic | 1875 |
| X20CM4323 | X20 PWM module, 4 digital outputs for switching electromechanical loads, 24 VDC, oversampling output functions, time-triggered output functions, NetTime function | 2992 |
| X20CM8281 | X20 universal mixed module, 4 digital inputs, 24 VDC, sink, 1-wire connections, 2 digital outputs, 0.5 A, source, 1-wire connections, 1 analog input, ± 10 V or 0 to 20 mA / 4 to 20 mA, 12-bit converter resolution, 1 analog output, ± 10 V / 0 to 20 mA, 12-bit converter resolution, 2 counters as event counters or gate measurement | 3178 |
| X20CM8323 | X20 PWM module, 8 digital outputs for switching electromechanical loads, 0.6 A continuous current, 2 A peak current, current monitoring, switching time detection | 3197 |
| X20DM9324 | X20 digital mixed module, 8 inputs, 24 VDC, sink, configurable input filter, 4 outputs, 24 VDC, 0.5 A, source 1-wire connections | 1572 |
| X20DO2321 | X20 digital output module, 2 outputs, 24 VDC, 0.5 A, sink, 3-wire connections | 1581 |
| X20DO2322 | X20 digital output module, 2 outputs, 24 VDC, 0.5 A, source, 3-wire connections | 1590 |
| X20DO2623 | X20 digital output module, 2 outputs, 100 to 240 VAC, 1 A, source, 240 V keyed, 3-wire connections | 1599 |
| X20DO2633 | X20 digital output module, 2 triac outputs, 48 to 240 VAC, 2 A, L-switching, phase angle control, 240 V keyed | 1610 |
| X20DO2649 | X20 digital output module, 2 relays, changeover contacts, 240 VAC / 5 A, 24 VDC / 5 A | 1626 |
| X20DO4321 | X20 digital output module, 4 outputs, 24 VDC, 0.5 A, sink, 3-wire connections | 1632 |
| X20DO4322 | X20 digital output module, 4 outputs, 24 VDC, 0.5 A, source, 3-wire connections | 1641 |
| X20DO4331 | X20 digital output module, 4 outputs, 24 VDC, 2 A, sink, 3-wire connections | 1649 |
| X20DO4332 | X20 digital output module, 4 outputs, 24 VDC, 2 A, source, 3-wire connections | 1659 |
| X20DO4332-1 | X20 digital output module, 4 outputs, 24 VDC, 2 A, source, 3-wire connections, PWM output | 1669 |
| X20DO4529 | X20 digital output module, 4 relays, changeover contacts, 115 VAC / 0.5 A, 24 VDC / 1 A | 1679 |
| X20DO4613 | X20 digital output module, 4 triac coupler outputs, 48 to 240 VAC, 50 mA, zero-crossing detection, 240 V keyed | 1686 |
| X20DO4623 | X20 digital output module, 4 outputs, 100 to 240 VAC, 0.5 A, source, 240 V keyed, 2-wire connections | 1699 |
| X20DO4633 | X20 digital output module, 4 triac outputs, 48 to 240 VAC, 1 A, L-switching, phase angle control, 240 V keyed | 1709 |
| X20DO4649 | X20 digital output module, 4 relays, N.O. contacts, 240 VAC / 5 A | 1726 |
| X20DO4F49 | X20 digital output module, 4 relays, 2x normally open contacts, 2x changeover contacts, 240 VAC / 2 A, 250 VDC / 0.28 A | 1732 |
| X20DO6321 | X20 digital output module, 6 outputs, 24 VDC, 0.5 A, sink, 2-wire connections | 1739 |
| X20DO6322 | X20 digital output module, 6 outputs, 24 VDC, 0.5 A, source, 2-wire connections | 1746 |
| X20DO6325 | X20 digital output module, 6 outputs, 24 VDC, 0.5 A, source, open line and overload detection, 2-wire connections | 1755 |
| X20DO6529 | X20 digital output module, 6 relays, normally open contacts, 115 VAC / 0.5 A, 30 VDC / 1 A | 1766 |
| X20DO6639 | X20 digital output module, 6 relays, normally open contacts, 240 VAC / 2 A, 30 VDC / 2 A | 1773 |
| X20DO8232 | X20 digital output module, 8 outputs, 12 VDC, 2 A, source, supply directly on module, 1-wire connections | 1779 |
| X20DO8322 | X20 digital output module, 8 outputs, 24 VDC, 0.5 A, source, 1-wire connections | 1791 |
| X20DO8323 | X20 digital output module, 8 outputs, 12 to 24 V, 0.5 A, sink/source, 1-wire connections, full bridge, half bridge, thermal overload protection | 1799 |
| X20DO8331 | X20 digital output module, 8 outputs, 24 VDC, 2 A, sink, supply directly on module, 1-wire connections | 1808 |
| X20DO8332 | X20 digital output module, 8 outputs, 24 VDC, 2 A, source, supply directly on module, 1-wire connections | 1820 |
| X20DO8332-1 | X20 digital output module, 8 outputs, 24 VDC, 2 A, source, optimized for inductive loads, power supply directly on module, 1-wire connections | 1832 |
| X20DO9321 | X20 digital output module, 12 outputs, 24 VDC, 0.5 A, sink, 1-wire connections | 1843 |
| X20DO9322 | X20 digital output module, 12 outputs, 24 VDC, 0.5 A, source, 1-wire connections | 1851 |
| X20DOD322 | X20 digital output module, 8 outputs, 24 VDC, 0.5 A, source, 2-wire connections | 1859 |
| X20DOF322 | X20 digital output module, 16 output, 24 VDC, 0.5 A, source, 1-wire connections | 1866 |
| X20DS1119 | X20 multifunction digital signal processor, 3 digital channels 5 V (symmetrical) configurable as inputs or outputs, 2 digital input channels 24 V (asymmetrical), max. 2 event counters, 1 universal counter pair as AB counter or up/down counter, linear movement generator (A/B, direction/frequency) with 1 reference pulse, 1 SSI absolute encoder, NetTime function | 1914 |
| X20DS1319 | X20 multifunction digital signal processor, 4 digital input channels, 4 digital channels configurable as inputs or outputs, 2 event counters 1 universal counter pair as AB counter or up/down counter, linear movement generator (A/B, direction/frequency) with max. 2 reference pulses, SSI absolute encoder, NetTime function | 1957 |
| X20RT8001 | X20 reACTION module, 4 digital inputs, 24 VDC, <1 μ s, 4 digital channels, 24 VDC, 0.1 A, <1 μ s, configurable as inputs or outputs, reACTION Technology module | 3448 |
| X20RT8201 | X20 reACTION module, 4 digital inputs, 24 VDC, <1 μ s, 4 digital channels, 24 VDC, 0.1 A, <1 μ s, configurable as inputs or outputs, 2 analog inputs ± 10 V, 500 kHz sampling frequency, 13-bit converter resolution including sign, configurable input filter, reACTION Technology module | 3477 |
| X20RT8202 | X20 reACTION module, 4 digital inputs, 24 VDC, <1 μ s, 4 digital channels, 24 VDC, 0.1 A, <1 μ s, configurable as inputs or outputs, 2 analog outputs ± 10 V, 2 μ s, 13-bit converter resolution including sign, reACTION Technology module | 3511 |
| X20RT8401 | X20 reACTION module, 4 digital inputs, 24 VDC, <1 μ s, 4 digital channels, 24 VDC, 0.1 A, <1 μ s, configurable as inputs or outputs, 1 analog input ± 10 V, 500 kHz sampling frequency, 13-bit converter resolution including sign, configurable input filter, 1 analog output ± 10 V, 2 μ s, 13-bit converter resolution including sign, reACTION Technology module | 3577 |

Digital inputs

| Order number | Short description | Page |
|--------------|--|------|
| X20CM1201 | X20 combination module, 1 AB incremental encoder, 24 V, 4 digital inputs 24 V, 4 channels 24 V configurable as inputs or outputs, flexible digital controller logic | 1875 |
| X20CM8281 | X20 universal mixed module, 4 digital inputs, 24 VDC, sink, 1-wire connections, 2 digital outputs, 0.5 A, source, 1-wire connections, 1 analog input, ± 10 V or 0 to 20 mA / 4 to 20 mA, 12-bit converter resolution, 1 analog output, ± 10 V / 0 to 20 mA, 12-bit converter resolution, 2 counters as event counters or gate measurement | 3178 |
| X20DI0471 | X20 digital input module, 10 inputs, 5-48 VDC, sink, configurable input filter, 1-wire connections | 1439 |
| X20DI2371 | X20 digital input module, 2 inputs, 24 VDC, sink, configurable input filter, 3-wire connections | 1446 |
| X20DI2372 | X20 digital input module, 2 inputs, 24 VDC, source, configurable input filter, 3-wire connections | 1452 |
| X20DI2377 | X20 digital input module, 2 inputs, 24 VDC, sink, configurable input filter, 2 event counters 50 kHz, 3-wire connections | 1458 |
| X20DI2653 | X20 digital input module, 2 inputs, 100 to 240 VAC, 240 V keyed, 3-wire connections | 1467 |
| X20DI4371 | X20 digital input module, 4 inputs, 24 VDC, sink, configurable input filter, 3-wire connections | 1473 |
| X20DI4372 | X20 digital input module, 4 inputs, 24 VDC, source, configurable input filter, 3-wire connections | 1480 |
| X20DI4375 | X20 digital input module, 4 inputs, 24 VDC, sink, configurable input filter, open-circuit and short-circuit detection, 3-wire connections | 1486 |
| X20DI4653 | X20 digital input module, 4 inputs, 100 to 240 VAC, 240 V keyed, 2-wire connections | 1499 |
| X20DI4760 | X20 digital input module, 4 NAMUR inputs, 8.05 V | 1505 |
| X20DI6371 | X20 digital input module, 6 inputs, 24 VDC, sink, configurable input filter, 2-wire connections | 1514 |
| X20DI6372 | X20 digital input module, 6 inputs, 24 VDC, source, configurable input filter, 2-wire connections | 1520 |
| X20DI6373 | X20 digital input module, 6 inputs, 24 VDC, sink/source, all inputs floating, configurable input filter, 2-wire connections | 1526 |
| X20DI6553 | X20 digital input module, 6 inputs, 100 to 120 VAC, 240 V keyed, 1-wire connections | 1532 |
| X20DI8371 | X20 digital input module, 8 inputs, 24 VDC, sink, configurable input filter, 1-wire connections | 1538 |
| X20DI9371 | X20 digital input module, 12 inputs, 24 VDC, sink, configurable input filter, 1-wire connections | 1544 |
| X20DI9372 | X20 digital input module, 12 inputs, 24 VDC, source, configurable input filter, 1-wire connections | 1551 |
| X20DID371 | X20 digital input module, 8 inputs, 24 VDC, sink, configurable input filter, 2-wire connections | 1558 |
| X20DIF371 | X20 digital input module, 16 inputs, 24 VDC, sink, configurable input filter, 1-wire connections | 1564 |
| X20DM9324 | X20 digital mixed module, 8 inputs, 24 VDC, sink, configurable input filter, 4 outputs, 24 VDC, 0.5 A, source 1-wire connections | 1572 |
| X20DS1119 | X20 multifunction digital signal processor, 3 digital channels 5 V (symmetrical) configurable as inputs or outputs, 2 digital input channels 24 V (asymmetrical), max. 2 event counters, 1 universal counter pair as AB counter or up/down counter, linear movement generator (A/B, direction/frequency) with 1 reference pulse, 1 SSI absolute encoder, NetTime function | 1914 |
| X20DS1319 | X20 multifunction digital signal processor, 4 digital input channels, 4 digital channels configurable as inputs or outputs, 2 event counters 1 universal counter pair as AB counter or up/down counter, linear movement generator (A/B, direction/frequency) with max. 2 reference pulses, SSI absolute encoder, NetTime function | 1957 |
| X20RT8001 | X20 reACTION module, 4 digital inputs, 24 VDC, < 1 μ s, 4 digital channels, 24 VDC, 0.1 A, < 1 μ s, configurable as inputs or outputs, reACTION Technology module | 3448 |
| X20RT8201 | X20 reACTION module, 4 digital inputs, 24 VDC, < 1 μ s, 4 digital channels, 24 VDC, 0.1 A, < 1 μ s, configurable as inputs or outputs, 2 analog inputs ± 10 V, 500 kHz sampling frequency, 13-bit converter resolution including sign, configurable input filter, reACTION Technology module | 3477 |
| X20RT8202 | X20 reACTION module, 4 digital inputs, 24 VDC, < 1 μ s, 4 digital channels, 24 VDC, 0.1 A, < 1 μ s, configurable as inputs or outputs, 2 analog outputs ± 10 V, 2 μ s, 13-bit converter resolution including sign, reACTION Technology module | 3511 |
| X20RT8401 | X20 reACTION module, 4 digital inputs, 24 VDC, < 1 μ s, 4 digital channels, 24 VDC, 0.1 A, < 1 μ s, configurable as inputs or outputs, 1 analog input ± 10 V, 500 kHz sampling frequency, 13-bit converter resolution including sign, configurable input filter, 1 analog output ± 10 V, 2 μ s, 13-bit converter resolution including sign, reACTION Technology module | 3577 |

Digital inputs and outputs

| Order number | Short description | Page |
|--------------|--|------|
| X20CM1201 | X20 combination module, 1 AB incremental encoder, 24 V, 4 digital inputs 24 V, 4 channels 24 V configurable as inputs or outputs, flexible digital controller logic | 1875 |
| X20CM8281 | X20 universal mixed module, 4 digital inputs, 24 VDC, sink, 1-wire connections, 2 digital outputs, 0.5 A, source, 1-wire connections, 1 analog input, ± 10 V or 0 to 20 mA / 4 to 20 mA, 12-bit converter resolution, 1 analog output, ± 10 V / 0 to 20 mA, 12-bit converter resolution, 2 counters as event counters or gate measurement | 3178 |
| X20DM9324 | X20 digital mixed module, 8 inputs, 24 VDC, sink, configurable input filter, 4 outputs, 24 VDC, 0.5 A, source 1-wire connections | 1572 |
| X20RT8001 | X20 reACTION module, 4 digital inputs, 24 VDC, < 1 μ s, 4 digital channels, 24 VDC, 0.1 A, < 1 μ s, configurable as inputs or outputs, reACTION Technology module | 3448 |
| X20RT8201 | X20 reACTION module, 4 digital inputs, 24 VDC, < 1 μ s, 4 digital channels, 24 VDC, 0.1 A, < 1 μ s, configurable as inputs or outputs, 2 analog inputs ± 10 V, 500 kHz sampling frequency, 13-bit converter resolution including sign, configurable input filter, reACTION Technology module | 3477 |
| X20RT8202 | X20 reACTION module, 4 digital inputs, 24 VDC, < 1 μ s, 4 digital channels, 24 VDC, 0.1 A, < 1 μ s, configurable as inputs or outputs, 2 analog outputs ± 10 V, 2 μ s, 13-bit converter resolution including sign, reACTION Technology module | 3511 |
| X20RT8401 | X20 reACTION module, 4 digital inputs, 24 VDC, < 1 μ s, 4 digital channels, 24 VDC, 0.1 A, < 1 μ s, configurable as inputs or outputs, 1 analog input ± 10 V, 500 kHz sampling frequency, 13-bit converter resolution including sign, configurable input filter, 1 analog output ± 10 V, 2 μ s, 13-bit converter resolution including sign, reACTION Technology module | 3577 |

Digital signal processing and preparation

| Order number | Short description | Page |
|--------------|---|------|
| X20CM1201 | X20 combination module, 1 AB incremental encoder, 24 V, 4 digital inputs 24 V, 4 channels 24 V configurable as inputs or outputs, flexible digital controller logic | 1875 |
| X20DC1073 | X20 digital counter module, 1x SinCos, 1 Vss, 400 kHz input frequency, encoder monitoring, NetTime function | 1899 |
| X20DS1119 | X20 multifunction digital signal processor, 3 digital channels 5 V (symmetrical) configurable as inputs or outputs, 2 digital input channels 24 V (asymmetrical), max. 2 event counters, 1 universal counter pair as AB counter or up/down counter, linear movement generator (A/B, direction/frequency) with 1 reference pulse, 1 SSI absolute encoder, NetTime function | 1914 |
| X20DS1319 | X20 multifunction digital signal processor, 4 digital input channels, 4 digital channels configurable as inputs or outputs, 2 event counters 1 universal counter pair as AB counter or up/down counter, linear movement generator (A/B, direction/frequency) with max. 2 reference pulses, SSI absolute encoder, NetTime function | 1957 |
| X20DS1828 | X20 digital signal module, 1 HIPERFACE interface, NetTime function | 1999 |
| X20DS1928 | X20 digital signal module, 1 EnDat 2.1/2.2 interface, NetTime function | 2031 |
| X20DS4389 | X20 digital signal module, 4 digital inputs, 24 VDC, 4 digital outputs, 24 VDC, 0.1 A, oversampling I/O functions, time-triggered I/O functions, NetTime function | 2056 |

Power supply modules

| Order number | Short description | Page |
|--------------|---|------|
| X20PS2100 | X20 power supply module, for internal I/O supply | 3356 |
| X20PS2110 | X20 power supply module, for internal I/O power supply, integrated microfuse | 3361 |
| X20PS3300 | X20 power supply module, for X2X Link and internal I/O power supply | 3367 |
| X20PS3310 | X20 power supply module, for X2X Link and internal I/O power supply, integrated microfuse | 3373 |

Expandable bus controllers

| Order number | Short description | Page |
|--------------|--|------|
| X20BC1083 | X20 bus controller, 1 POWERLINK interface, integrated 2-port hub, supports X20 interface module expansions, 2 RJ45, order bus base, power supply module and terminal block separately | 2213 |
| X20BC8083 | X20 bus controller, 1 POWERLINK interface, integrated 2-port hub, supports expansion with X20 hub modules, 2 RJ45, order bus base, power supply module and terminal block separately. | 2220 |
| X20BC8084 | X20 bus controller, 1 POWERLINK interface, 1x link selector for POWERLINK cable redundancy, supports expansion with enabled X20 hub modules, 2x RJ45, order bus base, power supply module and terminal block separately! | 2227 |

Terminal blocks

| Order number | Short description | Page |
|--------------|--|------|
| X20TB06 | X20 terminal block, 6-pin, 24 VDC keyed | 3775 |
| X20TB12 | X20 terminal block, 12-pin, 24 VDC keyed | 3775 |
| X20TB1E | X20 terminal block, 12-pin, 24 VDC keyed, 2x PT1000 integrated for terminal temperature compensation | 3778 |
| X20TB1F | X20 terminal block, 16-pin, 24 VDC keyed | 3781 |
| X20TB32 | X20 terminal block, 12-pin, 240 VAC keyed | 3784 |

Hub system

| Order number | Short description | Page |
|--------------|--|------|
| X20ET8819 | X20 Ethernet analysis tool, can be expanded with active hub modules, 2x RJ45 | 2468 |
| X20HB8815 | X20 POWERLINK - TCP/IP gateway, can be expanded with active hub modules, 2x RJ45 | 2480 |
| X20HB8880 | X20 base hub module, integrated 2-port hub, 2x RJ45 | 2490 |

Communication in the X20 electronics module

| Order number | Short description | Page |
|--------------|---|------|
| X20CS1011 | X20 interface module, 1 Moeller SmartWire interface | 2101 |
| X20CS1012 | X20 interface module, 1 M-Bus master interface, integrated slave supply | 2116 |
| X20CS1013 | X20 interface module, 1 DALI master interface | 2136 |
| X20CS1020 | X20 interface module, 1 RS232 interface, max. 115.2 kbit/s | 2147 |
| X20CS1030 | X20 interface module, 1 RS422/485 interface, max. 115.2 kbit/s | 2162 |
| X20CS1070 | X20 interface module, 1 CAN bus interface, max. 1 Mbit/s, object buffers in both send and receive directions | 2177 |
| X20CS2770 | X20 interface module, 2 CAN bus interfaces, max. 1 Mbit/s, object buffers in both send and receive directions | 2194 |

Communication in the X20 interface module

| Order number | Short description | Page |
|--------------|---|------|
| X20IF1020 | X20 interface module, 1 RS232 interface, max. 115.2 kbit/s, electrically isolated | 2268 |
| X20IF1030 | X20 interface module, 1 RS422/485 interface, max. 115.2 kbit/s, electrically isolated | 2271 |
| X20IF1041-1 | X20 interface module, for DTM configuration, 1 CANOpen master interface, electrically isolated, order 1x TB2105 terminal block separately | 2274 |
| X20IF1043-1 | X20 interface module, for DTM configuration, 1 CANOpen slave interface, electrically isolated, order 1x TB2105 terminal block separately | 2288 |
| X20IF1051-1 | X20 interface module, for DTM configuration, 1 DeviceNet scanner (master) interface, electrically isolated, order 1x terminal block TB2105 separately! | 2302 |
| X20IF1053-1 | X20 interface module, for DTM configuration, 1 DeviceNet adapter (slave) interface, electrically isolated, order 1x terminal block TB2105 separately! | 2315 |
| X20IF1061-1 | X20 interface module for DTM configuration, 1 PROFIBUS DP V0/V1 master interface, electrically isolated | 2328 |
| X20IF1063 | X20 interface module, 1 PROFIBUS DP V0 slave interface, max. 12 Mbit/s, electrically isolated | 2339 |
| X20IF1063-1 | X20 interface module, for DTM configuration, 1 PROFIBUS DP V1 slave interface, electrically isolated | 2342 |
| X20IF1072 | X20 interface module, 1 CAN bus interface, max. 1 Mbit/s, electrically isolated, order 1x TB2105 terminal block separately | 2353 |
| X20IF1082 | X20 interface module, 1 POWERLINK interface, managing or controlled node, integrated 2-port hub, ring redundancy function | 2357 |
| X20IF1082-2 | X20 interface module, 1 POWERLINK interface, managing or controlled node, integrated 2-port hub, ring redundancy function PRC function | 2363 |
| X20IF1086-2 | X20 interface module, 1 POWERLINK interface, managing or controlled node, PRC function, 1 fiber optic connection | 2369 |
| X20IF1091 | X20 interface module, 1 X2X Link master interface, electrically isolated, order 1x TB704 terminal block separately | 2375 |
| X20IF10A1-1 | X20 interface module, for DTM configuration, 1 ASi master interface, electrically isolated, order 1x terminal block TB704 separately! | 2378 |
| X20IF10D1-1 | X20 interface module, for DTM configuration, 1 EtherNet/IP scanner (master) interface, electrically isolated | 2392 |
| X20IF10D3-1 | X20 interface module, for DTM configuration, 1 EtherNet/IP adapter (slave) interface, electrically isolated | 2402 |
| X20IF10E1-1 | X20 interface module, for DTM configuration, 1 PROFINET IO controller (master) interface, electrically isolated | 2413 |
| X20IF10E3-1 | X20 interface module, for DTM configuration, 1 PROFINET IO device (slave) interface module, electrically isolated | 2424 |
| X20IF10G3-1 | X20 interface module for DTM configuration, 1 EtherCAT slave interface, electrically isolated | 2434 |
| X20IF10X0 | X20 interface module, 1 redundancy link interface 1000BASE-SX, CPU-CPU data synchronization module for controller redundancy | 2447 |
| X20IF2181-2 | X20 interface module, 1x link selector for POWERLINK cable redundancy, POWERLINK functions: - Managing node - Controlled node for iCN operation - Redundant managing node for controller redundancy - Ring redundancy - 2x hub - Multi ASend - PRC function 2x RJ45 | 2452 |
| X20IF2772 | X20 interface module, 2 CAN bus interfaces, max. 1 Mbit/s, electrically isolated, order 2x TB2105 terminal block separately | 2458 |
| X20IF2792 | X20 interface module, 1 CAN bus interface, max. 1 Mbit/s, electrically isolated, 1 X2X Link master interface, electrically isolated, order 1x terminal block TB2105 and 1x terminal block TB704 separately! | 2462 |

Motor controllers

| Order number | Short description | Page |
|--------------|---|------|
| X20MM2436 | X20 PWM motor module, 24 to 39 VDC $\pm 25\%$, 2 PWM motor bridges, 3 A continuous current, 3.5 A peak current, 4 digital inputs 24 VDC, sink, configurable as incremental encoder | 2496 |
| X20MM3332 | X20 digital motor module, 24 VDC, 3 digital outputs, full bridge (H bridge), 3 A continuous current, 5 A peak current | 2523 |
| X20MM4331 | X20 digital motor module, 24 VDC, 4 digital outputs, half bridge, 3 A continuous current, 5 A peak current | 2538 |
| X20MM4455 | X20 PWM motor module, 24 to 48 VDC $\pm 25\%$, 4 PWM motor bridges, 6 A continuous current, 10 A peak current, 4x 3 digital inputs 5 VDC single-ended, source, configurable as incremental encoder | 2551 |
| X20MM4456 | X20 PWM motor module, 24 to 48 VDC $\pm 25\%$, 4 PWM motor bridges, 6 A continuous current, 10 A peak current, 4x 4 digital inputs 24 VDC, sink, configurable as incremental encoder | 2577 |
| X20SM1426 | X20 stepper motor module, 1 motor connection, 1 A continuous current, 1.2 A peak current, 4 digital inputs 24 VDC, sink, configurable as incremental encoder, NetTime function | 2603 |
| X20SM1436 | X20 stepper motor module, module power supply 24 to 39 VDC $\pm 25\%$, 1 motor connection, 3 A continuous current, 3.5 A peak current, 4 digital inputs 24 VDC, sink, configurable as incremental encoder, NetTime function | 2652 |
| X20SM1436-1 | X20 stepper motor module, with current reduction function, module power supply 24 to 48 VDC $\pm 25\%$, 1 motor connection, 2.5 A continuous current, 3.5 A peak current, 4 digital inputs 24 VDC, sink, configurable as incremental encoder, NetTime function | 2700 |
| X20SM1446-1 | X20 stepper motor module, module power supply 24 to 48 VDC $\pm 25\%$, with current reduction function, 1 motor connection, 5 A continuous current, 10 A peak current, 4 digital inputs 24 VDC, sink, configurable as incremental encoder, NetTime function, double-width module | 2751 |

reACTION I/O modules

| Order number | Short description | Page |
|--------------|---|------|
| X20RT8001 | X20 reACTION module, 4 digital inputs, 24 VDC, $<1 \mu\text{s}$, 4 digital channels, 24 VDC, 0.1 A, $<1 \mu\text{s}$, configurable as inputs or outputs, reACTION Technology module | 3448 |
| X20RT8201 | X20 reACTION module, 4 digital inputs, 24 VDC, $<1 \mu\text{s}$, 4 digital channels, 24 VDC, 0.1 A, $<1 \mu\text{s}$, configurable as inputs or outputs, 2 analog inputs $\pm 10 \text{ V}$, 500 kHz sampling frequency, 13-bit converter resolution including sign, configurable input filter, reACTION Technology module | 3477 |
| X20RT8202 | X20 reACTION module, 4 digital inputs, 24 VDC, $<1 \mu\text{s}$, 4 digital channels, 24 VDC, 0.1 A, $<1 \mu\text{s}$, configurable as inputs or outputs, 2 analog outputs $\pm 10 \text{ V}$, 2 μs , 13-bit converter resolution including sign, reACTION Technology module | 3511 |
| X20RT8381 | X20 reACTION module, real computing function, 4 digital inputs, 24 VDC, $<1 \mu\text{s}$, 4 digital channels, 24 VDC, 0.1 A, $<1 \mu\text{s}$, configurable as inputs or outputs, 2 analog inputs $\pm 10 \text{ V}$, 500 kHz sampling frequency, 13-bit converter resolution including sign, configurable input filter, 1 analog output $\pm 10 \text{ V}$, 2 μs , 13-bit converter resolution including sign, reACTION Technology module | 3543 |
| X20RT8401 | X20 reACTION module, 4 digital inputs, 24 VDC, $<1 \mu\text{s}$, 4 digital channels, 24 VDC, 0.1 A, $<1 \mu\text{s}$, configurable as inputs or outputs, 1 analog input $\pm 10 \text{ V}$, 500 kHz sampling frequency, 13-bit converter resolution including sign, configurable input filter, 1 analog output $\pm 10 \text{ V}$, 2 μs , 13-bit converter resolution including sign, reACTION Technology module | 3577 |

Redundancy system

| Order number | Short description | Page |
|--------------|--|------|
| X20HB8884 | X20 compact link selector, 2x RJ45, order bus base, power supply module and terminal block separately. | 3614 |

Other functions

| Order number | Short description | Page |
|--------------|--|------|
| X20CM0985 | X20 digital and analog mixed module, multi-measurement transducer/ synchronization module, 5 digital outputs, 24 VDC, 0.5 A source, 1 relay, 1 A, changeover contact, 8 analog inputs, $\pm 480\text{ V} / 120\text{ V}$, 16-bit converter resolution, 3 analog inputs 5 A / 1 A AC, 16-bit converter resolution, order terminal blocks 0TB3102-7011, 0TB3104-7011, 0TB3102-7012, 0TB3104-7012 and 2x TB12 separately. | 2803 |
| X20CM0985-02 | X20 digital and analog mixed module, multi-measurement transducer / synchronization module, 5 digital outputs, 24 VDC, 0.5 A, source, 1 relay, 1 A, 8 analog inputs, $\pm 480\text{ V} / 120\text{ V}$, 16-bit converter resolution, 3 analog inputs, 5 A / 1 A AC, 16-bit converter resolution, additional software functionalities, adapted to VDE guidelines (2018), order terminal blocks 0TB3102-7011, 0TB3104-7011, 0TB3102-7012, 0TB3104-7012 and 2x X20TB12 separately! | 2846 |
| X20CM0985-1 | X20 digital and analog mixed module, multi-measurement transducer / synchronization module, 5 digital outputs, 24 VDC, 0.5 A, source, 1 relay, 1 A, 8 analog inputs, $\pm 480\text{ V} / 120\text{ V}$, 16-bit converter resolution, 3 analog inputs, 5 A / 1 A AC, 16-bit converter resolution, additional software functionalities, order terminal blocks 0TB3102-7011, 0TB3104-7011, 0TB3102-7012, 0TB3104-7012 and 2x X20TB12 separately! | 2921 |
| X20CM4323 | X20 PWM module, 4 digital outputs for switching electromechanical loads, 24 VDC, oversampling output functions, time-triggered output functions, NetTime function | 2992 |
| X20CM4800X | X20 analog input module, vibration measurement, 4 IEPE analog inputs, 50 kHz sampling frequency, 24-bit converter resolution | 3021 |
| X20CM4810 | X20 analog input module, for vibration measurement and analysis of condition monitoring tasks, 4 IEPE analog inputs, 51.5625 kHz sampling frequency, 24-bit converter resolution | 3039 |
| X20CM6209 | X20 diode array module, 1 A, 40 V reverse voltage, no module status data | 3174 |
| X20CM8281 | X20 universal mixed module, 4 digital inputs, 24 VDC, sink, 1-wire connections, 2 digital outputs, 0.5 A, source, 1-wire connections, 1 analog input, $\pm 10\text{ V}$ or 0 to 20 mA / 4 to 20 mA, 12-bit converter resolution, 1 analog output, $\pm 10\text{ V} / 0$ to 20 mA, 12-bit converter resolution, 2 counters as event counters or gate measurement | 3178 |
| X20CM8323 | X20 PWM module, 8 digital outputs for switching electromechanical loads, 0.6 A continuous current, 2 A peak current, current monitoring, switching time detection | 3197 |
| X20CMR010 | X20 cabinet monitoring module, integrated temperature and humidity sensor, production data acquisition, 512 kB flash memory for user data | 3216 |
| X20CMR100 | X20 cabinet monitoring module, integrated temperature and humidity sensor, production data acquisition, integrated Technology Guard | 3230 |
| X20CMR111 | X20 cabinet monitoring module, integrated temperature sensor, moisture sensor and accelerometer, production data acquisition, 2 inputs for external PT1000, 2 digital inputs 24 V, 1 digital output 24 V, 0.5 A, 512 kB flash memory for user data, integrated Technology Guard | 3242 |
| X20DS4387 | X20 digital signal module, 4x IO-Link master, 4 digital channels configurable as inputs or outputs, 3-wire connections | 3269 |
| X20DS438A | X20 digital signal module, 4x IO-Link master V1.1, 4 digital channels configurable as inputs or outputs, 3-wire connections, Net-Time function | 3287 |
| X20PD0011 | X20 potential distributor module, 12x GND, integrated microfuse | 3327 |
| X20PD0012 | X20 potential distributor module, 12x 24 VDC, integrated microfuse | 3332 |
| X20PD0016 | X20 potential distributor module, 5x GND, 5x 24 VDC, each with 1x floating feed, integrated microfuse | 3337 |
| X20PD2113 | X20 potential distributor module, 6x GND, 6x 24 VDC, with feed option, integrated microfuse | 3343 |
| X20PS4951 | X20 power supply module, for potentiometers, 4x $\pm 10\text{ V}$ for potentiometer supply | 3349 |

System modules for bus controllers

| Order number | Short description | Page |
|--------------|--|------|
| X20BB80 | X20 bus base, for X20 base module (BC, HB, etc.) and X20 power supply module, X20 end plates (left and right) X20AC0SL1/X20AC0SR1 included | 922 |
| X20PS9400 | X20 power supply module, for bus controller and internal I/O power supply, X2X Link power supply | 926 |
| X20PS9402 | X20 power supply module, for bus controller and internal I/O power supply, X2X Link power supply, supply not electrically isolated | 932 |

System modules for Compact CPUs

| Order number | Short description | Page |
|--------------|--|------|
| X20BB22 | X20 compact CPU base, for compact CPU and compact CPU power supply module, base for integrated RS232 interface, X20 connection, X20 locking plates (left and right) X20AC0SL1/X20AC0SR1 included | 1001 |
| X20BB27 | X20 compact CPU base, for compact CPU and compact CPU power supply module, base for integrated RS232 and CAN bus interface, X20 connection, X20 locking plates (left and right) X20AC0SL1/X20AC0SR1 included | 1003 |
| X20PS9500 | X20 power supply module for Compact and Fieldbus CPUs and internal I/O power supply, X2X Link power supply | 1006 |
| X20PS9502 | X20 power supply module, for Compact and Fieldbus CPUs and internal I/O power supply, X2X Link power supply, supply not electrically isolated | 1012 |

System modules for Compact-S CPUs

| Order number | Short description | Page |
|--------------|---|------|
| X20BB52 | X20 Compact-S bus base, for Compact-S CPU and Compact-S CPU power supply module, base for integrated RS232 interface, X20 connection, X20 end cover plates (left and right) X20AC0SL1/X20AC0SR1 included | 1035 |
| X20BB57 | X20 Compact-S bus base, for Compact-S CPU and Compact-S CPU power supply module, base for integrated RS232 and CAN bus interface, X20 connection, X20 end cover plates (left and right) X20AC0SL1/X20AC0SR1 included | 1037 |
| X20BB62 | X20 Compact-S bus base, for Compact-S CPU and Compact-S CPU power supply module, base for integrated RS232 interface, slots for X20 interface module, X20 connection, X20 end cover plates (left and right) X20AC0SL1/X20AC0SR1 included | 1039 |
| X20BB67 | X20 Compact-S bus base, for Compact-S CPU and Compact-S CPU power supply module, base for integrated RS232 and CAN bus interface, slot for X20 interface module, X20 connection, X20 end cover plates (left and right) X20AC0SL1/X20AC0SR1 included | 1041 |
| X20BB72 | X20 Compact-S bus base, for Compact-S CPU and Compact-S CPU power supply module, base for integrated RS232 interface, 2 slots for X20 interface modules, X20 connection, X20 end cover plates (left and right) X20AC0SL1/X20AC0SR1 included | 1043 |
| X20BB77 | X20 Compact-S bus base, for Compact-S CPU and Compact-S CPU power supply module, base for integrated RS232 and CAN bus interface, 2 slots for X20 interface modules, X20 connection, X20 end cover plates (left and right) X20AC0SL1/X20AC0SR1 included | 1045 |
| X20PS9600 | X20 power supply module, for Compact-S CPU and internal I/O power supply, X2X Link power supply | 1047 |
| X20PS9602 | X20 power supply module, for Compact-S CPU and internal I/O power supply, X2X Link power supply, power supply not electrically isolated | 1055 |

System modules for expandable bus controllers

| Order number | Short description | Page |
|--------------|---|------|
| X20BB81 | X20 bus base, for X20 base module (BC, HB, etc.) and X20 power supply module, with one expansion slot for an X20 add-on module (IF, HB, etc.), X20 locking plates (left and right) X20AC0SL1/X20AC0SR1 included | 2234 |
| X20BB82 | X20 bus base, for X20 base module (BC, HB, etc.) and X20 power supply module, with 2 expansion slots for 2 X20 add-on modules (IF, HB, etc.), X20 locking plates (left and right) X20AC0SL1/X20AC0SR1 included | 2237 |
| X20HB1881 | X20 hub expansion module, integrated 1-port hub, for multimode fiber optic cable | 3619 |
| X20HB1882 | X20 hub expansion module, integrated 1-port hub, for monomode fiber optic cables | 3623 |
| X20HB2880 | X20 hub expansion module, integrated 2-port hub, 2x RJ45 | 3627 |
| X20HB2881 | X20 hub expansion module, integrated 2-port hub, for fiber optic cable | 3632 |
| X20HB2885 | X20 hub expansion module, integrated active 2-port hub, 2x RJ45 | 3641 |
| X20HB2886 | X20 hub expansion module, integrated active 2-port hub, 2 fiber optic interfaces | 3644 |
| X20IF1041-1 | X20 interface module, for DTM configuration, 1 CANopen master interface, electrically isolated, order 1x TB2105 terminal block separately | 2274 |
| X20IF1043-1 | X20 interface module, for DTM configuration, 1 CANopen slave interface, electrically isolated, order 1x TB2105 terminal block separately | 2288 |
| X20IF1051-1 | X20 interface module, for DTM configuration, 1 DeviceNet scanner (master) interface, electrically isolated, order 1x terminal block TB2105 separately! | 2302 |
| X20IF1053-1 | X20 interface module, for DTM configuration, 1 DeviceNet adapter (slave) interface, electrically isolated, order 1x terminal block TB2105 separately! | 2315 |
| X20IF1061-1 | X20 interface module for DTM configuration, 1 PROFIBUS DP V0/V1 master interface, electrically isolated | 2328 |
| X20IF1063-1 | X20 interface module, for DTM configuration, 1 PROFIBUS DP V1 slave interface, electrically isolated | 2342 |
| X20IF1091-1 | X20 interface module, for expandable bus controller, 1 X2X Link master interface, electrically isolated, order 1x TB704 terminal block separately | 2240 |
| X20IF10A1-1 | X20 interface module, for DTM configuration, 1 ASi master interface, electrically isolated, order 1x terminal block TB704 separately! | 2378 |
| X20IF10D1-1 | X20 interface module, for DTM configuration, 1 EtherNet/IP scanner (master) interface, electrically isolated | 2392 |
| X20IF10D3-1 | X20 interface module, for DTM configuration, 1 EtherNet/IP adapter (slave) interface, electrically isolated | 2402 |
| X20IF10E1-1 | X20 interface module, for DTM configuration, 1 PROFINET IO controller (master) interface, electrically isolated | 2413 |
| X20IF10E3-1 | X20 interface module, for DTM configuration, 1 PROFINET IO device (slave) interface module, electrically isolated | 2424 |
| X20IF10G3-1 | X20 interface module for DTM configuration, 1 EtherCAT slave interface, electrically isolated | 2434 |
| X20PS9400 | X20 power supply module, for bus controller and internal I/O power supply, X2X Link power supply | 926 |
| X20PS9402 | X20 power supply module, for bus controller and internal I/O power supply, X2X Link power supply, supply not electrically isolated | 932 |

System modules for Fieldbus CPUs

| Order number | Short description | Page |
|--------------|---|------|
| X20BB32 | X20 Fieldbus CPU base, for Fieldbus CPU and Compact CPU power supply module, base for integrated RS232 interface, slot for X20 interface module, X20 connection, X20 end cover plates (left and right) X20AC0SL1/X20AC0SR1 included | 2253 |
| X20BB37 | X20 Fieldbus CPU base, for Fieldbus CPU and Compact CPU power supply module, base for integrated RS232 and CAN bus interface, slot for X20 interface module, X20 connection, X20 end cover plates (left and right) X20AC0SL1/X20AC0SR1 included | 2255 |
| X20BB42 | X20 fieldbus CPU base, for fieldbus CPU and compact CPU power supply module, base for integrated RS232 interface, 2 slots for X20 interface modules, X20 connection, X20 locking plates (left and right) X20AC0SL1/X20AC0SR1 included | 2258 |
| X20BB47 | X20 fieldbus CPU base, for fieldbus CPU and compact CPU power supply module, base for integrated RS232 and CAN bus interface, 2 slots for X20 interface modules, X20 connection, X20 locking plates (left and right) X20AC0SL1/X20AC0SR1 included | 2260 |
| X20IF1074 | X20 interface module, for SGC, 1 CAN bus interface, max. 1 Mbit/s, electrically isolated, order 1x TB2105 terminal block separately | 2263 |
| X20PS9500 | X20 power supply module for Compact and Fieldbus CPUs and internal I/O power supply, X2X Link power supply | 1006 |
| X20PS9502 | X20 power supply module, for Compact and Fieldbus CPUs and internal I/O power supply, X2X Link power supply, supply not electrically isolated | 1012 |

System modules for hub system

| Order number | Short description | Page |
|--------------|---|------|
| X20BB80 | X20 bus base, for X20 base module (BC, HB, etc.) and X20 power supply module, X20 end plates (left and right) X20AC0SL1/X20AC0SR1 included | 922 |
| X20BB81 | X20 bus base, for X20 base module (BC, HB, etc.) and X20 power supply module, with one expansion slot for an X20 add-on module (IF, HB, etc.), X20 locking plates (left and right) X20AC0SL1/X20AC0SR1 included | 2234 |
| X20BB82 | X20 bus base, for X20 base module (BC, HB, etc.) and X20 power supply module, with 2 expansion slots for 2 X20 add-on modules (IF, HB, etc.), X20 locking plates (left and right) X20AC0SL1/X20AC0SR1 included | 2237 |
| X20HB1881 | X20 hub expansion module, integrated 1-port hub, for multimode fiber optic cable | 3619 |
| X20HB1882 | X20 hub expansion module, integrated 1-port hub, for monomode fiber optic cables | 3623 |
| X20HB2880 | X20 hub expansion module, integrated 2-port hub, 2x RJ45 | 3627 |
| X20HB2881 | X20 hub expansion module, integrated 2-port hub, for fiber optic cable | 3632 |
| X20PS8002 | X20 power supply module for standalone hub and compact link selector | 3636 |
| X20PS9400 | X20 power supply module, for bus controller and internal I/O power supply, X2X Link power supply | 926 |
| X20PS9402 | X20 power supply module, for bus controller and internal I/O power supply, X2X Link power supply, supply not electrically isolated | 932 |

System modules for redundancy system

| Order number | Short description | Page |
|--------------|--|------|
| X20HB2885 | X20 hub expansion module, integrated active 2-port hub, 2x RJ45 | 3641 |
| X20HB2886 | X20 hub expansion module, integrated active 2-port hub, 2 fiber optic interfaces | 3644 |

Temperature measurement

| Order number | Short description | Page |
|--------------|--|------|
| X20AT2222 | X20 temperature input module, 2 inputs for resistance measurement, PT100, PT1000, resolution 0.1°C, 3-wire connections | 3649 |
| X20AT2311 | X20 temperature input module, 2 resistance measurement inputs, PT100, resolution 0.001°C, 4-wire connections | 3659 |
| X20AT2402 | X20 temperature input module, 2 thermocouple inputs, Type J, K, N, S, B, R, resolution 0.1°C | 3667 |
| X20AT4222 | X20 temperature input module, 4 inputs for resistance measurement, PT100, PT1000, resolution 0.1°C, 3-wire connections | 3679 |
| X20AT4232 | X20 temperature input module, 4 inputs for resistance measurement, NTC 10 kΩ, resolution 0.1°C, 2-wire connections | 3689 |
| X20AT6402 | X20 temperature input module, 6 thermocouple inputs, Type J, K, N, S, B, R, resolution 0.1°C | 3698 |
| X20ATA312 | X20 temperature input module, 2 resistance measurement inputs, PT100, resolution 0.01°C, 4-wire connections, NetTime function | 3710 |
| X20ATA492 | X20 temperature input module, 2 thermocouple inputs, type J, K, N, S, B, R, E, C, T, single-channel isolation, NetTime function, 2x PT1000 integrated in terminal block X20TB1E for temperature compensation, order terminal block separately. | 3723 |
| X20ATB312 | X20 temperature input module, 4 resistance measurement inputs, PT100, resolution 0.01°C, 4-wire connections, NetTime function | 3742 |
| X20ATC402 | X20 temperature input module, 6 thermocouple inputs, type J, K, N, S, B, R, E, C, T, NetTime function, 2x PT1000 integrated in terminal block X20TB1E for temperature compensation, order terminal block separately. | 3755 |

Counter functions

| Order number | Short description | Page |
|--------------|---|------|
| X20CM1201 | X20 combination module, 1 AB incremental encoder, 24 V, 4 digital inputs 24 V, 4 channels 24 V configurable as inputs or outputs, flexible digital controller logic | 1875 |
| X20CM1941 | X20 resolver module, 14-bit resolver input, converter up to 12-bit ABR output | 1063 |
| X20CM8281 | X20 universal mixed module, 4 digital inputs, 24 VDC, sink, 1-wire connections, 2 digital outputs, 0.5 A, source, 1-wire connections, 1 analog input, ± 10 V or 0 to 20 mA / 4 to 20 mA, 12-bit converter resolution, 1 analog output, ± 10 V / 0 to 20 mA, 12-bit converter resolution, 2 counters as event counters or gate measurement | 3178 |
| X20DC1073 | X20 digital counter module, 1x SinCos, 1 Vss, 400 kHz input frequency, encoder monitoring, NetTime function | 1899 |
| X20DC1176 | X20 digital counter module, 1 ABR incremental encoder, 5 V, 600 kHz input frequency, 4x evaluation, encoder monitoring, NetTime function | 1071 |
| X20DC1178 | X20 digital counter module, 1 SSI absolute encoder, 5 V, 1 Mbit/s, 32-bit, encoder monitoring, NetTime function | 1087 |
| X20DC1196 | X20 digital counter module, 1 ABR incremental encoders, 5 V, 600 kHz input frequency, 4x resolution | 1105 |
| X20DC1198 | X20 digital counter module, 1 SSI absolute encoder, 5 V, 1 Mbit/s, 32-bit | 1115 |
| X20DC11A6 | X20 digital counter module, 1 ABR incremental encoder, 5 V, 5 MHz input frequency, 4x evaluation, encoder monitoring, NetTime function | 1122 |
| X20DC1376 | X20 digital counter module, 1 ABR incremental encoder, 24 V, 100 kHz input frequency, 4x evaluation, encoder monitoring, NetTime function | 1137 |
| X20DC1396 | X20 digital counter module, 1 ABR incremental encoders, 24 V, 100 kHz input frequency, 4x evaluation | 1169 |
| X20DC137A | X20 digital counter module, 1 ABR incremental encoder, 24 V (differential), 300 kHz input frequency, 4x evaluation, encoder monitoring, NetTime function | 1153 |
| X20DC1398 | X20 digital counter module, 1 SSI absolute encoder, 24 V, 125 kbit/s, 32-bit | 1179 |
| X20DC1976 | X20 digital counter module, 1 ABR incremental encoder, 5 V (single-ended), 250 kHz input frequency, 4x evaluation, encoder monitoring, NetTime function | 1186 |
| X20DC2190 | X20 digital counter module, ultrasonic transducer module, interfaces: EP start/stop, DPI/IP, 2 transducer rods, 4-position detection | 1202 |
| X20DC2395 | X20 digital counter module, 1 SSI absolute encoder, 24 V, 1 ABR incremental encoder, 24 V, 2 AB incremental encoders, 24 V, 4 event counters or 2 PWM, local time measurement function | 1216 |
| X20DC2396 | X20 digital counter module, 2 ABR incremental encoders, 24 V, 100 kHz input frequency, 4x evaluation | 1256 |
| X20DC2398 | X20 digital counter module, 2 SSI absolute encoder, 24 V, 125 kbit/s, 32-bit | 1267 |
| X20DC4395 | X20 digital counter module, 2 SSI absolute encoders, 24 V, 2 ABR incremental encoders, 24 V, 4 AB incremental encoders, 24 V, 8 event counters or 4 PWM, local time measurement functions | 1275 |
| X20DS1119 | X20 multifunction digital signal processor, 3 digital channels 5 V (symmetrical) configurable as inputs or outputs, 2 digital input channels 24 V (asymmetrical), max. 2 event counters, 1 universal counter pair as AB counter or up/down counter, linear movement generator (A/B, direction/frequency) with 1 reference pulse, 1 SSI absolute encoder, NetTime function | 1914 |

6.2 Coated modules

6.2.1 Module overview: Alphabetically

| Order number | Short description | Page |
|---------------|---|------|
| X20cAI1744 | X20 analog input module, coated, 1 full-bridge strain gauge input, 24-bit converter resolution, 5 kHz input filter | 196 |
| X20cAI1744-3 | X20 analog input module, coated, 1 full-bridge strain gauge input, 24-bit converter resolution, 5 Hz input filter | 243 |
| X20cAI2438 | X20 analog input module, coated, 2 inputs, 4 to 20 mA, 16-bit converter resolution, single-channel isolation with separate sensor power supply, supports the HART protocol, NetTime function | 373 |
| X20cAI4622 | X20 analog input module, coated, 4 inputs, ± 10 V or 0 to 20 mA / 4 to 20 mA, 13-bit converter resolution, configurable input filter | 509 |
| X20cAI4632 | X20 analog input module, coated, 4 inputs, ± 10 V or 0 to 20 mA, 16-bit converter resolution, configurable input filter, oscilloscope functions | 520 |
| X20cAI4632-1 | X20 analog input module, coated, 4 inputs, ± 11 V or 0 to 22 mA, 16-bit converter resolution, configurable input filter, oscilloscope functions | 545 |
| X20cAO2437 | X20 analog output module, coated, 2 outputs, 4 to 20 mA / 0 to 20 mA or 0 to 24 mA, 16-bit converter resolution, single channel electrically isolated | 735 |
| X20cAO2438 | X20 analog output module, coated, 2 outputs, 4 to 20 mA / 0 to 20 mA or 0 to 24 mA, 16-bit converter resolution, single-channel isolation, supports the HART protocol, NetTime function | 748 |
| X20cAO4622 | X20 analog output module, coated, 4 outputs, ± 10 V or 0 to 20 mA / 4 to 20 mA, 13-bit converter resolution | 796 |
| X20cAO4632 | X20 analog output module, coated, 4 outputs, ± 10 V or 0 to 20 mA, 16-bit converter resolution, NetTime function | 805 |
| X20cAO4632-1 | X20 analog output module, coated, 4 outputs, ± 11 V or 0 to 22 mA, 16-bit converter resolution, NetTime function | 815 |
| X20cAP3121 | X20 energy metering module, coated, 3 analog inputs, 480 VAC, 50/60 Hz, 4 analog inputs, 1 A AC, calculates effective, reactive and apparent power/energy, calculates RMS values, 240 V keyed, NetTime function | 661 |
| X20cAP3131 | X20 energy metering module, coated, 3 analog inputs, 480 VAC, 50/60 Hz, 4 analog inputs, 5 A AC, calculates effective, reactive and apparent power/energy, calculates RMS values, 240 V keyed, NetTime function | 661 |
| X20cAT2311 | X20 temperature input module, coated, 2 resistance measurement inputs, PT100, resolution 0.001°C, 4-wire connections | 3659 |
| X20cAT4222 | X20 temperature input module, coated, 4 inputs for resistance measurement, PT100, PT1000, resolution 0.1°C, 3-wire connections | 3679 |
| X20cAT6402 | X20 temperature input module, coated, 6 thermocouple inputs, Type J, K, N, S, B, R, resolution 0.1°C | 3698 |
| X20cBB80 | X20 bus base, coated, for X20 base module (BC, HB, etc.) and X20 power supply module, X20 end plates (left and right) X20AC0SL1/X20AC0SR1 included | 922 |
| X20cBB81 | X20 bus base, coated, for X20 base module (BC, HB, etc.) and X20 power supply module, with one expansion slot for an X20 add-on module (IF, HB, etc.), X20 locking plates (left and right) X20AC0SL1/X20AC0SR1 included | 2234 |
| X20cBB82 | X20 bus base, coated, for X20 base module (BC, HB, etc.) and X20 power supply module, with two expansion slots for two X20 add-on modules (IF, HB, etc.), X20 locking plates (left and right) X20AC0SL1/X20AC0SR1 included | 2237 |
| X20cBC0083 | X20 bus controller, coated, 1 POWERLINK interface, integrated 2-port hub, 2x RJ45, order bus base, power supply module and terminal block separately! | 859 |
| X20cBC0087 | X20 bus controller, coated, Modbus/TCP or Modbus/UDP interface, integrated 2-port switch, 2x RJ45, order bus base, power supply module and terminal block separately | 864 |
| X20cBC0088 | X20 bus controller, coated, 1 EtherNet/IP interface, integrated switch, web interface, 2x RJ45, order bus base, power supply module and terminal block separately! | 877 |
| X20cBC00E3 | X20 bus controller, coated, 1 PROFINET IO interface, integrated 2-port switch, 2x RJ45, order bus base, power supply module and terminal block separately! | 904 |
| X20cBC1083 | X20 bus controller, coated, 1 POWERLINK interface, integrated 2-port hub, supports X20 interface module expansions, 2 RJ45, order bus base, power supply module and terminal block separately | 2213 |
| X20cBC8083 | X20 bus controller, coated, 1 POWERLINK interface, integrated 2-port hub, supports X20 hub module expansions, 2 RJ45, order bus base, power supply module and terminal block separately | 2220 |
| X20cBC8084 | X20 bus controller, coated, 1 POWERLINK interface, 1x link selector for POWERLINK cable redundancy, supports expansion with active X20 hub modules, 2x RJ45, order bus base, power supply module and terminal block separately! | 2227 |
| X20cBM01 | X20 power supply bus module, coated, 24 VDC keyed, internal I/O supply interrupted to the left | 939 |
| X20cBM11 | X20 bus module, coated, 24 VDC keyed, internal I/O supply continuous | 945 |
| X20cBM12 | X20 bus module, coated, 240 VAC keyed, internal I/O supply continuous | 948 |
| X20cBM31 | X20 bus module, coated, for double-width modules, 24 VDC keyed, internal I/O supply continuous | 956 |
| X20cBM32 | X20 bus module, coated, for double-width modules, 240 VAC keyed, internal I/O supply continuous | 959 |
| X20cBR9300 | X20 bus receiver, coated, X2X Link, supply for X2X Link and internal I/O power supply, X20 end cover plates (left and right) X20AC0SL1/X20AC0SR1 included | 973 |
| X20cBT9100 | X20 bus transmitter, coated, X2X Link, supply for internal I/O supply | 980 |
| X20cCM0985-1 | X20 digital and analog mixed module, coated, multi-measurement transducer / synchronization module, 5 digital outputs, 24 VDC, 0.5 A, source, 1 relay, 1 A, 8 analog inputs, ± 480 V / 120 V, 16-bit converter resolution, 3 analog inputs, 5 A / 1 A AC, 16-bit converter resolution, additional software functionalities, order terminal blocks 0TB3102-7011, 0TB3104-7011, 0TB3102-7012, 0TB3104-7012 and 2x X20TB12 separately! | 2921 |
| X20cCM4810 | X20 analog input module, coated, for vibration measurement and analysis of condition monitoring tasks, 4 IEPe analog inputs, 51.5625 kHz sampling frequency, 24-bit converter resolution | 3039 |
| X20cCP1301 | X20 CPU coated, with integrated I/O, x86-200, 128 MB DDR3 RAM, 16 kB FRAM, 1 GB onboard flash drive, 1 insert slot for X20 interface modules, 1 USB interface, 1 RS232 interface, 1 Ethernet interface 10/100BASE-T, 14 digital inputs, 24 VDC, sink, 4 digital inputs, 2 μ s, 24 VDC, sink, 4 digital outputs, 24 VDC, 0.5 A, source, 4 digital outputs, 2 μ s, 24 VDC, 0.2 A, 4 digital inputs/outputs, 24 VDC, 0.5 A, 2 analog inputs ± 10 V or 0 to 20 mA / 4 to 20 mA, 1 PT1000 instead of an analog input, includes power supply module, 3x terminal block X20TB1F, slot cover and X20 end cover plate X20AC0SR1 (right) included | 1324 |
| X20cCP1382-RT | X20 CPU, coated with integrated I/O, x86-400, 256 MB DDR3 RAM, 32 kB FRAM, 2 GB flash drive on board, 1 insert slot for X20 interface modules, 2 USB interfaces, 1 RS232 interface, 1 CAN bus interface, 1 POWERLINK interface, 1 Ethernet interface 10/100 Base-T, reACTION Technology, 14 digital inputs, 24 VDC, sink, 4 digital inputs, 2 μ s, 24 VDC, sink, 4 digital outputs, 24 VDC, 0.5 A, source, 4 digital outputs, 2 μ s, 24 VDC, 0.2 A, 4 digital inputs/outputs, 24 VDC, 0.5 A, 2 analog inputs ± 10 V or 0 to 20 mA / 4 to 20 mA, 1 PT1000 instead of an analog input, including supply module, 3x X20TB1F terminal blocks, slot cover and X20AC0SR1 end cover plate (right) included | 3382 |
| X20cCP1584 | X20 CPU, coated, Atom 0.6 GHz, 256 MB DDR2 RAM, 1 MB SRAM, removable application memory: CompactFlash, 1 insert slot for X20 interface modules, 2 USB interfaces, 1 RS232 interface, 1 Ethernet interface 10/100/1000BASE-T, 1 POWERLINK interface, including power supply module, 1x terminal block X20TB12, slot cover and X20 end cover plate X20AC0SR1 (right) included, order application memory separately! | 1397 |

| Order number | Short description | Page |
|--------------|---|------|
| X20cCP1586 | X20 CPU, coated, Atom 1.6 GHz, 512 MB DDR2 RAM, 1 MB SRAM, removable application memory: CompactFlash, 1 insert slot for X20 interface modules, 2 USB interfaces, 1 RS232 interface, 1 Ethernet interface 10/100/1000BASE-T, 1 POWERLINK interface, including power supply module, 1x terminal block X20TB12, slot cover and X20 end cover plate X20AC0SR1 (right) included, order application memory separately! | 1397 |
| X20cCP3584 | X20 CPU, coated, ATOM 0.6 GHz, 256 MB DDR2 RAM, 1 MB SRAM, removable application memory: CompactFlash, 3 insert slots for X20 interface modules, 2 USB interfaces, 1 RS232 interface, 1 Ethernet interface 10/100/1000 Base-T, 1 POWERLINK interface, incl. supply module, 1 X20TB12 terminal block, slot covers and X20 end cover plate (right) X20AC0SR1 included, order application memory separately. | 1401 |
| X20cCP3586 | X20 CPU, coated, ATOM 1.6 GHz, 512 MB DDR2 RAM, 1 MB SRAM, removable application memory: CompactFlash, 3 insert slots for X20 interface modules, 2 USB interfaces, 1 RS232 interface, 1 Ethernet interface 10/100/1000 Base-T, 1 POWERLINK interface, incl. supply module, 1 X20TB12 terminal block, slot covers and X20 end cover plate (right) X20AC0SR1 included, order application memory separately. | 1401 |
| X20cCS1020 | X20 interface module, coated, 1 RS232 interface, max. 115.2 kbit/s | 2147 |
| X20cCS1030 | X20 interface module, coated, 1 RS422/485 interface, max. 115.2 kbit/s | 2162 |
| X20cDC1196 | X20 digital counter module, coated, 1 ABR incremental encoder, 5 V, 600 kHz input frequency, 4x resolution | 1105 |
| X20cDC1198 | X20 digital counter module, coated, 1 SSI absolute encoders, 5 V, 1 Mbit/s, 32-bit | 1115 |
| X20cDC1396 | X20 digital counter module, coated, 1 ABR incremental encoders, 24 V, 100 kHz input frequency, 4x evaluation | 1169 |
| X20cDC2190 | X20 digital counter module, coated, ultrasonic transducer module, interfaces: EP start/stop, DPI/IP, 2 transducer rods, 4-position detection | 1202 |
| X20cDC2395 | X20 digital counter module, coated, 1 SSI absolute encoder, 24 V, 1 ABR incremental encoder, 24 V, 2 AB incremental encoders, 24 V, 4 event counters or 2 PWM, local time measurement function | 1216 |
| X20cDI4371 | X20 digital input module, coated, 4 inputs, 24 VDC, sink, configurable input filter, 3-wire connections | 1473 |
| X20cDI4375 | X20 digital input module, coated, 4 inputs, 24 VDC, sink, configurable input filter, open-circuit and short-circuit detection, 3-wire connections | 1486 |
| X20cDI4760 | X20 digital input module, coated, 4 NAMUR inputs, 8.05 V | 1505 |
| X20cDI6371 | X20 digital input module, coated, 6 inputs, 24 VDC, sink, configurable input filter, 2-wire connections | 1514 |
| X20cDI6372 | X20 digital input module, coated, 6 inputs, 24 VDC, source, configurable input filter, 2-wire connections | 1520 |
| X20cDI9371 | X20 digital input module, coated, 12 inputs, 24 VDC, sink, configurable input filter, 1-wire connections | 1544 |
| X20cDI9372 | X20 digital input module, coated, 12 inputs, 24 VDC, source, configurable input filter, 1-wire connections | 1551 |
| X20cDIF371 | X20 digital input module, coated, 16 inputs, 24 VDC, sink, configurable input filter, 1-wire connections | 1564 |
| X20cDM9324 | X20 digital mixed module, coated, 8 inputs, 24 VDC, sink, configurable input filter, 4 outputs, 24 VDC, 0.5 A, source, 1-wire connections | 1572 |
| X20cDO2633 | X20 digital output module, coated, 2 triac outputs, 48 to 240 VAC, 2 A, L switching, phase angle control, 240 V keyed | 1610 |
| X20cDO4322 | X20 digital output module, coated, 4 outputs, 24 VDC, 0.5 A, source, 3-wire connections | 1641 |
| X20cDO4332 | X20 digital output module, coated, 4 outputs, 24 VDC, 2 A, source, 3-wire connections | 1659 |
| X20cDO4633 | X20 digital output module, coated, 4 triac outputs, 48 to 240 VAC, 1 A, L switching, phase angle control, 240 V keyed | 1709 |
| X20cDO4649 | X20 digital output module, coated, 4 relays, N.O. contacts, 240 VAC / 5 A | 1726 |
| X20cDO6321 | X20 digital output module, coated, 6 outputs, 24 VDC, 0.5 A, sink, 2-wire connections | 1739 |
| X20cDO6322 | X20 digital output module, coated, 6 outputs, 24 VDC, 0.5 A, source, 2-wire connections | 1746 |
| X20cDO6529 | X20 digital output module, coated, 6 relays, normally open contacts, 115 VAC / 0.5 A, 30 VDC / 1 A | 1766 |
| X20cDO6639 | X20 digital output module, coated, 6 relays, normally open contacts, 240 VAC / 2 A, 30 VDC / 2 A | 1773 |
| X20cDO8331 | X20 digital output module, coated, 8 outputs, 24 VDC, 2 A, sink, supply directly on module, 1-wire connections | 1808 |
| X20cDO8332 | X20 digital output module, coated, 8 outputs, 24 VDC, 2 A, source, supply directly on module, 1-wire connections | 1820 |
| X20cDO9321 | X20 digital output module, coated, 12 outputs, 24 VDC, 0.5 A, sink, 1-wire connections | 1843 |
| X20cDO9322 | X20 digital output module, coated, 12 outputs, 24 VDC, 0.5 A, source, 1-wire connections | 1851 |
| X20cDOF322 | X20 digital output module, coated, 16 output, 24 VDC, 0.5 A, source, 1-wire connections | 1866 |
| X20cDS1119 | X20 multifunction digital signal processor, coated, 3 digital channels 5 V (symmetrical) configurable as inputs or outputs, 2 digital input channels 24 V (asymmetrical), max. 2 event counters, 1 universal counter pair as AB counter or up/down counter, linear movement generator (A/B, direction/frequency) with 1 reference pulse, 1 SSI absolute encoder, NetTime function | 1914 |
| X20cDS438A | X20 digital signal module, coated, 4x IO-Link master V1.1, 4 digital channels configurable as inputs or outputs, 3-wire connections, NetTime function | 3287 |
| X20cHB1881 | X20 hub expansion module, coated, integrated 1-port hub, for fiber optic cable | 3619 |
| X20cHB2880 | X20 hub expansion module, coated, integrated 2-port hub, 2x RJ45 | 3627 |
| X20cHB2881 | X20 hub expansion module, coated, integrated 2-port hub, for fiber optic cable | 3632 |
| X20cHB2885 | X20 hub expansion module, coated, integrated active 2-port hub, 2x RJ45 | 3641 |
| X20cHB2886 | X20 hub expansion module, coated, integrated active 2-port hub, 2 fiber optic interfaces | 3644 |
| X20cHB8815 | X20 POWERLINK - TCP/IP gateway, coated, can be expanded with active hub modules, 2x RJ45 | 2480 |
| X20cHB8880 | X20 base hub module, coated, integrated 2-port hub, 2x RJ45 | 2490 |
| X20cHB8884 | X20 compact link selector, coated, 2x RJ45, order bus base, power supply module and terminal block separately. | 3614 |
| X20clF1030 | X20 interface module, coated, 1 RS422/485 interface, max. 115.2 kbit/s, electrically isolated | 2271 |
| X20clF1041-1 | X20 interface module, coated, for DTM configuration, 1 CANopen master interface, electrically isolated, order 1x TB2105 terminal block separately | 2274 |
| X20clF1061-1 | X20 interface module coated, for DTM configuration, 1 PROFIBUS DP V0/V1 master interface, electrically isolated | 2328 |
| X20clF1063-1 | X20 interface module, coated, for DTM configuration, 1 PROFIBUS DP V1 slave interface, electrically isolated | 2342 |
| X20clF1072 | X20 interface module, coated, 1 CAN bus interface, max. 1 Mbit/s, electrically isolated, order 1x TB2105 terminal block separately | 2353 |
| X20clF1082-2 | X20 interface module, coated, 1 POWERLINK interface, managing or controlled node, integrated 2-port hub, ring redundancy function PRC function | 2363 |
| X20clF10D1-1 | X20 interface module, coated, for DTM configuration, 1 EtherNet/IP scanner (master) interface, electrically isolated | 2392 |
| X20clF10D3-1 | X20 interface module, coated, for DTM configuration, 1 EtherNet/IP adapter (slave) interface, electrically isolated | 2402 |
| X20clF10E3-1 | X20 interface module, coated, for DTM configuration, 1 PROFINET IO device (slave) interface module, electrically isolated | 2424 |
| X20clF10X0 | X20 interface module, coated, 1 redundancy link interface 1000 Base-FX, CPU-CPU data synchronization for controller redundancy | 2447 |
| X20clF2181-2 | X20 interface module, coated, 1x link selector for POWERLINK cable redundancy, POWERLINK functions: - Managing node - Controlled node for iCN operation - Redundant managing node for controller redundancy - Ring redundancy - 2x hub - Multi ASend - PRC function 2x RJ45 | 2452 |
| X20cMM2436 | Coated X20 PWM motor module, 24 to 39 VDC \pm 25%, 2 PWM motor bridges, 3 A continuous current, 3.5 A peak current, 4 digital inputs 24 VDC, sink, configurable as incremental encoder | 2496 |

Module overviews

| Order number | Short description | Page |
|----------------------------|--|----------------------|
| X20cPD2113 | X20 potential distributor, coated, 6x GND, 6x 24 VDC, with supply option, integrated microfuse | 3343 |
| X20cPS2100 | X20 power supply module, coated, for internal I/O supply | 3356 |
| X20cPS2110 | X20 power supply module, coated, for internal I/O power supply, integrated microfuse | 3361 |
| X20cPS3300 | X20 power supply module, coated, for X2X Link and internal I/O power supply | 3367 |
| X20cPS3310 | X20 power supply module, coated, for X2X Link and internal I/O power supply integrated microfuse | 3373 |
| X20cPS8002 | X20 power supply module, coated, for standalone hub and compact link selector | 3636 |
| X20cPS9400 | X20 power supply module, coated, for bus controller and internal I/O power supply, X2X Link power supply | 926 |

6.2.2 Module overview: Grouped

6.2.2.1 CPUs

Standard CPU

| Order number | Short description | Page |
|----------------------------|--|----------------------|
| X20cCP1301 | X20 CPU coated, with integrated I/O, x86-200, 128 MB DDR3 RAM, 16 kB FRAM, 1 GB onboard flash drive, 1 insert slot for X20 interface modules, 1 USB interface, 1 RS232 interface, 1 Ethernet interface 10/100BASE-T, 14 digital inputs, 24 VDC, sink, 4 digital outputs, 24 VDC, 0.5 A, source, 4 digital outputs, 2 μ s, 24 VDC, 0.2 A, 4 digital inputs/outputs, 24 VDC, 0.5 A, 2 analog inputs \pm 10 V or 0 to 20 mA / 4 to 20 mA, 1 PT1000 instead of an analog input, includes power supply module, 3x terminal block X20TB1F, slot cover and X20 end cover plate X20AC0SR1 (right) included | 1324 |
| X20cCP1584 | X20 CPU, coated, Atom 0.6 GHz, 256 MB DDR2 RAM, 1 MB SRAM, removable application memory: CompactFlash, 1 insert slot for X20 interface modules, 2 USB interfaces, 1 RS232 interface, 1 Ethernet interface 10/100/1000BASE-T, 1 POWERLINK interface, including power supply module, 1x terminal block X20TB12, slot cover and X20 end cover plate X20AC0SR1 (right) included, order application memory separately! | 1397 |
| X20cCP1586 | X20 CPU, coated, Atom 1.6 GHz, 512 MB DDR2 RAM, 1 MB SRAM, removable application memory: CompactFlash, 1 insert slot for X20 interface modules, 2 USB interfaces, 1 RS232 interface, 1 Ethernet interface 10/100/1000BASE-T, 1 POWERLINK interface, including power supply module, 1x terminal block X20TB12, slot cover and X20 end cover plate X20AC0SR1 (right) included, order application memory separately! | 1397 |
| X20cCP3584 | X20 CPU, coated, ATOM 0.6 GHz, 256 MB DDR2 RAM, 1 MB SRAM, removable application memory: CompactFlash, 3 insert slots for X20 interface modules, 2 USB interfaces, 1 RS232 interface, 1 Ethernet interface 10/100/1000 Base-T, 1 POWERLINK interface, incl. supply module, 1 X20TB12 terminal block, slot covers and X20 end cover plate (right) X20AC0SR1 included, order application memory separately. | 1401 |
| X20cCP3586 | X20 CPU, coated, ATOM 1.6 GHz, 512 MB DDR2 RAM, 1 MB SRAM, removable application memory: CompactFlash, 3 insert slots for X20 interface modules, 2 USB interfaces, 1 RS232 interface, 1 Ethernet interface 10/100/1000 Base-T, 1 POWERLINK interface, incl. supply module, 1 X20TB12 terminal block, slot covers and X20 end cover plate (right) X20AC0SR1 included, order application memory separately. | 1401 |

reACTION Technology CPU

| Order number | Short description | Page |
|-------------------------------|---|----------------------|
| X20cCP1382-RT | X20 CPU, coated with integrated I/O, x86-400, 256 MB DDR3 RAM, 32 kB FRAM, 2 GB flash drive on board, 1 insert slot for X20 interface modules, 2 USB interfaces, 1 RS232 interface, 1 CAN bus interface, 1 POWERLINK interface, 1 Ethernet interface 10/100 Base-T, reACTION Technology, 14 digital inputs, 24 VDC, sink, 4 digital inputs, 2 μ s, 24 VDC, sink, 4 digital outputs, 24 VDC, 0.5 A, source, 4 digital outputs, 2 μ s, 24 VDC, 0.2 A, 4 digital inputs/outputs, 24 VDC, 0.5 A, 2 analog inputs \pm 10 V or 0 to 20 mA / 4 to 20 mA, 1 PT1000 instead of an analog input, including supply module, 3x X20TB1F terminal blocks, slot cover and X20AC0SR1 end cover plate (right) included | 3382 |

6.2.2.2 Other modules

Analog outputs

| Order number | Short description | Page |
|--------------|---|------|
| X20cAO2437 | X20 analog output module, coated, 2 outputs, 4 to 20 mA / 0 to 20 mA or 0 to 24 mA, 16-bit converter resolution, single channel electrically isolated | 735 |
| X20cAO2438 | X20 analog output module, coated, 2 outputs, 4 to 20 mA / 0 to 20 mA or 0 to 24 mA, 16-bit converter resolution, single-channel isolation, supports the HART protocol, NetTime function | 748 |
| X20cAO4622 | X20 analog output module, coated, 4 outputs, ± 10 V or 0 to 20 mA / 4 to 20 mA, 13-bit converter resolution | 796 |
| X20cAO4632 | X20 analog output module, coated, 4 outputs, ± 10 V or 0 to 20 mA, 16-bit converter resolution, NetTime function | 805 |
| X20cAO4632-1 | X20 analog output module, coated, 4 outputs, ± 11 V or 0 to 22 mA, 16-bit converter resolution, NetTime function | 815 |

Analog inputs

| Order number | Short description | Page |
|--------------|---|------|
| X20cAI1744 | X20 analog input module, coated, 1 full-bridge strain gauge input, 24-bit converter resolution, 5 kHz input filter | 196 |
| X20cAI1744-3 | X20 analog input module, coated, 1 full-bridge strain gauge input, 24-bit converter resolution, 5 Hz input filter | 243 |
| X20cAI2438 | X20 analog input module, coated, 2 inputs, 4 to 20 mA, 16-bit converter resolution, single-channel isolation with separate sensor power supply, supports the HART protocol, NetTime function | 373 |
| X20cAI4622 | X20 analog input module, coated, 4 inputs, ± 10 V or 0 to 20 mA / 4 to 20 mA, 13-bit converter resolution, configurable input filter | 509 |
| X20cAI4632 | X20 analog input module, coated, 4 inputs, ± 10 V or 0 to 20 mA, 16-bit converter resolution, configurable input filter, oscilloscope functions | 520 |
| X20cAI4632-1 | X20 analog input module, coated, 4 inputs, ± 11 V or 0 to 22 mA, 16-bit converter resolution, configurable input filter, oscilloscope functions | 545 |
| X20cAP3121 | X20 energy metering module, coated, 3 analog inputs, 480 VAC, 50/60 Hz, 4 analog inputs, 1 A AC, calculates effective, reactive and apparent power/energy, calculates RMS values, 240 V keyed, NetTime function | 661 |
| X20cAP3131 | X20 energy metering module, coated, 3 analog inputs, 480 VAC, 50/60 Hz, 4 analog inputs, 5 A AC, calculates effective, reactive and apparent power/energy, calculates RMS values, 240 V keyed, NetTime function | 661 |
| X20cCM0985-1 | X20 digital and analog mixed module, coated, multi-measurement transducer / synchronization module, 5 digital outputs, 24 VDC, 0.5 A, source, 1 relay, 1 A, 8 analog inputs, ± 480 V / 120 V, 16-bit converter resolution, 3 analog inputs, 5 A / 1 A AC, 16-bit converter resolution, additional software functionalities, order terminal blocks 0TB3102-7011, 0TB3104-7011, 0TB3102-7012, 0TB3104-7012 and 2x X20TB12 separately! | 2921 |

Bus Controllers

| Order number | Short description | Page |
|--------------|--|------|
| X20cBC0083 | X20 bus controller, coated, 1 POWERLINK interface, integrated 2-port hub, 2x RJ45, order bus base, power supply module and terminal block separately! | 859 |
| X20cBC0087 | X20 bus controller, coated, Modbus/TCP or Modbus/UDP interface, integrated 2-port switch, 2x RJ45, order bus base, power supply module and terminal block separately | 864 |
| X20cBC0088 | X20 bus controller, coated, 1 EtherNet/IP interface, integrated switch, web interface, 2x RJ45, order bus base, power supply module and terminal block separately! | 877 |
| X20cBC00E3 | X20 bus controller, coated, 1 PROFINET IO interface, integrated 2-port switch, 2x RJ45, order bus base, power supply module and terminal block separately! | 904 |

Bus receivers and bus transmitters

| Order number | Short description | Page |
|--------------|---|------|
| X20cBR9300 | X20 bus receiver, coated, X2X Link, supply for X2X Link and internal I/O power supply, X20 end cover plates (left and right) X20AC0SL1/X20AC0SR1 included | 973 |
| X20cBT9100 | X20 bus transmitter, coated, X2X Link, supply for internal I/O supply | 980 |

Bus modules

| Order number | Short description | Page |
|--------------|---|------|
| X20cBM01 | X20 power supply bus module, coated, 24 VDC keyed, internal I/O supply interrupted to the left | 939 |
| X20cBM11 | X20 bus module, coated, 24 VDC keyed, internal I/O supply continuous | 945 |
| X20cBM12 | X20 bus module, coated, 240 VAC keyed, internal I/O supply continuous | 948 |
| X20cBM31 | X20 bus module, coated, for double-width modules, 24 VDC keyed, internal I/O supply continuous | 956 |
| X20cBM32 | X20 bus module, coated, for double-width modules, 240 VAC keyed, internal I/O supply continuous | 959 |

Digital outputs

| Order number | Short description | Page |
|--------------|---|------|
| X20cCM0985-1 | X20 digital and analog mixed module, coated, multi-measurement transducer / synchronization module, 5 digital outputs, 24 VDC, 0.5 A, source, 1 relay, 1 A, 8 analog inputs, ± 480 V / 120 V, 16-bit converter resolution, 3 analog inputs, 5 A / 1 A AC, 16-bit converter resolution, additional software functionalities, order terminal blocks OTB3102-7011, OTB3104-7011, OTB3102-7012, OTB3104-7012 and 2x X20TB12 separately! | 2921 |
| X20cDM9324 | X20 digital mixed module, coated, 8 inputs, 24 VDC, sink, configurable input filter, 4 outputs, 24 VDC, 0.5 A, source, 1-wire connections | 1572 |
| X20cDO2633 | X20 digital output module, coated, 2 triac outputs, 48 to 240 VAC, 2 A, L switching, phase angle control, 240 V keyed | 1610 |
| X20cDO4322 | X20 digital output module, coated, 4 outputs, 24 VDC, 0.5 A, source, 3-wire connections | 1641 |
| X20cDO4332 | X20 digital output module, coated, 4 outputs, 24 VDC, 2 A, source, 3-wire connections | 1659 |
| X20cDO4633 | X20 digital output module, coated, 4 triac outputs, 48 to 240 VAC, 1 A, L switching, phase angle control, 240 V keyed | 1709 |
| X20cDO4649 | X20 digital output module, coated, 4 relays, N.O. contacts, 240 VAC / 5 A | 1726 |
| X20cDO6321 | X20 digital output module, coated, 6 outputs, 24 VDC, 0.5 A, sink, 2-wire connections | 1739 |
| X20cDO6322 | X20 digital output module, coated, 6 outputs, 24 VDC, 0.5 A, source, 2-wire connections | 1746 |
| X20cDO6529 | X20 digital output module, coated, 6 relays, normally open contacts, 115 VAC / 0.5 A, 30 VDC / 1 A | 1766 |
| X20cDO6639 | X20 digital output module, coated, 6 relays, normally open contacts, 240 VAC / 2 A, 30 VDC / 2 A | 1773 |
| X20cDO8331 | X20 digital output module, coated, 8 outputs, 24 VDC, 2 A, sink, supply directly on module, 1-wire connections | 1808 |
| X20cDO8332 | X20 digital output module, coated, 8 outputs, 24 VDC, 2 A, source, supply directly on module, 1-wire connections | 1820 |
| X20cDO9321 | X20 digital output module, coated, 12 outputs, 24 VDC, 0.5 A, sink, 1-wire connections | 1843 |
| X20cDO9322 | X20 digital output module, coated, 12 outputs, 24 VDC, 0.5 A, source, 1-wire connections | 1851 |
| X20cDOF322 | X20 digital output module, coated, 16 output, 24 VDC, 0.5 A, source, 1-wire connections | 1866 |
| X20cDS1119 | X20 multifunction digital signal processor, coated, 3 digital channels 5 V (symmetrical) configurable as inputs or outputs, 2 digital input channels 24 V (asymmetrical), max. 2 event counters, 1 universal counter pair as AB counter or up/down counter, linear movement generator (A/B, direction/frequency) with 1 reference pulse, 1 SSI absolute encoder, NetTime function | 1914 |

Digital inputs

| Order number | Short description | Page |
|--------------|---|------|
| X20cDI4371 | X20 digital input module, coated, 4 inputs, 24 VDC, sink, configurable input filter, 3-wire connections | 1473 |
| X20cDI4375 | X20 digital input module, coated, 4 inputs, 24 VDC, sink, configurable input filter, open-circuit and short-circuit detection, 3-wire connections | 1486 |
| X20cDI4760 | X20 digital input module, coated, 4 NAMUR inputs, 8.05 V | 1505 |
| X20cDI6371 | X20 digital input module, coated, 6 inputs, 24 VDC, sink, configurable input filter, 2-wire connections | 1514 |
| X20cDI6372 | X20 digital input module, coated, 6 inputs, 24 VDC, source, configurable input filter, 2-wire connections | 1520 |
| X20cDI9371 | X20 digital input module, coated, 12 inputs, 24 VDC, sink, configurable input filter, 1-wire connections | 1544 |
| X20cDI9372 | X20 digital input module, coated, 12 inputs, 24 VDC, source, configurable input filter, 1-wire connections | 1551 |
| X20cDIF371 | X20 digital input module, coated, 16 inputs, 24 VDC, sink, configurable input filter, 1-wire connections | 1564 |
| X20cDM9324 | X20 digital mixed module, coated, 8 inputs, 24 VDC, sink, configurable input filter, 4 outputs, 24 VDC, 0.5 A, source, 1-wire connections | 1572 |
| X20cDS1119 | X20 multifunction digital signal processor, coated, 3 digital channels 5 V (symmetrical) configurable as inputs or outputs, 2 digital input channels 24 V (asymmetrical), max. 2 event counters, 1 universal counter pair as AB counter or up/down counter, linear movement generator (A/B, direction/frequency) with 1 reference pulse, 1 SSI absolute encoder, NetTime function | 1914 |

Digital inputs and outputs

| Order number | Short description | Page |
|--------------|---|------|
| X20cDM9324 | X20 digital mixed module, coated, 8 inputs, 24 VDC, sink, configurable input filter, 4 outputs, 24 VDC, 0.5 A, source, 1-wire connections | 1572 |

Digital signal processing and preparation

| Order number | Short description | Page |
|--------------|---|------|
| X20cDS1119 | X20 multifunction digital signal processor, coated, 3 digital channels 5 V (symmetrical) configurable as inputs or outputs, 2 digital input channels 24 V (asymmetrical), max. 2 event counters, 1 universal counter pair as AB counter or up/down counter, linear movement generator (A/B, direction/frequency) with 1 reference pulse, 1 SSI absolute encoder, NetTime function | 1914 |

Power supply modules

| Order number | Short description | Page |
|--------------|--|------|
| X20cPS2100 | X20 power supply module, coated, for internal I/O supply | 3356 |
| X20cPS2110 | X20 power supply module, coated, for internal I/O power supply, integrated microfuse | 3361 |
| X20cPS3300 | X20 power supply module, coated, for X2X Link and internal I/O power supply | 3367 |
| X20cPS3310 | X20 power supply module, coated, for X2X Link and internal I/O power supply integrated microfuse | 3373 |

Electronics module communication

| Order number | Short description | Page |
|--------------|---|------|
| X20cBC1083 | X20 bus controller, coated, 1 POWERLINK interface, integrated 2-port hub, supports X20 interface module expansions, 2 RJ45, order bus base, power supply module and terminal block separately | 2213 |
| X20cBC8083 | X20 bus controller, coated, 1 POWERLINK interface, integrated 2-port hub, supports X20 hub module expansions, 2 RJ45, order bus base, power supply module and terminal block separately | 2220 |
| X20cBC8084 | X20 bus controller, coated, 1 POWERLINK interface, 1x link selector for POWERLINK cable redundancy, supports expansion with active X20 hub modules, 2x RJ45, order bus base, power supply module and terminal block separately! | 2227 |

Expandable bus controllers

| Order number | Short description | Page |
|--------------|--|------|
| X20cHB8815 | X20 POWERLINK - TCP/IP gateway, coated, can be expanded with active hub modules, 2x RJ45 | 2480 |
| X20cHB8880 | X20 base hub module, coated, integrated 2-port hub, 2x RJ45 | 2490 |

Expandable bus controllers System modules

| Order number | Short description | Page |
|--------------|--|------|
| X20cCS1020 | X20 interface module, coated, 1 RS232 interface, max. 115.2 kbit/s | 2147 |
| X20cCS1030 | X20 interface module, coated, 1 RS422/485 interface, max. 115.2 kbit/s | 2162 |

Interface module communication

| Order number | Short description | Page |
|--------------|---|------|
| X20clF1030 | X20 interface module, coated, 1 RS422/485 interface, max. 115.2 kbit/s, electrically isolated | 2271 |
| X20clF1041-1 | X20 interface module, coated, for DTM configuration, 1 CANopen master interface, electrically isolated, order 1x TB2105 terminal block separately | 2274 |
| X20clF1061-1 | X20 interface module coated, for DTM configuration, 1 PROFIBUS DP V0/V1 master interface, electrically isolated | 2328 |
| X20clF1063-1 | X20 interface module, coated, for DTM configuration, 1 PROFIBUS DP V1 slave interface, electrically isolated | 2342 |
| X20clF1072 | X20 interface module, coated, 1 CAN bus interface, max. 1 Mbit/s, electrically isolated, order 1x TB2105 terminal block separately | 2353 |
| X20clF1082-2 | X20 interface module, coated, 1 POWERLINK interface, managing or controlled node, integrated 2-port hub, ring redundancy function PRC function | 2363 |
| X20clF10D1-1 | X20 interface module, coated, for DTM configuration, 1 EtherNet/IP scanner (master) interface, electrically isolated | 2392 |
| X20clF10D3-1 | X20 interface module, coated, for DTM configuration, 1 EtherNet/IP adapter (slave) interface, electrically isolated | 2402 |
| X20clF10E3-1 | X20 interface module, coated, for DTM configuration, 1 PROFINET IO device (slave) interface module, electrically isolated | 2424 |
| X20clF10X0 | X20 interface module, coated, 1 redundancy link interface 1000 Base-FX, CPU-CPU data synchronization for controller redundancy | 2447 |
| X20clF2181-2 | X20 interface module, coated, 1x link selector for POWERLINK cable redundancy, POWERLINK functions: - Managing node - Controlled node for iCN operation - Redundant managing node for controller redundancy - Ring redundancy - 2x hub - Multi ASend - PRC function 2x RJ45 | 2452 |

Motor controllers

| Order number | Short description | Page |
|--------------|--|------|
| X20cMM2436 | Coated X20 PWM motor module, 24 to 39 VDC \pm 25%, 2 PWM motor bridges, 3 A continuous current, 3.5 A peak current, 4 digital inputs 24 VDC, sink, configurable as incremental encoder | 2496 |

Hub system

| Order number | Short description | Page |
|--------------|--|------|
| X20cHB8884 | X20 compact link selector, coated, 2x RJ45, order bus base, power supply module and terminal block separately. | 3614 |

Other functions

| Order number | Short description | Page |
|--------------|---|------|
| X20cCM0985-1 | X20 digital and analog mixed module, coated, multi-measurement transducer / synchronization module, 5 digital outputs, 24 VDC, 0.5 A, source, 1 relay, 1 A, 8 analog inputs, \pm 480 V / 120 V, 16-bit converter resolution, 3 analog inputs, 5 A / 1 A AC, 16-bit converter resolution, additional software functionalities, order terminal blocks 0TB3102-7011, 0TB3104-7011, 0TB3102-7012, 0TB3104-7012 and 2x X20TB12 separately! | 2921 |
| X20cCM4810 | X20 analog input module, coated, for vibration measurement and analysis of condition monitoring tasks, 4 IEPE analog inputs, 51.5625 kHz sampling frequency, 24-bit converter resolution | 3039 |
| X20cDS438A | X20 digital signal module, coated, 4x IO-Link master V1.1, 4 digital channels configurable as inputs or outputs, 3-wire connections, NetTime function | 3287 |
| X20cPD2113 | X20 potential distributor, coated, 6x GND, 6x 24 VDC, with supply option, integrated microfuse | 3343 |

Redundancy system

| Order number | Short description | Page |
|--------------|--|------|
| X20cBB80 | X20 bus base, coated, for X20 base module (BC, HB, etc.) and X20 power supply module, X20 end plates (left and right) X20AC0SL1/X20AC0SR1 included | 922 |
| X20cPS9400 | X20 power supply module, coated, for bus controller and internal I/O power supply, X2X Link power supply | 926 |

System modules for expandable bus controllers

| Order number | Short description | Page |
|--------------|--|------|
| X20cBB81 | X20 bus base, coated, for X20 base module (BC, HB, etc.) and X20 power supply module, with one expansion slot for an X20 add-on module (IF, HB, etc.), X20 locking plates (left and right) X20AC0SL1/X20AC0SR1 included | 2234 |
| X20cBB82 | X20 bus base, coated, for X20 base module (BC, HB, etc.) and X20 power supply module, with two expansion slots for two X20 add-on modules (IF, HB, etc.), X20 locking plates (left and right) X20AC0SL1/X20AC0SR1 included | 2237 |
| X20cHB1881 | X20 hub expansion module, coated, integrated 1-port hub, for fiber optic cable | 3619 |
| X20cHB2880 | X20 hub expansion module, coated, integrated 2-port hub, 2x RJ45 | 3627 |
| X20cHB2881 | X20 hub expansion module, coated, integrated 2-port hub, for fiber optic cable | 3632 |
| X20cHB2885 | X20 hub expansion module, coated, integrated active 2-port hub, 2x RJ45 | 3641 |
| X20cHB2886 | X20 hub expansion module, coated, integrated active 2-port hub, 2 fiber optic interfaces | 3644 |
| X20cIF1041-1 | X20 interface module, coated, for DTM configuration, 1 CANopen master interface, electrically isolated, order 1x TB2105 terminal block separately | 2274 |
| X20cIF1061-1 | X20 interface module coated, for DTM configuration, 1 PROFIBUS DP V0/V1 master interface, electrically isolated | 2328 |
| X20cIF1063-1 | X20 interface module, coated, for DTM configuration, 1 PROFIBUS DP V1 slave interface, electrically isolated | 2342 |
| X20cIF10D3-1 | X20 interface module, coated, for DTM configuration, 1 EtherNet/IP adapter (slave) interface, electrically isolated | 2402 |
| X20cIF10E3-1 | X20 interface module, coated, for DTM configuration, 1 PROFINET IO device (slave) interface module, electrically isolated | 2424 |
| X20cPS9400 | X20 power supply module, coated, for bus controller and internal I/O power supply, X2X Link power supply | 926 |

System modules for the X20 hub system

| Order number | Short description | Page |
|--------------|--|------|
| X20cBB80 | X20 bus base, coated, for X20 base module (BC, HB, etc.) and X20 power supply module, X20 end plates (left and right) X20AC0SL1/X20AC0SR1 included | 922 |
| X20cBB81 | X20 bus base, coated, for X20 base module (BC, HB, etc.) and X20 power supply module, with one expansion slot for an X20 add-on module (IF, HB, etc.), X20 locking plates (left and right) X20AC0SL1/X20AC0SR1 included | 2234 |
| X20cBB82 | X20 bus base, coated, for X20 base module (BC, HB, etc.) and X20 power supply module, with two expansion slots for two X20 add-on modules (IF, HB, etc.), X20 locking plates (left and right) X20AC0SL1/X20AC0SR1 included | 2237 |
| X20cHB1881 | X20 hub expansion module, coated, integrated 1-port hub, for fiber optic cable | 3619 |
| X20cHB2880 | X20 hub expansion module, coated, integrated 2-port hub, 2x RJ45 | 3627 |
| X20cHB2881 | X20 hub expansion module, coated, integrated 2-port hub, for fiber optic cable | 3632 |
| X20cPS8002 | X20 power supply module, coated, for standalone hub and compact link selector | 3636 |
| X20cPS9400 | X20 power supply module, coated, for bus controller and internal I/O power supply, X2X Link power supply | 926 |

System modules for the X20 redundancy system

| Order number | Short description | Page |
|--------------|--|------|
| X20cHB2885 | X20 hub expansion module, coated, integrated active 2-port hub, 2x RJ45 | 3641 |
| X20cHB2886 | X20 hub expansion module, coated, integrated active 2-port hub, 2 fiber optic interfaces | 3644 |

Temperature measurement

| Order number | Short description | Page |
|--------------|--|------|
| X20cAT2311 | X20 temperature input module, coated, 2 resistance measurement inputs, PT100, resolution 0.001°C, 4-wire connections | 3659 |
| X20cAT4222 | X20 temperature input module, coated, 4 inputs for resistance measurement, PT100, PT1000, resolution 0.1°C, 3-wire connections | 3679 |
| X20cAT6402 | X20 temperature input module, coated, 6 thermocouple inputs, Type J, K, N, S, B, R, resolution 0.1°C | 3698 |

Counter functions

| Order number | Short description | Page |
|--------------|---|------|
| X20cDC1196 | X20 digital counter module, coated, 1 ABR incremental encoder, 5 V, 600 kHz input frequency, 4x resolution | 1105 |
| X20cDC1198 | X20 digital counter module, coated, 1 SSI absolute encoders, 5 V, 1 Mbit/s, 32-bit | 1115 |
| X20cDC1396 | X20 digital counter module, coated, 1 ABR incremental encoders, 24 V, 100 kHz input frequency, 4x evaluation | 1169 |
| X20cDC2190 | X20 digital counter module, coated, ultrasonic transducer module, interfaces: EP start/stop, DPI/IP, 2 transducer rods, 4-position detection | 1202 |
| X20cDC2395 | X20 digital counter module, coated, 1 SSI absolute encoder, 24 V, 1 ABR incremental encoder, 24 V, 2 AB incremental encoders, 24 V, 4 event counters or 2 PWM, local time measurement function | 1216 |
| X20cDS1119 | X20 multifunction digital signal processor, coated, 3 digital channels 5 V (symmetrical) configurable as inputs or outputs, 2 digital input channels 24 V (asymmetrical), max. 2 event counters, 1 universal counter pair as AB counter or up/down counter, linear movement generator (A/B, direction/frequency) with 1 reference pulse, 1 SSI absolute encoder, NetTime function | 1914 |

6.3 B&R ID codes

Module ID codes are displayed in Automation Studio error messages, for example. The ID code and following tables can be used to determine the affected module and associated data sheet.

6.3.1 B&R ID codes sorted by model number

| Model number | B&R ID code (hex.) | B&R ID code (dec.) | on page |
|--------------|--------------------|--------------------|---------|
| X20AI1744 | 0x1CDE | 7390 | 196 |

7 Accessories

7.1 Additional equipment for X20 modules and CPUs

The following additional equipment is available for X20 modules and CPUs:

- X20 modules** Plain text tag, accessory locking clip and tag holder that also serves as a terminal locking clip
- X20 CPU** Plain text tag

Installation of these accessories is described in section ["Installing accessories"](#) on page 114.

Figure 42: Additional equipment for X20 modules

Figure 43: Additional equipment for X20 CPUs

7.1.1 Tag holder, terminal locking clip

| Order number | Short description | Figure |
|----------------|---|---|
| | Tag holder, terminal locking clip |  |
| X20AC0SC1 | X20 terminal locking clip and tag holder for plain text tag | |
| X20AC0SC1.0100 | X20 terminal locking clip and tag holder for plain text tag, 100 pcs. per package | |

7.1.2 Plain text tag for X20 modules

A template file is available for X20 slide-in labels on the B&R website in the "Downloads" section under order number X20AC0LB2.0100. This template is in Excel format and makes it possible to enter the desired texts for the slide-in labels.

| Model number | Short description | Figure |
|----------------|---|--|
| | Plain text cover |  |
| X20AC0SH1 | X20 plain text tag | |
| X20AC0SH1.0100 | X20 plain text tag, 100 pcs. per package | |
| | X20 legend strips |  |
| X20AC0LB2.0100 | X20 slide-in labels for X20 plain text tags, paper, white, perforated, 88 strips on A4 sheets, 100 sheets per package | |

7.1.3 Plain text tag for X20 CPUs

The plain text tag is labeled with commercially available adhesive labels. The adhesive labels are not available as accessories.

| Model number | Short description | Figure |
|----------------|-------------------------|---|
| | X20 CPU Label |  |
| X20AC0SH2.0010 | X20 CPU labels, 10 pcs. | |

7.1.4 Accessory locking clips

| Order number | Short description | Figure |
|----------------|--|---|
| | Accessory locking clip |  |
| X20AC0AX1 | X20 accessory locking clip | |
| X20AC0AX1.0100 | X20 accessory locking clip, 100 pcs. per package | |

7.2 Locking plates

The locking plate protects the modules on the outside against dirt and damage.

| Order number | Short description | Figure |
|----------------|--|---|
| | End cover plate |  |
| X20AC0SL1 | X20 end cover plate (left) | |
| X20AC0SR1 | X20 end cover plate (right) | |
| X20AC0SL1.0010 | X20 end cover plate (left), 10 pcs. per package | |
| X20AC0SR1.0010 | X20 end cover plate (right), 10 pcs. per package | |

7.3 Cover for interface modules

The cover protects the slots for interface modules from dirt and damage.

| Model number | Short description | Figure |
|----------------|---|--|
| | Interface module slot cover |  |
| X20AC0IC1.0010 | X20 cover for interface module slot, 10-pc. package | |

Table 11: X20AC0IC1.0010 - Order data

7.4 Cable shield clamp

For information on use, see section "X20 cable shield clamp" on page 53.

| Model number | Short description | Figure |
|----------------|--|---|
| | Cable shield clamp |  |
| X20AC0SG1.0010 | X20 cable shield grounding clamp, 10 pcs. per package | |
| X20AC0SG1.0100 | X20 cable shield grounding clamp, 100 pcs. per package | |

7.5 Shielding bracket

The X20 shielding bracket provides an easy and space-saving way to ground the cable shielding (see "X20 shielding bracket" on page 53).

| Model number | Short description | Figure |
|----------------|-------------------------------------|---|
| | Shielding bracket |  |
| X20AC0SF7.0010 | X20 shielding bracket 66 mm 10 pcs. | |
| X20AC0SF9.0010 | X20 shielding bracket 88 mm 10 pcs. | |

7.7 Shield connection clamp

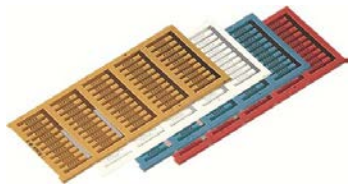

|  | |
|---|--|
| Model number | Short description |
| | Shield connection clamp |
| X20AC0SA08.0010 | X20 shield connection clamp 3 to 8 mm, 10 pieces |
| X20AC0SA14.0010 | X20 shield connection clamp 3 to 14 mm, 10 pieces |
| X20AC0SA20.0010 | X20 shield connection clamp 5 to 20 mm, 10 pieces |
| X20AC0SA35.0010 | X20 shield connection clamp 20 to 35 mm, 10 pieces |

Table 14: X20AC0SA08.0010, X20AC0SA14.0010, X20AC0SA20.0010, X20AC0SA35.0010 - Order data

7.8 Terminal labeling

Each terminal connection is identified clearly directly on the terminal. It is also possible to attach tags to label the terminals individually.

The labeling tool is needed for attachment (see "Label tags" on page 119). For information about printing terminal labels, see "Printing support" on page 45.

8 International and national certifications

Products and services from B&R comply with applicable standards. This includes international standards from organizations such as ISO, IEC and CENELEC, as well as national standards from organizations such as UL, CSA, DNV GL, etc. We are committed to ensuring the reliability of our products in an industrial environment.

Information:

Certifications that apply to a particular module are available at the following places:

- The data sheet's technical data under "Certifications".
- At www.br-automation.com under "Products" in the "General information → Certifications" area of the technical data
- On the side of the module housing

8.1 Overview of certifications

| Mark | Explanation | Certificate authority | Region |
|---|---|--|----------------------------|
|  | CE marking | Notified bodies | Europe (EU) |
|  | Functional safety (CE) | Notified bodies | Europe (EU) |
|  | Explosion protection (CE) | Notified bodies | Europe (EU) |
|  | Underwriters Laboratories Inc. (UL) (certification for US and Canada) | UL | Canada USA |
|  | Canadian Standards Association (CSA) (certification for US and Canada) | CSA | Canada USA |
|  | Det Norske Veritas - Germanischer Lloyd (DNV GL) | DNV GL | Germany Norway |
|  | Korean Register of Shipping (KR) | KR | Korea |
|  | Lloyd's Register (LR) | LR | Great Britain |
|  | Eurasian Conformity (EAC) | Federal agency on technical regulat- ing and metrology | Eurasian Economic Union |
|  | Korean Conformity (KC) | Radio Research Agency (RRA) | Korea |
|  | Regulatory Compliance Mark (RCM) | ACMA | Australia Oceania |

8.2 EU directives and standards (CE)

CE marking

Europe (EU)

The respective product complies with all applicable EU directives and relevant harmonized standards.

Certification of these products is performed in cooperation with accredited testing laboratories.

EMC Directive 2014/30/EU

All devices satisfy the protection requirements of the "EMC Directive" and are designed for industrial use.

Applicable standards from this directive:

| | |
|--------------|--|
| EN 61131-2 | Programmable logic controllers - Part 2: Equipment requirements and tests |
| EN 61000-6-2 | Electromagnetic compatibility (EMC) - Part 6-2: Generic standards - Immunity standard for industrial environments |
| EN 61000-6-4 | Electromagnetic compatibility (EMC) - Part 6-4: Generic standards - Emission standard for industrial environments |

Low Voltage Directive 2014/35/EU

The low voltage directive applies to electrical equipment with a nominal voltage from 50 to 1000 VAC and from 75 to 1500 VDC.

All devices within the area of application of this directive satisfy the its protection requirements.

Applicable standard from this directive:

| | |
|------------|--|
| EN 61131-2 | Programmable logic controllers - Part 2: Equipment requirements and tests |
|------------|--|

The corresponding declaration of conformity is available for download from the B&R website. For information about the versions of applicable standards, see the declaration of conformity.

Declaration of conformity

[Website > Downloads > Certificates > Declarations of conformity > Declaration of conformity - PLC](#)

Machinery directive 2006/42/EC**Functional safety****Europe (EU)**

In accordance with the machinery directive, safety technology products are designed, developed, tested and labeled for special applications providing protection to machinery and personnel.

Certification of these products is performed exclusively in cooperation with EU-authorized bodies (Notified Bodies).

Applicable standards from this directive:

SIL 3:

| | |
|-------------|--|
| IEC 61508-1 | Functional safety of electrical / electronic / programmable electronic safety-related systems - Part 1: General requirements |
| IEC 61508-2 | Functional safety of electrical / electronic / programmable electronic safety-related systems - Part 2: Requirements for electrical/electronic/programmable electronic safety-related systems |
| IEC 61508-3 | Functional safety of electrical / electronic / programmable electronic safety-related systems - Part 3: Software requirements |
| IEC 61508-4 | Functional safety of electrical/electronic/programmable electronic safety-related systems - Part 4: Definitions and abbreviations |
| EN 62061 | Safety of machinery - Functional safety of safety-related electrical, electronic and programmable electronic control systems |
| IEC 61511-1 | Functional safety - Safety instrumented systems for the process industry sector - Part 1: Framework, definitions, system, hardware and software requirements |

PL e, Cat. 4:

| | |
|----------------|--|
| EN ISO 13849-1 | Safety of machinery - Safety-related parts of control systems - Part 1: General principles for design |
| EN 61131-2 | Programmable logic controllers - Part 2: Equipment requirements and tests |

Declarations of conformity, certificates and any other safety-related documentation can be downloaded from the B&R website. For information about the versions of applicable standards, see the declaration of conformity.

ATEX directive 2014/34/EU

ATEX / Zone 2

II 3G Ex nA nC IIA T5 Gc

Europe (EU)

Products with this mark are suitable for use in potentially explosive atmospheres. The X20 system is certified for use in environments with explosive gases with a normal level of safety (Zone 2).

Certification of these products is performed exclusively in cooperation with EU-authorized bodies (Notified Bodies).

Each module is also accompanied by an information sheet providing detailed installation and safety guidelines.

Applicable standards from this directive:

| | |
|-------------|--|
| EN 60079-0 | Explosive atmospheres Part 0: Equipment - General requirements |
| EN 60079-15 | Explosive atmospheres - Part 15: Equipment protection by type of protection "n" |

The declaration of conformity and certificate can be downloaded from the B&R website. For information about the versions of applicable standards, see the declaration of conformity.

8.2.1 Overview of standards

| Standard | Description |
|--------------------------------|--|
| EN ISO 13849-1 | Safety of machinery - Safety-related parts of control systems - Part 1: General principles for design |
| EN 50581 | Technical documentation for the assessment of electrical and electronic products with respect to the restriction of hazardous substances |
| EN 55011 (CISPR 11) | Industrial, scientific and medical equipment - Radio frequency disturbance characteristics - Limits and methods of measurement |
| EN 55016-2-1 (CISPR 16-2-1) | Specification for radio disturbance and immunity measuring apparatus and methods - Part 2-1: Methods of measurement of disturbances and immunity - Conducted disturbance measurements |
| EN 55016-2-3 (CISPR 16-2-3) | Specification for radio disturbance and immunity measuring apparatus and methods - Part 2-3: Methods of measurement of disturbances and immunity - Radiated disturbance measurements |
| EN 55022 (CISPR 22) | Information technology equipment - Radio disturbance characteristics - Limits and methods of measurement |
| EN 60068-2-6 | Environmental testing - Part 2-6: Procedures - Test Fc: Vibration (sinusoidal) |
| EN 60068-2-27 | Environmental testing - Part 2-27: Test procedure - Test Ea and guidance: Shock |
| EN 60068-2-31 ¹⁾ | Environmental testing - Part 2-31: Test procedure - Test Ec: Rough handling shocks, mainly for devices |
| EN 60079-0 | Explosive atmospheres Part 0: Equipment - General requirements |
| EN 60079-15 | Explosive atmospheres - Part 15: Equipment protection by type of protection "n" |
| EN 60529 | Degrees of protection provided by enclosures (IP code) |
| EN 60664-1 | Insulation coordination for equipment within low-voltage systems - Part 1: Principles, requirements and tests |
| EN 60721-3-2 | Classification of environmental conditions - Part 3: Classification of groups of environmental parameters and their severities - Section 2: Transport and handling |
| EN 60721-3-3 | Classification of environmental conditions - Part 3: Classification of groups of environmental parameters and their severities - Section 3: Stationary use at weather-protected locations |
| EN 61000-4-2 | Electromagnetic compatibility (EMC) - Part 4-2: Testing and measurement techniques - Electrostatic discharge immunity test |
| EN 61000-4-3 | Electromagnetic compatibility (EMC) - Part 4-3: Testing and measurement techniques - Radiated, radio-frequency, electromagnetic field immunity test |
| EN 61000-4-4 | Electromagnetic compatibility (EMC) - Part 4-4: Testing and measurement techniques - Electrical fast transient/burst immunity test |
| EN 61000-4-5 | Electromagnetic compatibility (EMC) - Part 4-5: Testing and measuring techniques - Surge immunity test |
| EN 61000-4-6 | Electromagnetic compatibility (EMC) - Part 4-6: Testing and measurement techniques - Immunity to conducted disturbances, induced by radio-frequency fields |
| EN 61000-4-8 | Electromagnetic compatibility (EMC) - Part 4-8: Testing and measuring techniques - Power frequency magnetic field immunity test |
| EN 61000-4-11 | Electromagnetic compatibility (EMC) - Part 4-11: Testing and measuring techniques - Voltage dips, short interruptions and voltage variations |
| EN 61000-4-29 | Electromagnetic compatibility (EMC) - Part 4-29: Testing and measurement techniques - Voltage dips, short interruptions and voltage variations on d.c. input power port immunity tests |
| EN 61000-6-2 | Electromagnetic compatibility (EMC) - Part 6-2: Generic standards - Immunity standard for industrial environments |
| EN 61000-6-4 | Electromagnetic compatibility (EMC) - Part 6-4: Generic standards - Emission standard for industrial environments |
| EN 61131-2 | Programmable logic controllers - Part 2: Guidance for inspection and routine testing |
| IEC 61508-1 | Functional safety of electrical / electronic / programmable electronic safety-related systems - Part 1: General requirements |
| IEC 61508-2 | Functional safety of electrical / electronic / programmable electronic safety-related systems - Part 2: Requirements for electrical/electronic/programmable electronic safety-related systems |
| IEC 61508-3 | Functional safety of electrical / electronic / programmable electronic safety-related systems - Part 3: Software requirements |
| IEC 61508-4 | Functional safety of electrical / electronic / programmable electronic safety-related systems - Part 4: Definitions and abbreviations |
| IEC 61511-1 | Functional safety - Safety instrumented systems for the process industry sector - Part 1: Framework, definitions, system, hardware and software requirements |
| EN 62061 | Safety of machinery - Functional safety of safety-related electrical, electronic and programmable electronic control systems |

1) Replacement for EN 60068-2-32

8.2.2 Requirements for immunity to disturbances

| Immunity | Test carried out in accordance with | Requirements in accordance with |
|---|-------------------------------------|--|
| Electrostatic discharge (ESD) | EN 61000-4-2 | EN 61131-2: Product standard - Programmable logic controllers EN 61000-6-2: Generic standard - Immunity to disturbances in industrial sectors |
| High-frequency electromagnetic fields (HF field) | EN 61000-4-3 | EN 61131-2: Product standard - Programmable logic controllers EN 61000-6-2: Generic standard - Immunity to disturbances in industrial sectors |
| High-speed transient electrical disturbances (Burst) | EN 61000-4-4 | EN 61131-2: Product standard - Programmable logic controllers EN 61000-6-2: Generic standard - Immunity to disturbances in industrial sectors |
| Surge voltages (Surge) | EN 61000-4-5 | EN 61131-2: Product standard - Programmable logic controllers EN 61000-6-2: Generic standard - Immunity to disturbances in industrial sectors |
| Conducted disturbances | EN 61000-4-6 | EN 61131-2: Product standard - Programmable logic controllers EN 61000-6-2: Generic standard - Immunity to disturbances in industrial sectors |
| Magnetic fields with electrical frequencies | EN 61000-4-8 | EN 61131-2: Product standard - Programmable logic controllers EN 61000-6-2: Generic standard - Immunity to disturbances in industrial sectors |
| Voltage dips (AC) Short-term interruptions (AC) Voltage fluctuations (AC) | EN 61000-4-11 | EN 61131-2: Product standard - Programmable logic controllers EN 61000-6-2: Generic standard - Immunity to disturbances in industrial sectors |
| Short-term interruptions (DC) Voltage fluctuations (DC) | EN 61000-4-29 | EN 61131-2: Product standard - Programmable logic controllers |

Evaluation criteria for performance

| Criteria | During testing | After testing |
|----------|--|---|
| A | The PLC system shall continue to operate as intended. No loss of function or performance. | The PLC system shall continue to operate as intended. |
| B | Degradation of performance accepted. No change of operating mode. No irreversible loss of stored data. | The PLC system shall continue to operate as intended. Temporary degradation of performance must be self-recoverable. |
| C | Loss of functions accepted, but no destruction of hardware or software (programme or data). | The PLC system shall continue to operate as intended automatically, after manual restart or power off/power on. |
| D | Degradation or failure of functionality that can no longer be restored. | PLC system permanently damaged or destroyed. |

Electrostatic discharge (ESD)

| Test carried out in accordance with EN 61000-4-2 | Requirements in accordance with EN 61131-2 / Zone B | Requirements in accordance with EN 61000-6-2 |
|---|---|--|
| Contact discharge (CD) to conductive external parts | | ±4 kV Criteria B |
| Air discharge (AD) to insulating external parts | | ±8 kV Criteria B |

High-frequency electromagnetic fields (HF field)

| Test carried out in accordance with EN 61000-4-3 | Requirements in accordance with EN 61131-2 / Zone B | Requirements in accordance with EN 61000-6-2 |
|--|---|---|
| Housing, completely wired | | 80 MHz to 1 GHz, 10 V/m 1.4 GHz to 2 GHz, 3 V/m 2 GHz to 2.7 GHz, 1 V/m Criteria A |

High-speed transient electrical disturbances (Burst)

| Test carried out in accordance with EN 61000-4-4 | Requirements in accordance with EN 61131-2 / Zone B | Requirements in accordance with EN 61000-6-2 |
|--|---|--|
| AC power inputs | | ±2 kV / 5 kHz Criteria B |
| AC power outputs | ±2 kV / 5 kHz ¹⁾ Criteria B | ±2 kV / 5 kHz Criteria B |
| AC other I/Os | ±2 kV / 5 kHz ¹⁾ Criteria B | - |
| DC mains inputs/outputs | | ±2 kV / 5 kHz ¹⁾ Criteria B |
| Other I/Os and interfaces | | ±1 kV / 5 kHz ¹⁾ Criteria B |

1) Only for connections with a permitted line length >3 m.

Surge voltages (Surge)

| Test carried out in accordance with EN 61000-4-5 | Requirements in accordance with EN 61131-2 / Zone B | Requirements in accordance with EN 61000-6-2 |
|--|---|--|
| AC mains inputs/outputs Line / line | | ±1 kV Criteria B |
| AC mains inputs/outputs Line / ground | | ±2 kV Criteria B |
| DC mains inputs/outputs Line / line | ±0.5 kV ¹⁾ Criteria B | ±0.5 kV Criteria B |
| DC power inputs Line / ground | ±0.5 kV ¹⁾ Criteria B | ±0.5 kV Criteria B |
| DC power outputs Line / ground | ±0.5 kV ¹⁾ Criteria B | ±0.5 kV Criteria B |
| Signal connections, unshielded Line / ground | | ±1 kV ¹⁾ Criteria B |
| All shielded lines Line / ground | ±1 kV ¹⁾ Criteria B | - |

1) Only for connections with a permitted line length >30 m.

Conducted disturbances

| Test carried out in accordance with EN 61000-4-6 | Requirements in accordance with EN 61131-2 / Zone B | Requirements in accordance with EN 61000-6-2 |
|--|---|---|
| AC mains inputs/outputs | | 10 V 150 kHz to 80 MHz 80% AM (1 kHz) Criteria A |
| DC mains inputs/outputs | | 10 V 150 kHz to 80 MHz 80% AM (1 kHz) Criteria A |
| Other I/Os and interfaces | | 10 V ¹⁾ 150 kHz to 80 MHz 80% AM (1 kHz) Criteria A |

1) Only for connections with a permitted line length >3 m.

Magnetic fields with electrical frequencies

| Test carried out in accordance with EN 61000-4-8 | Requirements in accordance with EN 61131-2 / Zone B | Requirements in accordance with EN 61000-6-2 |
|--|---|--|
| Housing, completely wired | | 30 A/m 3 axes (x, y, z) 50/60 Hz ¹⁾ Criteria A |

1) Mains frequency per manufacturer data

Voltage dips

| Test carried out in accordance with EN 61000-4-11 | Requirements in accordance with EN 61131-2 / Zone B | Requirements in accordance with EN 61000-6-2 |
|--|--|---|
| AC power inputs | 0% residual voltage 250/300 periods (50/60 Hz) ¹⁾ 20 attempts Criteria C | |
| | 40% residual voltage 10/12 periods (50/60 Hz) ¹⁾ 20 attempts Criteria C | |
| | 70% residual voltage 25/30 periods (50/60 Hz) ¹⁾ 20 attempts Criteria C | |

1) Mains frequency per manufacturer data

Short-term interruptions

| Test carried out in accordance with EN 61000-4-11 / EN 61000-4-29 | Requirements in accordance with EN 61131-2 / Zone B | Requirements in accordance with EN 61000-6-2 |
|--|---|---|
| AC power inputs | 0% residual voltage 0.5 periods (50/60 Hz) ¹⁾ 20 interruptions Criteria A | 0% residual voltage 1 period (50/60 Hz) ¹⁾ 3 interruptions Criteria B |
| DC power inputs | 0% residual voltage ≥10 ms (PS2) 20 interruptions Criteria A | - |

1) Mains frequency per manufacturer data

Voltage fluctuations

| Test carried out in accordance with EN 61000-4-11 / EN 61000-4-29 | Requirements in accordance with EN 61131-2 / Zone B | Requirements in accordance with EN 61000-6-2 |
|--|---|---|
| AC power inputs | -15% / +10% Test duration per 30 minutes Criteria A | - |
| DC power inputs | -15% / +20% Test duration per 30 minutes Criteria A | - |

8.2.3 Emission requirements

| Phenomenon | Test carried out in accordance with | Limits in accordance with |
|----------------------------|-------------------------------------|---|
| Emissions related to lines | EN 55011 / EN 55022 EN 55016-2-1 | EN 61131-2: Product standard - Programmable logic controllers |
| | | EN 61000-6-4: Generic standard - Emissions in industrial sectors |
| Radiated emissions | EN 55011 / EN 55022 EN 55016-2-3 | EN 61131-2: Product standard - Programmable logic controllers |
| | | EN 61000-6-4: Generic standard - Emissions in industrial sectors |

Emissions related to lines

| Test carried out in accordance with EN 55011 / EN 55022 / EN 55016-2-1 | Limits in accordance with EN 61131-2 / Zone B | Limits in accordance with EN 61000-6-4 |
|---|---|--|
| AC mains connection 150 kHz to 30 MHz | 150 kHz to 500 kHz 79 dB (µV) quasi-peak value 66 dB (µV) average value | |
| | 500 kHz to 30 MHz 73 dB (µV) quasi-peak value 60 dB (µV) average value | |
| Telecommunications / network connection 150 kHz to 30 MHz | - | 150 kHz to 500 kHz 97 to 87 dB (µV) quasi-peak value 53 to 40 dB (µA) quasi-peak value 84 to 74 dB (µV) average value 40 to 30 dB (µA) average value |
| | - | 500 kHz to 30 MHz 87 dB (µV) quasi-peak value 43 dB (µA) quasi-peak value 74 dB (µV) average value 30 dB (µA) average value |

Radiated emissions

| Test carried out in accordance with EN 55011 / EN 55022 / EN 55016-2-3 | Limits in accordance with EN 61131-2 / Zone B | Limits in accordance with EN 61000-6-4 |
|---|--|---|
| Electric field / Measured from 10 m 30 MHz to 1 GHz | 30 MHz to 230 MHz 40 dB (µV/m) quasi-peak value | |
| | 230 MHz to 1 GHz 47 dB (µV/m) quasi-peak value | |
| Electric field / Measured from 3 m 1 GHz to 6 GHz ¹⁾ | - | 1 GHz to 3 GHz ¹⁾ 76 dB (µV/m) peak value 56 dB (µV/m) average value |
| | - | 3 GHz to 6 GHz ¹⁾ 80 dB (µV/m) peak value 60 dB (µV/m) average value |

1) Depending on highest internal frequency

8.2.4 Mechanical conditions

| Testing | Test carried out in accordance with | Requirements in accordance with |
|---|-------------------------------------|---|
| Vibration (sinusoidal) / Operation | EN 60068-2-6 | EN 61131-2: Product standard - Programmable logic controllers EN 60721-3-3 / Class 3M4 |

8.2.5 Electrical safety**Overvoltage category**

| Requirement per EN 61131-2 | Definition per EN 60664-1 |
|----------------------------|--|
| Overvoltage category II | Equipment of "Overvoltage category II" is energy-consuming equipment to be supplied by the fixed installation. |

Pollution degree

| Requirement per EN 61131-2 | Definition per EN 60664-1 |
|----------------------------|---|
| Pollution degree 2 | Only non-conductive pollution occurs. Occasionally, however, temporary conductivity caused by condensation is to be expected. |

Protection rating provided by enclosure (IP code)

| Requirement per EN 61131-2 | Meaning of codes per EN 60529 | Meaning for the protection of equipment | Meaning for the protection of personnel |
|----------------------------|-------------------------------|--|--|
| ≥IP20 | First number IP2x | Protected against solid foreign bodies with a diameter ≥ 12.5 mm. | Protected against touching dangerous parts with fingers. |
| | Second number IPx0 | Not protected. | - |

8.3 UL / CSA

Underwriters Laboratories (UL)

Products with this mark are tested by Underwriters Laboratories and listed as "industrial control equipment" in category NRAQ (programmable controllers) with file number E115267.

The mark is valid for the USA and Canada and facilitates the certification of your machines and systems in this economic area.

Standards applied:

UL 508
UL 61010-1
UL 61010-2-201

CSA C22.2 No. 142-M1987
CSA C22.2 No. 61010-1
CSA C22.2 No. 61010-2-201

Standard for industrial control equipment
Safety requirements for electrical equipment for measurement, control and laboratory use - Part 1: General requirements
Standard for safety requirements for electrical equipment for measurement, control and laboratory use - Part 2-201: Particular requirements for control equipment
Process control equipment
Safety requirements for electrical equipment for measurement, control and laboratory use - Part 1: General requirements
Safety requirements for electrical equipment for measurement, control and laboratory use - Part 2-201: Particular requirements for control equipment

Certificate

[Website > Downloads > Certificates > UL > X20 > E115267 UL Certificate of Compliance - X20](#)

CSA HazLoc

Canada / USA

Canadian Standards Association (CSA)

Products with this mark are certified by the Canadian Standard Association and suitable for use in potentially explosive atmospheres.

The products are listed in CLASS 2258 (Process control equipment - For hazardous locations) with file number 244665.

The X20 system has a hazardous locations certification for class I, division 2.

Each certified module is accompanied by an information sheet providing detailed installation and safety guidelines.

The mark is valid for the USA and Canada and facilitates the certification of your machines and systems in this economic area.

Standards applied:

CSA C22.2 No. 0-M1991
CSA C22.2 No. 142-M1987
CSA C22.2 No. 213-M1987
UL Std No. 916:2007
ANSI/ISA 12.12.01:2007

General requirements - Canadian electrical code part II
Process control equipment
Nonincendive electrical equipment for use in class I, division 2 hazardous locations
Energy management equipment
Nonincendive Electrical Equipment for Use in Class I and II, Division 2 and Class III, Division 1 and 2 Hazardous (Classified) Locations

8.4 Offshore/Maritime

With regard to maritime certification, B&R will limit itself to DNV GL for the time being. DNV GL testing is performed in accordance with the applicable standards: DNV GL, IACS E10 and IEC 60945 Section 1c. As a result, the tests comply with the requirements of other maritime classification societies.

DNV GL

**Germany
Norway**

Det Norske Veritas - Germanischer Lloyd

Many B&R products are certified by DNV GL and suitable for use in maritime environments.

DNV GL Maritime certificates (type approval) are generally accepted by other classification societies during ship acceptance procedures.

For corresponding environmental categories, see the technical data for the respective product.

Standards applied:

DNVGL-CG-0339

Environmental test specification for electrical, electronic and programmable equipment and systems

Certificate

[Website > Downloads > Certificates > Maritime > DNV GL > X20 / Power Panel T/C > DNV GL Type Approval Certificate](#)

KR

Korean Register of Shipping

Products are suitable for use in maritime environments in accordance with the guidelines set forth by the Korean Register of Shipping.

Standards applied:

List of Approved Manufacturers and Type Approved Equipment (Pt. 6, Ch. 2, Art. 301 of the Rules for Classification, Steel Ships).

Certificate

[Website > Downloads > Certificates > Maritime > KR > X20 > KR type approval certificate MIL39390-AC003 \(X20 system\)](#)

LR

15/20082

Great Britain

Lloyd's Register

Products are suitable for use in maritime environments in accordance with the guidelines set forth by the Lloyd's Register classification society.

Certification has taken place for marine, offshore and industrial applications for environmental categories ENV1, ENV2 and ENV3.

Safety technology assemblies are certified for ENV1 and ENV2

These environmental categories are defined in Lloyd's Register's type approval system, test specification number 1-2015.

Covered standard:

Test Specification Number 1-2015

Lloyd's Register's type approval system

Certificate

8.5 Other certifications

EAC

**Eurasian Conformity (EAC)**

Products with this marking have been tested by an accredited testing laboratory and approved for import (based on EU compliance) to the newly founded Eurasian Economic Union (Russia, Belarus, Kazakhstan, etc.).

KC

**Korean Conformity (KC)**

Products with this marking have been tested by an accredited testing laboratory and approved for import to the Korean market (based on EU compliance).

RCM

**Regulatory Compliance Mark (RCM)**

Products with this marking have been tested by an accredited testing laboratory and certified by the ACMA. This marking is valid in Australia/Oceania and simplifies the certification of your machines and systems in these areas (based on EU compliance).

9 Data sheets

9.1 Analog input modules

Analog input modules convert measured values (voltages, currents) into numerical values, which can be processed by the PLC.

In the PLC, analog data is always in 16-bit 2s complement regardless of the resolution. Therefore, the resolution of the module used does not have to be taken into consideration when creating an application program.

Every channel on an analog input module has a status LED.

9.1.1 Summary

| Model number | Short description | Page |
|--------------|---|------|
| X20AI1744 | X20 analog input module, 1 full-bridge strain gauge input, 24-bit converter resolution, 5 kHz input filter | 196 |
| X20AI1744-10 | X20 analog input module, 1 full-bridge strain input 10 V, 24-bit converter resolution, 5 kHz input filter | 289 |
| X20AI1744-3 | X20 analog input module, 1 full-bridge strain gauge input, 24-bit converter resolution, 5 Hz input filter | 243 |
| X20AI2222 | X20 analog input module, 2 inputs, ± 10 V, 13-bit converter resolution, configurable input filter | 318 |
| X20AI2237 | X20 analog input module, 2 inputs, ± 10 V, 16-bit converter resolution, single-channel isolation with separate sensor power supply, NetTime function | 328 |
| X20AI2322 | X20 analog input module, 2 inputs, 0-20 mA / 4-20 mA, 12-bit converter resolution, configurable input filter | 346 |
| X20AI2437 | X20 analog input module, 2 inputs, 4 to 20 mA, 16-bit converter resolution, single-channel isolation with separate sensor power supply, NetTime function | 357 |
| X20AI2438 | X20 analog input module, 2 inputs, 4 to 20 mA, 16-bit converter resolution, single-channel isolation with separate sensor power supply, supports the HART protocol, NetTime function | 373 |
| X20AI2622 | X20 analog input module, 2 inputs, ± 10 V or 0 to 20 mA / 4 to 20 mA, 13-bit converter resolution, configurable input filter | 397 |
| X20AI2632 | X20 analog input module, 2 inputs, ± 10 V or 0 to 20 mA, 16-bit converter resolution, configurable input filter, oscilloscope functions | 408 |
| X20AI2632-1 | X20 analog input module, 2 inputs, ± 11 V or 0 to 22 mA, 16-bit converter resolution, configurable input filter | 433 |
| X20AI2636 | X20 analog input module, 2 inputs, ± 10 V or 0 to 20 mA, 16-bit converter resolution, configurable input filter, oversampling functions | 458 |
| X20AI4222 | X20 analog input module, 4 inputs, ± 10 V, 13-bit converter resolution, configurable input filter | 489 |
| X20AI4322 | X20 analog input module, 4 inputs, 0-20 mA / 4-20 mA, 12-bit converter resolution, configurable input filter | 499 |
| X20AI4622 | X20 analog input module, 4 inputs, ± 10 V or 0 to 20 mA / 4 to 20 mA, 13-bit converter resolution, configurable input filter | 509 |
| X20AI4632 | X20 analog input module, 4 inputs, ± 10 V or 0 to 20 mA, 16-bit converter resolution, configurable input filter, oscilloscope functions | 520 |
| X20AI4632-1 | X20 analog input module, 4 inputs, ± 11 V or 0 to 22 mA, 16-bit converter resolution, configurable input filter, oscilloscope functions | 545 |
| X20AI4636 | X20 analog input module, 4 inputs, ± 10 V or 0 to 20 mA, 16-bit converter resolution, configurable input filter, oversampling functions | 570 |
| X20AI8221 | X20 analog input module, 8 inputs, ± 10 V, 13-bit converter resolution | 602 |
| X20AI8321 | X20 analog input module, 8 inputs, 0 to 20 mA, 12-bit converter resolution | 612 |
| X20AIA744 | X20 analog input module, 2 full-bridge strain inputs, 24-bit converter resolution, 2.5 kHz input filter | 622 |
| X20AIB744 | X20 analog input module, 4 full-bridge strain inputs, 24-bit converter resolution, 2.5 kHz input filter | 641 |
| X20AP3111 | X20 energy metering module, 3 analog inputs, 480 VAC, 50/60 Hz, 4 analog inputs, 20 mA AC, calculates effective, reactive and apparent power/energy, calculates RMS values, 240 V keyed, NetTime function | 661 |
| X20AP3121 | X20 energy metering module, 3 analog inputs, 480 VAC, 50/60 Hz, 4 analog inputs, 1 A AC, calculates effective, reactive and apparent power/energy, calculates RMS values, 240 V keyed, NetTime function | 661 |
| X20AP3122 | X20 energy metering module, 3 analog inputs, 480 VAC, 50/60 Hz, 4 analog inputs, 1 A AC, groundable, calculates effective, reactive and apparent power/energy, calculates RMS values, 240 V keyed, NetTime function | 661 |
| X20AP3131 | X20 energy metering module, 3 analog inputs, 480 VAC, 50/60 Hz, 4 analog inputs, 5 A AC, calculates effective, reactive and apparent power/energy, calculates RMS values, 240 V keyed, NetTime function | 661 |
| X20AP3132 | X20 energy metering module, 3 analog inputs, 480 VAC, 50/60 Hz, 4 analog inputs, 5 A AC, groundable, calculates effective, reactive and apparent power/energy, calculates RMS values, 240 V keyed, NetTime function | 661 |
| X20AP3161 | X20 energy metering module, 3 analog inputs, 480 VAC, 50/60 Hz, 4 analog inputs, 333 mV AC, calculates effective, reactive and apparent power/energy, calculates RMS values, 240 V keyed, NetTime function | 661 |
| X20AP3171 | X20 energy metering module, 3 analog inputs, 480 VAC, 50/60 Hz, 4 analog inputs, Rogowski adjustable (μ V/A), max. 52 mV, calculates effective, reactive and apparent power/energy, calculates RMS values, 240 V keyed, NetTime function | 661 |
| X20cAI1744 | X20 analog input module, coated, 1 full-bridge strain gauge input, 24-bit converter resolution, 5 kHz input filter | 196 |

9.1.2 X20(c)AI1744

Data sheet version: 4.25

This data sheet describes 2 module revisions. The module revision is laser-marked on the side of the module. Select the desired module revision from the following table to view its description.

| Module | Revision | Page |
|------------|----------|------|
| X20AI1744 | ≥H0 | 195 |
| X20cAI1744 | All | |
| X20AI1744 | <H0 | 225 |

9.1.2.1 X20(c)AI1744 with Rev. ≥H0

9.1.2.1.1 General information

This module works with both 4-wire and 6-wire strain gauge load cells. The concept applied by the module requires compensation in the measurement system. This compensation eliminates the absolute uncertainty in the measurement circuit, such as component tolerances, effective bridge voltage or zero point offset. The measurement precision refers to the absolute (compensated) value, which will only change as a result of changes in the operating temperature.

- 1 full-bridge strain gauge input
- Data output rate configurable from 0.1 Hz to 7.5 kHz
- Special operating modes (synchronous mode and multiple sampling)
- Configurable filter level

9.1.2.1.2 Coated modules

Coated modules are X20 modules with a protective coating for the electronics component. This coating protects X20c modules from condensation and corrosive gases.

The modules' electronics are fully compatible with the corresponding X20 modules.

For simplification purposes, only images and module IDs of uncoated modules are used in this data sheet.

The coating has been certified according to the following standards:

- Condensation: BMW GS 95011-4, 2x 1 cycle
- Corrosive gas: EN 60068-2-60, method 4, exposure 21 days

9.1.2.1.2.1 Starting temperature

The starting temperature describes the minimum permissible ambient temperature when the power is switched off at the time the coated module is switched on. This is permitted to be as low as -40°C. During operation, the conditions as specified in the technical data continue to apply.

Information:

It is important to absolutely ensure that there is no forced cooling by air currents in a closed control cabinet, for example using a fan or ventilation slots.

9.1.2.1.3 Order data

| Model number | Short description | Figure |
|--------------|--|---|

Table 19: X20AI1744, X20cAI1744 - Technical data

- 1) Depends on the full-bridge strain gauge being used.
- 2) With 6-wire connections, line compensation does not function (see section "Connection examples").
- 3) Sensor cable with twisted and shielded conductors, cable length as short as possible, cable routing separate from load circuits, without intermediate terminal to the sensor.
- 4) Quantization depends on the strain gauge factor.
- 5) Based on the current measured value.
- 6) Based on the entire measurement range.

9.1.2.1.5 LED status indicators

For a description of the various operating modes, see "Diagnostic LEDs" on page 3787.

| Figure | LED | Color | Status | Description |
|---|-----|-------|--------------|--|
|  | r | Green | Off | No power to module |
| | | | Single flash | RESET mode |
| | | | Double flash | BOOT mode (during firmware update) ¹⁾ |
| | | | Blinking | PREOPERATIONAL mode |
| | | | On | RUN mode |
| | e | Red | Off | No power to module or everything OK |
| | | | On | Error or reset status |
| | 1 | Green | Off | Possible causes: <ul style="list-style-type: none"> • Open circuit • Sensor is disconnected • Converter is busy |
| | | | On | Analog/digital converter running, value OK |

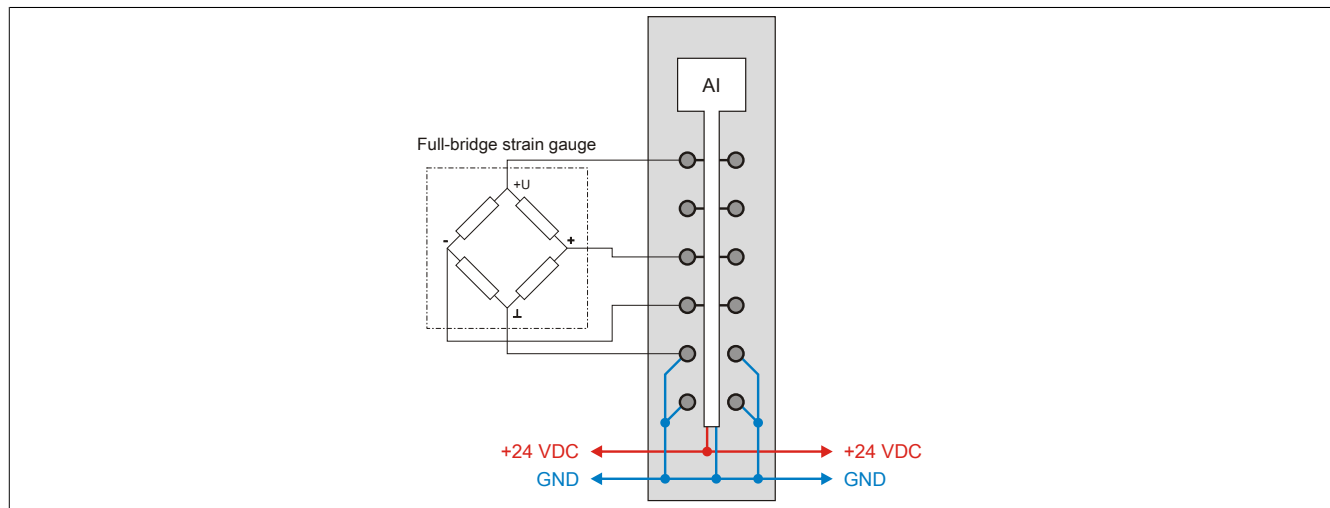

1) Depending on the configuration, a firmware update can take up to several minutes.

9.1.2.1.6 Pinout

9.1.2.1.7 Connection examples

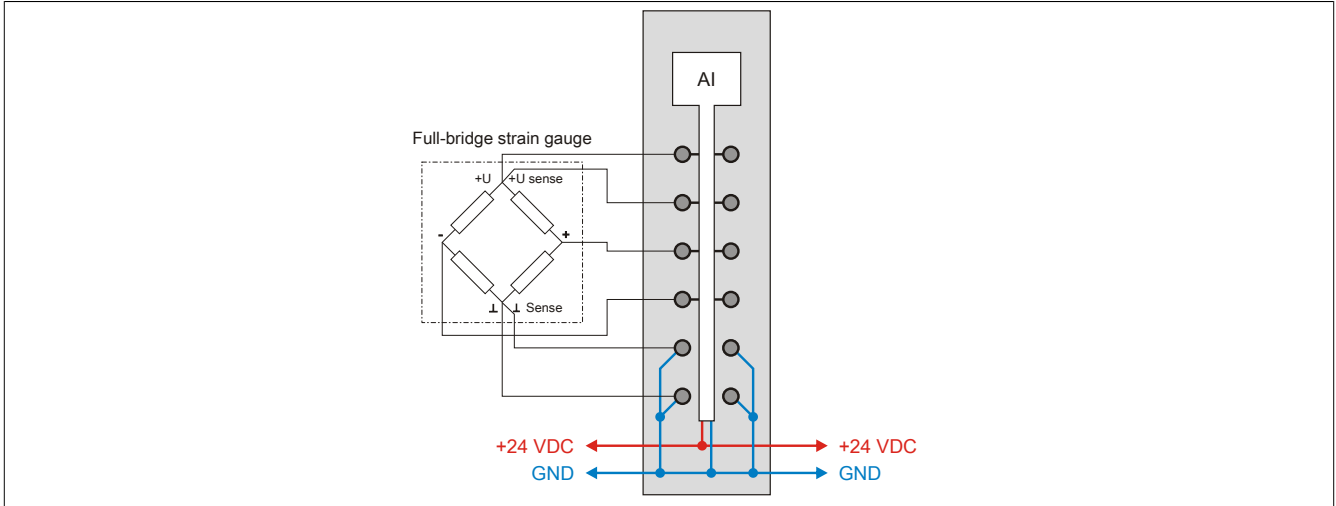

Full-bridge strain gauge with 4-wire connections

Full-bridge strain gauge with 6-wire connections

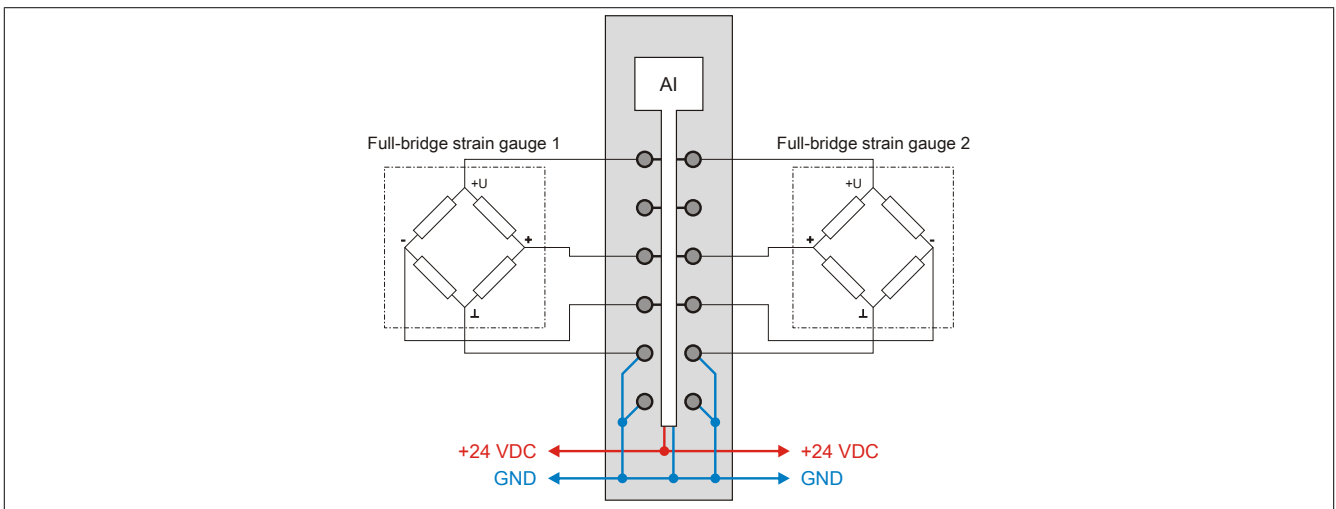

Full-bridge strain gauges can be connected to this module with 6-wire connections. Line compensation is not supported by the module, however. The sense lines are short circuited by the internally connected strain gauge VCC and GND connections (see "Input circuit diagram" on page 200). The measurement precision is therefore affected by changes in operating temperature. Longer cable lengths and smaller cable cross sections also increase the potential for errors in the measurement system.

In order to reduce cable resistance, the sense lines should be connected in parallel with the strain gauge supply lines. Optimal signal quality can be obtained by using a shielded twisted pair cable. The connections for the strain gauge supply lines, the sensor lines and the bridge differential voltage lines should each use one twisted pair cable.

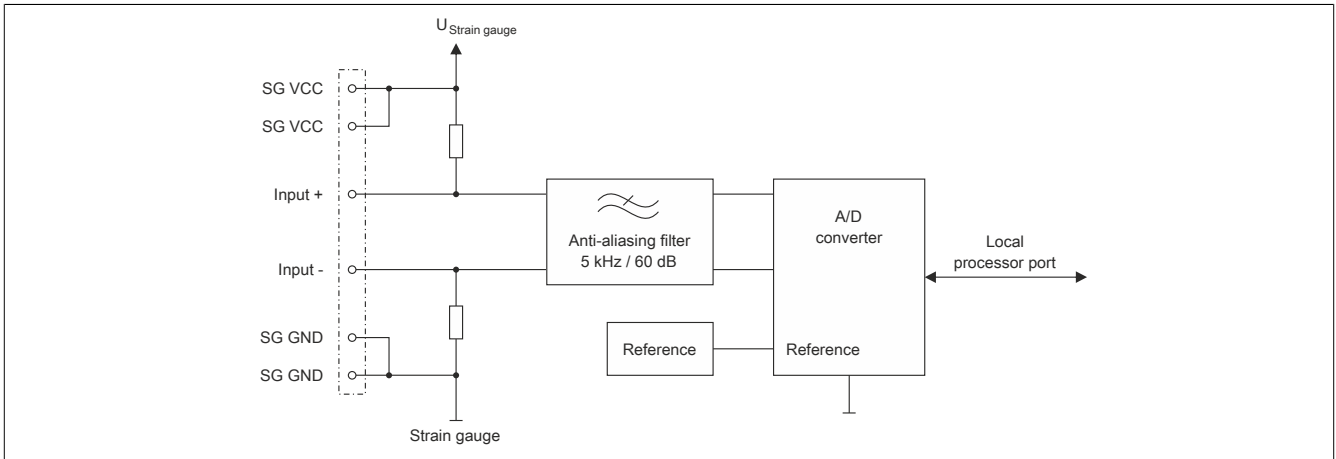

Parallel connection of 2 full-bridge strain gauges (4-wire connections)

If connecting the full-bridge strain gauges in parallel, the manufacturer's guidelines must be observed.

When connecting 3 or more full-bridge strain gauges in parallel, 2 lines must be connected together in an X20 terminal block.

9.1.2.1.8 Input circuit diagram

9.1.2.1.9 Effective resolution of the A/D converter

The A/D converter on the module provides a 24-bit measured value. The actual attainable noise-free resolution is always less than 24-bit, however. This "effective resolution" depends on the data rate and measurement range.

Example:

Based on the conversion method, a data rate of 2.5 Hz and a specified measurement range of 2 mV/V result in an effective resolution of 17.4 bits:

The low-order bits (grayed out) contain only noise instead of valid values and are therefore not permitted to be evaluated.

With "Function model 1 - Multisampling", only the highest 16 bits are made available.

9.1.2.1.10 Calculation example

The following example shows the influence of the length of the measuring cable on the bridge voltage of the module and the quantization calculated with it.

9.1.2.1.10.1 Bridge voltage

Although the measuring bridge must be adjusted with the module, the cable length has an influence on the accuracy of the measurement. The reason for this is the voltage drop on the power supply lines of the measuring bridge. As a result, the strain gauge supply voltage at the measuring bridge no longer amounts to the full 5.5 V. The reduced bridge voltage also has an effect on the quantization.

Example

Characteristics of the measuring device used:

- Full-bridge strain gauge with 4-wire connections
- Material-dependent conductivity of the cable (copper: $12 \frac{\text{m}}{\Omega \cdot \text{mm}^2}$)
- Cross section of the cable: 22 AWG = 0.34 mm²
- Length of the cable: 5 m
- Nominal current of the measuring bridge: 15 mA
- Bridge voltage of the module: 5.5 V

Actual bridge voltage taking the voltage drop on the measuring line into account:

$$5.5\text{V} - \frac{2 \cdot 5\text{m}}{12 \frac{\text{m}}{\Omega \cdot \text{mm}^2} \cdot 0.34\text{mm}^2} \cdot 0.015\text{A} = 5.463\text{V}$$

The quantization must be calculated using the actual calculated bridge voltage (see ["Quantization" on page 202](#)).

9.1.2.1.10.2 Quantization

In a weighing application, the corresponding weight located on the connected load cell should be determined from the value derived from the module.

Example

The characteristics of the strain gauge load cell are as follows:

- Rated load: 1000 kg
- Strain gauge factor: 4 mV/V
- Actual bridge voltage: 5.463 V

Maximum quantization:

Multiplying the bridge factor of the strain gauge load cell with the bridge supply voltage from the module results in the value for the positive full-scale deflection at a specified rated load of 1000 kg:

$$4 \text{ mV/V} \cdot 5.5 \text{ V} = 22 \text{ mV}$$

Actual quantization:

Taking the voltage drop on the measuring line into account, the actual bridge voltage is 5.463 V (for the calculation, see section "Bridge voltage" on page 201). If this voltage is multiplied by the strain gauge factor of 4 mV/V, the following actual quantization results:

$$4 \text{ mV/V} \cdot 5.463 \text{ V} = 21.85 \text{ mV}$$

These 21.85 mV correspond to 99.3% of the maximum possible measurement range.

Information:

If the quantization decreases, the maximum possible effective resolution also decreases (see "Effective resolution of the A/D converter" on page 200).

With a simple Rule of Three calculation, the corresponding value can be calculated (as seen in the table) from weight to the converter value and vice versa. This simplified theoretical approach is only valid for an ideal measurement system. Calibration of the entire measurement system is recommended because not only the module, but particularly the strain gauge bridges exhibit tolerances (offset, gain). When taring, the gradient offset is recalculated and the gain of the linear equation is determined when normalized. In addition to the calculation displayed in the table, these calculations must also be carried out in the application.

| 24-bit value of the module | | Quantization | Corresponding weight |
|----------------------------|-----------|---------------|----------------------|
| 0x007F FFFF | 8,388,607 | 21.85 mV | 1000 kg |
| 0x0000 0001 | 1 | 2.61 nV | 0.119 g |
| 0x0000 20C3 | 8387 | 21.85 μ V | 1 kg |
| 0x0001 0000 | 65536 | 170.7 μ V | 7.81 kg |

The values for 1 LSB are also included in the module's technical data under item "Quantization" (1 LSB each for 16 bits and 24 bits).

9.1.2.1.11 Filter characteristics of the sigma-delta A/D converter

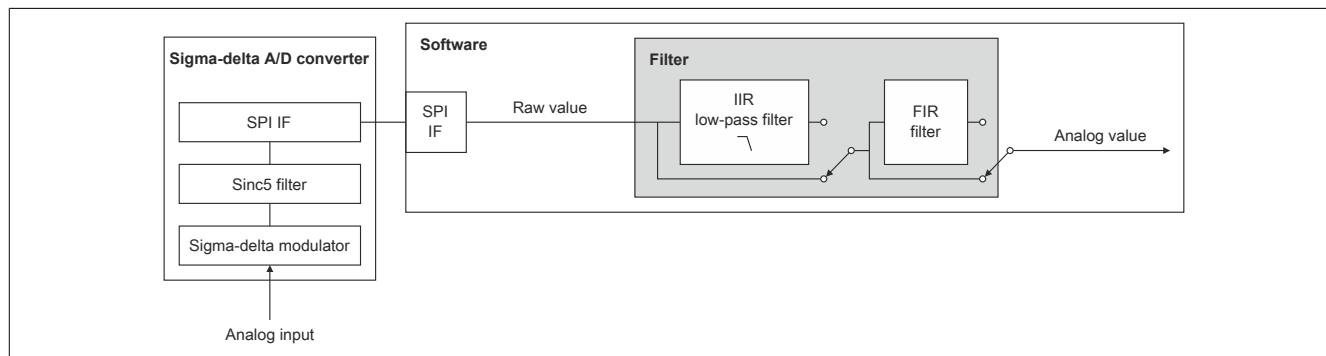

9.1.2.1.12 Software filters

2 filters are available for the analog input. They can be individually enabled and configured at runtime. By default, both filters are disabled when the device is switched on. The filters are controlled and configured using "Function model 2 - Extended filter".

In order to allow the filter behavior to be adapted to the measuring situation or machine cycle (high dynamics and low precision or low dynamics and high precision), the filter characteristics of both the IIR low-pass filter as well as the FIR filter can be changed synchronously at any time.

Filter diagram

9.1.2.1.12.1 IIR low-pass filter

General information

The IIR low-pass filter is used to generally smooth and increase the resolution of the analog value. The filter works according to the following formula:

$$y = y_{\text{Old}} + \frac{x - y_{\text{Old}}}{2^{\text{Filter level}}}$$

- x ... Current filter input value
- y_{Old} ... Old filter output value
- y ... New filter output value

Parameter "Filter level" in the formula above is configured using register "ConfigCommonOutput01" on page 222. "Filter level" = 0 if the IIR low-pass filter is disabled.

Filter characteristics of the first-order IIR low-pass filter

Limit frequency f_c

The following table provides an overview of the -3 dB limit frequency f_c depending on the configured filter level.

| Filter level | Normalized f_c [I/O update rate] | f_c [Hz] I/O update rate = 15000/s | f_c [Hz] I/O update rate = 20000/s |
|--------------|---------------------------------------|---|---|
| 1 | 0.11476 | 1721.4 | 2295.2 |
| 2 | 0.046 | 690 | 920 |
| 3 | 0.02124 | 318.6 | 424.8 |
| 4 | 0.01026 | 153.9 | 205.2 |
| 5 | 0.00504 | 75.6 | 100.8 |
| 6 | 0.0025 | 37.5 | 50 |
| 7 | 0.00124 | 18.6 | 24.8 |
| 8 | 0.00062 | 9.3 | 12.4 |

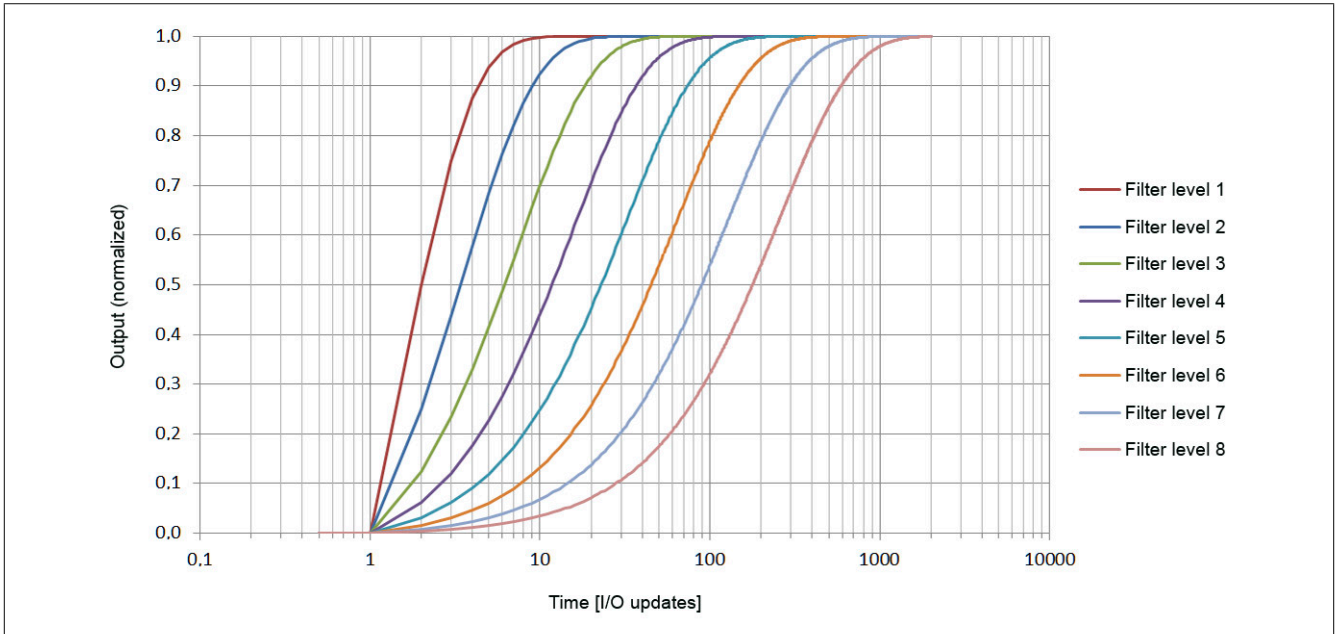

Gain of the IIR low-pass filter

Phase shift of the IIR low-pass filter

Step response of the IIR low-pass filter

Group delay of the IIR low-pass filter

9.1.2.1.12.2 FIR filter

Like the IIR low-pass filter, the FIR filter can also be used to smooth out the signal and increase its resolution. In addition, configuring the filter length accordingly makes it possible to target and efficiently filter out individual interference frequencies. The source of these interference frequencies may be mechanical or electromagnetic. Multiples of these are also filtered out (as long as they are a whole-number factor of the data output rate).

Example:

Data output rate = 15000 samples/s, averaging over 15 values → "Notch" at 1 kHz (2 kHz, etc.)

When reconfiguring the filter, it takes 1/data rate (FIR filter in mode "Selectable data rate") or 1/filter frequency (FIR filter in mode "High-resolution data rate") until the filter is tuned. During tuning, bit 5 is set in register "StatusInput01" on page 224.

Characteristics of the FIR filter in mode "Selectable data rate"

The following table applies to "Function model 0 - Standard" and "Function model 254 - Bus controller" as well as for "Function model 2 - Extended filter" in mode "Selectable data rate".

| Set value 1) 2) | Data rate (f_{Data}) [Hz] 3) 4) | f_{Notch} [Hz] | I/O update rate [Hz] | | I/O update time [ms] | |
|--------------------|---|-------------------------|------------------------------|---|------------------------------|---|
| | | | Function models 0 and 254 | Function model 2 (mode "Selectable data rate") | Function models 0 and 254 | Function model 2 (mode "Selectable data rate") |
| 0000 | 2.5 | 2.5 | 2.5 | 15000 | 400 | 0.0667 |
| 0001 | 5 | 5 | 5 | 15000 | 200 | 0.0667 |
| 0010 | 10 | 10 | 10 | 15000 | 100 | 0.0667 |
| 0011 | 15 | 15 | 15 | 15000 | 66.6667 | 0.0667 |
| 0100 | 25 | 25 | 25 | 15000 | 40 | 0.0667 |
| 0101 | 30 | 30 | 30 | 15000 | 33.3333 | 0.0667 |
| 0110 | 50 | 50 | 50 | 15000 | 20 | 0.0667 |
| 0111 | 60 | 60 | 60 | 15000 | 16.6667 | 0.0667 |
| 1000 | 100 | 100 | 100 | 15000 | 10 | 0.0667 |
| 1001 | 500 | 500 | 500 | 15000 | 2 | 0.0667 |

| 1110 | | | Reserved | | | |
| 1111 | | | Reserved | | | |

- 1) Function model 0 and 254: Bits 0 to 3 of register "ConfigOutput01" on page 215
- 2) Function model 2: Bits 0 to 3 of register "ConfigDataRateOutput01" on page 223
- 3) Function models 0 and 254: Data rate = 1/Filter length [s] (f_{Notch}) = I/O update rate
- 4) Function model 2: Data rate = 1/Filter length [s] (f_{Notch})

Characteristics of the FIR filter in mode "High-resolution data rate"

The following table applies to "Function model 2 - Extended filter".

| Setpoint [0.1 Hz] ¹⁾ | Data rate (f _{Data}) [Hz] | f _{Notch} [Hz] | I/O update time [μs] |
|---------------------------------|-------------------------------------|-------------------------|----------------------|
| 1 to 65535 | Setpoint / 10 | = Data rate | ≈50 μs ²⁾ |

- 1) Setpoint from register "ConfigHighResolutionOutput01" on page 223
- 2) The value varies between 42 and 56 μs (see also the next section "I/O update time")

I/O update time

The value of the I/O update time depends on the setpoint and varies between 42 and 56 μs. The following formula can be used to precisely calculate the I/O update time:

$$\text{I/O update time} = 1e6 \cdot (1e-4 - 10 / (\text{Setpoint} \cdot [10 / (5e-5 \cdot \text{Setpoint})]))$$

Legend: The square brackets in the formula above mean that the calculated value must be rounded to a whole number.

The following image shows the I/O update time depending on the setpoint:

Examples for the gain of the FIR filter

Example 1

Filter setting = 10:

- $f_{\text{Notch}} = 1000 \text{ Hz}$
- $f_c = 439.3 \text{ Hz}$

Example 2

Filter setting = 6:

- $f_{\text{Notch}} = 50 \text{ Hz}$
- $f_c = 21.8 \text{ Hz}$

Detailed excerpt from the filter curve shown above:

9.1.2.1.13 Hardware configuration

9.1.2.1.13.1 Hardware configuration for horizontal installation starting at 55°C ambient temperature

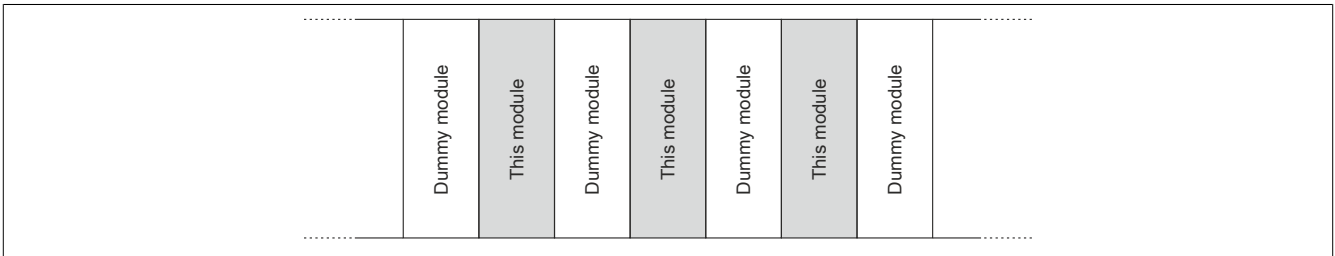

Operating a strain gauge module

Starting at an ambient temperature of 55°C, a dummy module must be connected to the left and right of the strain gauge module in a horizontal mounting orientation.

Operating multiple strain gauge modules side by side

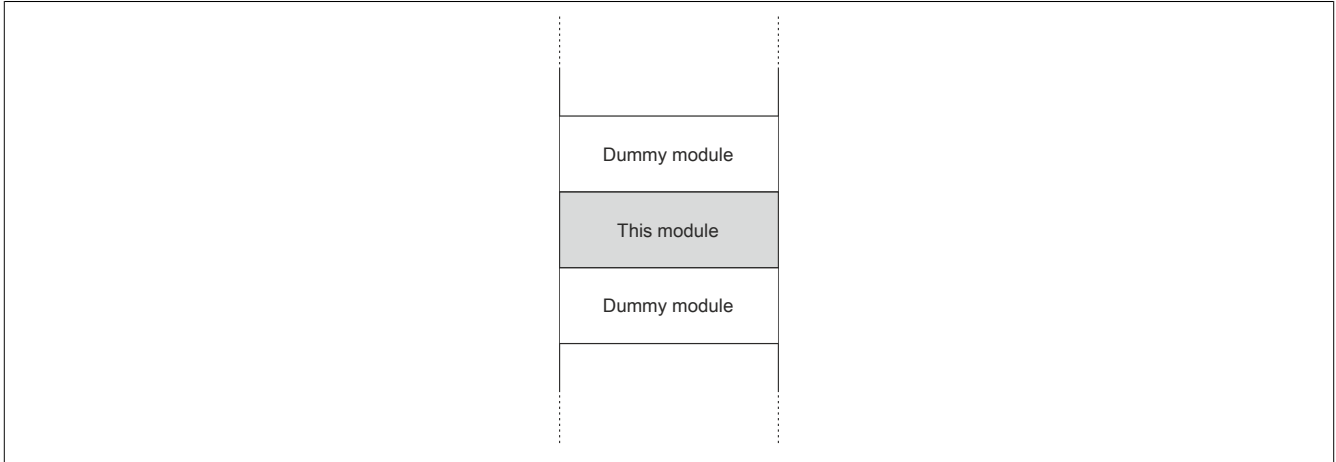

If 2 or more horizontal strain gauge modules are being operated in a cluster, the following arrangement of modules must be observed.

9.1.2.1.13.2 Hardware configuration for vertical installation starting at 45°C ambient temperature

Operating a strain gauge module

Starting at an ambient temperature of 45°C, a dummy module must be connected to the left and right of the strain gauge module in a vertical mounting orientation.

Operating multiple strain gauge modules side by side

If 2 or more vertical strain gauge modules are being operated in a cluster, the following arrangement of modules must be observed.

9.1.2.1.14 Register description

9.1.2.1.14.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section ["General data points" on page 3790](#).

9.1.2.1.14.2 Function model 0 - Standard

| Register | Name | Data type | Read | | Write | |
|--------------------------------------|--|-----------|--------|---------|--------|---------|
| | | | Cyclic | Acyclic | Cyclic | Acyclic |
| Analog signal - Configuration | | | | | | |
| 16 | ConfigOutput01 (A/D converter configuration) | USINT | | | • | |
| 18 | ConfigCycletime01 | UINT | | | | • |
| 32 | AdcClkFreqShift01 | USINT | | | | • |
| Analog signal - Communication | | | | | | |
| 2 | StatusInput01 | USINT | • | | | |
| 4 | AnalogInput01 | DINT | • | | | |

9.1.2.1.14.3 Function model 1 - Multisampling

In this function model, the A/D converter is operated synchronously to X2X Link with a predefined A/D converter cycle time. The value is configurable as 50 or 100 μ s.

The module returns between 3 and 10 measured values per X2X cycle depending on the configuration. With an X2X cycle time of 400 μ s and A/D converter cycle time of 50 μ s, exactly 8 measurements are performed and the module can return 8 values (strain gauge value 01 to strain gauge value 08).

If a longer cycle time is used, the values returned correspond to the last measurements. If using an X2X cycle time that is not a whole number multiple of the A/D converter cycle time, then the conversion cannot be synchronized with X2X Link. In this case, the module outputs the invalid value 0x8000.

Example 1

If using an X2X cycle time of 800 μ s, it is possible to perform 16 measurements per X2X cycle if the A/D converter cycle time equals 50 μ s. The first 6 measured values are discarded; the last 10 measured values are provided by the module.

With a shorter X2X cycle time, the number of measured values should not exceed the number of measurements that can actually be made. All other measured values are invalid (0x8000). To minimize the load on the X2X Link network, it is possible to disable these unneeded registers (see ["Number of measured values" on page 220](#)).

Example 2

If using an X2X cycle time of 300 μ s, it is possible to perform 6 measurements per X2X cycle if the A/D converter cycle time equals 50 μ s. For this reason, only the first 6 registers are valid. The registers for the 7th through 10th measured value ([AnalogInput07](#) to [AnalogInput10](#)) should be disabled by setting [Number of measured values](#) to "6 measured values" in the I/O configuration.

| Register | Name | Data type | Read | | Write | |
|--------------------------------------|---|-----------|--------|---------|--------|---------|
| | | | Cyclic | Acyclic | Cyclic | Acyclic |
| Analog signal - Configuration | | | | | | |
| 1601 | ConfigGain01_MultiSample | USINT | | | • | |
| 1603 | ConfigCycletime01_MultiSample | USINT | | | | • |
| Analog signal - Communication | | | | | | |
| 2 | StatusInput01 | USINT | • | | | |
| 1534 + N * 4 | AnalogInput0N (N = 1 to 10) | INT | • | | | |

9.1.2.1.14.4 Function model 2 - Extended filter

This function model allows the IIR low-pass filter and the FIR filter to be enabled.

| Register | Name | Data type | Read | | Write | |
|--------------------------------------|--|-----------|--------|---------|--------|---------|
| | | | Cyclic | Acyclic | Cyclic | Acyclic |
| Analog signal - Configuration | | | | | | |
| 272 | ConfigCommonOutput01 (A/D converter and IIR filter configuration) | USINT | | | • | |
| 288 | ConfigFilterOutput01 | UINT | | | | • |
| 273 | ConfigDatarateOutput01 | USINT | | | • | |
| 274 | ConfigHighResolutionOutput01 | UINT | | | • | |
| Analog signal - Communication | | | | | | |
| 2 | StatusInput01 | USINT | • | | | |
| 4 | AnalogInput01 | DINT | • | | | |
| 256 | AdcConvTimeStampInput01 | DINT | • | | | |

9.1.2.1.14.5 Function model 254 - Bus controller

In function model "254 - Bus controller", the module behaves as it does in "Function model 0 - Standard" with the exception that it is not synchronized to the X2X Link network even if synchronous mode is enabled in register "ConfigOutput01" on page 215. Instead, the module behaves as if the set A/D converter cycle time is not a factor or multiple of the X2X cycle time and attempts to maintain the set A/D converter cycle time as precisely as possible.

| Register | Offset ¹⁾ | Name | Data type | Read | | Write | |
|--------------------------------------|----------------------|--|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| Analog signal - Configuration | | | | | | | |
| 16 | 0 | ConfigOutput01 (A/D converter configuration) | USINT | | | • | |
| 18 | 18 | ConfigCycletime01 | UINT | | | | • |
| 32 | 32 | AdcClkFreqShift01 | USINT | | | | • |
| Analog signal - Communication | | | | | | | |
| 2 | 4 | StatusInput01 | USINT | • | | | |
| 4 | 0 | AnalogInput01 | DINT | • | | | |

1) The offset specifies the position of the register within the CAN object.

Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see "Using I/O modules on the bus controller" on page 3789.

CAN I/O bus controller

The module occupies 1 analog logical slot on CAN I/O.

9.1.2.1.14.6 Registers for function models "0 - Standard" and "254 - Bus controller"

A/D converter configuration

Name:

ConfigOutput01

The data rate and measurement range of the A/D converter can be configured in this register.

| Data type | Values | Bus controller default setting |
|-----------|--------------------|--------------------------------|
| USINT | See bit structure. | 13 |

Bit structure:

| Bit | Description | Value | Information | |
|-------|--|--|--|----------|
| 0 - 3 | Data rate f_{DATA} (samples per second): | 0000 | 2.5 | |
| | | 0001 | 5 | |
| | | 0010 | 10 | |
| | | 0011 | 15 | |
| | | 0100 | 25 | |
| | | 0101 | 30 | |
| | | 0110 | 50 | |
| | | 0111 | 60 | |
| | | 1000 | 100 | |
| | | 1001 | 500 | |
| | | 1010 | 1000 | |
| | | 1011 | 2000 | |
| | | 1100 | 3750 | |
| | | 1101 | 7500 (bus controller default setting) | |
| 4 - 6 | Standard measurement range (bit 6 = 0) | 000 | 16 mV/V (bus controller default setting) | |
| | | 001 | 8 mV/V | |
| | | 010 | 4 mV/V | |
| | | 011 | 2 mV/V | |
| | | Extended measurement range (bit 6 = 1) | 100 | 256 mV/V |
| | | | 101 | 128 mV/V |
| 110 | 64 mV/V | | | |
| 7 | Reserved | 111 | 32 mV/V | |
| | | 0 | (must be 0) | |

Synchronous mode

The module's analog/digital converter (A/D converter) can optionally be operated and read synchronously to the X2X Link network. Synchronous mode is enabled by selecting the respective operating mode in register "ConfigOutput01" on page 215. A time between 200 and 2000 μ s must be set in register "ConfigCycletime01" on page 216 for this. If this time is a whole number factor or multiple of the configured cycle time of X2X Link, then the A/D converter is read synchronously to X2X Link.

Information:

The A/D converter cycle time must be $\geq 1/4$ of the X2X cycle time!

Bit 2 in *Module status* is set (i.e. A/D converter not running synchronously)...

- ... If the configured A/D converter cycle time cannot be synchronized with X2X Link.
- ... If the module is still in the settling phase.

Jitter, dead time and settling time:

| | | |
|---|--|---|
| Jitter | | |
| A/D converter cycle times <1500 μ s | | Max. $\pm 1 \mu$ s |
| A/D converter cycle times >1500 μ s | | Max. $\pm 4 \mu$ s |
| X2X link dead time | | 50μ s + $\frac{X2X \text{ cycle time}}{128}$ |
| Settling time | | 150 x X2X cycle time |

The settling time corresponds to the time needed until the A/D converter can be operated after enabling synchronous mode or following conversion of the A/D converter cycle time.

A/D converter cycle time

Name:

ConfigCycletime01

This register is only used in [Synchronous mode](#). If synchronous mode is enabled in the A/D converter configuration, then the module attempts to operate the A/D converter as synchronously as possible to the X2X Link network (based on the A/D converter cycle time set in this register). It is of course necessary for the X2X Link cycle time and the A/D converter cycle time to have a certain ratio. The following conditions must be observed:

- 1) A/D converter cycle time $\geq 1/4$ X2X cycle time
- 2) A/D converter cycle time corresponds to a whole number factor or multiple of the X2X cycle time
- 3) A/D converter cycle time must be in the range 50 to 2000 μ s

| Data type | Values | Information |
|-----------|------------|-------------------------------------|
| UINT | 50 to 2000 | Bus controller default setting: 400 |

A/D converter clock frequency shift

Name:

AdcClkFreqShift01

In rare cases, strain gauge modules connected to neighboring slots can influence one another. This can result in temporary, minimal deviations in measured values. This can only occur if the sigma-delta A/D converters on the neighboring strain gauge modules are operated at exactly the same clock frequency.

In most cases, these clock frequencies vary slightly due to part variances. When they are the same however, this register on the strain gauge module provides a safe way for an application to prevent this type of mutual influence.

| Data type | Values | Information |
|-----------|-------------|-------------------------------------|
| SINT | -128 to 127 | Bus controller default setting: 127 |

This register can be used to vary the clock frequency in increments of 200 ppm. Setting values from -50 to 50 cover a range of -10000 ppm to 10000 ppm. This corresponds with -1% to 1%.

Values beyond this range will cause activation of a default mode. The frequency shift is derived from the last 2 digits of the serial number by the module firmware. This saves time that would otherwise be needed for programming, provided that the last two digits of the serial numbers on the neighboring modules are not the same

| Register value | Frequency shift in ppm | Example of a sampling rate ¹⁾ |
|----------------|--|--|
| 127 | $((\text{SerialNo. modulo } 100) - 50) * (-200)$ ppm | Based on the serial number |
| ... | ... | ... |
| 51 | $((\text{SerialNo. modulo } 100) - 50) * (-200)$ ppm | Based on the serial number |
| 50 | 10000 | 505 |
| 49 | 9800 | 504.9 |
| ... | ... | ... |
| 2 | 400 | 500.2 |
| 1 | 200 | 500.1 |
| 0 | 0 | 500 |
| -1 | -200 | 499.9 |
| -2 | -400 | 499.8 |
| ... | ... | ... |
| -50 | -10000 | 495 |
| -51 | $((\text{SerialNo. modulo } 100) - 50) * (-200)$ ppm | Based on the serial number |
| ... | ... | ... |
| -128 | $((\text{SerialNo. modulo } 100) - 50) * (-200)$ ppm | Based on the serial number |

1) Nominal sampling rate of 500 samples per second

Important:

As shown in the table above, shifting the A/D converter clock frequency will equally shift the A/D converter sampling rate. Shifting the A/D converter clock frequency too much can cause problems with disturbance suppression particularly when a very specific sampling rate has been defined to suppress existing disturbances (e.g. 50 Hz to suppress the 50 Hz hum). See also "[Filter characteristics of the sigma-delta A/D converter](#)" on page 203.

It is situations like this where the option to manually shift the frequency in the I/O configuration or ASIOACC library should be utilized rather than relying on the default frequency shift that is based on the serial number.

A frequency shift like the one shown below would be sufficient to prevent modules from influencing one another and would not cause any noticeable difference to the filter characteristics.

| Slot | 1 | 2 | 3 | 4 | 5 | 6 | ... |
|-------------------------------------|---|---|----|---|----|---|-----|
| A/D converter clock frequency shift | 0 | 2 | -1 | 1 | -2 | 0 | ... |

Information:

- This register has no effect in synchronous mode because the firmware regulates the A/D converter clock frequency in such a way that the A/D converter cycle is synchronous with the X2X cycle.
- When writing to this register using the ASIOACC library, only the lowest value byte of the written value is accepted. For example, the value 256 (=0x100) is identical to the value 0 (=0x00).

Module status

Name:

StatusInput01

The current state of the module is indicated in this register.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|--------------------------------|-------|---|
| 0 | A/D converter value | 0 | Valid A/D converter value |
| | | 1 | Invalid A/D converter value (analog value = 0xFF800000). Possible causes: <ul style="list-style-type: none"> • Strain gauge supply error • I/O power supply error • A/D converter not (yet) configured |
| 1 | Line monitoring | 0 | Ok |
| | | 1 | Open circuit |
| 2 | Only valid in synchronous mode | 0 | A/D converter runs synchronous to X2X Link |
| | | 1 | A/D converter does not run synchronous to X2X Link |
| 3 - 7 | Reserved | - | |

Strain gauge value

Name:

AnalogInput01

This register contains the raw value determined by the A/D converter for the full-bridge strain gauge with 24-bit resolution.

| Data type | Values | Information |
|-----------|-----------------------|--|
| DINT | -8,388,608 | Negative invalid value |
| | -8,388,607 | Negative full-scale deflection / Underflow |
| | -8,388,606 to 8388606 | Valid range |
| | 8,388,607 | Positive full-scale deflection / Overflow / Open circuit |

Effective resolution

In principle, the effective resolution of the A/D converter is dependent on the data rate and the measurement range (see "Effective resolution of the A/D converter" on page 200).

The following table shows how the effective resolution (in bits) or effective range of values of the strain gauge value depend on the module configuration (data rate, measurement range).

| Data rate f_{DATA} [Hz] | Measurement range | | | | | | | |
|-------------------------------------|-------------------|-----------------|--------------|-----------------|--------------|-----------------|--------------|-----------------|
| | ± 16 mV/V | | ± 8 mV/V | | ± 4 mV/V | | ± 2 mV/V | |
| | Bits | Range of values | Bits | Range of values | Bits | Range of values | Bits | Range of values |
| 2.5 | 19.9 | $\pm 489,000$ | 19.1 | $\pm 281,000$ | 18.0 | $\pm 131,000$ | 17.4 | $\pm 86,500$ |

Table 21: Effective resolution of the strain gauge value in bits for the measurement range 32 to 256 mV/V

9.1.2.1.14.7 Register for "Function model 1 - Multisampling"**A/D converter configuration**

Name:

ConfigGain01_MultiSample

The measurement range for the A/D converter can be configured in this register.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|--|-------|-------------|
| 0 - 2 | Standard measurement range (bit 2 = 0) | 000 | 16 mV/V |
| | | 001 | 8 mV/V |
| | | 010 | 4 mV/V |
| | | 011 | 2 mV/V |
| | Extended measurement range (bit 2 = 1) | 100 | 256 mV/V |
| | | 101 | 128 mV/V |
| | | 110 | 64 mV/V |
| 3 - 7 | Reserved | 111 | 32 mV/V |
| | | 0 | (must be 0) |

A/D converter cycle time

Name:

ConfigCycletime01_MultiSample

The A/D converter cycle time can be configured in this register.

In order for multisampling to work, the X2X cycle time must be divisible by the A/D converter cycle time to produce a whole number.

| Data type | Value | Information |
|-----------|----------|----------------------|
| USINT | 0 | 50 μ s (default) |
| | 1 | 100 μ s |
| | 2 to 255 | Reserved |

Number of measured values

If the X2X cycle time is too short, then not all 10 measurements can be performed. To reduce the load on X2X Link, it makes sense to only transfer as many values as measurements that can be made. This is why it is possible to configure the number of measured values to be transferred (see "Function model 1 - Multisampling" on page 213).

Example: A/D converter cycle time = 50 μ s

| X2X cycle time | Number of measured values to be transferred |
|--------------------|---|
| 250 μ s | 5 |
| 300 μ s | 6 |
| 350 μ s | 7 |
| 400 μ s | 8 |
| 450 μ s | 9 |
| \geq 500 μ s | 10 |

Example: A/D converter cycle time = 100 μ s

| X2X cycle time | Number of measured values to be transferred |
|----------------|---|
| 300 μ s | 3 |
| 400 μ s | 4 |
| 500 μ s | 5 |
| 600 μ s | 6 |
| 700 μ s | 7 |
| 800 μ s | 8 |
| 900 μ s | 9 |
| \geq 1 ms | 10 |

Module status

Name:
StatusInput01

This register contains the current state of the module.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|----------------------|-------|--|
| 0 | A/D converter values | 0 | Valid A/D converter value |
| | | 1 | Invalid A/D converter value |
| 1 | Line monitoring | 0 | OK |
| | | 1 | Open circuit An open circuit was found during at least one measurement in this X2X cycle. This bit is reset if all measurements are OK after correcting this error, i.e. it does not have to be acknowledged. |
| 2 | Synchronous mode | 0 | A/D converter runs synchronous to X2X Link |
| | | 1 | A/D converter does not run synchronous to X2X Link |
| 3 - 7 | Reserved | - | |

Strain gauge value - Multiple

Name:
AnalogInput01 to AnalogInput10

This register contains the raw value determined by the A/D converter for the full-bridge strain gauge with 16-bit resolution. The module returns between 3 and 10 measured values per X2X cycle depending on the configuration.

Effective resolution

In principle, the effective resolution of the A/D converter is dependent on the data rate and measurement range (see "[Effective resolution of the A/D converter](#)" on page 200).

The following table shows how the effective resolution (in bits) or effective range of values of the strain gauge value depend on the module configuration (data rate, measurement range).

| Measurement range | | | | | | | |
|-------------------|-----------------|---------|-----------------|---------|-----------------|---------|-----------------|
| ±16 mV/V | | ±8 mV/V | | ±4 mV/V | | ±2 mV/V | |
| Bits | Range of values | Bits | Range of values | Bits | Range of values | Bits | Range of values |
| 13.4 | ±5,240 | 12.3 | ±2,510 | 11.3 | ±1,300 | 10.3 | ±630 |

Table 22: Effective resolution of the strain gauge value in bits for the measurement range 2 to 16 mV/V

| Measurement range | | | | | | | |
|-------------------|-----------------|-----------|-----------------|----------|-----------------|----------|-----------------|
| ±256 mV/V | | ±128 mV/V | | ±64 mV/V | | ±32 mV/V | |
| Bits | Range of values | Bits | Range of values | Bits | Range of values | Bits | Range of values |
| 15.5 | ±23,200 | 15.0 | ±16,400 | 15.0 | ±16,400 | 14.1 | ±8,490 |

Table 23: Effective resolution of the strain gauge value in bits for the measurement range 32 to 256 mV/V

9.1.2.1.14.8 Register for "Function model 2 - Extended filter"**A/D converter and IIR filter configuration**

Name:

ConfigCommonOutput01

The IIR low-pass filter and measurement range of the A/D converter can be configured in this register.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|----------------------------|-------------|--|
| | | | Filter level |
| 0 - 3 | IIR low-pass filter | 0000 | 0: IIR low-pass filter switched off |
| | | 0001 | 1 |
| | | 0010 | 2 |
| | | 0011 | 3 |
| | | 0100 | 4 |
| | | 0101 | 5 |
| | | 0110 | 6 |
| | | 0111 | 7 |
| | | 1000 | 8 |
| | | 1001 - 1111 | The analog input value indicates an invalid range. |
| 4 - 6 | Default measurement range | 000 | 16 mV/V |
| | | 001 | 8 mV/V |
| | | 010 | 4 mV/V |
| | | 011 | 2 mV/V |
| | Extended measurement range | 100 | 256 mV/V |
| | | 101 | 128 mV/V |
| | | 110 | 64 mV/V |
| | | 111 | 32 mV/V |
| 7 | Reserved | 0 | (must be 0) |

Data rate configuration

Name:

ConfigFilterOutput01

Whether a selectable data rate or a high-resolution data rate is being used for the FIR filter is configured in this register.

| Data type | Values | Information |
|-----------|--------|--|
| UINT | 0 | Mode "Selectable data rate": A selectable data rate is used for the FIR filter (default). Configuration takes place in register "ConfigDatarateOutput01" on page 223. |
| | 1 | Mode "High-resolution data rate": A high-resolution data rate is used for the FIR filter. Configuration takes place in register "ConfigHighResolutionOutput01" on page 223. |

Name:

ConfigDatarateOutput01

The data rate of the FIR filter in mode "Selectable data rate" is configured in this register.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|--|-------------|--|
| 0 - 3 | Data rate f_{DATA} (samples per second): | 0000 | 2.5 |
| | | 0001 | 5 |
| | | 0010 | 10 |
| | | 0011 | 15 |
| | | 0100 | 25 |
| | | 0101 | 30 |
| | | 0110 | 50 |
| | | 0111 | 60 |
| | | 1000 | 100 |
| | | 1001 | 500 |
| | | 1010 | 1000 |
| | | 1011 | 2000 |
| | | 1100 | 3750 |
| | | 1101 | 7500 |
| | | 1110 - 1111 | The analog input value indicates an invalid range. |
| 4 - 7 | Reserved | 0 | (must be 0) |

Name:

ConfigHighResolutionOutput01

The data rate of the FIR filter in 0.1 Hz steps is configured in this register (0.1 to 6553.5 Hz).

| Data type | Values | Information |
|-----------|-------------|-------------------------|
| UINT | 0 | Disables the FIR filter |
| | 1 to 65,535 | 0.1 to 6553.5 Hz |

Module status

Name:

StatusInput01

This register contains the current state of the module. If there is a fault in the module power supply or strain gauge supply, the analog input value indicates an invalid range and the buffer of the enabled filter is reset.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|----------------------|-------|------------------------------|
| 0 | A/D converter values | 0 | Valid A/D converter value |
| | | 1 | Invalid A/D converter value |
| 1 | Line monitoring | 0 | OK |
| | | 1 | Open circuit |
| 2 | Reserved | - | |
| 3 | Module power supply | 0 | OK |
| | | 1 | Error in module power supply |
| 4 | Strain gauge supply | 0 | OK |
| | | 1 | Error in strain gauge supply |
| 5 | FIR filter ready | 0 | OK |
| | | 1 | FIR filter not yet ready |
| 6 - 7 | Reserved | - | |

A/D converter conversion timestamp

Name:

AdcConvTimeStampInput01

This register holds the timestamp of the last analog conversion. This is always the point in time in [μ s] at which the conversion of the latest A/D converter raw value is completed.

| Data type | Values | Explanation |
|-----------|---------------------------------|--|
| DINT | -2,147,483,648 to 2,147,483,647 | Timestamp [μ s] of the last analog conversion |

9.1.2.1.14.9 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time |
|--------------------|
| 250 μ s |

9.1.2.1.14.10 Minimum I/O update time

The minimum I/O update time specifies how far the bus cycle can be reduced so that an I/O update is performed in each cycle.

For the I/O update times for function models "0 - Standard", "2 - Extended filter" and "254 - Bus controller", see section ["Characteristics of the FIR filter in mode "Selectable data rate" on page 207.](#)

Depending on the setting in register ["ConfigCycletime01_MultiSample" on page 220](#), the I/O update time in "Function model 1 - Multisampling" is 50 or 100 μ s.

9.1.2.2 X20AI1744 - With Rev. <H0

9.1.2.2.1 General information

This module works with both 4-wire and 6-wire strain gauge load cells. The concept applied by the module requires compensation in the measurement system. This compensation eliminates the absolute uncertainty in the measurement circuit, such as component tolerances, effective bridge voltage or zero point offset. The measurement precision refers to the absolute (compensated) value, which will only change as a result of changes in the operating temperature.

- 1 full-bridge strain gauge input
- Data output rate configurable from 2.5 Hz to 7.5 kHz
- Special operating modes (synchronous mode and multiple sampling)

9.1.2.2.2 Order data

| Model number | Short description | Figure |
|--------------|--|--|
| | Analog inputs |  |
| X20AI1744 | X20 analog input module, 1 full-bridge strain gauge input, 24-bit converter resolution, 5 kHz input filter | |

Table 25: X20AI1744 - Technical data

- 1) Depends on the full-bridge strain gauge being used.
- 2) With 6-wire connections, line compensation does not function (see section "Connection examples").
- 3) The maximum current of 90 mA is permitted up to an operating temperature of 45°C.
- 4) Quantization depends on the strain gauge factor.

9.1.2.2.4 LED status indicators

For a description of the various operating modes, see "[Diagnostic LEDs](#)" on page 3787.

| Figure | LED | Color | Status | Description |
|---|-----|-------|--------------|--|
|  | r | Green | Off | No power to module |
| | | | Single flash | RESET mode |
| | | | Double flash | BOOT mode (during firmware update) ¹⁾ |
| | | | Blinking | PREOPERATIONAL mode |
| | | | On | RUN mode |
| | e | Red | Off | No power to module or everything OK |
| | | | On | Error or reset status |
| | 1 | Green | Off | Possible causes: <ul style="list-style-type: none"> • Open circuit • Sensor is disconnected • Converter is busy |
| | | | On | Analog/digital converter running, value OK |
| | | | On | Analog/digital converter running, value OK |

- 1) Depending on the configuration, a firmware update can take up to several minutes.

9.1.2.2.5 Pinout

9.1.2.2.6 Connection examples

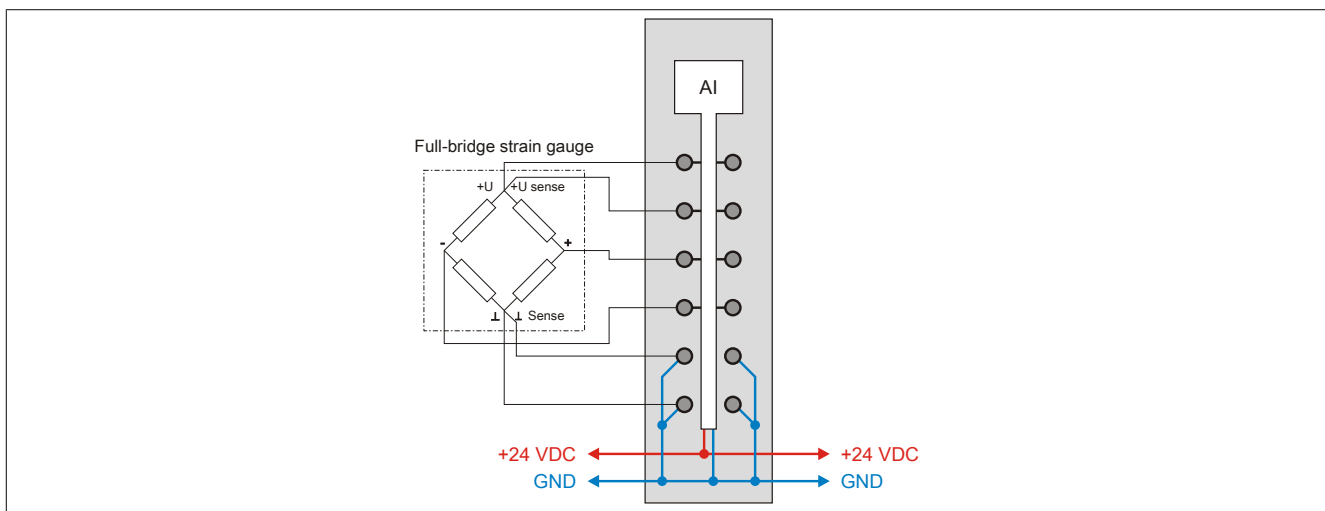

Full-bridge strain gauge with 4-wire connections

Full-bridge strain gauge with 6-wire connections

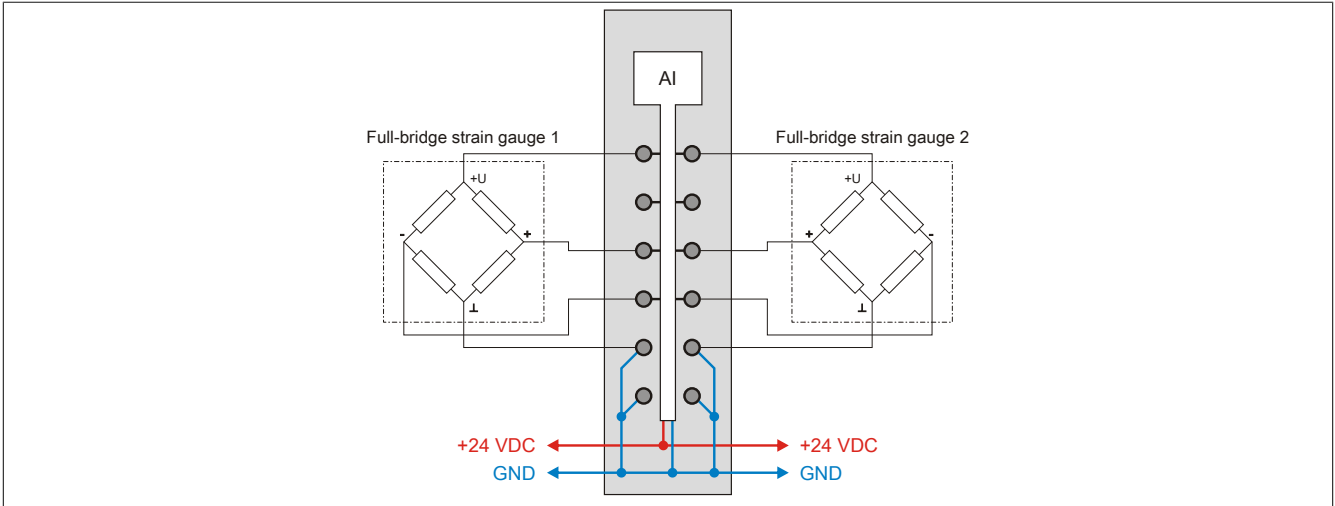

Full-bridge strain gauges can be connected to this module with 6-wire connections. Line compensation is not supported by the module, however. The sense lines are short circuited by the internally connected strain gauge VCC and GND connections (see "Input circuit diagram" on page 229). The measurement precision is therefore affected by changes in operating temperature. Longer cable lengths and smaller cable cross sections also increase the potential for errors in the measurement system.

In order to reduce cable resistance, the sense lines should be connected in parallel with the strain gauge supply lines. Optimal signal quality can be obtained by using a shielded twisted pair cable. The connections for the strain gauge supply lines, the sensor lines, and the bridge differential voltage lines should each use one twisted pair cable.

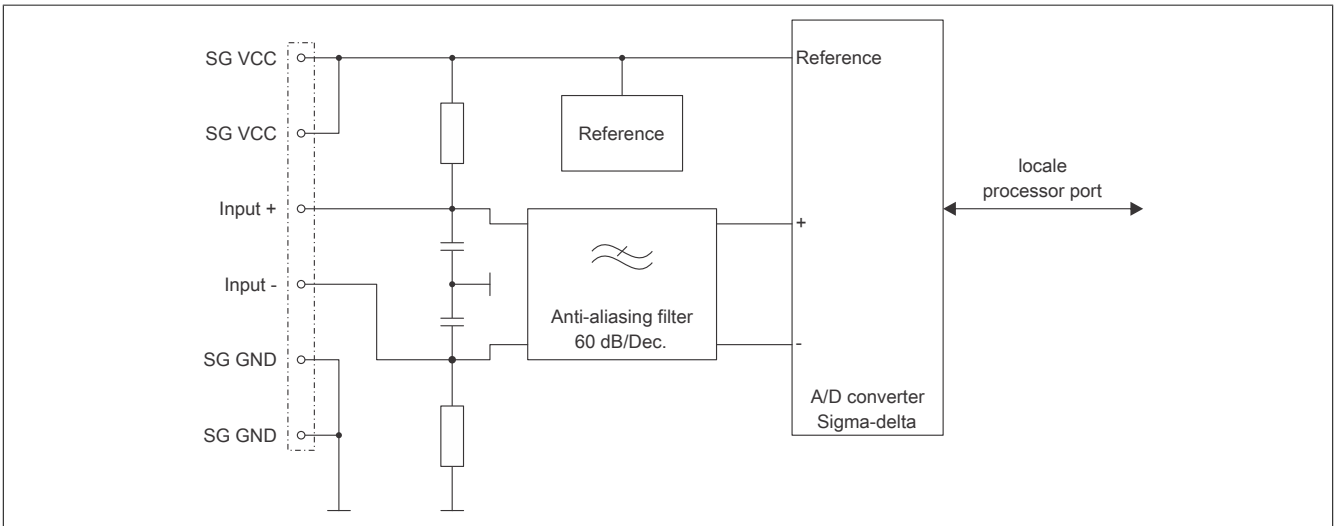

Parallel connection of 2 full-bridge strain gauges (4-wire connections)

If connecting the full-bridge strain gauges in parallel, the manufacturer's guidelines must be observed.

When connecting 3 or more full-bridge strain gauges in parallel, 2 lines must be connected together in an X20 terminal block.

9.1.2.2.7 Input circuit diagram

9.1.2.2.8 Filter characteristics of the sigma-delta A/D converter

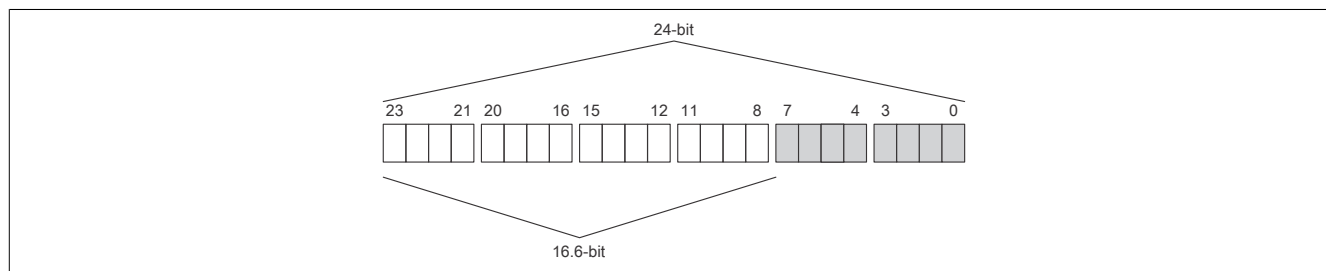

9.1.2.2.9 Effective resolution of the A/D converter

The A/D converter on the module provides a 24-bit measured value. The actual attainable noise-free resolution is always less than 24-bit, however. This "effective resolution" depends on the data rate and measurement range.

Example:

Based on the conversion method, a data rate of 2.5 Hz and a specified measurement range of 2 mV/V result in an effective resolution of 16.6 bits:

The low-order bits (grayed out) contain only noise instead of valid values and must therefore not be evaluated.

With "Function model 1 - Multisampling", only the highest 16 bits are made available.

9.1.2.2.10 Calculation example / Quantization

In a weighing application, the corresponding weight located on the connected load cell should be determined from the value derived from the module.

The characteristics of the strain gauge load cell are as follows:

- Rated load: 1000 kg
- Strain gauge factor: 4 mV/V

The value for the positive full-scale deflection at a specified rated load of 1000 kg is derived from the bridge factor of the strain gauge load cell (multiplication with the bridge supply voltage from the module):

$$4 \text{ mV/V} \times 5.5 \text{ V} = 22 \text{ mV}$$

With a simple Rule of Three calculation, the corresponding value can be calculated (as seen in the table) from weight to the converter value and vice versa. This simplified theoretical approach is only valid for an ideal measurement system. Calibration of the entire measurement system is recommended because not only the module, but particularly the strain gauge bridges exhibit tolerances (offset, gain). When taring, the gradient offset is recalculated and the gain of the linear equation is determined when normalized. In addition to the calculation displayed in the table, these calculations must also be carried out in the application.

| 24-bit value of the module | | Quantization | Corresponding weight |
|----------------------------|-----------|---------------|----------------------|
| 0x007F FFFF | 8,388,607 | 22.0 mV | 1000 kg |
| 0x0000 0001 | 1 | 2.62 nV | 0.119 g |
| 0x0000 20C3 | 8387 | 22.0 μ V | 1 kg |
| 0x0001 0000 | 65536 | 171.9 μ V | 7.81 kg |

The values for each LSB can be found in the technical data of the module under "Quantization" (1 LSB in reference to 16-bit and 1 LSB in reference to 24-bit).

9.1.2.2.11 Hardware configuration

9.1.2.2.11.1 Hardware configuration for horizontal installation at 50°C ambient temperature

Operating a strain gauge module

Starting at an ambient temperature of 50°C, a dummy module must be connected to the left and right of the strain gauge module in a horizontal mounting orientation.

Operating multiple strain gauge modules side by side

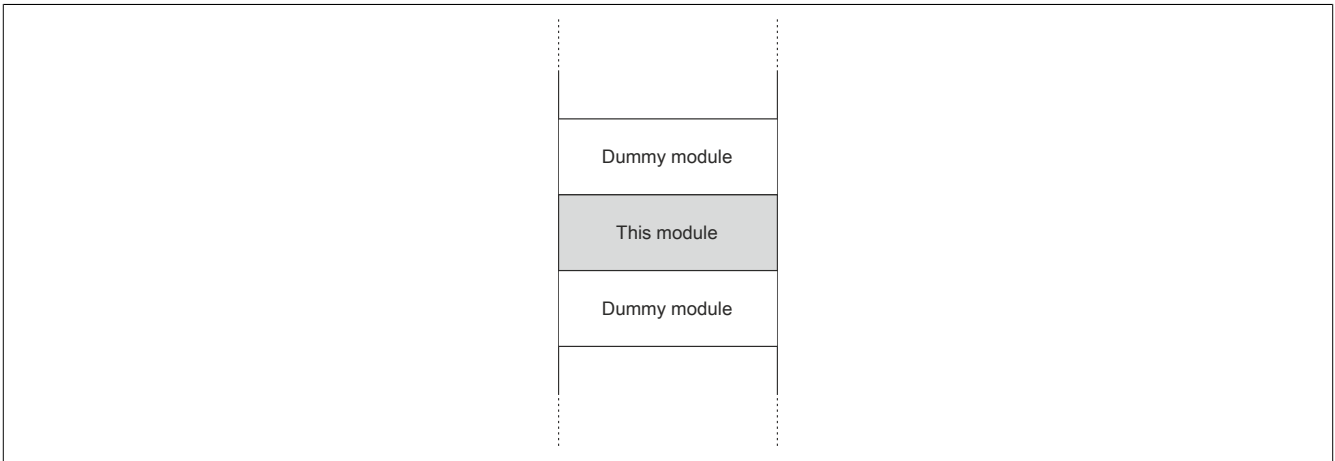

If 2 or more horizontal strain gauge modules are being operated in a cluster, the following arrangement of modules must be observed.

9.1.2.2.11.2 Hardware configuration for vertical installation at 40°C ambient temperature

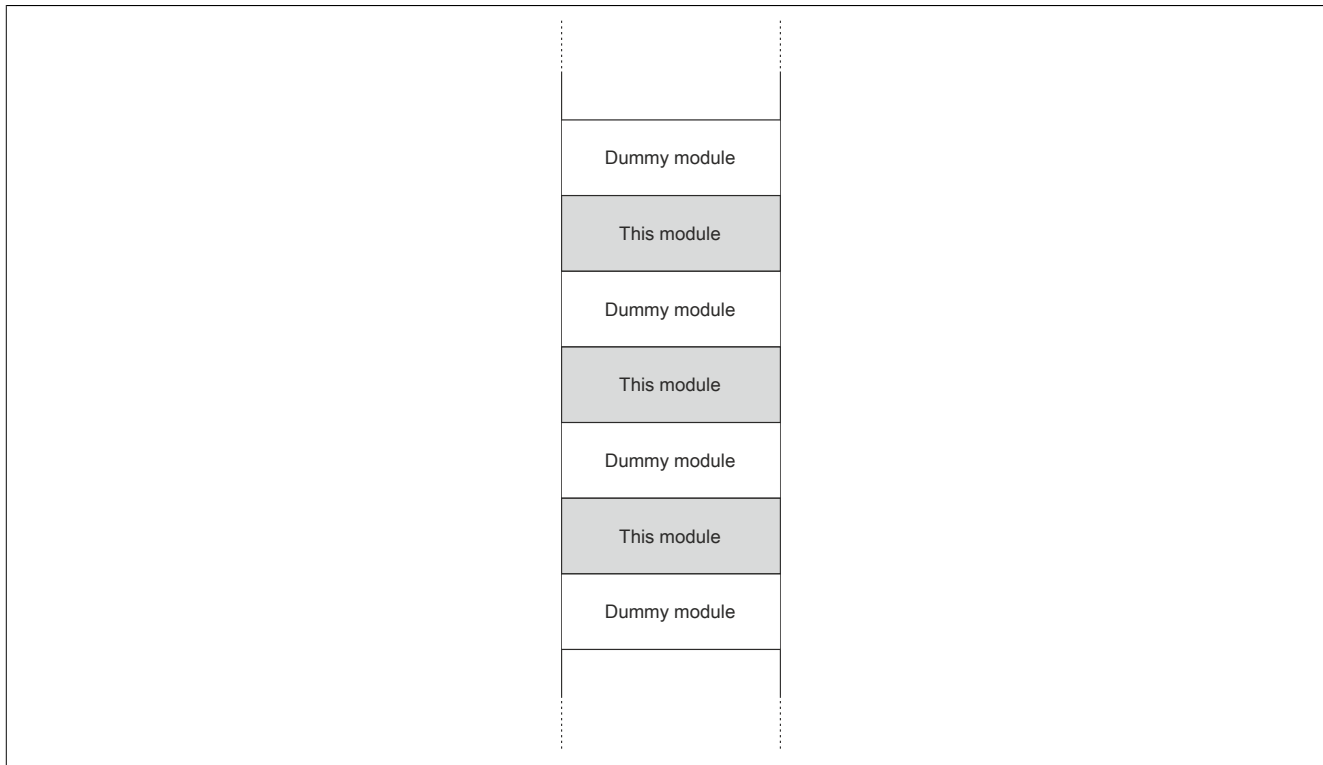

Operating a strain gauge module

Starting at an ambient temperature of 40°C, a dummy module must be connected to the left and right of the strain gauge module in a vertical mounting orientation.

Operating multiple strain gauge modules side by side

If 2 or more vertical strain gauge modules are being operated in a cluster, the following arrangement of modules must be observed.

9.1.2.2.12 Register description

9.1.2.2.12.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section ["General data points" on page 3790](#).

9.1.2.2.12.2 Function model 0 - Standard

| Register | Name | Data type | Read | | Write | |
|----------|---------------------------------|-----------|--------|---------|--------|---------|
| | | | Cyclic | Acyclic | Cyclic | Acyclic |
| 2 | StatusInput01 | USINT | • | | | |
| 4 | AnalogInput01 | DINT | • | | | |
| 16 | ConfigOutput01 | USINT | | | • | |
| 18 | ConfigCycletime01 | UINT | | | | • |
| 32 | AdcClkFreqShift01 ¹⁾ | USINT | | | | • |

1) Firmware version 8 / Upgrade 1.3.0.0 or higher

9.1.2.2.12.3 Function model 1 - Multisampling

In this function model, the A/D converter is operated synchronously to X2X Link with a predefined A/D converter cycle time. The value is configurable as 50 or 100 μ s.

The module returns between 3 and 10 measured values per X2X cycle depending on the configuration. With an X2X cycle time of 400 μ s and A/D converter cycle time of 50 μ s, exactly 8 measurements are performed and the module can return 8 values (strain gauge value 01 to strain gauge value 08).

If a longer cycle time is used, the values returned correspond to the last measurements. If using an X2X cycle time that is not a whole number multiple of the A/D converter cycle time, then the conversion cannot be synchronized with X2X Link. In this case, the module outputs the invalid value 0x8000.

Example 1

If using an X2X cycle time of 800 μ s, it is possible to perform 16 measurements per X2X cycle if the A/D converter cycle time equals 50 μ s. The first 6 measured values are discarded; the last 10 measured values are provided by the module.

With a shorter X2X cycle time, the number of measured values should not exceed the number of measurements that can actually be made. All other measured values are invalid (0x8000). To minimize the load on the X2X Link network, it is possible to disable these unneeded registers (see ["Number of measured values" on page 240](#)).

Example 2

If using an X2X cycle time of 300 μ s, it is possible to perform 6 measurements per X2X cycle if the A/D converter cycle time equals 50 μ s. For this reason, only the first 6 registers are valid. The registers for the 7th through 10th measured value (AnalogInput07 to AnalogInput10) should be disabled by setting [Number of measured values](#) to "6 measured values" in the I/O configuration.

| Register | Name | Data type | Read | | Write | |

| 1534 + N * 4 | AnalogInput0N (N = 1 to 10) | INT | • | | | |

9.1.2.2.12.4 Function model 254 - Bus controller

In function model "254 - Bus controller", the module behaves as it does in "Function model 0 - Standard" with the exception that it is not synchronized to the X2X Link network even if synchronous mode is enabled in register "ConfigOutput01" on page 236. Instead, the module behaves as if the set A/D converter cycle time is not a factor or multiple of the X2X cycle time and attempts to maintain the set A/D converter cycle time as precisely as possible.

| Register | Name | Data type | Read | | Write | |
|----------|---------------------------------|-----------|--------|---------|--------|---------|

1) Firmware version 8 / Upgrade 1.3.0.0 or later

9.1.2.2.12.5 Registers for function models "0 - Standard" and "254 - Bus controller"

Module status

Name:

StatusInput01

The current state of the module is indicated in this register.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|--------------------------------|-------|---|
| 0 | A/D converter value | 0 | Valid A/D converter value |
| | | 1 | Invalid A/D converter value (analog value = 0xFF800000). Possible causes: <ul style="list-style-type: none"> Strain gauge supply error I/O power supply error A/D converter not (yet) configured |
| 1 | Line monitoring | 0 | Ok |
| | | 1 | Open circuit |
| 2 | Only valid in synchronous mode | 0 | A/D converter runs synchronous to X2X Link |
| | | 1 | A/D converter does not run synchronous to X2X Link |
| 3 - 7 | Reserved | - | |

Strain gauge value

Name:

AnalogInput01

This register contains the raw value determined by the A/D converter for the full-bridge strain gauge with 24-bit resolution.

| Data type | Values | Information |
|-----------|-------------------------|--|
| DINT | -8,388,608 | Negative invalid value |
| | -8,388,607 | Negative full-scale deflection / Underflow |
| | -8,388,606 to 8,388,606 | Valid range |
| | 8,388,607 | Positive full-scale deflection / Overflow / Open circuit |

Effective resolution

In principle, the effective resolution of the A/D converter is dependent on the data rate and measurement range (see "Effective resolution of the A/D converter" on page 230).

The following table shows how the effective resolution (in bits), or the RMS value range of the strain gauge value depend on the module configuration (data rate, measurement area).

| Data rate f_{DATA} [Hz] | Measurement range | | | | | | | |
|-------------------------------------|-------------------|-----------------|--------------|-----------------|--------------|-----------------|--------------|-----------------|
| | ± 16 mV/V | | ± 8 mV/V | | ± 4 mV/V | | ± 2 mV/V | |
| | Bits | Range of values | Bits | Range of values | Bits | Range of values | Bits | Range of values |
| 2.5 | 21.3 | $\pm 1,290,000$ | 20.8 | $\pm 912,000$ | 19.7 | $\pm 425,000$ | 18.7 | $\pm 212,000$ |
| 5 | 20.7 | $\pm 851,000$ | 20.3 | $\pm 645,000$ | 19.3 | $\pm 322,000$ | 18.3 | $\pm 161,000$ |

| 7500 | 17.7 | $\pm 106,000$ | 17.3 | $\pm 81,000$ | 16.9 | $\pm 61,000$ | 16.2 | $\pm 38,000$ |

Table 27: Effective resolution of the strain gauge value in bits for the measurement range 32 to 256 mV/V

A/D converter configuration

Name:

ConfigOutput01

The data rate and measurement range of the A/D converter can be configured in this register.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|--|-------|-------------|
| 0 - 3 | Data rate f_{DATA} (samples per second): | 0000 | 2.5 |
| | | 0001 | 5 |
| | | 0010 | 10 |
| | | 0011 | 15 |
| | | 0100 | 25 |
| | | 0101 | 30 |
| | | 0110 | 50 |
| | | 0111 | 60 |
| | | 1000 | 100 |
| | | 1001 | 500 |
| | | 1010 | 1000 |
| | | 1011 | 2000 |
| | | 1100 | 3750 |
| | | 1101 | 7500 |
| 1110 | Synchronous mode ¹⁾ | | |
| 1111 | Reserved | | |
| 4 - 6 | Standard measurement range (bit 6 = 0) | 000 | 16 mV/V |
| | | 001 | 8 mV/V |
| | | 010 | 4 mV/V |
| | | 011 | 2 mV/V |
| | Extended measurement range (bit 6 = 1) ²⁾ | 100 | 256 mV/V |
| | | 101 | 128 mV/V |
| | | 110 | 64 mV/V |
| | | 111 | 32 mV/V |
| 7 | Reserved | 0 | (must be 0) |

1) A/D converter is operated synchronously with X2X Link if possible - firmware version 2 or higher.

2) Firmware version 4 or higher

Synchronous mode

Beginning with firmware version 2, the analog/digital converter (A/D converter) of the module can be operated and read synchronously to X2X Link. Synchronous mode is enabled by selecting the respective operating mode in register "ConfigOutput01" on page 236. A time between 200 and 2000 μ s must also be set in register "ConfigCycletime01" on page 237. If this time is a whole number factor or multiple of the configured cycle time of X2X Link, then the A/D converter is read synchronously to X2X Link.

Information:

The A/D converter cycle time must be $\geq 1/4$ of the X2X cycle time!

Bit 2 in *Module status* is set (i.e. A/D converter not running synchronously)...

- ... If the configured A/D converter cycle time cannot be synchronized with X2X Link.
- ... If the module is still in the settling phase.

Jitter, dead time and settling time:

| | | |
|---|--|---|
| Jitter | | |
| A/D converter cycle times <1500 μ s | | Max. $\pm 1 \mu$ s |
| A/D converter cycle times >1500 μ s | | Max. $\pm 4 \mu$ s |
| X2X link dead time | | 50μ s + $\frac{X2X \text{ cycle time}}{128}$ |
| Settling time | | |
| Firmware version ≤ 4 | | Max. 150 x A/D converter cycle time |
| Firmware version ≥ 5 | | 150 x X2X cycle time |

The settling time corresponds to the time needed until the A/D converter can be operated after enabling synchronous mode or following conversion of the A/D converter cycle time.

A/D converter cycle time

Name:

ConfigCycletime01

This register is only used in [Synchronous mode](#). If synchronous mode is enabled in the A/D converter configuration, then the module attempts to operate the A/D converter as synchronously as possible to X2X Link (based on the A/D converter cycle time set in this register). It is of course necessary for the X2X Link cycle time and the A/D converter cycle time to have a certain ratio. The following conditions must be observed:

- 1) A/D converter cycle time $\geq 1/4$ X2X cycle time
- 2) A/D converter cycle time corresponds to a whole number factor or multiple of the X2X cycle time
- 3) A/D converter cycle time must be in the range 50 to 2000 μ s

| Data type | Value |
|-----------|------------|
| UINT | 50 to 2000 |

A/D converter clock frequency shift

Name:

AdcClkFreqShift01

In rare cases, strain gauge modules connected to neighboring slots can influence one another. This can result in temporary, minimal deviations in measured values. This can only occur if the sigma-delta A/D converters on the neighboring strain gauge modules are operated at exactly the same clock frequency.

In most cases, these clock frequencies vary slightly due to part variances. When they are the same however, this register on the strain gauge module provides a safe way for an application to prevent this type of mutual influence.

| Data type | Value |
|-----------|-------------|
| SINT | -128 to 127 |

This register can be used to vary the clock frequency in increments of 200 ppm. Setting values from -50 to 50 cover a range of -10000 ppm to 10000 ppm. This corresponds with -1% to 1%.

Values beyond this range will cause activation of a default mode. The frequency shift is derived from the last 2 digits of the serial number by the module firmware. This saves time that would otherwise be needed for programming, provided that the last two digits of the serial numbers on the neighboring modules are not the same

| Register value | Frequency shift in ppm | Example of a sampling rate ¹⁾ |
|----------------|--|--|
| 127 | $((\text{SerialNo. modulo } 100) - 50) * (-200)$ ppm | Based on the serial number |
| ... | ... | ... |
| 51 | $((\text{SerialNo. modulo } 100) - 50) * (-200)$ ppm | Based on the serial number |
| 50 | 10000 | 505 |
| 49 | 9800 | 504.9 |
| ... | ... | ... |
| 2 | 400 | 500.2 |
| 1 | 200 | 500.1 |
| 0 | 0 | 500 |
| -1 | -200 | 499.9 |
| -2 | -400 | 499.8 |
| ... | ... | ... |
| -50 | -10000 | 495 |
| -51 | $((\text{SerialNo. modulo } 100) - 50) * (-200)$ ppm | Based on the serial number |
| ... | ... | ... |
| -128 | $((\text{SerialNo. modulo } 100) - 50) * (-200)$ ppm | Based on the serial number |

1) Nominal sampling rate of 500 samples per second

Important:

As shown in the table above, shifting the A/D converter clock frequency will equally shift the A/D converter sampling rate. Shifting the A/D converter clock frequency too much can cause problems with disturbance suppression particularly when a very specific sampling rate has been defined to suppress existing disturbances (e.g. 50 Hz to suppress the 50 Hz hum). See also "[Filter characteristics of the sigma-delta A/D converter](#)" on page 229.

It's situations like this where the option to manually shift the frequency in the I/O configuration or ASIOACC library should be utilized rather than relying on the default frequency shift that is based on the serial number.

A frequency shift like the one shown below would be sufficient to prevent modules from influencing one another and would not cause any noticeable difference to the filter characteristics.

| Slot | 1 | 2 | 3 | 4 | 5 | 6 | ... |
|-------------------------------------|---|---|----|---|----|---|-----|
| A/D converter clock frequency shift | 0 | 2 | -1 | 1 | -2 | 0 | ... |

Information:

- This register has no effect in synchronous mode because the firmware regulates the A/D converter clock frequency in such a way that the A/D converter cycle is synchronous with the X2X cycle.
- When writing to this register using the ASIOACC library, only the lowest value byte of the written value is accepted. For example, the value 256 (=0x100) is identical to the value 0 (=0x00).

9.1.2.2.12.6 Register for "Function model 1 - Multisampling"

Module status

Name:

StatusInput01

This register contains the current state of the module.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|----------------------|-------|--|
| 0 | A/D converter values | 0 | Valid A/D converter value |
| | | 1 | Invalid A/D converter value |
| 1 | Line monitoring | 0 | OK |
| | | 1 | Open circuit An open circuit was found during at least one measurement in this X2X cycle. This bit is reset if all measurements are OK after correcting this error, i.e. it does not have to be acknowledged. |
| 2 | Synchronous mode | 0 | A/D converter runs synchronous to X2X Link |
| | | 1 | A/D converter does not run synchronous to X2X Link |
| 3 - 7 | Reserved | - | |

Strain gauge value - Multiple

Name:

AnalogInput01 to AnalogInput10

This register contains the raw value determined by the A/D converter for the full-bridge strain gauge with 16-bit resolution. The module returns between 3 and 10 measured values per X2X cycle depending on the configuration.

Effective resolution

In principle, the effective resolution of the A/D converter is dependent on the data rate and measurement range (see).

The following table shows how the effective resolution (in bits), or the RMS value range of the strain gauge value depend on the module configuration (data rate, measurement area).

| Measurement range | | | | | | | |
|-------------------|-----------------|---------|-----------------|---------|-----------------|---------|-----------------|
| ±16 mV/V | | ±8 mV/V | | ±4 mV/V | | ±2 mV/V | |
| Bits | Range of values | Bits | Range of values | Bits | Range of values | Bits | Range of values |
| 15.4 | 22,000 | 14.6 | 12,000 | 13.8 | 7,000 | 12.8 | 4,000 |

Table 28: Effective resolution of the strain gauge value in bits for the measurement range 2 to 16 mV/V

| Measurement range | | | | | | | |
|-------------------|-----------------|-----------|-----------------|----------|-----------------|----------|-----------------|
| ±256 mV/V | | ±128 mV/V | | ±64 mV/V | | ±32 mV/V | |
| Bits | Range of values | Bits | Range of values | Bits | Range of values | Bits | Range of values |
| 17.1 | 70,000 | 16.7 | 53,000 | 16.4 | 43,000 | 15.9 | 31,000 |

Table 29: Effective resolution of the strain gauge value in bits for the measurement range 32 to 256 mV/V

A/D converter configuration

Name:

ConfigGain01_MultiSample

The measurement range for the A/D converter can be configured in this register.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|--|-------|-------------|
| 0 - 2 | Standard measurement range (bit 2 = 0) | 000 | 16 mV/V |
| | | 001 | 8 mV/V |
| | | 010 | 4 mV/V |
| | | 011 | 2 mV/V |
| | Extended measurement range (bit 2 = 1) ¹⁾ | 100 | 256 mV/V |
| | | 101 | 128 mV/V |
| | | 110 | 64 mV/V |
| 3 - 7 | Reserved | 111 | 32 mV/V |
| | | 0 | (must be 0) |

1) Firmware V4 and later. In the standard measurement range (2 to 16 mV/V), open-circuit detection works reliably at all adjustable data rates. In the extended measurement range (32 to 256 mV/V), open circuit detection does not work reliably (because of the variable input impedance of the amplifier in relation to the set data rate).

A/D converter cycle time

Name:

ConfigCycletime01_MultiSample

The A/D converter cycle time can be configured in this register.

In order for multiple sampling to work, the X2X cycle time must be divisible by the A/D converter cycle time (i.e. result in a whole number).

| Data type | Value | Information |
|-----------|----------|-----------------|
| USINT | 0 | 50 µs (default) |
| | 1 | 100 µs |
| | 2 to 255 | Reserved |

Number of measured values

If the X2X cycle time is too short, then not all 10 measurements can be performed. To reduce the load on X2X Link, it makes sense to only transfer as many values as measurements that can be made. This is why it is possible to configure the number of measured values to be transferred (see "[Function model 1 - Multisampling](#)" on page 233).

Example: A/D converter cycle time = 50 µs

| X2X cycle time | Number of measured values to be transferred |
|----------------|---|
| 250 µs | 5 |
| 300 µs | 6 |
| 350 µs | 7 |
| 400 µs | 8 |
| 450 µs | 9 |
| ≥500 µs | 10 |

Example: A/D converter cycle time = 100 µs

| X2X cycle time | Number of measured values to be transferred |
|----------------|---|
| 300 µs | 3 |
| 400 µs | 4 |
| 500 µs | 5 |
| 600 µs | 6 |
| 700 µs | 7 |
| 800 µs | 8 |
| 900 µs | 9 |
| ≥1 ms | 10 |

9.1.2.2.12.7 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time |
|--------------------|
| 250 μ s |

9.1.2.2.12.8 Minimum I/O update time

The minimum I/O update time specifies how far the bus cycle can be reduced so that an I/O update is performed in each cycle.

There is no limitation or basic dependency on the bus cycle time. In function model "0 - Standard", the I/O update time is defined using registers "[ConfigOutput01](#)" on page 236 and "[ConfigCycletime01](#)" on page 237.

Depending on the setting in register "[ConfigCycletime01_MultiSample](#)" on page 240, the I/O update time in function model "1 - Multiple sampling" is 50 or 100 μ s.

9.1.3 X20(c)AI1744-3

Data sheet version: 4.15

This data sheet describes 2 module revisions. The module revision is laser-marked on the side of the module. Select the desired module revision from the following table to view its description.

| Module | Revision | Page |
|--------------|----------|------|
| X20AI1744-3 | ≥G0 | 242 |
| X20cAI1744-3 | All | |
| X20AI1744-3 | <G0 | 272 |

9.1.3.1 X20(c)AI1744-3 with Rev. ≥G0

9.1.3.1.1 General information

This module works with both 4-wire and 6-wire strain gauge load cells. The concept applied by the module requires compensation in the measurement system. This compensation eliminates the absolute uncertainty in the measurement circuit, such as component tolerances, effective bridge voltage or zero point offset. The measurement precision refers to the absolute (compensated) value, which will only change as a result of changes in the operating temperature.

- 1 full-bridge strain gauge input
- Data output rate configurable from 0.1 Hz to 7.5 kHz
- Special operating modes (synchronous mode and multiple sampling)
- Configurable filter level

9.1.3.1.2 Coated modules

Coated modules are X20 modules with a protective coating for the electronics component. This coating protects X20c modules from condensation and corrosive gases.

The modules' electronics are fully compatible with the corresponding X20 modules.

For simplification purposes, only images and module IDs of uncoated modules are used in this data sheet.

The coating has been certified according to the following standards:

- Condensation: BMW GS 95011-4, 2x 1 cycle
- Corrosive gas: EN 60068-2-60, method 4, exposure 21 days

9.1.3.1.2.1 Starting temperature

The starting temperature describes the minimum permissible ambient temperature when the power is switched off at the time the coated module is switched on. This is permitted to be as low as -40°C. During operation, the conditions as specified in the technical data continue to apply.

Information:

It is important to absolutely ensure that there is no forced cooling by air currents in a closed control cabinet, for example using a fan or ventilation slots.

9.1.3.1.3 Order data

| Model number | Short description | Figure |

Table 31: X20AI1744-3, X20cAI1744-3 - Technical data

- 1) Depends on the full-bridge strain gauge being used.
- 2) With 6-wire connections, line compensation does not function (see section "Connection examples").
- 3) Sensor cable with twisted and shielded conductors, cable length as short as possible, cable routing separate from load circuits, without intermediate terminal to the sensor.
- 4) Quantization depends on the strain gauge factor.
- 5) Based on the current measured value.
- 6) Based on the entire measurement range.

9.1.3.1.5 LED status indicators

For a description of the various operating modes, see "[Diagnostic LEDs](#)" on page 3787.

| Figure | LED | Color | Status | Description |
|---|-----|-------|--------------|--|
|  | r | Green | Off | No power to module |
| | | | Single flash | RESET mode |
| | | | Double flash | BOOT mode (during firmware update) ¹⁾ |
| | | | Blinking | PREOPERATIONAL mode |
| | | | On | RUN mode |
| | e | Red | Off | No power to module or everything OK |
| | | | On | Error or reset status |
| | 1 | Green | Off | Possible causes: <ul style="list-style-type: none"> • Open circuit • Sensor is disconnected • Converter is busy |
| | | | On | Analog/digital converter running, value OK |
| | | | On | Analog/digital converter running, value OK |

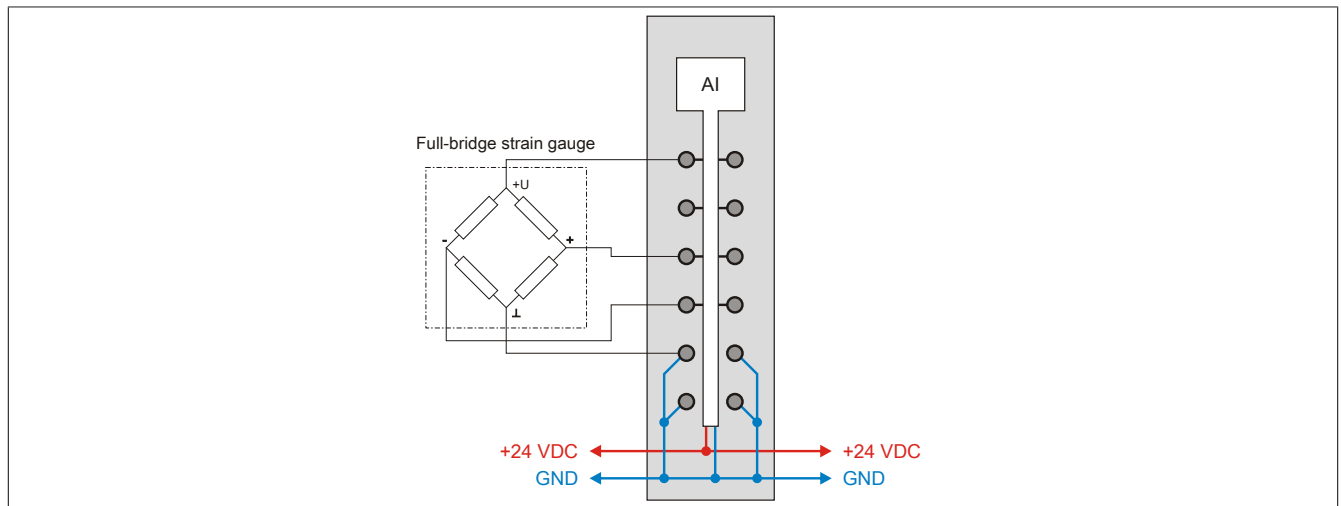

1) Depending on the configuration, a firmware update can take up to several minutes.

9.1.3.1.6 Pinout

9.1.3.1.7 Connection examples

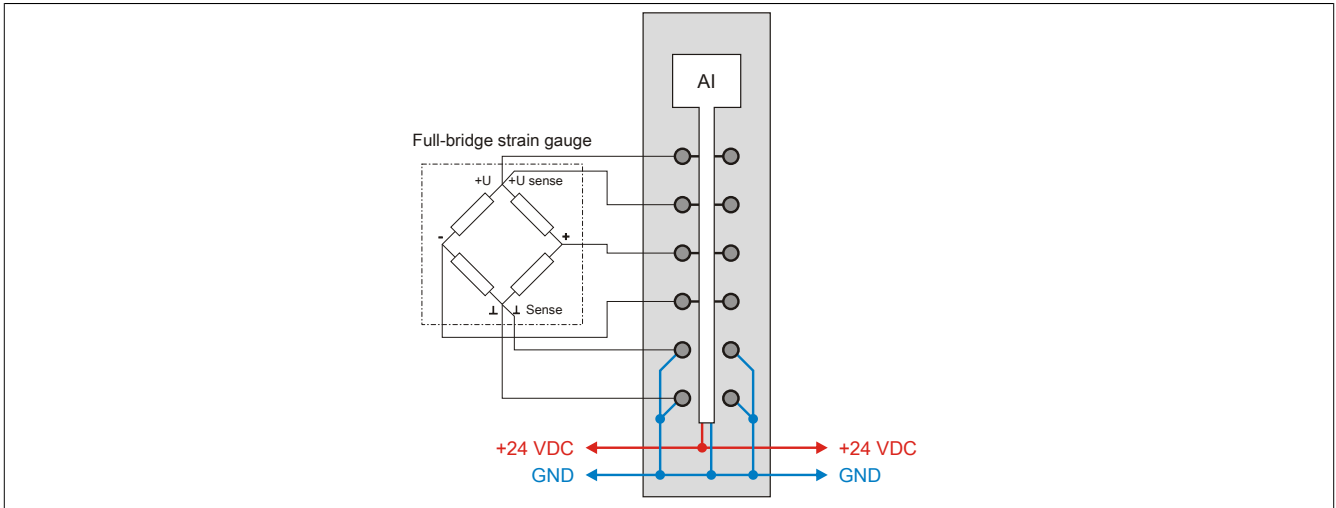

Full-bridge strain gauge with 4-wire connections

Full-bridge strain gauge with 6-wire connections

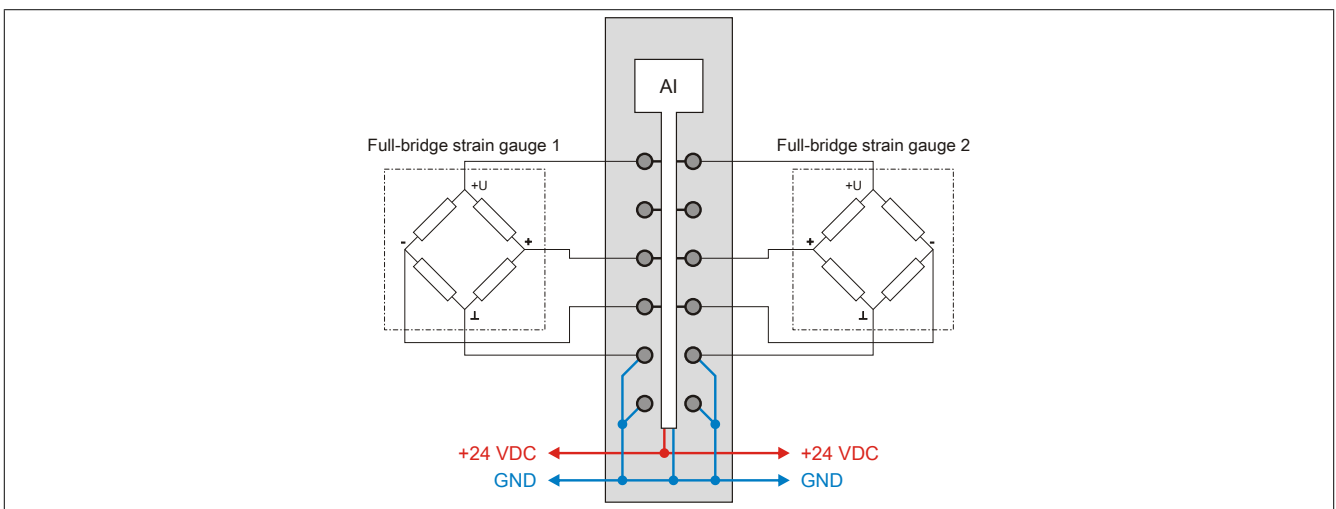

Full-bridge strain gauges can be connected to this module with 6-wire connections. Line compensation is not supported by the module, however. The sense lines are short circuited by the internally connected strain gauge VCC and GND connections (see "Input circuit diagram" on page 247). The measurement precision is therefore affected by changes in operating temperature. Longer cable lengths and smaller cable cross sections also increase the potential for errors in the measurement system.

In order to reduce cable resistance, the sense lines should be connected in parallel with the strain gauge supply lines. Optimal signal quality can be obtained by using a shielded twisted pair cable. The connections for the strain gauge supply lines, the sensor lines and the bridge differential voltage lines should each use one twisted pair cable.

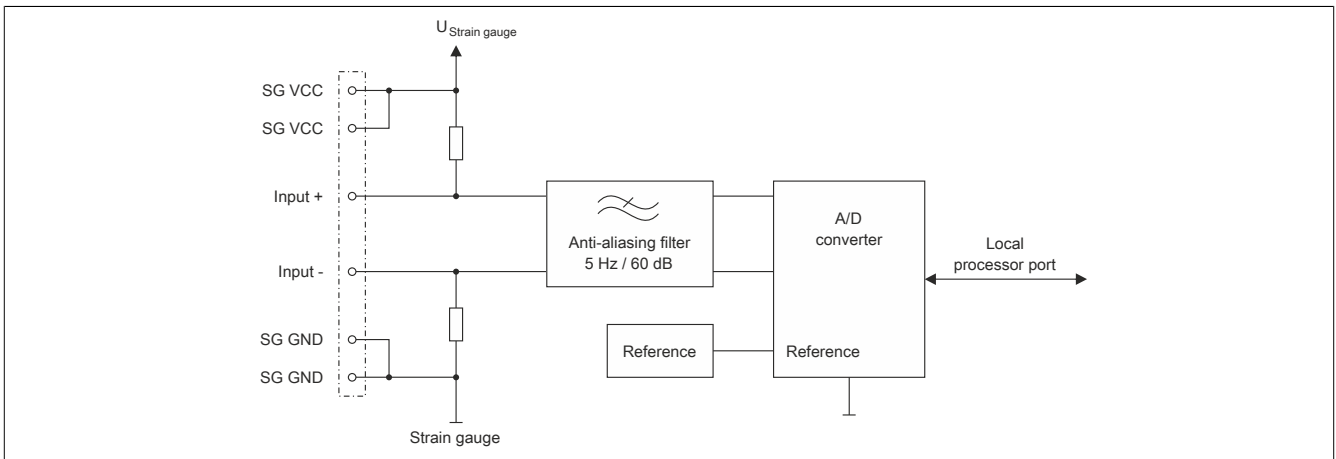

Parallel connection of 2 full-bridge strain gauges (4-wire connections)

If connecting the full-bridge strain gauges in parallel, the manufacturer's guidelines must be observed.

When connecting 3 or more full-bridge strain gauges in parallel, 2 lines must be connected together in an X20 terminal block.

9.1.3.1.8 Input circuit diagram

9.1.3.1.9 Effective resolution of the A/D converter

The A/D converter on the module provides a 24-bit measured value. The actual attainable noise-free resolution is always less than 24-bit, however. This "effective resolution" depends on the data rate and measurement range.

Example:

Based on the conversion method, a data rate of 2.5 Hz and a specified measurement range of 2 mV/V result in an effective resolution of 17.4 bits:

The low-order bits (grayed out) contain only noise instead of valid values and are therefore not permitted to be evaluated.

With "Function model 1 - Multisampling", only the highest 16 bits are made available.

9.1.3.1.10 Calculation example

The following example shows the influence of the length of the measuring cable on the bridge voltage of the module and the quantization calculated with it.

9.1.3.1.10.1 Bridge voltage

Although the measuring bridge must be adjusted with the module, the cable length has an influence on the accuracy of the measurement. The reason for this is the voltage drop on the power supply lines of the measuring bridge. As a result, the strain gauge supply voltage at the measuring bridge no longer amounts to the full 5.5 V. The reduced bridge voltage also has an effect on the quantization.

Example

Characteristics of the measuring device used:

- Full-bridge strain gauge with 4-wire connections
- Material-dependent conductivity of the cable (copper: $12 \frac{\text{m}}{\Omega \cdot \text{mm}^2}$)
- Cross section of the cable: 22 AWG = 0.34 mm²
- Length of the cable: 5 m
- Nominal current of the measuring bridge: 15 mA
- Bridge voltage of the module: 5.5 V

Actual bridge voltage taking the voltage drop on the measuring line into account:

$$5.5\text{V} - \frac{2 \cdot 5\text{m}}{12 \frac{\text{m}}{\Omega \cdot \text{mm}^2} \cdot 0.34\text{mm}^2} \cdot 0.015\text{A} = 5.463\text{V}$$

The quantization must be calculated using the actual calculated bridge voltage (see "Quantization" on page 249).

9.1.3.1.10.2 Quantization

In a weighing application, the corresponding weight located on the connected load cell should be determined from the value derived from the module.

Example

The characteristics of the strain gauge load cell are as follows:

- Rated load: 1000 kg
- Strain gauge factor: 4 mV/V
- Actual bridge voltage: 5.463 V

Maximum quantization:

Multiplying the bridge factor of the strain gauge load cell with the bridge supply voltage from the module results in the value for the positive full-scale deflection at a specified rated load of 1000 kg:

$$4 \text{ mV/V} \cdot 5.5 \text{ V} = 22 \text{ mV}$$

Actual quantization:

Taking the voltage drop on the measuring line into account, the actual bridge voltage is 5.463 V (for the calculation, see section "Bridge voltage" on page 248). If this voltage is multiplied by the strain gauge factor of 4 mV/V, the following actual quantization results:

$$4 \text{ mV/V} \cdot 5.463 \text{ V} = 21.85 \text{ mV}$$

These 21.85 mV correspond to 99.3% of the maximum possible measurement range.

Information:

If the quantization decreases, the maximum possible effective resolution also decreases (see "Effective resolution of the A/D converter" on page 247).

With a simple Rule of Three calculation, the corresponding value can be calculated (as seen in the table) from weight to the converter value and vice versa. This simplified theoretical approach is only valid for an ideal measurement system. Calibration of the entire measurement system is recommended because not only the module, but particularly the strain gauge bridges exhibit tolerances (offset, gain). When taring, the gradient offset is recalculated and the gain of the linear equation is determined when normalized. In addition to the calculation displayed in the table, these calculations must also be carried out in the application.

| 24-bit value of the module | | Quantization | Corresponding weight |
|----------------------------|-----------|---------------|----------------------|
| 0x007F FFFF | 8,388,607 | 21.85 mV | 1000 kg |
| 0x0000 0001 | 1 | 2.61 nV | 0.119 g |
| 0x0000 20C3 | 8387 | 21.85 μ V | 1 kg |
| 0x0001 0000 | 65536 | 170.7 μ V | 7.81 kg |

The values for 1 LSB are also included in the module's technical data under item "Quantization" (1 LSB each for 16 bits and 24 bits).

9.1.3.1.11 Filter characteristics of the sigma-delta A/D converter

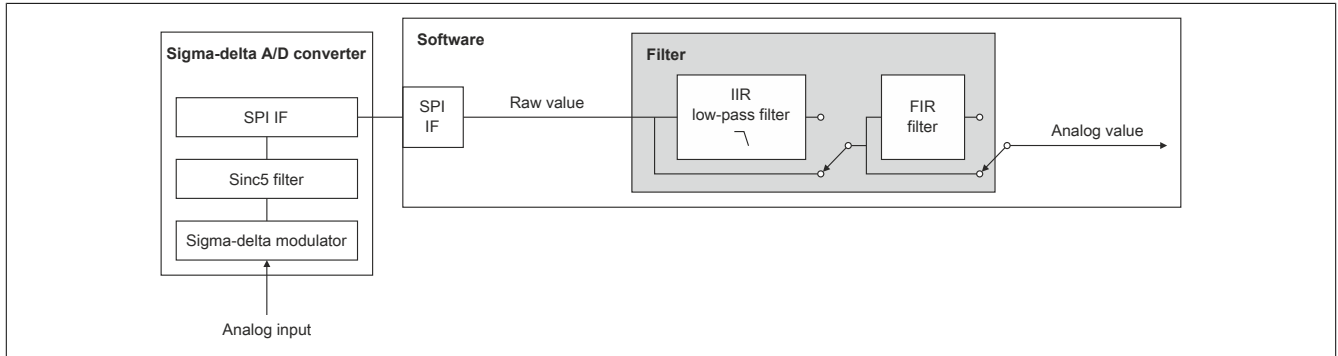

9.1.3.1.12 Software filters

2 filters are available for the analog input. They can be individually enabled and configured at runtime. By default, both filters are disabled when the device is switched on. The filters are controlled and configured using "Function model 2 - Extended filter".

In order to allow the filter behavior to be adapted to the measuring situation or machine cycle (high dynamics and low precision or low dynamics and high precision), the filter characteristics of both the IIR low-pass filter as well as the FIR filter can be changed synchronously at any time.

Filter diagram

9.1.3.1.12.1 IIR low-pass filter

General information

The IIR low-pass filter is used to generally smooth and increase the resolution of the analog value. The filter works according to the following formula:

$$y = y_{\text{Old}} + \frac{x - y_{\text{Old}}}{2^{\text{Filter level}}}$$

- x ... Current filter input value
- y_{Old} ... Old filter output value
- y ... New filter output value

Parameter "Filter level" in the formula above is configured using register "ConfigCommonOutput01" on page 269. "Filter level" = 0 if the IIR low-pass filter is disabled.

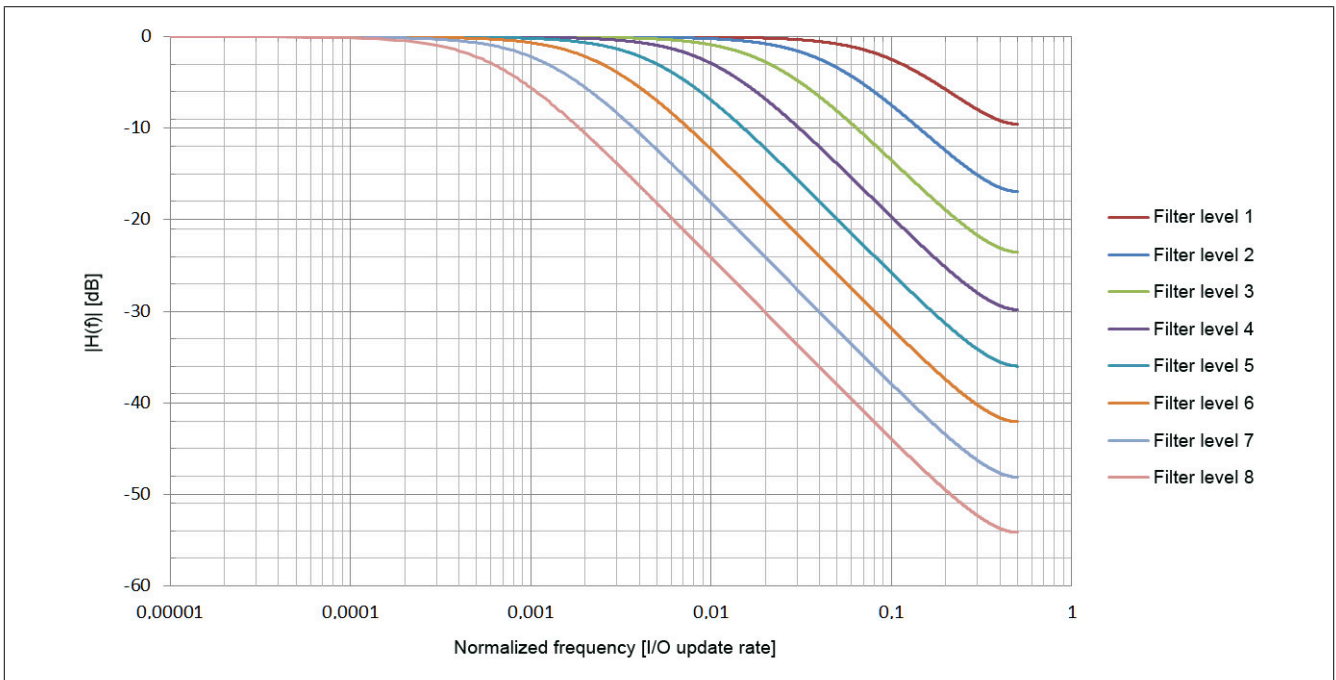

Filter characteristics of the first-order IIR low-pass filter

Limit frequency f_c

The following table provides an overview of the -3 dB limit frequency f_c depending on the configured filter level.

| Filter level | Normalized f_c [I/O update rate] | f_c [Hz] | |
|--------------|---------------------------------------|---------------------------|---------------------------|
| | | I/O update rate = 15000/s | I/O update rate = 20000/s |
| 1 | 0.11476 | 1721.4 | 2295.2 |
| 2 | 0.046 | 690 | 920 |
| 3 | 0.02124 | 318.6 | 424.8 |

| 6 | 0.0025 | 37.5 | 50 |
| 7 | 0.00124 | 18.6 | 24.8 |
| 8 | 0.00062 | 9.3 | 12.4 |

Gain of the IIR low-pass filter

Phase shift of the IIR low-pass filter

Step response of the IIR low-pass filter

Group delay of the IIR low-pass filter

9.1.3.1.12.2 FIR filter

Like the IIR low-pass filter, the FIR filter can also be used to smooth out the signal and increase its resolution. In addition, configuring the filter length accordingly makes it possible to target and efficiently filter out individual interference frequencies. The source of these interference frequencies may be mechanical or electromagnetic. Multiples of these are also filtered out (as long as they are a whole-number factor of the data output rate).

Example:

Data output rate = 15000 samples/s, averaging over 15 values → "Notch" at 1 kHz (2 kHz, etc.)

When reconfiguring the filter, it takes 1/data rate (FIR filter in mode "Selectable data rate") or 1/filter frequency (FIR filter in mode "High-resolution data rate") until the filter is tuned. During tuning, bit 5 is set in register "StatusInput01" on page 271.

Characteristics of the FIR filter in mode "Selectable data rate"

The following table applies to "Function model 0 - Standard" and "Function model 254 - Bus controller" as well as for "Function model 2 - Extended filter" in mode "Selectable data rate".

| Set value 1) 2) | Data rate (f_{Data}) [Hz] 3) 4) | f_{Notch} [Hz] | I/O update rate [Hz] | | I/O update time [ms] | |
|--------------------|---|-------------------------|------------------------------|---|------------------------------|---|
| | | | Function models 0 and 254 | Function model 2 (mode "Selectable data rate") | Function models 0 and 254 | Function model 2 (mode "Selectable data rate") |

Characteristics of the FIR filter in mode "High-resolution data rate"

The following table applies to "Function model 2 - Extended filter".

| Setpoint [0.1 Hz] ¹⁾ | Data rate (f_{Data}) [Hz] | f_{Notch} [Hz] | I/O update time [μ s] |
|---------------------------------|-------------------------------|------------------|----------------------------------|
| 1 to 65535 | Setpoint / 10 | = Data rate | $\approx 50 \mu$ s ²⁾ |

1) Setpoint from register "ConfigHighResolutionOutput01" on page 223

2) The value varies between 42 and 56 μ s (see also the next section "I/O update time")

I/O update time

The value of the I/O update time depends on the setpoint and varies between 42 and 56 μ s. The following formula can be used to precisely calculate the I/O update time:

$$\text{I/O update time} = 1e6 \cdot (1e-4 - 10 / (\text{Setpoint} \cdot [10 / (5e-5 \cdot \text{Setpoint})]))$$

Legend: The square brackets in the formula above mean that the calculated value must be rounded to a whole number.

The following image shows the I/O update time depending on the setpoint:

Examples for the gain of the FIR filter**Example 1**

Filter setting = 10:

- $f_{\text{Notch}} = 1000 \text{ Hz}$
- $f_c = 439.3 \text{ Hz}$

Example 2

Filter setting = 6:

- $f_{\text{Notch}} = 50 \text{ Hz}$
- $f_c = 21.8 \text{ Hz}$

Detailed excerpt from the filter curve shown above:

9.1.3.1.13 Hardware configuration

9.1.3.1.13.1 Hardware configuration for horizontal installation starting at 55°C ambient temperature

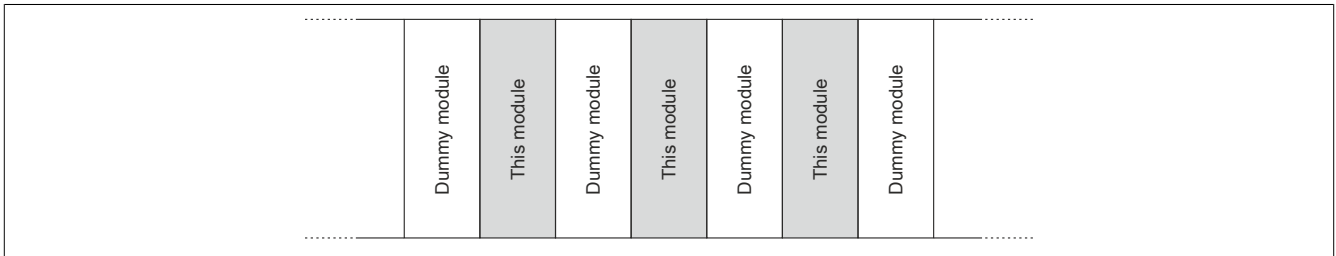

Operating a strain gauge module

Starting at an ambient temperature of 55°C, a dummy module must be connected to the left and right of the strain gauge module in a horizontal mounting orientation.

Operating multiple strain gauge modules side by side

If 2 or more horizontal strain gauge modules are being operated in a cluster, the following arrangement of modules must be observed.

9.1.3.1.13.2 Hardware configuration for vertical installation starting at 45°C ambient temperature

Operating a strain gauge module

Starting at an ambient temperature of 45°C, a dummy module must be connected to the left and right of the strain gauge module in a vertical mounting orientation.

Operating multiple strain gauge modules side by side

If 2 or more vertical strain gauge modules are being operated in a cluster, the following arrangement of modules must be observed.

9.1.3.1.14 Register description

9.1.3.1.14.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section "[General data points](#)" on page 3790.

9.1.3.1.14.2 Function model 0 - Standard

| Register | Name | Data type | Read | | Write | |
|--------------------------------------|--|-----------|--------|---------|--------|---------|
| | | | Cyclic | Acyclic | Cyclic | Acyclic |
| Analog signal - Configuration | | | | | | |
| 16 | ConfigOutput01 (A/D converter configuration) | USINT | | | • | |
| 18 | ConfigCycletime01 | UINT | | | | • |
| 32 | AdcClkFreqShift01 | USINT | | | | • |
| Analog signal - Communication | | | | | | |
| 2 | StatusInput01 | USINT | • | | | |
| 4 | AnalogInput01 | DINT | • | | | |

9.1.3.1.14.3 Function model 1 - Multisampling

In this function model, the A/D converter is operated synchronously to X2X Link with a predefined A/D converter cycle time. The value is configurable as 50 or 100 μ s.

The module returns between 3 and 10 measured values per X2X cycle depending on the configuration. With an X2X cycle time of 400 μ s and A/D converter cycle time of 50 μ s, exactly 8 measurements are performed and the module can return 8 values (strain gauge value 01 to strain gauge value 08).

If a longer cycle time is used, the values returned correspond to the last measurements. If using an X2X cycle time that is not a whole number multiple of the A/D converter cycle time, then the conversion cannot be synchronized with X2X Link. In this case, the module outputs the invalid value 0x8000.

Example 1

If using an X2X cycle time of 800 μ s, it is possible to perform 16 measurements per X2X cycle if the A/D converter cycle time equals 50 μ s. The first 6 measured values are discarded; the last 10 measured values are provided by the module.

With a shorter X2X cycle time, the number of measured values should not exceed the number of measurements that can actually be made. All other measured values are invalid (0x8000). To minimize the load on the X2X Link network, it is possible to disable these unneeded registers (see "[Number of measured values](#)" on page 267).

Example 2

If using an X2X cycle time of 300 μ s, it is possible to perform 6 measurements per X2X cycle if the A/D converter cycle time equals 50 μ s. For this reason, only the first 6 registers are valid. The registers for the 7th through 10th measured value ([AnalogInput07](#) to [AnalogInput10](#)) should be disabled by setting [Number of measured values](#) to "6 measured values" in the I/O configuration.

| Register | Name | Data type | Read | | Write | |
|--------------------------------------|---|-----------|--------|---------|--------|---------|
| | | | Cyclic | Acyclic | Cyclic | Acyclic |
| Analog signal - Configuration | | | | | | |
| 1601 | ConfigGain01_MultiSample | USINT | | | • | |
| 1603 | ConfigCycletime01_MultiSample | USINT | | | | • |
| Analog signal - Communication | | | | | | |
| 2 | StatusInput01 | USINT | • | | | |
| 1534 + N * 4 | AnalogInput0N (N = 1 to 10) | INT | • | | | |

9.1.3.1.14.4 Function model 2 - Extended filter

This function model allows the IIR low-pass filter and the FIR filter to be enabled.

| Register | Name | Data type | Read | | Write | |
|--------------------------------------|--|-----------|--------|---------|--------|---------|
| | | | Cyclic | Acyclic | Cyclic | Acyclic |
| Analog signal - Configuration | | | | | | |
| 272 | ConfigCommonOutput01 (A/D converter and IIR filter configuration) | USINT | | | • | |
| 288 | ConfigFilterOutput01 | UINT | | | | • |
| 273 | ConfigDatarateOutput01 | USINT | | | • | |
| 274 | ConfigHighResolutionOutput01 | UINT | | | • | |
| Analog signal - Communication | | | | | | |
| 2 | StatusInput01 | USINT | • | | | |
| 4 | AnalogInput01 | DINT | • | | | |
| 256 | AdcConvTimeStampInput01 | DINT | • | | | |

9.1.3.1.14.5 Function model 254 - Bus controller

In function model "254 - Bus controller", the module behaves as it does in "Function model 0 - Standard" with the exception that it is not synchronized to the X2X Link network even if synchronous mode is enabled in register "ConfigOutput01" on page 262. Instead, the module behaves as if the set A/D converter cycle time is not a factor or multiple of the X2X cycle time and attempts to maintain the set A/D converter cycle time as precisely as possible.

| Register | Offset ¹⁾ | Name | Data type | Read | | Write | |
|--------------------------------------|----------------------|--|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| Analog signal - Configuration | | | | | | | |
| 16 | 0 | ConfigOutput01 (A/D converter configuration) | USINT | | | • | |
| 18 | 18 | ConfigCycletime01 | UINT | | | | • |
| 32 | 32 | AdcClkFreqShift01 | USINT | | | | • |
| Analog signal - Communication | | | | | | | |
| 2 | 4 | StatusInput01 | USINT | • | | | |
| 4 | 0 | AnalogInput01 | DINT | • | | | |

1) The offset specifies the position of the register within the CAN object.

Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see "Using I/O modules on the bus controller" on page 3789.

CAN I/O bus controller

The module occupies 1 analog logical slot on CAN I/O.

9.1.3.1.14.6 Registers for function models "0 - Standard" and "254 - Bus controller"

A/D converter configuration

Name:

ConfigOutput01

The data rate and measurement range of the A/D converter can be configured in this register.

| Data type | Values | Bus controller default setting |
|-----------|--------------------|--------------------------------|
| USINT | See bit structure. | 13 |

Bit structure:

| Bit | Description | Value | Information | |
|-------|--|--|--|----------|
| 0 - 3 | Data rate f_{DATA} (samples per second): | 0000 | 2.5 | |
| | | 0001 | 5 | |
| | | 0010 | 10 | |
| | | 0011 | 15 | |
| | | 0100 | 25 | |
| | | 0101 | 30 | |
| | | 0110 | 50 | |
| | | 0111 | 60 | |
| | | 1000 | 100 | |
| | | 1001 | 500 | |
| | | 1010 | 1000 | |
| | | 1011 | 2000 | |
| | | 1100 | 3750 | |
| | | 1101 | 7500 (bus controller default setting) | |
| 4 - 6 | Standard measurement range (bit 6 = 0) | 000 | 16 mV/V (bus controller default setting) | |
| | | 001 | 8 mV/V | |
| | | 010 | 4 mV/V | |
| | | 011 | 2 mV/V | |
| | | Extended measurement range (bit 6 = 1) | 100 | 256 mV/V |
| | | | 101 | 128 mV/V |
| 110 | 64 mV/V | | | |
| 7 | Reserved | 111 | 32 mV/V | |
| | | 0 | (must be 0) | |

Synchronous mode

The module's analog/digital converter (A/D converter) can optionally be operated and read synchronously to the X2X Link network. Synchronous mode is enabled by selecting the respective operating mode in register "ConfigOutput01" on page 262. A time between 200 and 2000 μ s must be set in register "ConfigCycletime01" on page 263 for this. If this time is a whole number factor or multiple of the configured cycle time of X2X Link, then the A/D converter is read synchronously to X2X Link.

Information:

The A/D converter cycle time must be $\geq 1/4$ of the X2X cycle time!

Bit 2 in *Module status* is set (i.e. A/D converter not running synchronously)...

- ... If the configured A/D converter cycle time cannot be synchronized with X2X Link.
- ... If the module is still in the settling phase.

Jitter, dead time and settling time:

| | | |
|---|--|---|
| Jitter | | |
| A/D converter cycle times <1500 μ s | | Max. $\pm 1 \mu$ s |
| A/D converter cycle times >1500 μ s | | Max. $\pm 4 \mu$ s |
| X2X link dead time | | 50μ s + $\frac{X2X \text{ cycle time}}{128}$ |
| Settling time | | 150 x X2X cycle time |

The settling time corresponds to the time needed until the A/D converter can be operated after enabling synchronous mode or following conversion of the A/D converter cycle time.

A/D converter cycle time

Name:

ConfigCycletime01

This register is only used in [Synchronous mode](#). If synchronous mode is enabled in the A/D converter configuration, then the module attempts to operate the A/D converter as synchronously as possible to the X2X Link network (based on the A/D converter cycle time set in this register). It is of course necessary for the X2X Link cycle time and the A/D converter cycle time to have a certain ratio. The following conditions must be observed:

- 1) A/D converter cycle time $\geq 1/4$ X2X cycle time
- 2) A/D converter cycle time corresponds to a whole number factor or multiple of the X2X cycle time
- 3) A/D converter cycle time must be in the range 50 to 2000 μ s

| Data type | Values | Information |
|-----------|------------|-------------------------------------|
| UINT | 50 to 2000 | Bus controller default setting: 400 |

A/D converter clock frequency shift

Name:

AdcClkFreqShift01

In rare cases, strain gauge modules connected to neighboring slots can influence one another. This can result in temporary, minimal deviations in measured values. This can only occur if the sigma-delta A/D converters on the neighboring strain gauge modules are operated at exactly the same clock frequency.

In most cases, these clock frequencies vary slightly due to part variances. When they are the same however, this register on the strain gauge module provides a safe way for an application to prevent this type of mutual influence.

| Data type | Values | Information |
|-----------|-------------|-------------------------------------|
| SINT | -128 to 127 | Bus controller default setting: 127 |

This register can be used to vary the clock frequency in increments of 200 ppm. Setting values from -50 to 50 cover a range of -10000 ppm to 10000 ppm. This corresponds with -1% to 1%.

Values beyond this range will cause activation of a default mode. The frequency shift is derived from the last 2 digits of the serial number by the module firmware. This saves time that would otherwise be needed for programming, provided that the last two digits of the serial numbers on the neighboring modules are not the same

| Register value | Frequency shift in ppm | Example of a sampling rate ¹⁾ |
|----------------|--|--|
| 127 | $((\text{SerialNo. modulo } 100) - 50) * (-200) \text{ ppm}$ | Based on the serial number |
| ... | ... | ... |
| 51 | $((\text{SerialNo. modulo } 100) - 50) * (-200) \text{ ppm}$ | Based on the serial number |
| 50 | 10000 | 505 |
| 49 | 9800 | 504.9 |
| ... | ... | ... |
| 2 | 400 | 500.2 |
| 1 | 200 | 500.1 |
| 0 | 0 | 500 |
| -1 | -200 | 499.9 |
| -2 | -400 | 499.8 |
| ... | ... | ... |
| -50 | -10000 | 495 |
| -51 | $((\text{SerialNo. modulo } 100) - 50) * (-200) \text{ ppm}$ | Based on the serial number |
| ... | ... | ... |
| -128 | $((\text{SerialNo. modulo } 100) - 50) * (-200) \text{ ppm}$ | Based on the serial number |

1) Nominal sampling rate of 500 samples per second

Important:

As shown in the table above, shifting the A/D converter clock frequency will equally shift the A/D converter sampling rate. Shifting the A/D converter clock frequency too much can cause problems with disturbance suppression particularly when a very specific sampling rate has been defined to suppress existing disturbances (e.g. 50 Hz to suppress the 50 Hz hum). See also "[Filter characteristics of the sigma-delta A/D converter](#)" on page 250.

It is situations like this where the option to manually shift the frequency in the I/O configuration or ASIOACC library should be utilized rather than relying on the default frequency shift that is based on the serial number.

A frequency shift like the one shown below would be sufficient to prevent modules from influencing one another and would not cause any noticeable difference to the filter characteristics.

| Slot | 1 | 2 | 3 | 4 | 5 | 6 | ... |
|-------------------------------------|---|---|----|---|----|---|-----|
| A/D converter clock frequency shift | 0 | 2 | -1 | 1 | -2 | 0 | ... |

Information:

- This register has no effect in synchronous mode because the firmware regulates the A/D converter clock frequency in such a way that the A/D converter cycle is synchronous with the X2X cycle.
- When writing to this register using the ASIOACC library, only the lowest value byte of the written value is accepted. For example, the value 256 (=0x100) is identical to the value 0 (=0x00).

Module status

Name:

StatusInput01

The current state of the module is indicated in this register.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|--------------------------------|-------|---|
| 0 | A/D converter value | 0 | Valid A/D converter value |
| | | 1 | Invalid A/D converter value (analog value = 0xFF800000). Possible causes: <ul style="list-style-type: none"> • Strain gauge supply error • I/O power supply error • A/D converter not (yet) configured |
| 1 | Line monitoring | 0 | Ok |
| | | 1 | Open circuit |
| 2 | Only valid in synchronous mode | 0 | A/D converter runs synchronous to X2X Link |
| | | 1 | A/D converter does not run synchronous to X2X Link |
| 3 - 7 | Reserved | - | |

Strain gauge value

Name:

AnalogInput01

This register contains the raw value determined by the A/D converter for the full-bridge strain gauge with 24-bit resolution.

| Data type | Values | Information |
|-----------|-----------------------|--|
| DINT | -8,388,608 | Negative invalid value |
| | -8,388,607 | Negative full-scale deflection / Underflow |
| | -8,388,606 to 8388606 | Valid range |
| | 8,388,607 | Positive full-scale deflection / Overflow / Open circuit |

Effective resolution

In principle, the effective resolution of the A/D converter is dependent on the data rate and the measurement range (see "Effective resolution of the A/D converter" on page 247).

The following table shows how the effective resolution (in bits) or effective range of values of the strain gauge value depend on the module configuration (data rate, measurement range).

| Data rate f_{DATA} [Hz] | Measurement range | | | | | | | |
|-------------------------------------|-------------------|-----------------|--------------|-----------------|--------------|-----------------|--------------|-----------------|
| | ± 16 mV/V | | ± 8 mV/V | | ± 4 mV/V | | ± 2 mV/V | |
| | Bits | Range of values | Bits | Range of values | Bits | Range of values | Bits | Range of values |
| 2.5 | 19.9 | $\pm 489,000$ | 19.1 | $\pm 281,000$ | 18.0 | $\pm 131,000$ | 17.4 | $\pm 86,500$ |
| 5 | 19.4 | $\pm 346,000$ | 18.2 | $\pm 151,000$ | 17.5 | $\pm 92,700$ | 16.4 | $\pm 43,200$ |
| 10 | 18.5 | $\pm 185,000$ | 17.8 | $\pm 114,000$ | 16.8 | $\pm 57,100$ | 15.9 | $\pm 30,600$ |
| 15 | 18.2 | $\pm 151,000$ | 17.3 | $\pm 80,700$ | 16.4 | $\pm 43,200$ | 15.4 | $\pm 21,600$ |
| 25 | 17.8 | $\pm 114,000$ | 16.9 | $\pm 61,100$ | 16.0 | $\pm 32,800$ | 14.9 | $\pm 15,300$ |
| 30 | 17.8 | $\pm 114,000$ | 16.8 | $\pm 57,100$ | 15.9 | $\pm 30,600$ | 14.8 | $\pm 14,300$ |
| 50 | 17.4 | $\pm 86,500$ | 16.3 | $\pm 40,300$ | 15.4 | $\pm 21,600$ | 14.4 | $\pm 10,800$ |
| 60 | 17.4 | $\pm 86,500$ | 16.2 | $\pm 37,600$ | 15.3 | $\pm 20,200$ | 14.1 | $\pm 8,780$ |
| 100 | 16.9 | $\pm 61,100$ | 15.9 | $\pm 30,600$ | 14.8 | $\pm 14,300$ | 13.8 | $\pm 7,130$ |
| 500 | 15.5 | $\pm 23,200$ | 14.5 | $\pm 11,600$ | 13.5 | $\pm 5,790$ | 12.5 | $\pm 2,900$ |
| 1000 | 15.0 | $\pm 16,400$ | 14.1 | $\pm 8,780$ | 13.1 | $\pm 4,390$ | 11.9 | $\pm 1,910$ |
| 2000 | 14.5 | $\pm 11,600$ | 13.4 | $\pm 5,400$ | 12.6 | $\pm 3,100$ | 11.4 | $\pm 1,350$ |
| 3750 | 14.1 | $\pm 8,780$ | 13.1 | $\pm 4,390$ | 12.1 | $\pm 2,190$ | 11.1 | $\pm 1,100$ |
| 7500 | 13.8 | $\pm 7,130$ | 12.7 | $\pm 3,330$ | 11.8 | $\pm 1,780$ | 10.6 | ± 776 |

Table 32: Effective resolution of the strain gauge value in bits for the measurement range 2 to 16 mV/V

| Data rate f_{DATA} [Hz] | Measurement range | | | | | | | |
|-------------------------------------|-------------------|-----------------|----------------|-----------------|---------------|-----------------|---------------|-----------------|
| | ± 256 mV/V | | ± 128 mV/V | | ± 64 mV/V | | ± 32 mV/V | |
| | Bits | Range of values | Bits | Range of values | Bits | Range of values | Bits | Range of values |
| 2.5 | 22.0 | $\pm 2,100,000$ | 22.0 | $\pm 2,100,000$ | 21.2 | $\pm 1,200,000$ | 20.5 | $\pm 741,000$ |
| 5 | 21.7 | $\pm 1,700,000$ | 21.4 | $\pm 1,380,000$ | 20.8 | $\pm 913,000$ | 20.3 | $\pm 645,000$ |
| 10 | 20.8 | $\pm 913,000$ | 20.8 | $\pm 913,000$ | 20.2 | $\pm 602,000$ | 19.4 | $\pm 346,000$ |
| 15 | 20.7 | $\pm 852,000$ | 20.5 | $\pm 741,000$ | 19.9 | $\pm 489,000$ | 19.3 | $\pm 323,000$ |
| 25 | 20.1 | $\pm 562,000$ | 19.9 | $\pm 489,000$ | 19.7 | $\pm 426,000$ | 18.9 | $\pm 245,000$ |
| 30 | 19.9 | $\pm 489,000$ | 19.9 | $\pm 489,000$ | 19.4 | $\pm 346,000$ | 18.8 | $\pm 228,000$ |
| 50 | 19.8 | $\pm 456,000$ | 19.2 | $\pm 301,000$ | 19.2 | $\pm 301,000$ | 18.2 | $\pm 151,000$ |
| 60 | 19.5 | $\pm 371,000$ | 19.2 | $\pm 301,000$ | 19.0 | $\pm 262,000$ | 18.2 | $\pm 151,000$ |
| 100 | 19.0 | $\pm 262,000$ | 18.8 | $\pm 228,000$ | 18.5 | $\pm 185,000$ | 17.6 | $\pm 99,300$ |
| 500 | 17.8 | $\pm 114,000$ | 17.5 | $\pm 92,700$ | 17.1 | $\pm 70,200$ | 16.4 | $\pm 43,200$ |
| 1000 | 17.2 | $\pm 75,300$ | 17.1 | $\pm 70,200$ | 16.7 | $\pm 53,200$ | 15.8 | $\pm 28,500$ |
| 2000 | 16.7 | $\pm 53,200$ | 16.5 | $\pm 46,300$ | 16.1 | $\pm 35,100$ | 15.2 | $\pm 18,800$ |
| 3750 | 16.2 | $\pm 37,600$ | 16.1 | $\pm 35,100$ | 15.8 | $\pm 28,500$ | 14.9 | $\pm 15,300$ |
| 7500 | 15.9 | $\pm 30,600$ | 15.8 | $\pm 28,500$ | 15.3 | $\pm 20,200$ | 14.6 | $\pm 12,400$ |

Table 33: Effective resolution of the strain gauge value in bits for the measurement range 32 to 256 mV/V

9.1.3.1.14.7 Register for "Function model 1 - Multisampling"

A/D converter configuration

Name:

ConfigGain01_MultiSample

The measurement range for the A/D converter can be configured in this register.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|--|-------|-------------|
| 0 - 2 | Standard measurement range (bit 2 = 0) | 000 | 16 mV/V |
| | | 001 | 8 mV/V |
| | | 010 | 4 mV/V |
| | | 011 | 2 mV/V |
| | Extended measurement range (bit 2 = 1) | 100 | 256 mV/V |
| | | 101 | 128 mV/V |
| | | 110 | 64 mV/V |
| | | 111 | 32 mV/V |
| 3 - 7 | Reserved | 0 | (must be 0) |

A/D converter cycle time

Name:

ConfigCycletime01_MultiSample

The A/D converter cycle time can be configured in this register.

In order for multisampling to work, the X2X cycle time must be divisible by the A/D converter cycle time to produce a whole number.

| Data type | Value | Information |
|-----------|----------|----------------------|
| USINT | 0 | 50 μ s (default) |
| | 1 | 100 μ s |
| | 2 to 255 | Reserved |

Number of measured values

If the X2X cycle time is too short, then not all 10 measurements can be performed. To reduce the load on X2X Link, it makes sense to only transfer as many values as measurements that can be made. This is why it is possible to configure the number of measured values to be transferred (see "Function model 1 - Multisampling" on page 260).

Example: A/D converter cycle time = 50 μ s

| X2X cycle time | Number of measured values to be transferred |
|--------------------|---|
| 250 μ s | 5 |
| 300 μ s | 6 |
| 350 μ s | 7 |
| 400 μ s | 8 |
| 450 μ s | 9 |
| \geq 500 μ s | 10 |

Example: A/D converter cycle time = 100 μ s

| X2X cycle time | Number of measured values to be transferred |
|----------------|---|
| 300 μ s | 3 |
| 400 μ s | 4 |
| 500 μ s | 5 |
| 600 μ s | 6 |
| 700 μ s | 7 |
| 800 μ s | 8 |
| 900 μ s | 9 |
| \geq 1 ms | 10 |

Module status

Name:
StatusInput01

This register contains the current state of the module.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|----------------------|-------|--|
| 0 | A/D converter values | 0 | Valid A/D converter value |
| | | 1 | Invalid A/D converter value |
| 1 | Line monitoring | 0 | OK |
| | | 1 | Open circuit An open circuit was found during at least one measurement in this X2X cycle. This bit is reset if all measurements are OK after correcting this error, i.e. it does not have to be acknowledged. |
| 2 | Synchronous mode | 0 | A/D converter runs synchronous to X2X Link |
| | | 1 | A/D converter does not run synchronous to X2X Link |
| 3 - 7 | Reserved | - | |

Strain gauge value - Multiple

Name:
AnalogInput01 to AnalogInput10

This register contains the raw value determined by the A/D converter for the full-bridge strain gauge with 16-bit resolution. The module returns between 3 and 10 measured values per X2X cycle depending on the configuration.

Effective resolution

In principle, the effective resolution of the A/D converter is dependent on the data rate and measurement range (see "[Effective resolution of the A/D converter](#)" on page 247).

The following table shows how the effective resolution (in bits) or effective range of values of the strain gauge value depend on the module configuration (data rate, measurement range).

| Measurement range | | | | | | | |
|-------------------|-----------------|---------|-----------------|---------|-----------------|---------|-----------------|
| ±16 mV/V | | ±8 mV/V | | ±4 mV/V | | ±2 mV/V | |
| Bits | Range of values | Bits | Range of values | Bits | Range of values | Bits | Range of values |
| 13.4 | ±5,240 | 12.3 | ±2,510 | 11.3 | ±1,300 | 10.3 | ±630 |

Table 34: Effective resolution of the strain gauge value in bits for the measurement range 2 to 16 mV/V

| Measurement range | | | | | | | |
|-------------------|-----------------|-----------|-----------------|----------|-----------------|----------|-----------------|
| ±256 mV/V | | ±128 mV/V | | ±64 mV/V | | ±32 mV/V | |
| Bits | Range of values | Bits | Range of values | Bits | Range of values | Bits | Range of values |
| 15.5 | ±23,200 | 15.0 | ±16,400 | 15.0 | ±16,400 | 14.1 | ±8,490 |

Table 35: Effective resolution of the strain gauge value in bits for the measurement range 32 to 256 mV/V

9.1.3.1.14.8 Register for "Function model 2 - Extended filter"**A/D converter and IIR filter configuration**

Name:

ConfigCommonOutput01

The IIR low-pass filter and measurement range of the A/D converter can be configured in this register.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|----------------------------|-------------|--|
| | | | Filter level |
| 0 - 3 | IIR low-pass filter | 0000 | 0: IIR low-pass filter switched off |
| | | 0001 | 1 |
| | | 0010 | 2 |
| | | 0011 | 3 |
| | | 0100 | 4 |
| | | 0101 | 5 |
| | | 0110 | 6 |
| | | 0111 | 7 |
| | | 1000 | 8 |
| | | 1001 - 1111 | The analog input value indicates an invalid range. |
| 4 - 6 | Default measurement range | 000 | 16 mV/V |
| | | 001 | 8 mV/V |
| | | 010 | 4 mV/V |
| | | 011 | 2 mV/V |
| | Extended measurement range | 100 | 256 mV/V |
| | | 101 | 128 mV/V |
| | | 110 | 64 mV/V |
| | | 111 | 32 mV/V |
| 7 | Reserved | 0 | (must be 0) |

Data rate configuration

Name:

ConfigFilterOutput01

Whether a selectable data rate or a high-resolution data rate is being used for the FIR filter is configured in this register.

| Data type | Values | Information |
|-----------|--------|--|
| UINT | 0 | Mode "Selectable data rate": A selectable data rate is used for the FIR filter (default). Configuration takes place in register "ConfigDatarateOutput01" on page 223. |
| | 1 | Mode "High-resolution data rate": A high-resolution data rate is used for the FIR filter. Configuration takes place in register "ConfigHighResolutionOutput01" on page 223. |

Name:

ConfigDatarateOutput01

The data rate of the FIR filter in mode "Selectable data rate" is configured in this register.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------------|--|-------|--|
| 0 - 3 | Data rate f_{DATA} (samples per second): | 0000 | 2.5 |
| | | 0001 | 5 |
| | | 0010 | 10 |
| | | 0011 | 15 |
| | | 0100 | 25 |
| | | 0101 | 30 |
| | | 0110 | 50 |
| | | 0111 | 60 |
| | | 1000 | 100 |
| | | 1001 | 500 |
| | | 1010 | 1000 |
| | | 1011 | 2000 |
| | | 1100 | 3750 |
| 1101 | 7500 | | |
| 1110 - 1111 | | | The analog input value indicates an invalid range. |
| 4 - 7 | Reserved | 0 | (must be 0) |

Name:

ConfigHighResolutionOutput01

The data rate of the FIR filter in 0.1 Hz steps is configured in this register (0.1 to 6553.5 Hz).

| Data type | Values | Information |
|-----------|-------------|-------------------------|
| UINT | 0 | Disables the FIR filter |
| | 1 to 65,535 | 0.1 to 6553.5 Hz |

Module status

Name:

StatusInput01

This register contains the current state of the module. If there is a fault in the module power supply or strain gauge supply, the analog input value indicates an invalid range and the buffer of the enabled filter is reset.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|----------------------|-------|------------------------------|
| 0 | A/D converter values | 0 | Valid A/D converter value |
| | | 1 | Invalid A/D converter value |
| 1 | Line monitoring | 0 | OK |
| | | 1 | Open circuit |
| 2 | Reserved | - | |
| 3 | Module power supply | 0 | OK |
| | | 1 | Error in module power supply |
| 4 | Strain gauge supply | 0 | OK |
| | | 1 | Error in strain gauge supply |
| 5 | FIR filter ready | 0 | OK |
| | | 1 | FIR filter not yet ready |
| 6 - 7 | Reserved | - | |

A/D converter conversion timestamp

Name:

AdcConvTimeStampInput01

This register holds the timestamp of the last analog conversion. This is always the point in time in [μ s] at which the conversion of the latest A/D converter raw value is completed.

| Data type | Values | Explanation |
|-----------|---------------------------------|--|
| DINT | -2,147,483,648 to 2,147,483,647 | Timestamp [μ s] of the last analog conversion |

9.1.3.1.14.9 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time |
|--------------------|
| 250 μ s |

9.1.3.1.14.10 Minimum I/O update time

The minimum I/O update time specifies how far the bus cycle can be reduced so that an I/O update is performed in each cycle.

For the I/O update times for function models "0 - Standard", "2 - Extended filter" and "254 - Bus controller", see section ["Characteristics of the FIR filter in mode "Selectable data rate" on page 254.](#)

Depending on the setting in register ["ConfigCycletime01_MultiSample" on page 267](#), the I/O update time in "Function model 1 - Multisampling" is 50 or 100 μ s.

9.1.3.2 X20AI1744-3 with Rev. <G0

9.1.3.2.1 General information

This module works with both 4-wire and 6-wire strain gauge load cells. The concept applied by the module requires compensation in the measurement system. This compensation eliminates the absolute uncertainty in the measurement circuit, such as component tolerances, effective bridge voltage or zero point offset. The measurement precision refers to the absolute (compensated) value, which will only change as a result of changes in the operating temperature.

- 1 full-bridge strain gauge input
- Data output rate configurable from 2.5 Hz to 7.5 kHz
- Special operating modes (synchronous mode and multiple sampling)

9.1.3.2.2 Order data

| Model number | Short description | Figure |

Table 37: X20AI1744-3 - Technical data

- 1) Depends on the full-bridge strain gauge being used.
- 2) With 6-wire connections, line compensation does not function (see section "Connection examples").
- 3) The maximum current of 90 mA is permitted up to an operating temperature of 45°C.
- 4) Quantization depends on the strain gauge factor.

9.1.3.2.4 LED status indicators

For a description of the various operating modes, see "Diagnostic LEDs" on page 3787.

| Figure | LED | Color | Status | Description |
|---|-----|-------|--------------|--|
|  | r | Green | Off | No power to module |
| | | | Single flash | RESET mode |
| | | | Double flash | BOOT mode (during firmware update) ¹⁾ |
| | | | Blinking | PREOPERATIONAL mode |
| | | | On | RUN mode |
| | e | Red | Off | No power to module or everything OK |
| | | | On | Error or reset status |
| | 1 | Green | Off | Possible causes: <ul style="list-style-type: none"> • Open circuit • Sensor is disconnected • Converter is busy |
| | | | On | Analog/digital converter running, value OK |

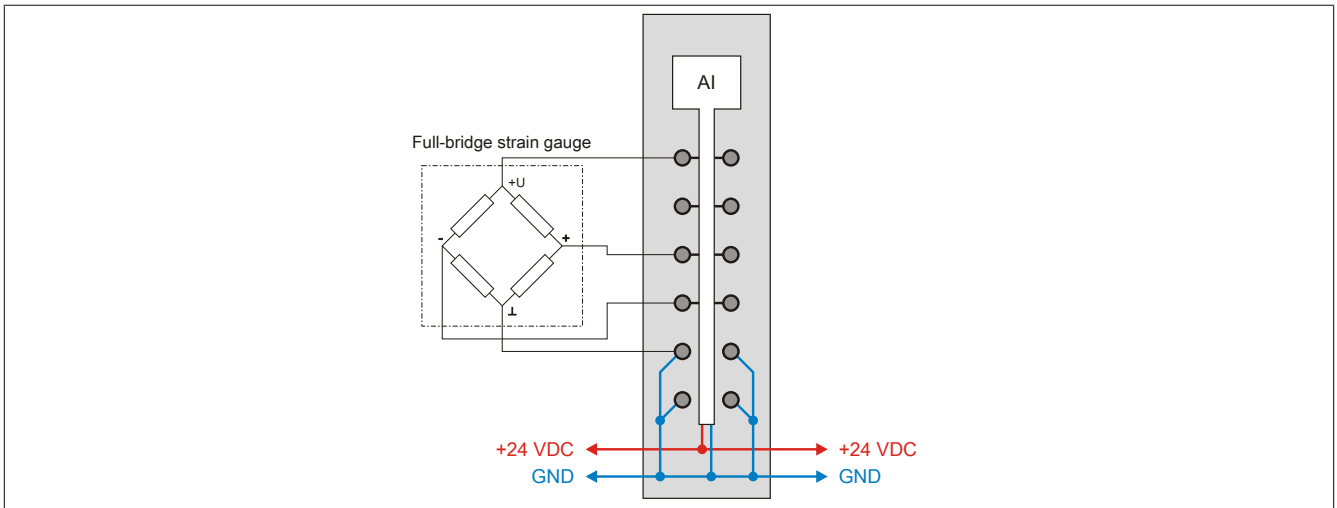

1) Depending on the configuration, a firmware update can take up to several minutes.

9.1.3.2.5 Pinout

9.1.3.2.6 Connection examples

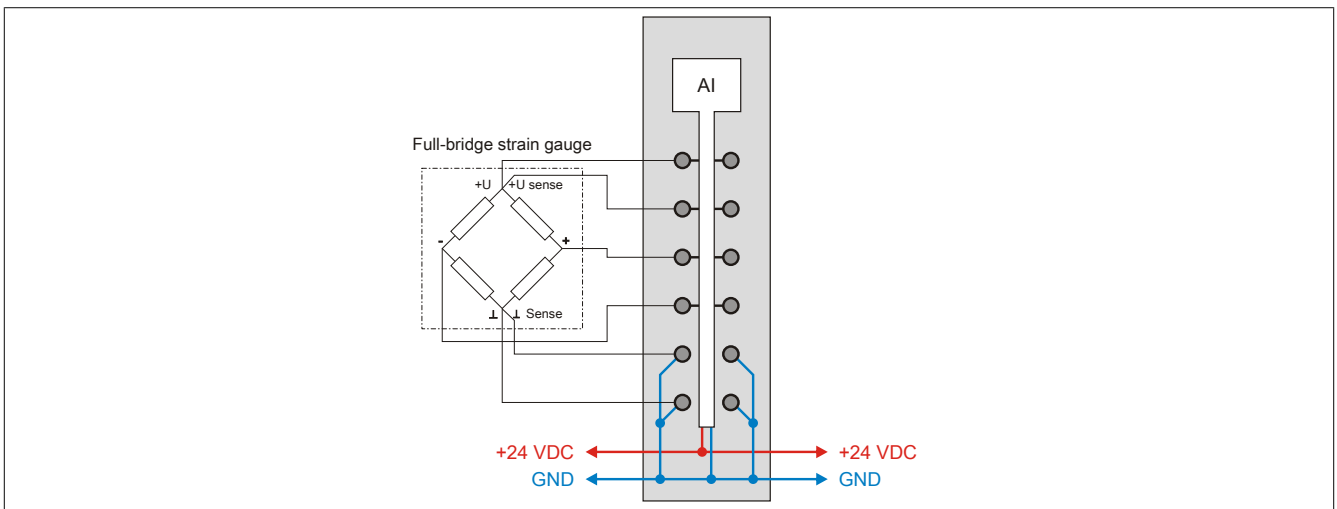

Full-bridge strain gauge with 4-wire connections

Full-bridge strain gauge with 6-wire connections

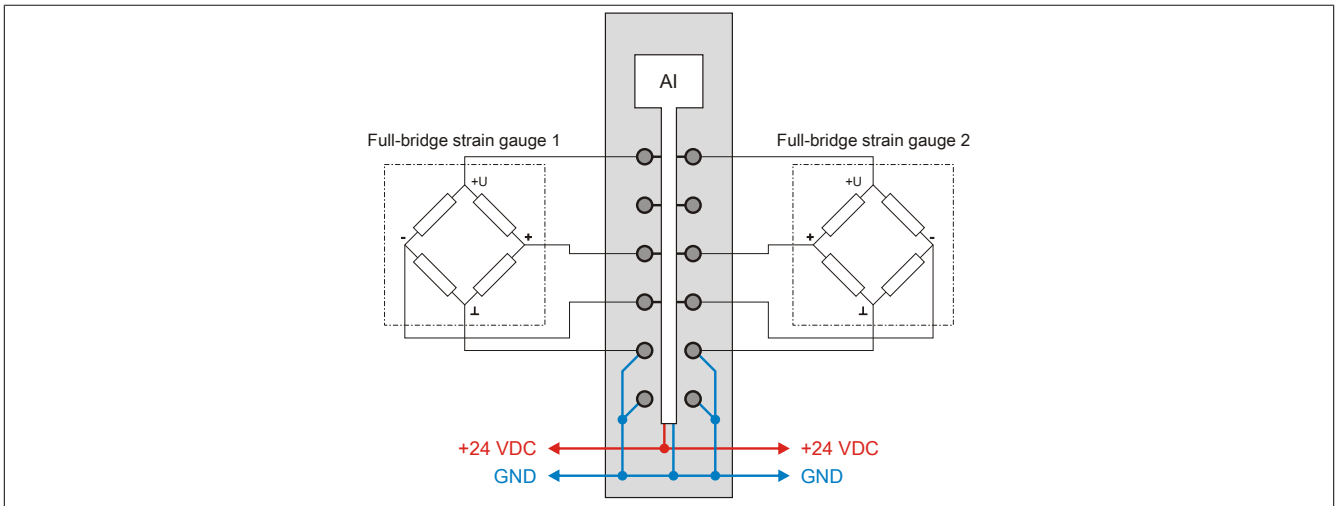

Full-bridge strain gauges can be connected to this module with 6-wire connections. Line compensation is not supported by the module, however. The sense lines are short circuited by the internally connected strain gauge VCC and GND connections (see "Input circuit diagram" on page 276). The measurement precision is therefore affected by changes in operating temperature. Longer cable lengths and smaller cable cross sections also increase the potential for errors in the measurement system.

In order to reduce cable resistance, the sense lines should be connected in parallel with the strain gauge supply lines. Optimal signal quality can be obtained by using a shielded twisted pair cable. The connections for the strain gauge supply lines, the sensor lines, and the bridge differential voltage lines should each use one twisted pair cable.

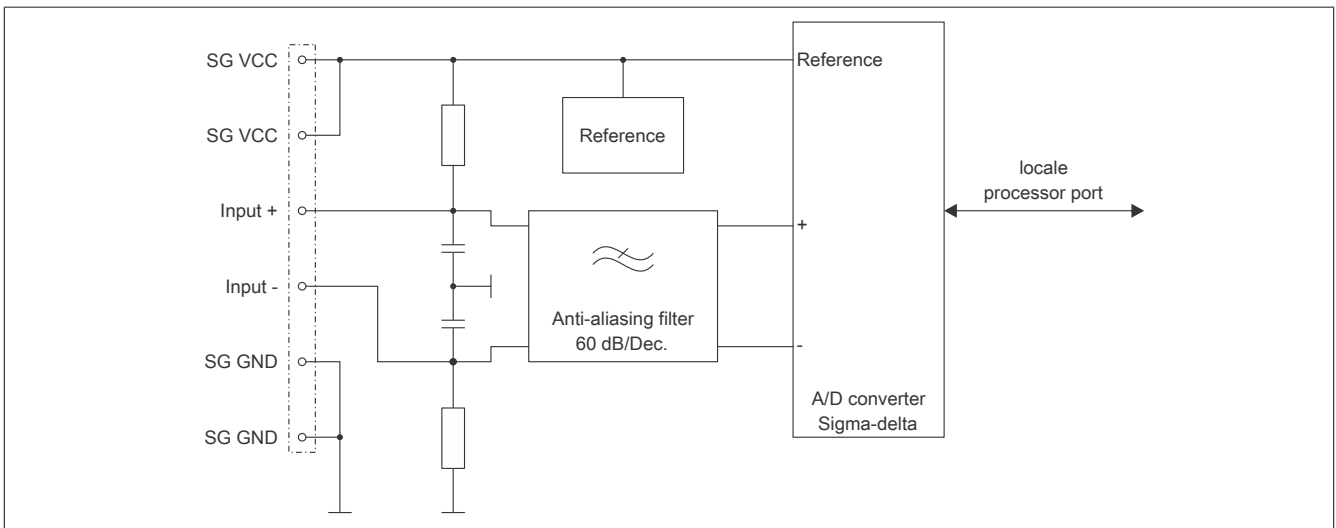

Parallel connection of 2 full-bridge strain gauges (4-wire connections)

If connecting the full-bridge strain gauges in parallel, the manufacturer's guidelines must be observed.

When connecting 3 or more full-bridge strain gauges in parallel, 2 lines must be connected together in an X20 terminal block.

9.1.3.2.7 Input circuit diagram

9.1.3.2.8 Filter characteristics of the sigma-delta A/D converter

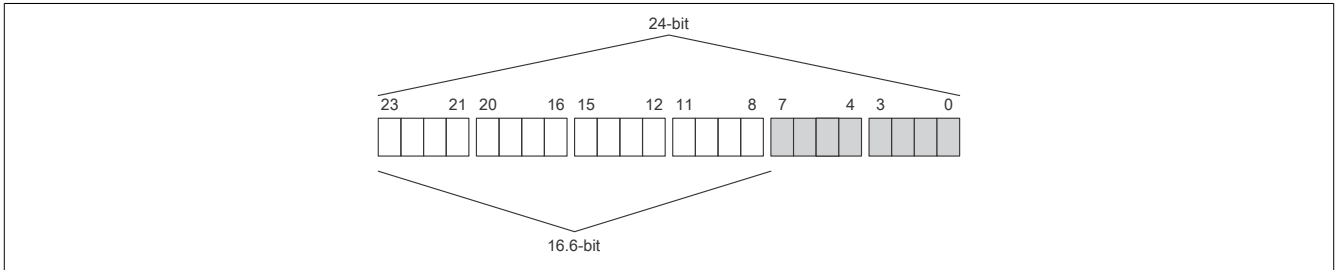

9.1.3.2.9 Effective resolution of the A/D converter

The A/D converter on the module provides a 24-bit measured value. The actual attainable noise-free resolution is always less than 24-bit, however. This "effective resolution" depends on the data rate and measurement range.

Example:

Based on the conversion method, a data rate of 2.5 Hz and a specified measurement range of 2 mV/V result in an effective resolution of 16.6 bits:

The low-order bits (grayed out) contain only noise instead of valid values and must therefore not be evaluated.

With "Function model 1 - Multisampling", only the highest 16 bits are made available.

9.1.3.2.10 Calculation example / Quantization

In a weighing application, the corresponding weight located on the connected load cell should be determined from the value derived from the module.

The characteristics of the strain gauge load cell are as follows:

- Rated load: 1000 kg
- Strain gauge factor: 4 mV/V

The value for the positive full-scale deflection at a specified rated load of 1000 kg is derived from the bridge factor of the strain gauge load cell (multiplication with the bridge supply voltage from the module):

$$4 \text{ mV/V} \times 5.5 \text{ V} = 22 \text{ mV}$$

With a simple Rule of Three calculation, the corresponding value can be calculated (as seen in the table) from weight to the converter value and vice versa. This simplified theoretical approach is only valid for an ideal measurement system. Calibration of the entire measurement system is recommended because not only the module, but particularly the strain gauge bridges exhibit tolerances (offset, gain). When taring, the gradient offset is recalculated and the gain of the linear equation is determined when normalized. In addition to the calculation displayed in the table, these calculations must also be carried out in the application.

| 24-bit value of the module | | Quantization | Corresponding weight |
|----------------------------|-----------|---------------|----------------------|
| 0x007F FFFF | 8,388,607 | 22.0 mV | 1000 kg |
| 0x0000 0001 | 1 | 2.62 nV | 0.119 g |
| 0x0000 20C3 | 8387 | 22.0 μ V | 1 kg |
| 0x0001 0000 | 65536 | 171.9 μ V | 7.81 kg |

The values for each LSB can be found in the technical data of the module under "Quantization" (1 LSB in reference to 16-bit and 1 LSB in reference to 24-bit).

9.1.3.2.11 Hardware configuration

9.1.3.2.11.1 Hardware configuration for horizontal installation at 50°C ambient temperature

Operating a strain gauge module

Starting at an ambient temperature of 50°C, a dummy module must be connected to the left and right of the strain gauge module in a horizontal mounting orientation.

Operating multiple strain gauge modules side by side

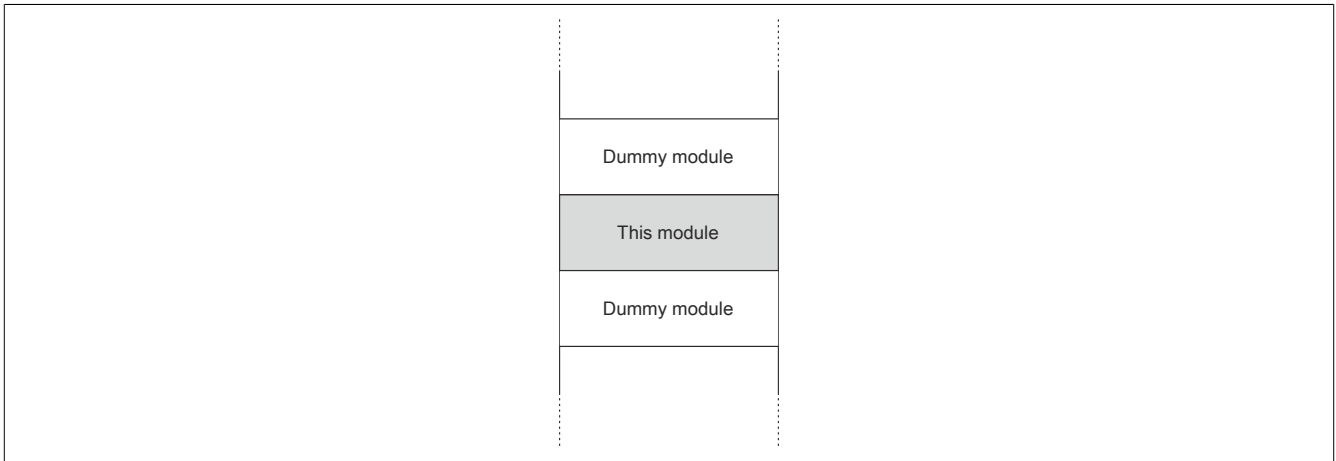

If 2 or more horizontal strain gauge modules are being operated in a cluster, the following arrangement of modules must be observed.

9.1.3.2.11.2 Hardware configuration for vertical installation at 40°C ambient temperature

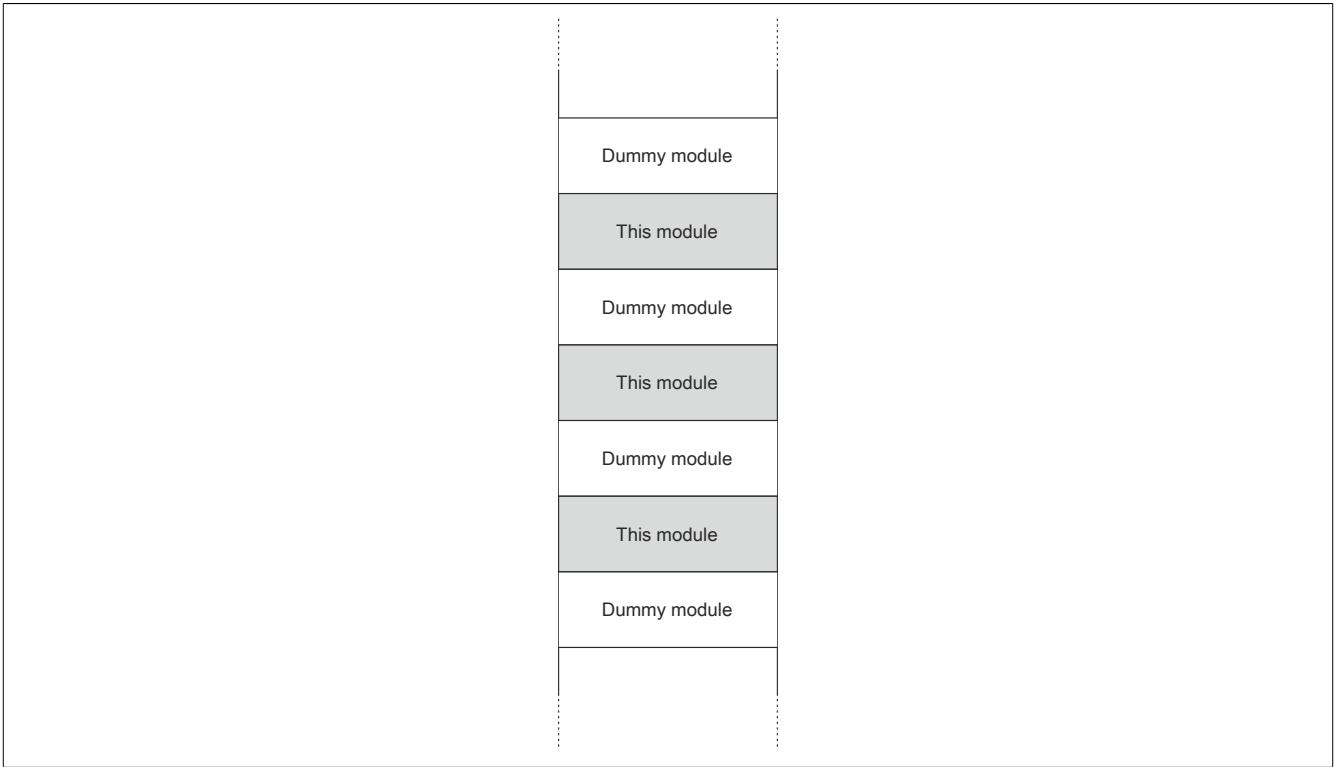

Operating a strain gauge module

Starting at an ambient temperature of 40°C, a dummy module must be connected to the left and right of the strain gauge module in a vertical mounting orientation.

Operating multiple strain gauge modules side by side

If 2 or more vertical strain gauge modules are being operated in a cluster, the following arrangement of modules must be observed.

9.1.3.2.12 Register description

9.1.3.2.12.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section "[General data points](#)" on page 3790.

9.1.3.2.12.2 Function model 0 - Standard

| Register | Name | Data type | Read | | Write | |
|----------|--|-----------|--------|---------|--------|---------|
| | | | Cyclic | Acyclic | Cyclic | Acyclic |
| 2 | StatusInput01 | USINT | • | | | |
| 4 | AnalogInput01 | DINT | • | | | |
| 16 | ConfigOutput01 | USINT | | | • | |
| 18 | ConfigCycletime01 | UINT | | | | • |
| 32 | AdcClkFreqShift01¹⁾ | USINT | | | | • |

1) Firmware version 8 / Upgrade 1.2.0.0 or higher

9.1.3.2.12.3 Function model 1 - Multisampling

In this function model, the A/D converter is operated synchronously to X2X Link with a predefined A/D converter cycle time. The value is configurable as 50 or 100 μ s.

The module returns between 3 and 10 measured values per X2X cycle depending on the configuration. With an X2X cycle time of 400 μ s and A/D converter cycle time of 50 μ s, exactly 8 measurements are performed and the module can return 8 values (strain gauge value 01 to strain gauge value 08).

If a longer cycle time is used, the values returned correspond to the last measurements. If using an X2X cycle time that is not a whole number multiple of the A/D converter cycle time, then the conversion cannot be synchronized with X2X Link. In this case, the module outputs the invalid value 0x8000.

Example 1

If using an X2X cycle time of 800 μ s, it is possible to perform 16 measurements per X2X cycle if the A/D converter cycle time equals 50 μ s. The first 6 measured values are discarded; the last 10 measured values are provided by the module.

With a shorter X2X cycle time, the number of measured values should not exceed the number of measurements that can actually be made. All other measured values are invalid (0x8000). To minimize the load on the X2X Link network, it is possible to disable these unneeded registers (see "[Number of measured values](#)" on page 287).

Example 2

If using an X2X cycle time of 300 μ s, it is possible to perform 6 measurements per X2X cycle if the A/D converter cycle time equals 50 μ s. For this reason, only the first 6 registers are valid. The registers for the 7th through 10th measured value (AnalogInput07 to AnalogInput10) should be disabled by setting [Number of measured values](#) to "6 measured values" in the I/O configuration.

| Register | Name | Data type | Read | | Write | |
|--------------------------------------|---|-----------|--------|---------|--------|---------|
| | | | Cyclic | Acyclic | Cyclic | Acyclic |
| Analog signal - Configuration | | | | | | |

| 1603 | ConfigCycletime01_MultiSample | USINT | | | | • |
| Analog signal - Communication | | | | | | |
| 2 | StatusInput01 | USINT | • | | | |
| 1534 + N * 4 | AnalogInput0N (N = 1 to 10) | INT | • | | | |

9.1.3.2.12.4 Function model 254 - Bus controller

In function model "254 - Bus controller", the module behaves as it does in "Function model 0 - Standard" with the exception that it is not synchronized to the X2X Link network even if synchronous mode is enabled in register "ConfigOutput01" on page 283. Instead, the module behaves as if the set A/D converter cycle time is not a factor or multiple of the X2X cycle time and attempts to maintain the set A/D converter cycle time as precisely as possible.

| Register | Name | Data type | Read | | Write | |
|----------|---------------------------------|-----------|--------|---------|--------|---------|
| | | | Cyclic | Acyclic | Cyclic | Acyclic |
| 2 | StatusInput01 | USINT | • | | | |
| 4 | AnalogInput01 | DINT | • | | | |

| 32 | AdcClkFreqShift01 ¹⁾ | USINT | | | | • |

1) Firmware version 8 / Upgrade 1.2.0.0 or later

9.1.3.2.12.5 Registers for function models "0 - Standard" and "254 - Bus controller"

Module status

Name:

StatusInput01

The current state of the module is indicated in this register.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|--------------------------------|-------|---|
| 0 | A/D converter value | 0 | Valid A/D converter value |
| | | 1 | Invalid A/D converter value (analog value = 0xFF800000). Possible causes: <ul style="list-style-type: none"> Strain gauge supply error I/O power supply error A/D converter not (yet) configured |
| 1 | Line monitoring | 0 | Ok |
| | | 1 | Open circuit |
| 2 | Only valid in synchronous mode | 0 | A/D converter runs synchronous to X2X Link |
| | | 1 | A/D converter does not run synchronous to X2X Link |
| 3 - 7 | Reserved | - | |

Strain gauge value

Name:

AnalogInput01

This register contains the raw value determined by the A/D converter for the full-bridge strain gauge with 24-bit resolution.

| Data type | Values | Information |
|-----------|-------------------------|--|
| DINT | -8,388,608 | Negative invalid value |
| | -8,388,607 | Negative full-scale deflection / Underflow |
| | -8,388,606 to 8,388,606 | Valid range |
| | 8,388,607 | Positive full-scale deflection / Overflow / Open circuit |

Effective resolution

In principle, the effective resolution of the A/D converter is dependent on the data rate and measurement range (see "Effective resolution of the A/D converter" on page 277).

The following table shows how the effective resolution (in bits), or the RMS value range of the strain gauge value depend on the module configuration (data rate, measurement area).

| Data rate f_{DATA} [Hz] | Measurement range | | | | | | | |
|------------------------------|-------------------|-----------------|--------------|-----------------|--------------|-----------------|--------------|-----------------|
| | ± 16 mV/V | | ± 8 mV/V | | ± 4 mV/V | | ± 2 mV/V | |
| | Bits | Range of values | Bits | Range of values | Bits | Range of values | Bits | Range of values |
| 2.5 | 21.3 | $\pm 1,290,000$ | 20.8 | $\pm 912,000$ | 19.7 | $\pm 425,000$ | 18.7 | $\pm 212,000$ |
| 5 | 20.7 | $\pm 851,000$ | 20.3 | $\pm 645,000$ | 19.3 | $\pm 322,000$ | 18.3 | $\pm 161,000$ |
| 10 | 20.4 | $\pm 691,000$ | 19.9 | $\pm 490,000$ | 18.9 | $\pm 244,000$ | 17.9 | $\pm 122,000$ |
| 15 | 20.1 | $\pm 562,000$ | 19.3 | $\pm 320,000$ | 18.7 | $\pm 212,000$ | 17.7 | $\pm 106,000$ |
| 25 | 19.7 | $\pm 425,000$ | 19.2 | $\pm 301,000$ | 18.5 | $\pm 185,000$ | 17.5 | $\pm 92,000$ |
| 30 | 19.6 | $\pm 397,000$ | 19.0 | $\pm 262,000$ | 18.1 | $\pm 140,000$ | 17.1 | $\pm 72,000$ |
| 50 | 19.4 | $\pm 346,000$ | 18.8 | $\pm 230,000$ | 17.9 | $\pm 122,000$ | 16.9 | $\pm 61,000$ |
| 60 | 19.3 | $\pm 320,000$ | 18.8 | $\pm 230,000$ | 17.8 | $\pm 114,000$ | 16.8 | $\pm 57,000$ |
| 100 | 19.1 | $\pm 280,000$ | 18.5 | $\pm 185,000$ | 17.4 | $\pm 86,000$ | 16.4 | $\pm 43,000$ |
| 500 | 18.0 | $\pm 130,000$ | 17.3 | $\pm 80,000$ | 16.3 | $\pm 40,000$ | 15.3 | $\pm 20,000$ |
| 1000 | 17.2 | $\pm 75,000$ | 16.5 | $\pm 46,000$ | 15.6 | $\pm 25,000$ | 14.6 | $\pm 12,000$ |
| 2000 | 16.6 | $\pm 49,600$ | 16.1 | $\pm 35,000$ | 15.3 | $\pm 20,000$ | 14.3 | $\pm 10,000$ |
| 3750 | 16.2 | $\pm 37,600$ | 15.7 | $\pm 26,600$ | 14.7 | $\pm 13,000$ | 13.7 | $\pm 6,600$ |
| 7500 | 15.8 | $\pm 28,500$ | 15.3 | $\pm 20,200$ | 14.4 | $\pm 10,800$ | 13.4 | $\pm 5,400$ |

Table 38: Effective resolution of the strain gauge value in bits for the measurement range 2 to 16 mV/V

| Data rate f_{DATA} [Hz] | Measurement range | | | | | | | |
|------------------------------|-------------------|-----------------|----------------|-----------------|---------------|-----------------|---------------|-----------------|
| | ± 256 mV/V | | ± 128 mV/V | | ± 64 mV/V | | ± 32 mV/V | |
| | Bits | Range of values | Bits | Range of values | Bits | Range of values | Bits | Range of values |

Table 39: Effective resolution of the strain gauge value in bits for the measurement range 32 to 256 mV/V

A/D converter configuration

Name:

ConfigOutput01

The data rate and measurement range of the A/D converter can be configured in this register.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|--|-------|--------------------------------|
| 0 - 3 | Data rate f_{DATA} (samples per second): | 0000 | 2.5 |
| | | 0001 | 5 |
| | | 0010 | 10 |
| | | 0011 | 15 |
| | | 0100 | 25 |
| | | 0101 | 30 |
| | | 0110 | 50 |
| | | 0111 | 60 |
| | | 1000 | 100 |
| | | 1001 | 500 |
| | | 1010 | 1000 |
| | | 1011 | 2000 |
| | | 1100 | 3750 |
| | | 1101 | 7500 |
| | | 1110 | Synchronous mode ¹⁾ |
| | | 1111 | Reserved |
| 4 - 6 | Standard measurement range (bit 6 = 0) | 000 | 16 mV/V |
| | | 001 | 8 mV/V |
| | | 010 | 4 mV/V |
| | | 011 | 2 mV/V |
| | Extended measurement range (bit 6 = 1) ²⁾ | 100 | 256 mV/V |
| | | 101 | 128 mV/V |
| | | 110 | 64 mV/V |
| | | 111 | 32 mV/V |
| 7 | Reserved | 0 | (must be 0) |

1) A/D converter is operated synchronously with X2X Link if possible - firmware version 2 or higher.

2) Firmware version 4 or higher

Synchronous mode

Beginning with firmware version 2, the analog/digital converter (A/D converter) of the module can be operated and read synchronously to X2X Link. Synchronous mode is enabled by selecting the respective operating mode in register "ConfigOutput01" on page 283. A time between 200 and 2000 μ s must also be set in register "ConfigCycletime01" on page 284. If this time is a whole number factor or multiple of the configured cycle time of X2X Link, then the A/D converter is read synchronously to X2X Link.

Information:

The A/D converter cycle time must be $\geq 1/4$ of the X2X cycle time!

Bit 2 in *Module status* is set (i.e. A/D converter not running synchronously)...

- ... If the configured A/D converter cycle time cannot be synchronized with X2X Link.
- ... If the module is still in the settling phase.

Jitter, dead time and settling time:

| | | |
|---|--|---|
| Jitter | | |
| A/D converter cycle times <1500 μ s | | Max. $\pm 1 \mu$ s |
| A/D converter cycle times >1500 μ s | | Max. $\pm 4 \mu$ s |
| X2X link dead time | | 50μ s + $\frac{X2X \text{ cycle time}}{128}$ |
| Settling time | | |
| Firmware version ≤ 4 | | Max. 150 x A/D converter cycle time |
| Firmware version ≥ 5 | | 150 x X2X cycle time |

The settling time corresponds to the time needed until the A/D converter can be operated after enabling synchronous mode or following conversion of the A/D converter cycle time.

A/D converter cycle time

Name:

ConfigCycletime01

This register is only used in [Synchronous mode](#). If synchronous mode is enabled in the A/D converter configuration, then the module attempts to operate the A/D converter as synchronously as possible to X2X Link (based on the A/D converter cycle time set in this register). It is of course necessary for the X2X Link cycle time and the A/D converter cycle time to have a certain ratio. The following conditions must be observed:

- 1) A/D converter cycle time $\geq 1/4$ X2X cycle time
- 2) A/D converter cycle time corresponds to a whole number factor or multiple of the X2X cycle time
- 3) A/D converter cycle time must be in the range 50 to 2000 μs

| Data type | Value |
|-----------|------------|
| UINT | 50 to 2000 |

A/D converter clock frequency shift

Name:

AdcClkFreqShift01

In rare cases, strain gauge modules connected to neighboring slots can influence one another. This can result in temporary, minimal deviations in measured values. This can only occur if the sigma-delta A/D converters on the neighboring strain gauge modules are operated at exactly the same clock frequency.

In most cases, these clock frequencies vary slightly due to part variances. When they are the same however, this register on the strain gauge module provides a safe way for an application to prevent this type of mutual influence.

| Data type | Value |
|-----------|-------------|
| SINT | -128 to 127 |

This register can be used to vary the clock frequency in increments of 200 ppm. Setting values from -50 to 50 cover a range of -10000 ppm to 10000 ppm. This corresponds with -1% to 1%.

Values beyond this range will cause activation of a default mode. The frequency shift is derived from the last 2 digits of the serial number by the module firmware. This saves time that would otherwise be needed for programming, provided that the last two digits of the serial numbers on the neighboring modules are not the same

| Register value | Frequency shift in ppm | Example of a sampling rate ¹⁾ |
|----------------|--|--|
| 127 | $((\text{SerialNo. modulo } 100) - 50) * (-200) \text{ ppm}$ | Based on the serial number |
| ... | ... | ... |
| 51 | $((\text{SerialNo. modulo } 100) - 50) * (-200) \text{ ppm}$ | Based on the serial number |
| 50 | 10000 | 505 |
| 49 | 9800 | 504.9 |
| ... | ... | ... |
| 2 | 400 | 500.2 |
| 1 | 200 | 500.1 |
| 0 | 0 | 500 |
| -1 | -200 | 499.9 |
| -2 | -400 | 499.8 |
| ... | ... | ... |
| -50 | -10000 | 495 |
| -51 | $((\text{SerialNo. modulo } 100) - 50) * (-200) \text{ ppm}$ | Based on the serial number |
| ... | ... | ... |
| -128 | $((\text{SerialNo. modulo } 100) - 50) * (-200) \text{ ppm}$ | Based on the serial number |

1) Nominal sampling rate of 500 samples per second

Important:

As shown in the table above, shifting the A/D converter clock frequency will equally shift the A/D converter sampling rate. Shifting the A/D converter clock frequency too much can cause problems with disturbance suppression particularly when a very specific sampling rate has been defined to suppress existing disturbances (e.g. 50 Hz to suppress the 50 Hz hum). See also "[Filter characteristics of the sigma-delta A/D converter](#)" on page 276.

It's situations like this where the option to manually shift the frequency in the I/O configuration or ASIOACC library should be utilized rather than relying on the default frequency shift that is based on the serial number.

A frequency shift like the one shown below would be sufficient to prevent modules from influencing one another and would not cause any noticeable difference to the filter characteristics.

| Slot | 1 | 2 | 3 | 4 | 5 | 6 | ... |
|-------------------------------------|---|---|----|---|----|---|-----|
| A/D converter clock frequency shift | 0 | 2 | -1 | 1 | -2 | 0 | ... |

Information:

- This register has no effect in synchronous mode because the firmware regulates the A/D converter clock frequency in such a way that the A/D converter cycle is synchronous with the X2X cycle.
- When writing to this register using the ASIOACC library, only the lowest value byte of the written value is accepted. For example, the value 256 (=0x100) is identical to the value 0 (=0x00).

9.1.3.2.12.6 Register for "Function model 1 - Multisampling"**Module status**

Name:
StatusInput01

This register contains the current state of the module.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|----------------------|-------|--|
| 0 | A/D converter values | 0 | Valid A/D converter value |
| | | 1 | Invalid A/D converter value |
| 1 | Line monitoring | 0 | OK |
| | | 1 | Open circuit An open circuit was found during at least one measurement in this X2X cycle. This bit is reset if all measurements are OK after correcting this error, i.e. it does not have to be acknowledged. |
| 2 | Synchronous mode | 0 | A/D converter runs synchronous to X2X Link |
| | | 1 | A/D converter does not run synchronous to X2X Link |
| 3 - 7 | Reserved | - | |

Strain gauge value - Multiple

Name:
AnalogInput01 to AnalogInput10

This register contains the raw value determined by the A/D converter for the full-bridge strain gauge with 16-bit resolution. The module returns between 3 and 10 measured values per X2X cycle depending on the configuration.

Effective resolution

In principle, the effective resolution of the A/D converter is dependent on the data rate and measurement range (see).

The following table shows how the effective resolution (in bits), or the RMS value range of the strain gauge value depend on the module configuration (data rate, measurement area).

| Measurement range | | | | | | | |
|-------------------|-----------------|---------|-----------------|---------|-----------------|---------|-----------------|
| ±16 mV/V | | ±8 mV/V | | ±4 mV/V | | ±2 mV/V | |
| Bits | Range of values | Bits | Range of values | Bits | Range of values | Bits | Range of values |
| 15.4 | 22,000 | 14.6 | 12,000 | 13.8 | 7,000 | 12.8 | 4,000 |

Table 40: Effective resolution of the strain gauge value in bits for the measurement range 2 to 16 mV/V

| Measurement range | | | | | | | |
|-------------------|-----------------|-----------|-----------------|----------|-----------------|----------|-----------------|
| ±256 mV/V | | ±128 mV/V | | ±64 mV/V | | ±32 mV/V | |
| Bits | Range of values | Bits | Range of values | Bits | Range of values | Bits | Range of values |
| 17.1 | 70,000 | 16.7 | 53,000 | 16.4 | 43,000 | 15.9 | 31,000 |

Table 41: Effective resolution of the strain gauge value in bits for the measurement range 32 to 256 mV/V

A/D converter configuration

Name:

ConfigGain01_MultiSample

The measurement range for the A/D converter can be configured in this register.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|--|-------|-------------|
| 0 - 2 | Standard measurement range (bit 2 = 0) | 000 | 16 mV/V |
| | | 001 | 8 mV/V |
| | | 010 | 4 mV/V |
| | | 011 | 2 mV/V |
| | Extended measurement range (bit 2 = 1) ¹⁾ | 100 | 256 mV/V |
| | | 101 | 128 mV/V |
| | | 110 | 64 mV/V |
| 3 - 7 | Reserved | 111 | 32 mV/V |
| | | 0 | (must be 0) |

1) Firmware V4 and later. In the standard measurement range (2 to 16 mV/V), open-circuit detection works reliably at all adjustable data rates. In the extended measurement range (32 to 256 mV/V), open circuit detection does not work reliably (because of the variable input impedance of the amplifier in relation to the set data rate).

A/D converter cycle time

Name:

ConfigCycletime01_MultiSample

The A/D converter cycle time can be configured in this register.

In order for multiple sampling to work, the X2X cycle time must be divisible by the A/D converter cycle time (i.e. result in a whole number).

| Data type | Value | Information |
|-----------|----------|-----------------|
| USINT | 0 | 50 µs (default) |
| | 1 | 100 µs |
| | 2 to 255 | Reserved |

Number of measured values

If the X2X cycle time is too short, then not all 10 measurements can be performed. To reduce the load on X2X Link, it makes sense to only transfer as many values as measurements that can be made. This is why it is possible to configure the number of measured values to be transferred (see "Function model 1 - Multisampling" on page 280).

Example: A/D converter cycle time = 50 µs

| X2X cycle time | Number of measured values to be transferred |
|----------------|---|
| 250 µs | 5 |
| 300 µs | 6 |
| 350 µs | 7 |
| 400 µs | 8 |
| 450 µs | 9 |
| ≥500 µs | 10 |

Example: A/D converter cycle time = 100 µs

| X2X cycle time | Number of measured values to be transferred |
|----------------|---|
| 300 µs | 3 |
| 400 µs | 4 |
| 500 µs | 5 |
| 600 µs | 6 |
| 700 µs | 7 |
| 800 µs | 8 |
| 900 µs | 9 |
| ≥1 ms | 10 |

9.1.3.2.12.7 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time |
|--------------------|
| 250 μ s |

9.1.3.2.12.8 Minimum I/O update time

The minimum I/O update time specifies how far the bus cycle can be reduced so that an I/O update is performed in each cycle.

There is no limitation or basic dependency on the bus cycle time. In function model "0 - Standard", the I/O update time is defined using registers "[ConfigOutput01](#)" on page 283 and "[ConfigCycletime01](#)" on page 284.

Depending on the setting in register "[ConfigCycletime01_MultiSample](#)" on page 287, the I/O update time in function model "1 - Multiple sampling" is 50 or 100 μ s.

9.1.4 X20AI1744-10

Data sheet version: 1.01

9.1.4.1 General information

This module works with both 4-wire and 6-wire strain gauge load cells. The concept applied by the module requires compensation in the measurement system. This compensation eliminates the absolute uncertainty in the measurement circuit, such as component tolerances, effective bridge voltage or zero point offset. The measurement precision refers to the absolute (compensated) value, which will only change as a result of changes in the operating temperature.

- 1 full-bridge strain gauge input
- Bridge voltage 10 VDC
- Data output rate configurable from 0.1 Hz to 7.5 kHz
- Special operating modes (synchronous mode and multisampling)
- Configurable filter level

9.1.4.2 Order data

Table 43: X20AI1744-10 - Technical data

- 1) Depends on the full-bridge strain gauge being used.
- 2) With 6-wire connections, line compensation does not function (see section "Connection examples").
- 3) Sensor cable with twisted and shielded conductors, cable length as short as possible, cable routing separate from load circuits, without intermediate terminal to the sensor.
- 4) The maximum current of 90 mA is permitted up to an operating temperature of 45°C.
- 5) Quantization depends on the strain gauge factor.

9.1.4.4 LED status indicators

For a description of the various operating modes, see "[Diagnostic LEDs](#)" on page 3787.

| Figure | LED | Color | Status | Description |
|--|-----|-------|--------------|--|
|  | r | Green | Off | No power to module |
| | | | Single flash | Mode RESET |
| | | | Double flash | Mode BOOT (during firmware update) ¹⁾ |
| | | | Blinking | Mode PREOPERATIONAL |
| | e | Red | On | Mode RUN |
| | | | Off | No power to module or everything OK |
| | 1 | Green | On | Error or reset state |
| | | | Off | Possible causes: <ul style="list-style-type: none"> • Open circuit • Sensor is disconnected • Converter is busy |
| | | | On | Analog/digital converter running, value OK |

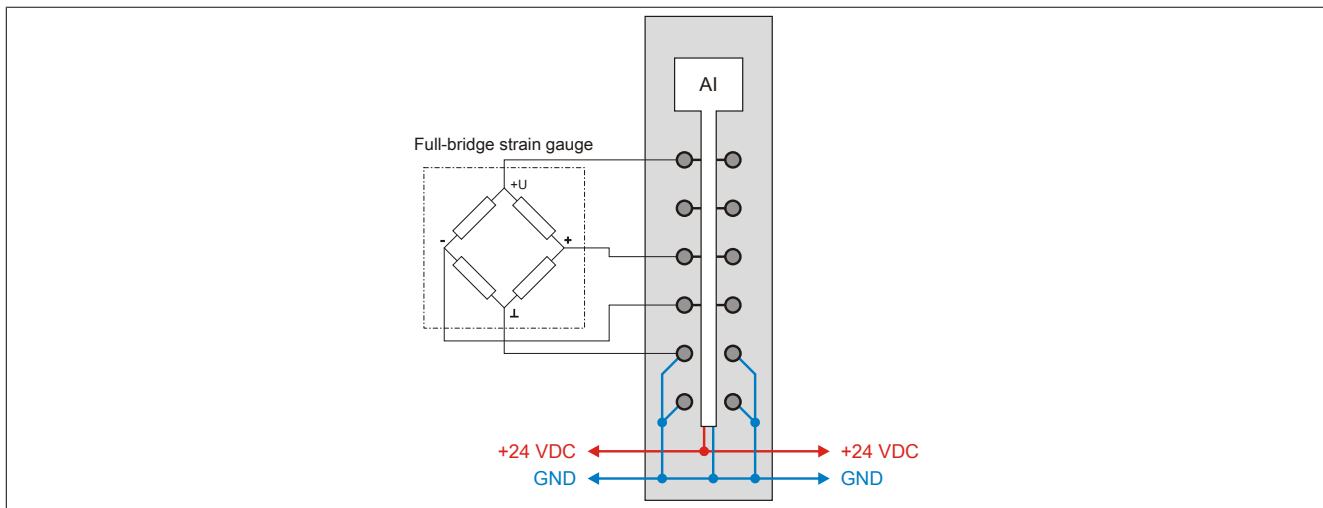

- 1) Depending on the configuration, a firmware update can take up to several minutes.

9.1.4.5 Pinout

9.1.4.6 Connection examples

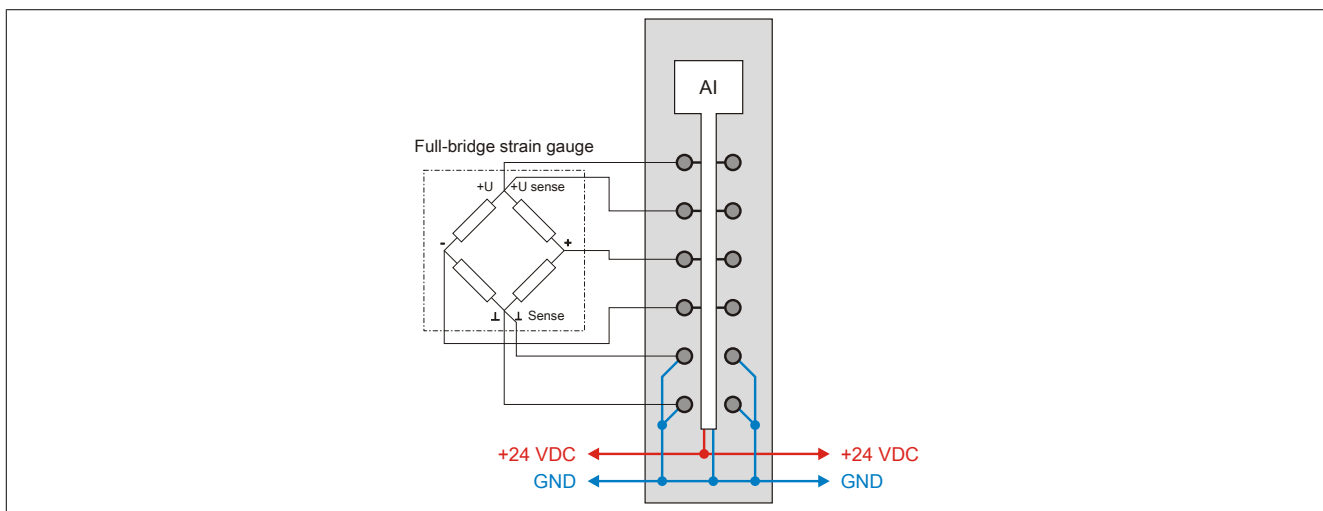

Full-bridge strain gauge with 4-wire connections

Full-bridge strain gauge with 6-wire connections

Full-bridge strain gauges can be connected to this module with 6-wire connections. Line compensation is not supported by the module, however. The sense lines are short circuited by the internally connected strain gauge VCC and GND connections (see "Input circuit diagram" on page 293). The measurement precision is therefore affected by changes in operating temperature. Longer cable lengths and smaller cable cross sections also increase the potential for errors in the measurement system.

In order to reduce cable resistance, the sense lines should be connected in parallel with the strain gauge supply lines. Optimal signal quality can be obtained by using a shielded twisted pair cable. The connections for the strain gauge supply lines, the sensor lines and the bridge differential voltage lines should each use one twisted pair cable.

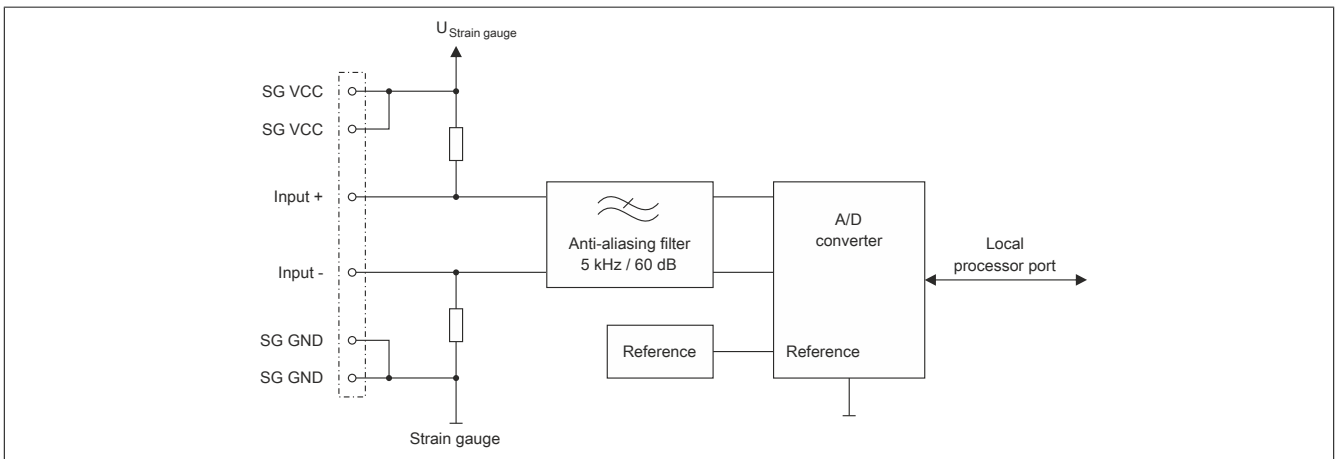

Parallel connection of 2 full-bridge strain gauges (4-wire connections)

If connecting the full-bridge strain gauges in parallel, the manufacturer's guidelines must be observed.

When connecting 3 or more full-bridge strain gauges in parallel, 2 lines must be connected together in an X20 terminal block.

9.1.4.7 Input circuit diagram

9.1.4.8 Effective resolution of the A/D converter

The A/D converter on the module provides a 24-bit measured value. The actual attainable noise-free resolution is always less than 24-bit, however. This "effective resolution" depends on the data rate and measurement range.

Example:

Based on the conversion method, a data rate of 2.5 Hz and a specified measurement range of 2 mV/V result in an effective resolution of 13.7 bits:

The low-order bits (grayed out) contain only noise instead of valid values and are therefore not permitted to be evaluated.

With "Function model 1 - Multisampling", only the highest 16 bits are made available.

9.1.4.9 Calculation example

The following example shows the influence of the length of the measuring cable on the bridge voltage of the module and the quantization calculated with it.

9.1.4.9.1 Bridge voltage

Although the measuring bridge must be adjusted with the module, the cable length has an influence on the accuracy of the measurement. The reason for this is the voltage drop on the power supply lines of the measuring bridge. As a result, the strain gauge supply voltage at the measuring bridge no longer amounts to the full 10.5 V. The reduced bridge voltage also has an effect on the quantization.

Example

Characteristics of the measuring device used:

- Full-bridge strain gauge with 4-wire connections
- Material-dependent conductivity of the cable (copper: $12 \frac{\text{m}}{\Omega \cdot \text{mm}^2}$)
- Cross section of the cable: 22 AWG = 0.34 mm²
- Length of the cable: 5 m
- Nominal current of the measuring bridge: 15 mA
- Bridge voltage of the module: 10.5 V

Actual bridge voltage taking the voltage drop on the measuring line into account:

$$10.5 \text{ V} - \frac{2 \cdot 5 \text{ m}}{12 \frac{\text{m}}{\Omega \cdot \text{mm}^2} \cdot 0.34 \text{ mm}^2} \cdot 0.015 \text{ A} = 10.463 \text{ V}$$

The quantization must be calculated using the actual calculated bridge voltage (see ["Quantization" on page 295](#)).

9.1.4.9.2 Quantization

In a weighing application, the corresponding weight located on the connected load cell should be determined from the value derived from the module.

Example

The characteristics of the strain gauge load cell are as follows:

- Rated load: 1000 kg
- Strain gauge factor: 4 mV/V
- Actual bridge voltage: 10.463 V

Maximum quantization:

Multiplying the bridge factor of the strain gauge load cell with the bridge supply voltage from the module results in the value for the positive full-scale deflection at a specified rated load of 1000 kg:

$$4 \text{ mV/V} \cdot 10.5 \text{ V} = 42 \text{ mV}$$

Actual quantization:

Taking the voltage drop on the measuring line into account, the actual bridge voltage is 10.463 V (for the calculation, see section "Bridge voltage" on page 294). If this voltage is multiplied by the strain gauge factor of 4 mV/V, the following actual quantization results:

$$4 \text{ mV/V} \cdot 10.463 \text{ V} = 41.85 \text{ mV}$$

These 41.85 mV correspond to 99.6% of the maximum possible measurement range.

Information:

If the quantization decreases, the maximum possible effective resolution also decreases (see "Effective resolution of the A/D converter" on page 293).

With a simple Rule of Three calculation, the corresponding value can be calculated (as seen in the table) from weight to the converter value and vice versa. This simplified theoretical approach is only valid for an ideal measurement system. Calibration of the entire measurement system is recommended because not only the module, but particularly the strain gauge bridges exhibit tolerances (offset, gain). When taring, the gradient offset is recalculated and the gain of the linear equation is determined when normalized. In addition to the calculation displayed in the table, these calculations must also be carried out in the application.

| 24-bit value of the module | | Quantization | Corresponding weight |
|----------------------------|-----------|--------------|----------------------|
| 0x007F FFFF | 8,388,607 | 41.85 mV | 1000 kg |
| 0x0000 0001 | 1 | 4.99 nV | 0.119 g |
| 0x0000 20C3 | 8387 | 41.84 µV | 1 kg |
| 0x0001 0000 | 65536 | 327.0 µV | 7.81 kg |

The values for 1 LSB are also included in the module's technical data under item "Quantization" (1 LSB each for 16 bits and 24 bits).

9.1.4.10 Filter characteristics of the sigma-delta A/D converter

9.1.4.11 Software filters

2 filters are available for the analog input. They can be individually enabled and configured at runtime. By default, both filters are disabled when the device is switched on. The filters are controlled and configured using "Function model 2 - Extended filter".

In order to allow the filter behavior to be adapted to the measuring situation or machine cycle (high dynamics and low precision or low dynamics and high precision), the filter characteristics of both the IIR low-pass filter as well as the FIR filter can be changed synchronously at any time.

Filter diagram

9.1.4.11.1 IIR low-pass filter

9.1.4.11.1.1 General information

The IIR low-pass filter is used to generally smooth and increase the resolution of the analog value. The filter works according to the following formula:

$$y = y_{\text{Old}} + \frac{x - y_{\text{Old}}}{2^{\text{Filter level}}}$$

- x ... Current filter input value
- y_{Old} ... Old filter output value
- y ... New filter output value

Parameter "Filter level" in the formula above is configured using register "ConfigCommonOutput01" on page 315. "Filter level" = 0 if the IIR low-pass filter is disabled.

9.1.4.11.1.2 Filter characteristics of the first-order IIR low-pass filter

Limit frequency f_c

The following table provides an overview of the -3 dB limit frequency f_c depending on the configured filter level.

| Filter level | Normalized f_c [I/O update rate] | f_c [Hz] | |
|--------------|---------------------------------------|---------------------------|---------------------------|
| | | I/O update rate = 15000/s | I/O update rate = 20000/s |
| 1 | 0.11476 | 1721.4 | 2295.2 |
| 2 | 0.046 | 690 | 920 |
| 3 | 0.02124 | 318.6 | 424.8 |
| 4 | 0.01026 | 153.9 | 205.2 |
| 5 | 0.00504 | 75.6 | 100.8 |
| 6 | 0.0025 | 37.5 | 50 |
| 7 | 0.00124 | 18.6 | 24.8 |
| 8 | 0.00062 | 9.3 | 12.4 |

Gain of the IIR low-pass filter

Phase shift of the IIR low-pass filter

Step response of the IIR low-pass filter

Group delay of the IIR low-pass filter

9.1.4.11.2 FIR filter

Like the IIR low-pass filter, the FIR filter can also be used to smooth out the signal and increase its resolution. In addition, configuring the filter length accordingly makes it possible to target and efficiently filter out individual interference frequencies. The source of these interference frequencies may be mechanical or electromagnetic. Multiples of these are also filtered out (as long as they are a whole-number factor of the data output rate).

Example:

Data output rate = 15000 samples/s, averaging over 15 values → "Notch" at 1 kHz (2 kHz, etc.)

When reconfiguring the filter, it takes 1/data rate (FIR filter in mode "Selectable data rate") or 1/filter frequency (FIR filter in mode "High-resolution data rate") until the filter is tuned. During tuning, bit 5 is set in register "StatusInput01" on page 317.

9.1.4.11.2.1 Characteristics of the FIR filter in mode "Selectable data rate"

The following table applies to "Function model 0 - Standard" and "Function model 254 - Bus controller" as well as for "Function model 2 - Extended filter" in mode "Selectable data rate".

| Set value 1) 2) | Data rate (f_{Data}) [Hz] 3) 4) | f_{Notch} [Hz] | I/O update rate [Hz] | | I/O update time [ms] | |
|--------------------|---|-------------------------|------------------------------|---|------------------------------|---|
| | | | Function models 0 and 254 | Function model 2 (mode "Selectable data rate") | Function models 0 and 254 | Function model 2 (mode "Selectable data rate") |
| 0000 | 2.5 | 2.5 | 2.5 | 15000 | 400 | 0.0667 |
| 0001 | 5 | 5 | 5 | 15000 | 200 | 0.0667 |
| 0010 | 10 | 10 | 10 | 15000 | 100 | 0.0667 |
| 0011 | 15 | 15 | 15 | 15000 | 66.6667 | 0.0667 |

| 1111 | Reserved | | | | | |

- 1) Function model 0 and 254: Bits 0 to 3 of register "ConfigOutput01" on page 308
- 2) Function model 2: Bits 0 to 3 of register "ConfigDatarateOutput01" on page 223
- 3) Function models 0 and 254: Data rate = 1/Filter length [s] (f_{Notch}) = I/O update rate
- 4) Function model 2: Data rate = 1/Filter length [s] (f_{Notch})

9.1.4.11.2.2 Characteristics of the FIR filter in mode "High-resolution data rate"

The following table applies to "Function model 2 - Extended filter".

| Setpoint [0.1 Hz] ¹⁾ | Data rate (f_{Data}) [Hz] | f_{Notch} [Hz] | I/O update time [μ s] |
|---------------------------------|-------------------------------|------------------|----------------------------------|
| 1 to 65535 | Setpoint / 10 | = Data rate | $\approx 50 \mu$ s ²⁾ |

1) Setpoint from register "ConfigHighResolutionOutput01" on page 223

2) The value varies between 42 and 56 μ s (see also the next section "I/O update time")

I/O update time

The value of the I/O update time depends on the setpoint and varies between 42 and 56 μ s. The following formula can be used to precisely calculate the I/O update time:

$$\text{I/O update time} = 1e6 \cdot (1e-4 - 10 / (\text{Setpoint} \cdot [10 / (5e-5 \cdot \text{Setpoint})]))$$

Legend: The square brackets in the formula above mean that the calculated value must be rounded to a whole number.

The following image shows the I/O update time depending on the setpoint:

9.1.4.11.2.3 Examples for the gain of the FIR filter

Example 1

Filter setting = 10:

- $f_{\text{Notch}} = 1000 \text{ Hz}$
- $f_c = 439.3 \text{ Hz}$

Example 2

Filter setting = 6:

- $f_{\text{Notch}} = 50 \text{ Hz}$
- $f_c = 21.8 \text{ Hz}$

Detailed excerpt from the filter curve shown above:

9.1.4.12 Hardware configuration

9.1.4.12.1 Hardware configuration for horizontal installation starting at 55°C ambient temperature

Operating a strain gauge module

Starting at an ambient temperature of 55°C, a dummy module must be connected to the left and right of the strain gauge module in a horizontal mounting orientation.

Operating multiple strain gauge modules side by side

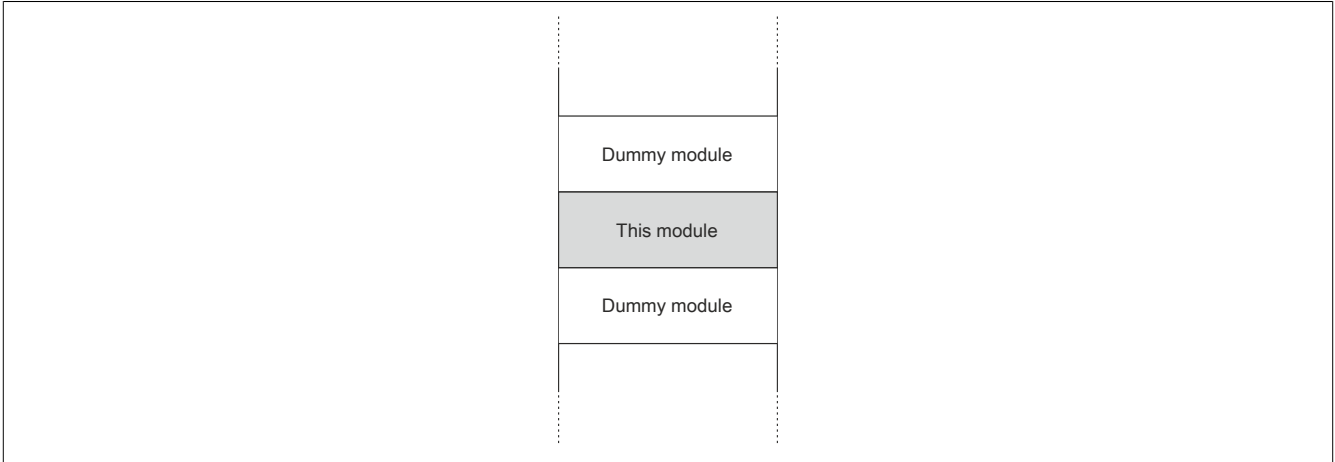

If 2 or more horizontal strain gauge modules are being operated in a cluster, the following arrangement of modules must be observed.

9.1.4.12.2 Hardware configuration for vertical installation starting at 45°C ambient temperature

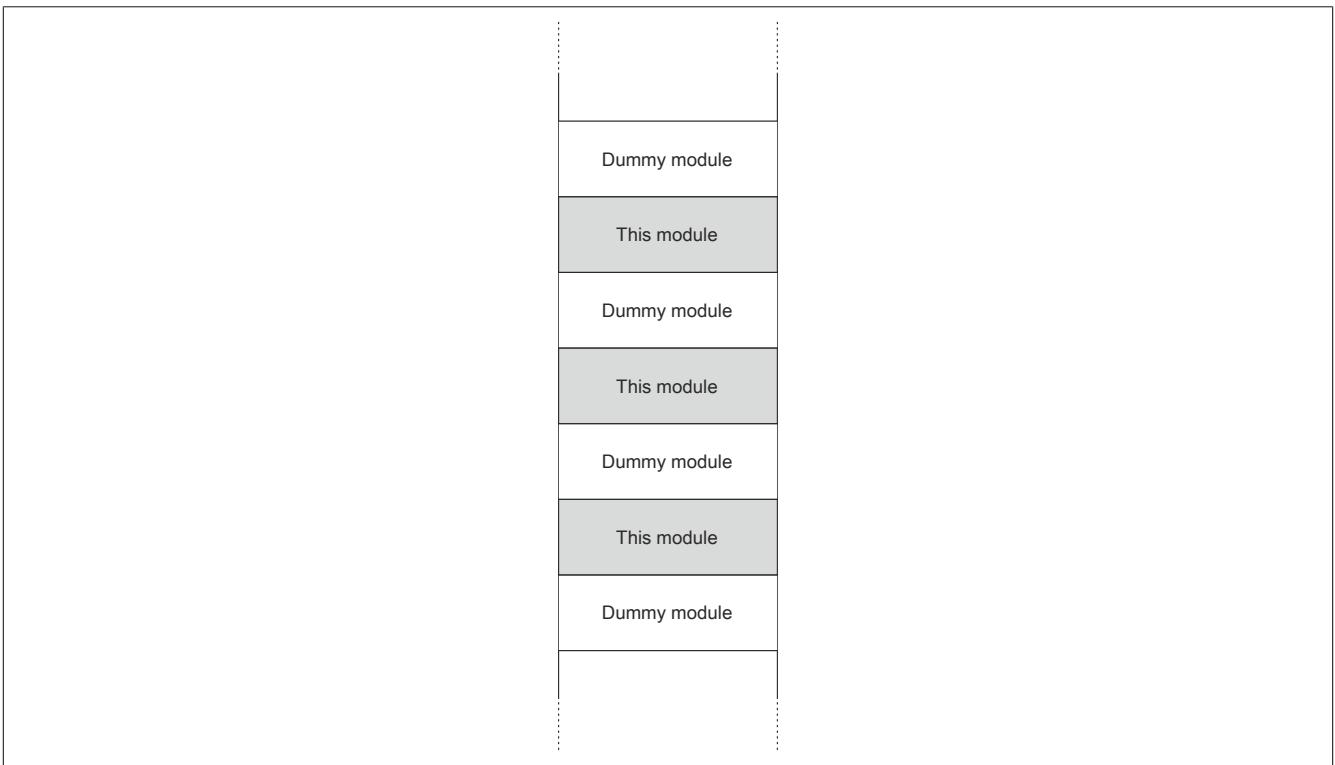

Operating a strain gauge module

Starting at an ambient temperature of 45°C, a dummy module must be connected to the left and right of the strain gauge module in a vertical mounting orientation.

Operating multiple strain gauge modules side by side

If 2 or more vertical strain gauge modules are being operated in a cluster, the following arrangement of modules must be observed.

9.1.4.13 Register description

9.1.4.13.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section "[General data points](#)" on page 3790.

9.1.4.13.2 Function model 0 - Standard

| Register | Name | Data type | Read | | Write | |
|--------------------------------------|--|-----------|--------|---------|--------|---------|
| | | | Cyclic | Acyclic | Cyclic | Acyclic |
| Analog signal - Configuration | | | | | | |
| 16 | ConfigOutput01 (A/D converter configuration) | USINT | | | • | |
| 18 | ConfigCycletime01 | UINT | | | | • |
| 32 | AdcClkFreqShift01 | USINT | | | | • |
| Analog signal - Communication | | | | | | |
| 2 | StatusInput01 | USINT | • | | | |
| 4 | AnalogInput01 | DINT | • | | | |

9.1.4.13.3 Function model 1 - Multisampling

In this function model, the A/D converter is operated synchronously to X2X Link with a predefined A/D converter cycle time. The value is configurable as 50 or 100 μ s.

The module returns between 3 and 10 measured values per X2X cycle depending on the configuration. With an X2X cycle time of 400 μ s and A/D converter cycle time of 50 μ s, exactly 8 measurements are performed and the module can return 8 values (strain gauge value 01 to strain gauge value 08).

If a longer cycle time is used, the values returned correspond to the last measurements. If using an X2X cycle time that is not a whole number multiple of the A/D converter cycle time, then the conversion cannot be synchronized with X2X Link. In this case, the module outputs the invalid value 0x8000.

Example 1

If using an X2X cycle time of 800 μ s, it is possible to perform 16 measurements per X2X cycle if the A/D converter cycle time equals 50 μ s. The first 6 measured values are discarded; the last 10 measured values are provided by the module.

With a shorter X2X cycle time, the number of measured values should not exceed the number of measurements that can actually be made. All other measured values are invalid (0x8000). To minimize the load on the X2X Link network, it is possible to disable these unneeded registers (see "[Number of measured values](#)" on page 313).

Example 2

If using an X2X cycle time of 300 μ s, it is possible to perform 6 measurements per X2X cycle if the A/D converter cycle time equals 50 μ s. For this reason, only the first 6 registers are valid. The registers for the 7th through 10th measured value (AnalogInput07 to AnalogInput10) should be disabled by setting [Number of measured values](#) to "6 measured values" in the I/O configuration.

| Register | Name | Data type | Read | | Write | |
|--------------------------------------|---|-----------|--------|---------|--------|---------|
| | | | Cyclic | Acyclic | Cyclic | Acyclic |
| Analog signal - Configuration | | | | | | |
| 1601 | ConfigGain01_MultiSample | USINT | | | • | |
| 1603 | ConfigCycletime01_MultiSample | USINT | | | | • |
| Analog signal - Communication | | | | | | |
| 2 | StatusInput01 | USINT | • | | | |
| 1534 + N * 4 | AnalogInput0N (N = 1 to 10) | INT | • | | | |

9.1.4.13.4 Function model 2 - Extended filter

This function model allows the IIR low-pass filter and the FIR filter to be enabled.

| Register | Name | Data type | Read | | Write | |
|--------------------------------------|--|-----------|--------|---------|--------|---------|
| | | | Cyclic | Acyclic | Cyclic | Acyclic |
| Analog signal - Configuration | | | | | | |
| 272 | ConfigCommonOutput01 (A/D converter and IIR filter configuration) | USINT | | | • | |
| 288 | ConfigFilterOutput01 | UINT | | | | • |
| 273 | ConfigDatarateOutput01 | USINT | | | • | |
| 274 | ConfigHighResolutionOutput01 | UINT | | | • | |
| Analog signal - Communication | | | | | | |
| 2 | StatusInput01 | USINT | • | | | |
| 4 | AnalogInput01 | DINT | • | | | |
| 256 | AdcConvTimeStampInput01 | DINT | • | | | |

9.1.4.13.5 Function model 254 - Bus controller

In function model "254 - Bus controller", the module behaves as it does in "Function model 0 - Standard" with the exception that it is not synchronized to the X2X Link network even if synchronous mode is enabled in register "ConfigOutput01" on page 308. Instead, the module behaves as if the set A/D converter cycle time is not a factor or multiple of the X2X cycle time and attempts to maintain the set A/D converter cycle time as precisely as possible.

| Register | Offset ¹⁾ | Name | Data type | Read | | Write | |
|--------------------------------------|----------------------|--|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| Analog signal - Configuration | | | | | | | |
| 16 | 0 | ConfigOutput01 (A/D converter configuration) | USINT | | | • | |
| 18 | 18 | ConfigCycletime01 | UINT | | | | • |
| 32 | 32 | AdcClkFreqShift01 | USINT | | | | • |
| Analog signal - Communication | | | | | | | |
| 2 | 4 | StatusInput01 | USINT | • | | | |
| 4 | 0 | AnalogInput01 | DINT | • | | | |

1) The offset specifies the position of the register within the CAN object.

9.1.4.13.5.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see "Using I/O modules on the bus controller" on page 3789.

9.1.4.13.5.2 CAN I/O bus controller

The module occupies 1 analog logical slot on CAN I/O.

9.1.4.13.6 Registers for function models "0 - Standard" and "254 - Bus controller"

9.1.4.13.6.1 A/D converter configuration

Name:

ConfigOutput01

The data rate and measurement range of the A/D converter can be configured in this register.

| Data type | Values | Bus controller default setting |
|-----------|--------------------|--------------------------------|
| USINT | See bit structure. | 13 |

Bit structure:

| Bit | Description | Value | Information | |
|-------|--|--|--|----------|
| 0 - 3 | Data rate f_{DATA} (samples per second): | 0000 | 2.5 | |
| | | 0001 | 5 | |
| | | 0010 | 10 | |
| | | 0011 | 15 | |
| | | 0100 | 25 | |
| | | 0101 | 30 | |
| | | 0110 | 50 | |
| | | 0111 | 60 | |
| | | 1000 | 100 | |
| | | 1001 | 500 | |
| | | 1010 | 1000 | |
| | | 1011 | 2000 | |
| | | 1100 | 3750 | |
| | | 1101 | 7500 (bus controller default setting) | |
| 4 - 6 | Standard measurement range (bit 6 = 0) | 000 | 16 mV/V (bus controller default setting) | |
| | | 001 | 8 mV/V | |
| | | 010 | 4 mV/V | |
| | | 011 | 2 mV/V | |
| | | Extended measurement range (bit 6 = 1) | 100 | 256 mV/V |
| | | | 101 | 128 mV/V |
| 110 | 64 mV/V | | | |
| 7 | Reserved | 111 | 32 mV/V | |
| | | 0 | (must be 0) | |

Synchronous mode

The module's analog/digital converter (A/D converter) can optionally be operated and read synchronously to the X2X Link network. Synchronous mode is enabled by selecting the respective operating mode in register "ConfigOutput01" on page 308. A time between 200 and 2000 μ s must be set in register "ConfigCycletime01" on page 309 for this. If this time is a whole number factor or multiple of the configured cycle time of X2X Link, then the A/D converter is read synchronously to X2X Link.

Information:

The A/D converter cycle time must be $\geq 1/4$ of the X2X cycle time!

Bit 2 in *Module status* is set (i.e. A/D converter not running synchronously)...

- ... If the configured A/D converter cycle time cannot be synchronized with X2X Link.
- ... If the module is still in the settling phase.

Jitter, dead time and settling time:

| | | |
|---|--|---|
| Jitter | | |
| A/D converter cycle times <1500 μ s | | Max. $\pm 1 \mu$ s |
| A/D converter cycle times >1500 μ s | | Max. $\pm 4 \mu$ s |
| X2X link dead time | | 50μ s + $\frac{X2X \text{ cycle time}}{128}$ |
| Settling time | | 150 x X2X cycle time |

The settling time corresponds to the time needed until the A/D converter can be operated after enabling synchronous mode or following conversion of the A/D converter cycle time.

9.1.4.13.6.2 A/D converter cycle time

Name:

ConfigCycletime01

This register is only used in [Synchronous mode](#). If synchronous mode is enabled in the A/D converter configuration, then the module attempts to operate the A/D converter as synchronously as possible to the X2X Link network (based on the A/D converter cycle time set in this register). It is of course necessary for the X2X Link cycle time and the A/D converter cycle time to have a certain ratio. The following conditions must be observed:

- 1) A/D converter cycle time $\geq 1/4$ X2X cycle time
- 2) A/D converter cycle time corresponds to a whole number factor or multiple of the X2X cycle time
- 3) A/D converter cycle time must be in the range 50 to 2000 μ s

| Data type | Values | Information |
|-----------|------------|-------------------------------------|
| UINT | 50 to 2000 | Bus controller default setting: 400 |

9.1.4.13.6.3 A/D converter clock frequency shift

Name:

AdcClkFreqShift01

In rare cases, strain gauge modules connected to neighboring slots can influence one another. This can result in temporary, minimal deviations in measured values. This can only occur if the sigma-delta A/D converters on the neighboring strain gauge modules are operated at exactly the same clock frequency.

In most cases, these clock frequencies vary slightly due to part variances. When they are the same however, this register on the strain gauge module provides a safe way for an application to prevent this type of mutual influence.

| Data type | Values | Information |
|-----------|-------------|-------------------------------------|
| SINT | -128 to 127 | Bus controller default setting: 127 |

This register can be used to vary the clock frequency in increments of 200 ppm. Setting values from -50 to 50 cover a range of -10000 ppm to 10000 ppm. This corresponds with -1% to 1%.

Values beyond this range will cause activation of a default mode. The frequency shift is derived from the last 2 digits of the serial number by the module firmware. This saves time that would otherwise be needed for programming, provided that the last two digits of the serial numbers on the neighboring modules are not the same

| Register value | Frequency shift in ppm | Example of a sampling rate ¹⁾ |
|----------------|--|--|
| 127 | $((\text{SerialNo. modulo } 100) - 50) * (-200)$ ppm | Based on the serial number |
| ... | ... | ... |
| 51 | $((\text{SerialNo. modulo } 100) - 50) * (-200)$ ppm | Based on the serial number |
| 50 | 10000 | 505 |
| 49 | 9800 | 504.9 |
| ... | ... | ... |
| 2 | 400 | 500.2 |
| 1 | 200 | 500.1 |
| 0 | 0 | 500 |
| -1 | -200 | 499.9 |
| -2 | -400 | 499.8 |
| ... | ... | ... |
| -50 | -10000 | 495 |
| -51 | $((\text{SerialNo. modulo } 100) - 50) * (-200)$ ppm | Based on the serial number |
| ... | ... | ... |
| -128 | $((\text{SerialNo. modulo } 100) - 50) * (-200)$ ppm | Based on the serial number |

1) Nominal sampling rate of 500 samples per second

Important:

As shown in the table above, shifting the A/D converter clock frequency will equally shift the A/D converter sampling rate. Shifting the A/D converter clock frequency too much can cause problems with disturbance suppression particularly when a very specific sampling rate has been defined to suppress existing disturbances (e.g. 50 Hz to suppress the 50 Hz hum). See also "[Filter characteristics of the sigma-delta A/D converter](#)" on page 296.

It is situations like this where the option to manually shift the frequency in the I/O configuration or ASIOACC library should be utilized rather than relying on the default frequency shift that is based on the serial number.

A frequency shift like the one shown below would be sufficient to prevent modules from influencing one another and would not cause any noticeable difference to the filter characteristics.

| Slot | 1 | 2 | 3 | 4 | 5 | 6 | ... |
|-------------------------------------|---|---|----|---|----|---|-----|
| A/D converter clock frequency shift | 0 | 2 | -1 | 1 | -2 | 0 | ... |

Information:

- This register has no effect in synchronous mode because the firmware regulates the A/D converter clock frequency in such a way that the A/D converter cycle is synchronous with the X2X cycle.
- When writing to this register using the ASIOACC library, only the lowest value byte of the written value is accepted. For example, the value 256 (=0x100) is identical to the value 0 (=0x00).

9.1.4.13.6.4 Module status

Name:

StatusInput01

The current state of the module is indicated in this register.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|--------------------------------|-------|---|
| 0 | A/D converter value | 0 | Valid A/D converter value |
| | | 1 | Invalid A/D converter value (analog value = 0xFF800000). Possible causes: <ul style="list-style-type: none"> • Strain gauge supply error • I/O power supply error • A/D converter not (yet) configured |
| 1 | Line monitoring | 0 | Ok |
| | | 1 | Open circuit |
| 2 | Only valid in synchronous mode | 0 | A/D converter runs synchronous to X2X Link |
| | | 1 | A/D converter does not run synchronous to X2X Link |
| 3 - 7 | Reserved | - | |

9.1.4.13.6.5 Strain gauge value

Name:

AnalogInput01

This register contains the raw value determined by the A/D converter for the full-bridge strain gauge with 24-bit resolution.

| Data type | Values | Information |
|-----------|-----------------------|--|
| DINT | -8,388,608 | Negative invalid value |
| | -8,388,607 | Negative full-scale deflection / Underflow |
| | -8,388,606 to 8388606 | Valid range |
| | 8,388,607 | Positive full-scale deflection / Overflow / Open circuit |

Effective resolution

In principle, the effective resolution of the A/D converter is dependent on the data rate and the measurement range (see "Effective resolution of the A/D converter" on page 293).

The following table shows how the effective resolution (in bits) or effective range of values of the strain gauge value depend on the module configuration (data rate, measurement range).

| Data rate f_{DATA} [Hz] | Measurement range | | | | | | | |
|-------------------------------------|-------------------|-----------------|--------------|-----------------|--------------|-----------------|--------------|-----------------|
| | ± 16 mV/V | | ± 8 mV/V | | ± 4 mV/V | | ± 2 mV/V | |
| | Bits | Range of values | Bits | Range of values | Bits | Range of values | Bits | Range of values |
| 2.5 | 16.9 | $\pm 61,100$ | 15.4 | $\pm 21,600$ | 14.5 | $\pm 11,600$ | 13.7 | $\pm 6,650$ |
| 5 | 16.6 | $\pm 49,700$ | 15.2 | $\pm 18,800$ | 14.2 | $\pm 9,410$ | 13.6 | $\pm 6,210$ |
| 10 | 16.0 | $\pm 32,800$ | 15.2 | $\pm 18,800$ | 14.2 | $\pm 9,410$ | 13.1 | $\pm 4,390$ |
| 15 | 16.0 | $\pm 32,800$ | 15.2 | $\pm 18,800$ | 14.1 | $\pm 8,780$ | 13.1 | $\pm 4,390$ |
| 25 | 15.9 | $\pm 30,600$ | 14.7 | $\pm 13,300$ | 13.9 | $\pm 7,640$ | 12.7 | $\pm 3,330$ |
| 30 | 15.7 | $\pm 26,600$ | 14.6 | $\pm 12,400$ | 13.6 | $\pm 6,210$ | 12.7 | $\pm 3,330$ |
| 50 | 15.4 | $\pm 21,600$ | 14.5 | $\pm 11,600$ | 13.3 | $\pm 5,040$ | 12.2 | $\pm 2,350$ |
| 60 | 15.2 | $\pm 18,800$ | 14.3 | $\pm 10,100$ | 13.1 | $\pm 4,390$ | 12.2 | $\pm 2,350$ |
| 100 | 14.9 | $\pm 15,300$ | 13.8 | $\pm 7,130$ | 13.0 | $\pm 4,100$ | 12.0 | $\pm 2,050$ |
| 500 | 13.8 | $\pm 7,130$ | 12.8 | $\pm 3,570$ | 11.7 | $\pm 1,660$ | 10.7 | ± 832 |
| 1000 | 13.3 | $\pm 5,040$ | 12.3 | $\pm 2,520$ | 11.3 | $\pm 1,260$ | 10.3 | ± 630 |
| 2000 | 12.7 | $\pm 3,330$ | 11.9 | $\pm 1,910$ | 10.8 | ± 891 | 9.7 | ± 416 |
| 3750 | 12.4 | $\pm 2,700$ | 11.4 | $\pm 1,350$ | 10.4 | ± 676 | 9.2 | ± 294 |
| 7500 | 12.0 | $\pm 2,050$ | 11.0 | $\pm 1,020$ | 10.1 | ± 549 | 8.9 | ± 239 |

Table 44: Effective resolution of the strain gauge value in bits for the measurement range 2 to 16 mV/V

| Data rate f_{DATA} [Hz] | Measurement range | | | | | | | |
|-------------------------------------|-------------------|-----------------|----------------|-----------------|---------------|-----------------|---------------|-----------------|
| | ± 256 mV/V | | ± 128 mV/V | | ± 64 mV/V | | ± 32 mV/V | |
| | Bits | Range of values | Bits | Range of values | Bits | Range of values | Bits | Range of values |
| 2.5 | 20.8 | $\pm 913,000$ | 20.0 | $\pm 524,000$ | 18.8 | $\pm 228,000$ | 17.6 | $\pm 99,300$ |
| 5 | 20.2 | $\pm 602,000$ | 19.5 | $\pm 371,000$ | 18.3 | $\pm 161,000$ | 17.4 | $\pm 86,500$ |
| 10 | 20.1 | $\pm 562,000$ | 19.4 | $\pm 346,000$ | 18.3 | $\pm 161,000$ | 17.0 | $\pm 65,500$ |
| 15 | 19.8 | $\pm 456,000$ | 19.0 | $\pm 262,000$ | 17.9 | $\pm 122,000$ | 17.0 | $\pm 65,500$ |
| 25 | 19.7 | $\pm 426,000$ | 18.8 | $\pm 228,000$ | 17.9 | $\pm 122,000$ | 16.7 | $\pm 53,200$ |
| 30 | 19.7 | $\pm 426,000$ | 18.5 | $\pm 185,000$ | 17.5 | $\pm 92,700$ | 16.7 | $\pm 53,200$ |
| 50 | 19.2 | $\pm 301,000$ | 18.3 | $\pm 161,000$ | 17.5 | $\pm 92,700$ | 16.3 | $\pm 40,300$ |
| 60 | 19.2 | $\pm 301,000$ | 18.2 | $\pm 151,000$ | 17.2 | $\pm 75,300$ | 16.2 | $\pm 37,600$ |
| 100 | 18.9 | $\pm 245,000$ | 17.9 | $\pm 122,000$ | 16.8 | $\pm 57,100$ | 15.9 | $\pm 30,600$ |
| 500 | 17.6 | $\pm 99,300$ | 16.8 | $\pm 57,100$ | 15.8 | $\pm 28,500$ | 14.8 | $\pm 14,300$ |
| 1000 | 17.2 | $\pm 75,300$ | 16.2 | $\pm 37,600$ | 15.2 | $\pm 18,800$ | 14.3 | $\pm 10,100$ |
| 2000 | 16.5 | $\pm 46,300$ | 15.8 | $\pm 28,500$ | 14.7 | $\pm 13,300$ | 13.8 | $\pm 7,130$ |
| 3750 | 16.1 | $\pm 35,100$ | 15.4 | $\pm 21,600$ | 14.3 | $\pm 10,100$ | 13.3 | $\pm 5,040$ |
| 7500 | 15.9 | $\pm 30,600$ | 15.0 | $\pm 16,400$ | 14.0 | $\pm 8,190$ | 13.0 | $\pm 4,100$ |

Table 45: Effective resolution of the strain gauge value in bits for the measurement range 32 to 256 mV/V

9.1.4.13.7 Register for "Function model 1 - Multisampling"

9.1.4.13.7.1 A/D converter configuration

Name:

ConfigGain01_MultiSample

The measurement range for the A/D converter can be configured in this register.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|--|-------|-------------|
| 0 - 2 | Standard measurement range (bit 2 = 0) | 000 | 16 mV/V |
| | | 001 | 8 mV/V |
| | | 010 | 4 mV/V |
| | | 011 | 2 mV/V |
| | Extended measurement range (bit 2 = 1) | 100 | 256 mV/V |
| | | 101 | 128 mV/V |
| | | 110 | 64 mV/V |
| 3 - 7 | Reserved | 0 | (must be 0) |

9.1.4.13.7.2 A/D converter cycle time

Name:

ConfigCycletime01_MultiSample

The A/D converter cycle time can be configured in this register.

In order for multisampling to work, the X2X cycle time must be divisible by the A/D converter cycle time to produce a whole number.

| Data type | Value | Information |
|-----------|----------|----------------------|
| USINT | 0 | 50 μ s (default) |
| | 1 | 100 μ s |
| | 2 to 255 | Reserved |

9.1.4.13.7.3 Number of measured values

If the X2X cycle time is too short, then not all 10 measurements can be performed. To reduce the load on X2X Link, it makes sense to only transfer as many values as measurements that can be made. This is why it is possible to configure the number of measured values to be transferred (see "Function model 1 - Multisampling" on page 306).

Example: A/D converter cycle time = 50 μ s

| X2X cycle time | Number of measured values to be transferred |
|--------------------|---|
| 250 μ s | 5 |
| 300 μ s | 6 |
| 350 μ s | 7 |
| 400 μ s | 8 |
| 450 μ s | 9 |
| \geq 500 μ s | 10 |

Example: A/D converter cycle time = 100 μ s

| X2X cycle time | Number of measured values to be transferred |
|----------------|---|
| 300 μ s | 3 |
| 400 μ s | 4 |
| 500 μ s | 5 |
| 600 μ s | 6 |
| 700 μ s | 7 |
| 800 μ s | 8 |
| 900 μ s | 9 |
| \geq 1 ms | 10 |

9.1.4.13.7.4 Module status

Name:
StatusInput01

This register contains the current state of the module.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|----------------------|-------|--|
| 0 | A/D converter values | 0 | Valid A/D converter value |
| | | 1 | Invalid A/D converter value |
| 1 | Line monitoring | 0 | OK |
| | | 1 | Open circuit An open circuit was found during at least one measurement in this X2X cycle. This bit is reset if all measurements are OK after correcting this error, i.e. it does not have to be acknowledged. |
| 2 | Synchronous mode | 0 | A/D converter runs synchronous to X2X Link |
| | | 1 | A/D converter does not run synchronous to X2X Link |
| 3 - 7 | Reserved | - | |

9.1.4.13.7.5 Strain gauge value - Multiple

Name:
AnalogInput01 to AnalogInput10

This register contains the raw value determined by the A/D converter for the full-bridge strain gauge with 16-bit resolution. The module returns between 3 and 10 measured values per X2X cycle depending on the configuration.

Effective resolution

In principle, the effective resolution of the A/D converter is dependent on the data rate and measurement range (see "[Effective resolution of the A/D converter](#)" on page 293).

The following table shows how the effective resolution (in bits) or effective range of values of the strain gauge value depend on the module configuration (data rate, measurement range).

| Measurement range | | | | | | | |
|-------------------|-----------------|---------|-----------------|---------|-----------------|---------|-----------------|
| ±16 mV/V | | ±8 mV/V | | ±4 mV/V | | ±2 mV/V | |
| Bits | Range of values | Bits | Range of values | Bits | Range of values | Bits | Range of values |
| 11.7 | ±1,700 | 10.7 | ±840 | 9.8 | ±430 | 8.8 | ±220 |

Table 46: Effective resolution of the strain gauge value in bits for the measurement range 2 to 16 mV/V

| Measurement range | | | | | | | |
|-------------------|-----------------|-----------|-----------------|----------|-----------------|----------|-----------------|
| ±256 mV/V | | ±128 mV/V | | ±64 mV/V | | ±32 mV/V | |
| Bits | Range of values | Bits | Range of values | Bits | Range of values | Bits | Range of values |
| 15.8 | ±27,600 | 15.0 | ±16,400 | 13.7 | ±6,520 | 12.8 | ±3,570 |

Table 47: Effective resolution of the strain gauge value in bits for the measurement range 32 to 256 mV/V

9.1.4.13.8 Register for "Function model 2 - Extended filter"**9.1.4.13.8.1 A/D converter and IIR filter configuration**

Name:

ConfigCommonOutput01

The IIR low-pass filter and measurement range of the A/D converter can be configured in this register.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|----------------------------|-------------|--|
| | | | Filter level |
| 0 - 3 | IIR low-pass filter | 0000 | 0: IIR low-pass filter switched off |
| | | 0001 | 1 |
| | | 0010 | 2 |
| | | 0011 | 3 |
| | | 0100 | 4 |
| | | 0101 | 5 |
| | | 0110 | 6 |
| | | 0111 | 7 |
| | | 1000 | 8 |
| | | 1001 - 1111 | The analog input value indicates an invalid range. |
| 4 - 6 | Default measurement range | 000 | 16 mV/V |
| | | 001 | 8 mV/V |
| | | 010 | 4 mV/V |
| | | 011 | 2 mV/V |
| | Extended measurement range | 100 | 256 mV/V |
| | | 101 | 128 mV/V |
| | | 110 | 64 mV/V |
| | | 111 | 32 mV/V |
| 7 | Reserved | 0 | (must be 0) |

9.1.4.13.8.2 Data rate configuration

Name:

ConfigFilterOutput01

Whether a selectable data rate or a high-resolution data rate is being used for the FIR filter is configured in this register.

| Data type | Values | Information |
|-----------|--------|--|
| UINT | 0 | Mode "Selectable data rate": A selectable data rate is used for the FIR filter (default). Configuration takes place in register "ConfigDatarateOutput01" on page 223. |
| | 1 | Mode "High-resolution data rate": A high-resolution data rate is used for the FIR filter. Configuration takes place in register "ConfigHighResolutionOutput01" on page 223. |

Name:

ConfigDatarateOutput01

The data rate of the FIR filter in mode "Selectable data rate" is configured in this register.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------------|--|-------|--|
| 0 - 3 | Data rate f_{DATA} (samples per second): | 0000 | 2.5 |
| | | 0001 | 5 |
| | | 0010 | 10 |
| | | 0011 | 15 |
| | | 0100 | 25 |
| | | 0101 | 30 |
| | | 0110 | 50 |
| | | 0111 | 60 |
| | | 1000 | 100 |
| | | 1001 | 500 |
| | | 1010 | 1000 |
| | | 1011 | 2000 |
| | | 1100 | 3750 |
| 1101 | 7500 | | |
| 1110 - 1111 | | | The analog input value indicates an invalid range. |
| 4 - 7 | Reserved | 0 | (must be 0) |

Name:

ConfigHighResolutionOutput01

The data rate of the FIR filter in 0.1 Hz steps is configured in this register (0.1 to 6553.5 Hz).

| Data type | Values | Information |
|-----------|-------------|-------------------------|
| UINT | 0 | Disables the FIR filter |
| | 1 to 65,535 | 0.1 to 6553.5 Hz |

9.1.4.13.8.3 Module status

Name:

StatusInput01

This register contains the current state of the module. If there is a fault in the module power supply or strain gauge supply, the analog input value indicates an invalid range and the buffer of the enabled filter is reset.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|----------------------|-------|------------------------------|
| 0 | A/D converter values | 0 | Valid A/D converter value |
| | | 1 | Invalid A/D converter value |
| 1 | Line monitoring | 0 | OK |
| | | 1 | Open circuit |
| 2 | Reserved | - | |
| 3 | Module power supply | 0 | OK |
| | | 1 | Error in module power supply |
| 4 | Strain gauge supply | 0 | OK |
| | | 1 | Error in strain gauge supply |
| 5 | FIR filter ready | 0 | OK |
| | | 1 | FIR filter not yet ready |
| 6 - 7 | Reserved | - | |

9.1.4.13.8.4 A/D converter conversion timestamp

Name:

AdcConvTimeStampInput01

This register holds the timestamp of the last analog conversion. This is always the point in time in [μ s] at which the conversion of the latest A/D converter raw value is completed.

| Data type | Values | Explanation |
|-----------|---------------------------------|--|
| DINT | -2,147,483,648 to 2,147,483,647 | Timestamp [μ s] of the last analog conversion |

9.1.4.13.9 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time |
|--------------------|
| 250 μ s |

9.1.4.13.10 Minimum I/O update time

The minimum I/O update time specifies how far the bus cycle can be reduced so that an I/O update is performed in each cycle.

For the I/O update times for function models "0 - Standard", "2 - Extended filter" and "254 - Bus controller", see section "[Characteristics of the FIR filter in mode "Selectable data rate"](#)" on page 300.

Depending on the setting in register "[ConfigCycletime01_MultiSample](#)" on page 313, the I/O update time in "Function model 1 - Multisampling" is 50 or 100 μ s.

9.1.5 X20AI2222

Data sheet version: 1.21

9.1.5.1 General information

The module is equipped with 2 inputs with 13-bit (including sign) digital converter resolution. It can be used to capture voltage signals in the range from ± 10 V.

This module is designed for X20 6-pin terminal blocks. If needed (e.g. for logistical reasons), the 12-pin terminal block can also be used.

- 2 analog inputs ± 10 V
- 13-bit digital converter resolution

9.1.5.2 Order data

| Model number | Short description | Figure |
|--------------|---|--|
| | Analog inputs |  |
| X20AI2222 | X20 analog input module, 2 inputs, ± 10 V, 13-bit converter resolution, configurable input filter | |
| | Required accessories | |
| | Bus modules | |
| X20BM11 | X20 bus module, 24 VDC keyed, internal I/O supply continuous | |
| X20BM15 | X20 bus module, with node number switch, 24 VDC keyed, internal I/O supply continuous | |
| | Terminal blocks | |
| X20TB06 | X20 terminal block, 6-pin, 24 VDC keyed | |
| X20TB12 | X20 terminal block, 12-pin, 24 VDC keyed | |
| | | |

9.1.5.7 Input circuit diagram

9.1.5.8 Register description

9.1.5.8.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section ["General data points" on page 3790](#).

9.1.5.8.2 Function model 0 - Standard

| Register | Name | Data type | Read | | Write | |
|--------------------------------------|------------------------------------|-----------|--------|------------|--------|------------|
| | | | Cyclic | Non-cyclic | Cyclic | Non-cyclic |
| Analog signal - Configuration | | | | | | |
| 16 | ConfigOutput01 (Input filter) | USINT | | | | • |
| 20 | ConfigOutput03 (Lower limit value) | INT | | | | • |
| 22 | ConfigOutput04 (Upper limit value) | INT | | | | • |
| Analog signal - Communication | | | | | | |
| 0 | AnalogInput01 | INT | • | | | |
| 2 | AnalogInput02 | INT | • | | | |
| 30 | StatusInput01 | USINT | • | | | |

9.1.5.8.3 Function model 254 - Bus controller

| Register | Offset ¹⁾ | Name | Data type | Read | | Write | |
|--------------------------------------|----------------------|------------------------------------|-----------|--------|------------|--------|------------|
| | | | | Cyclic | Non-cyclic | Cyclic | Non-cyclic |
| Analog signal - Configuration | | | | | | | |
| 16 | - | ConfigOutput01 (Input filter) | USINT | | | | • |
| 20 | - | ConfigOutput03 (Lower limit value) | INT | | | | • |
| 22 | - | ConfigOutput04 (Upper limit value) | INT | | | | • |
| Analog signal - Communication | | | | | | | |
| 0 | 0 | AnalogInput01 | INT | • | | | |
| 2 | 2 | AnalogInput02 | INT | • | | | |
| 30 | - | StatusInput01 | USINT | | • | | |

1) The offset specifies the position of the register within the CAN object.

9.1.5.8.3.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see ["Using I/O modules on the bus controller" on page 3789](#).

9.1.5.8.3.2 CAN I/O bus controller

The module occupies 1 analog logical slot on CAN I/O.

9.1.5.8.4 Analog inputs

The input state is collected with a fixed offset to the network cycle and transferred in the same cycle.

9.1.5.8.5 Input values of analog inputs

Name:

AnalogInput01 to AnalogInput02

The analog input value is mapped in this register.

| Data type | Value | Input signal: |
|-----------|-----------------|------------------------------|
| INT | -32768 to 32767 | Voltage signal -10 to 10 VDC |

9.1.5.8.6 Input filter

This module is equipped with a configurable input filter. The minimum cycle time must be $>500\ \mu\text{s}$. Filtering is disabled for shorter cycle times.

If the input filter is active, then the scan rate for the channels is measured in ms. The time offset between the channels is $200\ \mu\text{s}$. The conversion takes place asynchronously to the network cycle.

9.1.5.8.6.1 Input ramp limiting

Input ramp limiting can only be performed in conjunction with filtering. Input ramp limiting is performed before filtering.

The difference of the input value change is checked for exceeding the specified limit. In the event of overshoot, the tracked input value is equal to the old value \pm the limit value.

Configurable limit values:

| Value | Limit value |
|-------|---|
| 0 | The input value is used without limitation. |
| 1 | $0x3FFF = 16383$ |
| 2 | $0x1FFF = 8191$ |
| 3 | $0x0FFF = 4095$ |
| 4 | $0x07FF = 2047$ |
| 5 | $0x03FF = 1023$ |
| 6 | $0x01FF = 511$ |
| 7 | $0x00FF = 255$ |

Input ramp limiting is well suited for suppressing disturbances (spikes). The following examples show the functionality of input ramp limiting based on an input step and a disturbance.

Example 1

The input value jumps from 8000 to 17000. The diagram shows the tracked input value with the following settings:

Input ramp limiting = 4 = $0x07FF = 2047$

Filter level = 2

Figure 44: Tracked input value for input step

Example 2

A disturbance interferes with the input value. The diagram shows the tracked input value with the following settings:

Input ramp limiting = 4 = 0x07FF = 2047

Filter level = 2

Figure 45: Tracked input value for disturbance

9.1.5.8.6.2 Filter level

A filter can be defined to prevent large input jumps. This filter is used to bring the input value closer to the actual analog value over a period of several bus cycles.

Filtering takes place after input ramp limitation.

Formula for calculating the input value:

$$\text{Value}_{\text{New}} = \text{Value}_{\text{Old}} - \frac{\text{Value}_{\text{Old}}}{\text{Filter level}} + \frac{\text{Input value}}{\text{Filter level}}$$

Adjustable filter levels:

| Value | Filter level |
|-------|---------------------|
| 0 | Filter switched off |
| 1 | Filter level 2 |
| 2 | Filter level 4 |
| 3 | Filter level 8 |
| 4 | Filter level 16 |
| 5 | Filter level 32 |
| 6 | Filter level 64 |
| 7 | Filter level 128 |

The following examples show how filtering works in the event of an input jump or disturbance.

Example 1

The input value jumps from 8000 to 16000. The diagram shows the calculated value with the following settings:

Input ramp limiting = 0

Filter level = 2 or 4

Figure 46: Calculated value during input step

Example 2

A disturbance interferes with the input value. The diagram shows the calculated value with the following settings:

Input ramp limiting = 0

Filter level = 2 or 4

Figure 47: Calculated value during disturbance

9.1.5.8.7 Configuring the input filter

Name:

ConfigOutput01

The filter level and input ramp limiting of the input filter are set in this register.

| Data type | Values | Bus controller default setting |
|-----------|------------------------|--------------------------------|
| USINT | See the bit structure. | 0 |

Bit structure:

| Bit | Description | Value | Information |
|-------|-----------------------------|-------|--|
| 0 - 2 | Defines the filter level | 000 | Filter disabled (bus controller default setting) |
| | | 001 | Filter level 2 |
| | | 010 | Filter level 4 |
| | | 011 | Filter level 8 |
| | | 100 | Filter level 16 |
| | | 101 | Filter level 32 |
| | | 110 | Filter level 64 |
| | | 111 | Filter level 128 |
| 3 | Reserved | 0 | |
| 4 - 6 | Defines input ramp limiting | 000 | The input value is applied without limitation (bus controller default setting) |
| | | 001 | Limit value = 0x3FFF (16383) |
| | | 010 | Limit value = 0x1FFF (8191) |
| | | 011 | Limit value = 0x0FFF (4095) |
| | | 100 | Limit value = 0x07FF (2047) |
| | | 101 | Limit value = 0x03FF (1023) |
| | | 110 | Limit value = 0x01FF (511) |
| | | 111 | Limit value = 0x00FF (255) |
| 7 | Reserved | 0 | |

9.1.5.8.8 Lower limit value

Name:

ConfigOutput03

This register can be used to configure the lower limit for analog values. If the analog value goes below the limit value, it is frozen at this value and the corresponding error status bit is set.

| Data type | Values | Information |
|-----------|-----------------|--|
| INT | -32767 to 32767 | Bus controller default setting: -32767 |

Information:

The default value of -32767 corresponds to the minimum default value of -10 VDC.

Keep in mind that this setting applies to all channels!

9.1.5.8.9 Upper limit value

Name:

ConfigOutput04

This register can be used to configure the upper limit for analog values. If the analog value goes above the limit value, it is frozen at this value and the corresponding error status bit is set.

| Data type | Values | Information |
|-----------|-----------------|---------------------------------------|
| INT | -32767 to 32767 | Bus controller default setting: 32767 |

Information:

The default value of 32767 corresponds to the maximum default value at +10 VDC.

Keep in mind that this setting applies to all channels!

9.1.5.8.10 Input status

Name:
StatusInput01

This register is used to monitor the module inputs. A change in the monitoring status generates an error message.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|-------------|-------|----------------------------|
| 0 - 1 | Channel 1 | 00 | No error |
| | | 01 | Lower limit value exceeded |
| | | 10 | Upper limit value exceeded |
| | | 11 | Open line |
| 2 - 3 | Channel 2 | 00 | No error |
| | | 01 | Lower limit value exceeded |
| | | 10 | Upper limit value exceeded |
| | | 11 | Open line |
| 4 - 7 | Reserved | 0 | |

Limiting the analog value

In addition to the status information, the analog value is fixed to the values listed below by default in an error state. The analog value is limited to the new values if the limit values were changed.

| Error state | Digital value on error (default values) |
|-----------------------------|---|
| Open circuit | +32767 (0x7FFF) |
| Upper limit value overshoot | +32767 (0x7FFF) |
| Lower limit value undershot | -32767 (0x8001) |
| Invalid value | -32768 (0x8000) |

9.1.5.8.11 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time | |
|--------------------------|--------|
| Inputs without filtering | 100 µs |
| Inputs with filtering | 500 µs |

9.1.5.8.12 Minimum I/O update time

The minimum I/O update time specifies how far the bus cycle can be reduced so that an I/O update is performed in each cycle.

| Minimum I/O update time | |
|--------------------------|-----------------------|
| Inputs without filtering | 300 µs for all inputs |
| Inputs with filtering | 1 ms |

9.1.6 X20AI2237

Data sheet version: 1.30

9.1.6.1 General information

The module is equipped with 2 voltage measurement inputs with 16-bit digital converter resolution.

Each voltage input has its own sensor supply. The two channels with their respective sensor supplies are electrically isolated from each other.

- 2 analog voltage inputs
- Electrically isolated analog channels
- Electrically isolated sensor supplies
- 16-bit digital converter resolution
- Very high sampling rate
- NetTime timestamp: Moment of measurement

NetTime timestamp of the measurement

For many applications, not only the measured value is important, but also the exact time of the measurement. The module is equipped with a NetTime timestamp function for this that supplies a timestamp for the recorded position and trigger time with microsecond accuracy.

The timestamp function is based on synchronized timers. If a timestamp event occurs, the module immediately saves the current NetTime. After the respective data is transferred to the CPU, including this precise moment, the CPU can then evaluate the data using its own NetTime (or system time), if necessary.

9.1.6.2 Order data

| Model number | Short description | Figure |
|--------------|--|---|
| | Analog inputs |  |
| X20AI2237 | X20 analog input module, 2 inputs, ± 10 V, 16-bit converter resolution, single-channel isolation with separate sensor power supply, NetTime function | |

9.1.6.4 LED status indicators

For a description of the various operating modes, see "[Diagnostic LEDs](#)" on page 3787.

| Figure | LED | Color | Status | Description |
|---|------------------------|--------|------------------|---|
|  | Operating state | | | |
| | r | Green | Off | No power to module |
| | | | Single flash | UNLINK mode |
| | | | Double flash | BOOT mode (during firmware update) ¹⁾ |
| | | | Blinking quickly | SYNC mode |
| | | | Blinking slowly | PREOPERATIONAL mode |
| | | | On | RUN mode |
| | Module status | | | |
| | e | Red | Off | No power to module or everything OK |
| | | | On | Error or reset status |
| | Sensor supply | | | |
| | V | Yellow | Off | Module supply not connected or overload |
| | | | On | Sensor supply in its normal operating range |
| | Analog input | | | |
| | 1 - 2 | Green | Off | Indicates one of the following cases: <ul style="list-style-type: none"> • No power to module • Channel disabled • Open line |
| | | | Single flash | Input signal overflow or underflow |
| | | | On | Analog/digital converter running, value OK |

1) Depending on the configuration, a firmware update can take up to several minutes.

9.1.6.5 Pinout

Shielded twisted pair cables should be used to minimize coupling disturbances. Use either one cable for each channel or a multiple twisted pair cable for both channels.

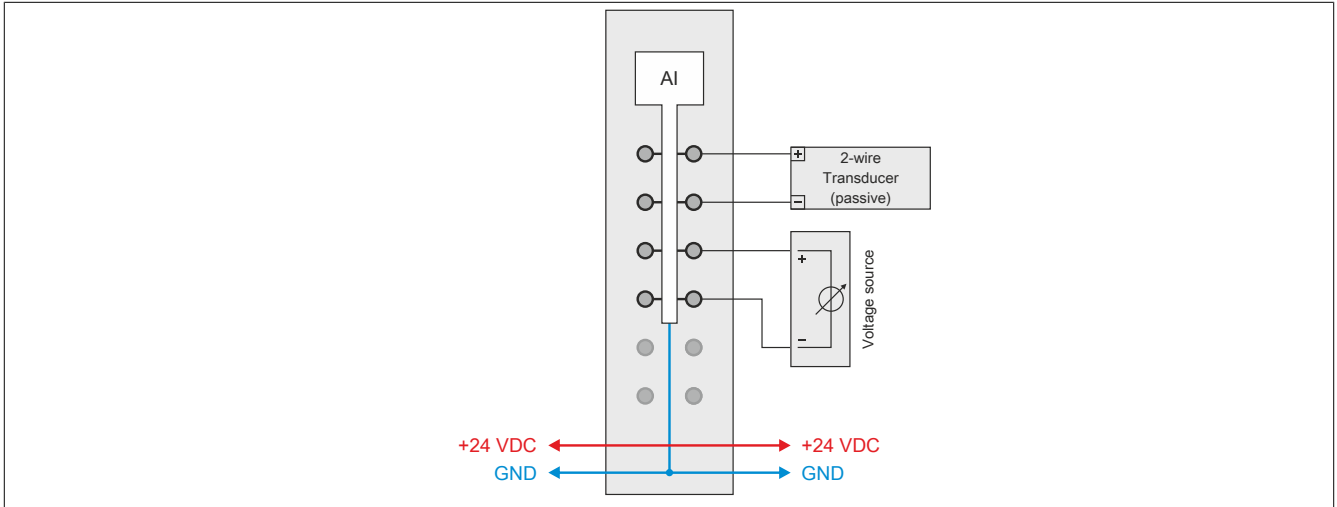

9.1.6.6 Connection examples

2-wire connections

A 2-wire connection can be implemented as follows:

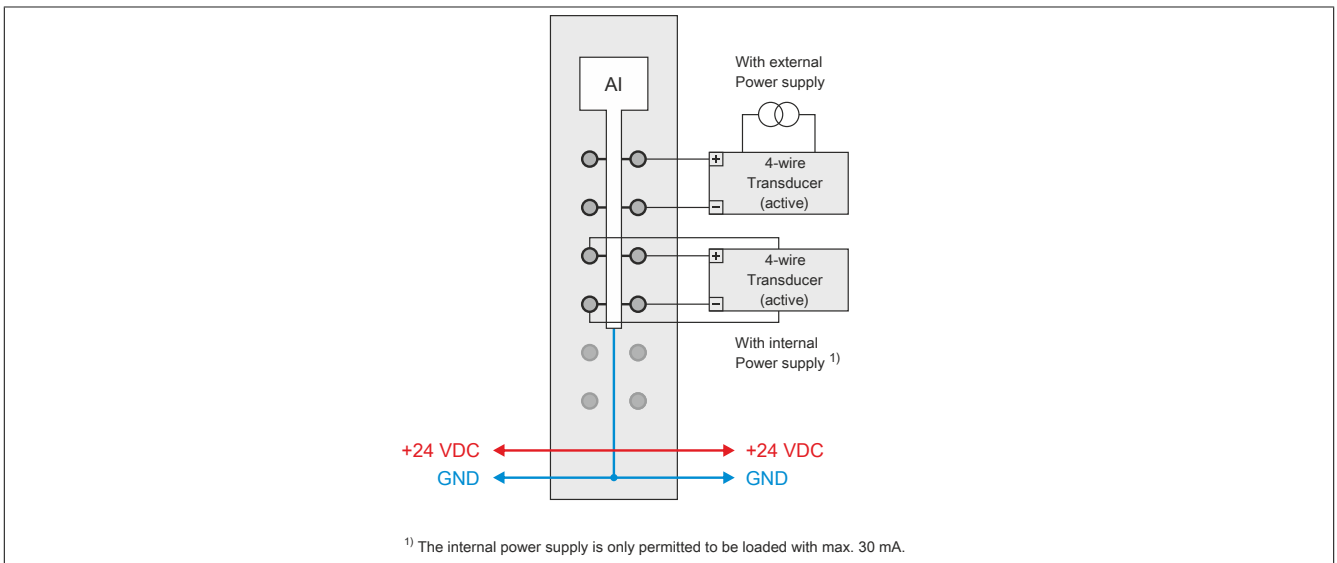

- 2-wire transducer
- Active voltage source

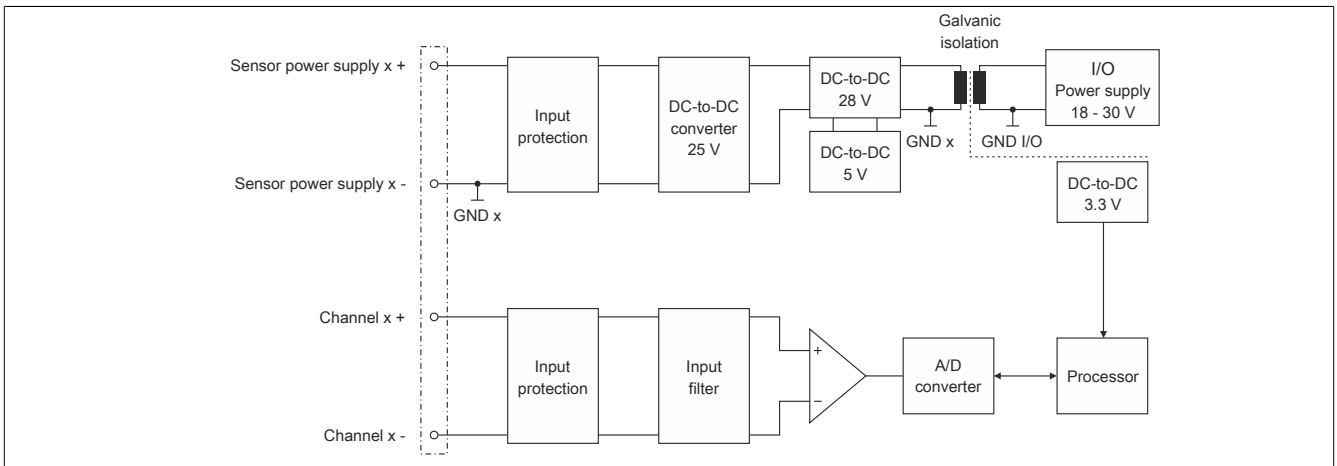

4-wire connections

A 4-wire connection can be implemented as follows:

- 4-wire transducer with external supply
- 4-wire transducer supplied by the module

9.1.6.7 Input circuit diagram

9.1.6.8 Behavior in the event of short circuit

In the event of a short circuit, the output current for the sensor supply is limited according to the following diagram.

9.1.6.9 Register description

9.1.6.9.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section ["General data points" on page 3790](#).

9.1.6.9.2 Function model 0 - default

| Register | Name | Data type | Read | | Write | |

1) The offset specifies the position of the register within the CAN object.

9.1.6.9.3.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see ["Using I/O modules on the bus controller" on page 3789](#).

9.1.6.9.3.2 CAN I/O bus controller

The module occupies 1 analog logical slot on CAN I/O.

9.1.6.9.4 General information

The module provides 2 electrically isolated channels. Each channel can read an electrical voltage signal in the ± 10 V range and supply the signal encoder with 24 VDC.

9.1.6.9.5 Analog input - Configuration

Each channel is configured and enabled separately. First, the user must set the scaling of the input value and select a replacement value strategy. Depending on the requirements of the application, the user can also set user-defined limit values and define an input filter.

Scaling

The module's A/D converter works with a resolution of 16 bits (± 15 bits). This allows the input value of ± 10 V to be mapped using ± 32767 steps. To simplify implementation, the user can configure scaling to ± 10000 steps. The conversion value corresponds to the voltage in mV, and with a resolution of more than 14 bits (± 13 bits) is still precise enough for the many different application that use this technology.

Replacement value strategy

The detected voltage is evaluated in order to ensure the quality of the read value. For example, if a logically impermissible voltage value or an open line is detected, the limit monitor triggers an appropriate response.

The response is determined by the replacement value strategy selected by the user. With the option "Replace with static value", the user defines two values that replace the converted value when the upper and lower limits are exceeded. The alternative "Retain last valid value" keeps the last validated value. However, the evaluation for this option takes more time. Depending on the "[preparation interval](#)", the value currently being read may be delayed.

Limit Value Monitoring

In addition to the qualitative evaluation of the input, the module also provides the option of adapting the range of permitted values to the requirements of the application. The registers "[UpperLimit](#)" on page 341 and "[LowerLimit](#)" on page 341 can be used to place additional restrictions on the permitted upper and lower limit. When this feature is used, the selected replacement value strategy is implemented according to the new limits.

9.1.6.9.5.1 Input filter

Analog input signals can experience brief disturbances caused by external factors (EMC). The A/D converters high sampling rate allows you to filter out these types of signal peaks without hindering the application processes.

2 configuration points are available for interpolating the input signal:

- "Input ramp limiting" on page 337
- "Filter level" on page 338

Input ramp limiting

Input ramp limiting can only be performed in conjunction with filtering. Input ramp limiting is performed before filtering.

The difference of the input value change is checked for exceeding the specified limit. In the event of overshoot, the tracked input value is equal to the old value \pm the limit value.

Configurable limit values:

| Value | Limit value |
|-------|---|
| 0 | The input value is used without limitation. |
| 1 | 0x3FFF = 16383 |
| 2 | 0x1FFF = 8191 |
| 3 | 0x0FFF = 4095 |
| 4 | 0x07FF = 2047 |
| 5 | 0x03FF = 1023 |
| 6 | 0x01FF = 511 |
| 7 | 0x00FF = 255 |

Input ramp limiting is well suited for suppressing disturbances (spikes). The following examples show the functionality of input ramp limiting based on an input step and a disturbance.

Example 1

The input value jumps from 8000 to 17000. The diagram shows the tracked input value with the following settings:

Input ramp limiting = 4 = 0x07FF = 2047

Filter level = 2

Figure 48: Tracked input value for input step

Example 2

A disturbance interferes with the input value. The diagram shows the tracked input value with the following settings:

Input ramp limiting = 4 = 0x07FF = 2047

Filter level = 2

Figure 49: Tracked input value for disturbance

Filter level

A filter can be defined to prevent large input jumps. This filter is used to bring the input value closer to the actual analog value over a period of several bus cycles.

Filtering takes place after input ramp limitation.

Formula for calculating the input value:

$$Value_{New} = Value_{Old} - \frac{Value_{Old}}{Filter\ level} + \frac{Input\ value}{Filter\ level}$$

Adjustable filter levels:

| Value | Filter level |
|-------|---------------------|
| 0 | Filter switched off |
| 1 | Filter level 2 |
| 2 | Filter level 4 |
| 3 | Filter level 8 |
| 4 | Filter level 16 |
| 5 | Filter level 32 |
| 6 | Filter level 64 |
| 7 | Filter level 128 |

The following examples show how filtering works in the event of an input jump or disturbance.

Example 1

The input value jumps from 8000 to 16000. The diagram shows the calculated value with the following settings:

Input ramp limiting = 0

Filter level = 2 or 4

Figure 50: Calculated value during input step

Example 2

A disturbance interferes with the input value. The diagram shows the calculated value with the following settings:

Input ramp limiting = 0

Filter level = 2 or 4

Figure 51: Calculated value during disturbance

Configuring filters

Name:

AnalogFilter01 to AnalogFilter02

This register is used to define the filter level and input ramp limitation of the input filter.

| Data type | Value | Bus controller default setting |
|-----------|--------------------|--------------------------------|
| UINT | See bit structure. | 0 |

Bit structure:

| Bit | Description | Value | Information |
|-------|-----------------------------|-------|--|
| 0 - 2 | Defines the filter level | 000 | Filter disabled (bus controller default setting) |
| | | 001 | Filter level 2 |
| | | 010 | Filter level 4 |
| | | 011 | Filter level 8 |
| | | 100 | Filter level 16 |
| | | 101 | Filter level 32 |
| | | 110 | Filter level 64 |
| | | 111 | Filter level 128 |
| 3 | Reserved | 0 | |
| 4 - 6 | Defines input ramp limiting | 000 | The input value is applied without limitation (bus controller default setting) |
| | | 001 | Limit value = 0x3FFF (16383) |
| | | 010 | Limit value = 0x1FFF (8191) |
| | | 011 | Limit value = 0x0FFF (4095) |
| | | 100 | Limit value = 0x07FF (2047) |
| | | 101 | Limit value = 0x03FF (1023) |
| | | 110 | Limit value = 0x01FF (511) |
| | | 111 | Limit value = 0x00FF (255) |
| 7 | Reserved | 0 | |

9.1.6.9.5.2 Channel parameters

Name:

AnalogMode01 to AnalogMode02

These registers are used to predefine the operating parameters that the module will be using for the respective channel. Each channel must be enabled individually and can be configured and operated independently.

Information:

Different limit values must be configured for any display normalizing that needs to take place.

| Data type | Value | Bus controller default setting |
|-----------|--------------------|--------------------------------|
| UINT | See bit structure. | 15 |

Bit structure:

| Bit | Name | Value | Information |
|--------|----------------------------|-------|--|
| 0 | Channel (on/off) | 0 | Disabled |
| | | 1 | Enabled (bus controller default setting) |
| 1 | Limit exceeded | 0 | Disabled |
| | | 1 | Enabled (bus controller default setting) |
| 2 | Lower limit violation | 0 | Disabled |
| | | 1 | Enabled (bus controller default setting) |
| 3 | Reserved | 0 | |
| 4 | Replacement value strategy | 0 | Replace with static value |
| | | 1 | Retain last valid value |
| 5 | Measured value scaling | 0 | ±32767 (resolution: 16-bit) |
| | | 1 | ±10000 (resolution: >14-bit) |
| 6 - 15 | Reserved | 0 | |

9.1.6.9.5.3 Upper limit value

Name:

UpperLimit01 to UpperLimit02

If the value range needs to be restricted further, this register can be used to enter new user-specific upper limit values.

| Data type | Value | Information |
|-----------|------------------|---------------------------------------|
| INT | -32767 to 32767. | Bus controller default setting: 32767 |
| | -10000 to 10000 | |

Information:

The defined limit values must take the configured scaling into consideration.

9.1.6.9.5.4 Lower limit value

Name:

LowerLimit01 to LowerLimit02

If the value range needs to be restricted further, this register can be used to enter new user-specific lower limit values.

| Data type | Value | Information |
|-----------|------------------|--|
| INT | -32767 to 32767. | Bus controller default setting: -32767 |
| | -10000 to 10000 | |

Information:

The defined limit values must take the configured scaling into consideration.

9.1.6.9.5.5 Hysteresis

Name:

Hysteres01 to Hysteres02

If the user-specific limit values are being used, then a hysteresis range should also be defined. These registers configure how far a limit value can be exceeded before a response is triggered.

The error status is cleared when the scaled input value once again passes the limit by at least the hysteresis value in the permitted direction.

| Data type | Value | Information |
|-----------|------------------|-------------------------------------|
| INT | -32767 to 32767. | Bus controller default setting: 100 |
| | -10000 to 10000 | |

Information:

The hysteresis value must take the scaling into consideration.

9.1.6.9.5.6 Upper replacement value

Name:

ReplacementUpper01 to ReplacementUpper02

This register is used to define the static values to be displayed instead of the current measured value when the limit is violated.

| Data type | Value | Information |
|-----------|------------------|---------------------------------------|
| INT | -32767 to 32767. | Bus controller default setting: 32767 |

9.1.6.9.5.7 Lower replacement value

Name:

ReplacementLower01 to ReplacementLower02

This register is used to define the lower static values to be displayed instead of the current measured value when the limit is violated.

| Data type | Value | Information |
|-----------|-----------------|--|
| INT | -32767 to 32767 | Bus controller default setting: -32767 |

9.1.6.9.5.8 Preparation time for the measured values

Name:

PreparationInterval01 to PreparationInterval02

If the last valid measured value should be kept when violating the limit value, then PreparationInterval must be defined. The measured values continue to be acquired and converted according to the configured I/O update time. They are then checked and discarded if they do not meet the specifications. When an error does not occur, therefore, the measured value acquired 2 preparation intervals ago is constantly output.

| Data type | Value | Information |
|-----------|------------|---|
| UINT | 0 to 65535 | In 0.1 ms. Bus controller default setting: 0 |

| | | |
|--|---|---|
| <p>Functionality: Measured values are continuously converted and stored to measured value memory depending on the configured input filter. The current contents of the measured value memory are checked within the configured interval. If a permissible value is present, then the contents of the buffer memory are passed to output memory and the contents of the measured value memory are passed to the buffer. If the check turns up an impermissible value, then the contents of the measured value memory are discarded. The copy direction between output and buffer memory reverses and the last valid value continues to be output.</p> <p>Information: If configured to keep the last valid value, the delay time from measuring to outputting the value will be at least twice the preparation interval. In the worst case scenario, this can also take twice the interval time plus the configured conversion rate of the A/D converter.</p> | | "Application" Value being measured (analog) |
| | ↓ | Condition: - Conversion interval (A/D converter) elapsed |
| | | "Measured value memory" Measured value (digital) |
| | ↓ | Condition: - PreparationInterval elapsed - Measured value permissible |
| | | "Buffer" Last valid value |
| | ↓ | Condition: - PreparationInterval elapsed - Measured value permissible |
| | | "Output memory" Next-to-last valid/ displayed value |

9.1.6.9.5.9 Delaying error messages

Name:

ErrorDelay01 to ErrorDelay02

This register specifies the number of consecutive conversion procedures where an error is pending until the corresponding individual error status bit is set. The delay applies to underflow, overflow and open circuit errors. This delay can be used to hide temporary measured value deviations, for example.

| Data type | Value | Information |
|-----------|------------|-----------------------------------|
| UINT | 0 to 65535 | Bus controller default setting: 2 |

9.1.6.9.5.10 Time for composite error bit

Name:

SumErrorDelay01 to SumErrorDelay02

This register can be used to set the time that an error must remain pending before the composite error bit is set.

| Data type | Value | Information |
|-----------|------------|--------------------------------------|
| UINT | 0 to 65535 | Bus controller default setting: 4000 |

9.1.6.9.6 Analog input - Communication

The measured voltage data can be obtained via 2 different registers: The [unevaluated measured value](#) contains the scaled converter value. The [evaluated measured value](#) also takes the limit values and the configured replacement value strategy into consideration.

9.1.6.9.6.1 Analog input values - Original values

Name:

AnalogInput01 to AnalogInput02

These registers are used to indicate the actual input values after standardization.

| Data type | Value |
|-----------|-----------------|
| INT | -32767 to 32767 |
| | -10000 to 10000 |

9.1.6.9.6.2 Analog input values - Limited

Name:

AnalogInput01 to AnalogInput02

These registers are used to indicate the actual input values after standardization. In addition, the settings for limit value monitoring and replacement value strategy are applied to this register.

| Data type | Value |
|-----------|-----------------|
| INT | -32767 to 32767 |
| | -10000 to 10000 |

9.1.6.9.6.3 Sample time

Name:

Sampletime01 to Sampletime02

These registers return the timestamp for when the module reads the current channel mapping. The values are provided as signed 2-byte or 4-byte values.

For more information about NetTime and timestamps, see "[NetTime Technology](#)" on page 3035.

| Data type | Values [μ s] | Information |
|-----------|---------------------------------|--|
| INT | -32,768 to 32767 | NetTime timestamp of the current input value |
| DINT | -2,147,483,648 to 2,147,483,647 | NetTime timestamp of the current input value |

9.1.6.9.6.4 Status of the inputs

Name:

AnalogStatus01 to AnalogStatus02

UnderflowAnalogInput01 to UnderflowAnalogInput02

OverflowAnalogInput01 to OverflowAnalogInput02

OpenLineAnalogInput01 to OpenLineAnalogInput02

SumErrorAnalogInput01 to SumErrorAnalogInput02

SensorErrorAnalogInput01 to SensorErrorAnalogInput02

IoSuppErrorAnalogInput01 to IoSuppErrorAnalogInput02

The current error status of the module channels is displayed in this register, regardless of the configured replacement value strategy. Some error information may be delayed according to the previously configured condition.

Setting "Format of status information" in Automation Studio allows you to specify whether the status information is transferred as USINT or bitwise.

| Data type | Value |
|-----------|--------------------|
| USINT | See bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|-----|--------------------------------|-------|---------------------------------|
| 0 | UnderflowAnalogInput01 or 02 | 0 | No error |
| | | 1 | Below lower limit value |
| 1 | OverflowAnalogInput01 or 02 | 0 | No error |
| | | 1 | Above upper limit value |
| 2 | OpenLineAnalogInput01 or 02 | 0 | No error |
| | | 1 | Open line detected |
| 3 | Reserved | 0 | |
| 4 | SumErrorAnalogInput01 or 02 | 0 | No error |
| | | 1 | Composite error detected |
| 5 | Reserved | 0 | |
| 6 | SensorErrorAnalogInput01 or 02 | 0 | Sensor voltage OK |
| | | 1 | Sensor load too high |
| 7 | IoSuppErrorAnalogInput01 or 02 | 0 | I/O power supply OK |
| | | 1 | I/O power supply error detected |

UnderflowAnalogInput

The signal underflow error status is indicated here according to the configuration. This error information is enabled as a multiple of the conversion cycle only after the configurable delay time has passed (see "[ErrorDelay](#)" on page 342 register).

OverflowAnalogInput

The signal overflow error status is indicated here according to the configuration. This error information is enabled as a multiple of the conversion cycle only after the configurable delay time has passed (see "[ErrorDelay](#)" on page 342 register).

SumErrorAnalogInput

This error information derives from the status of individual errors and is only activated after the configurable delay time has passed [ms] (see "[SumErrorDelay](#)" on page 342 register). Linking this error information to an application makes it possible to hide temporary temperature value overflows and underflows, for example.

SensorErrorAnalogInput

In addition to the analog input, the module also provides the option of supplying the connected encoder with 24 VDC. If the input impedance for the sensor is too high, however, the integrated voltage supply will fail.

IoSuppErrorAnalogInput

This error is activated immediately as soon as the module detects that the necessary supply voltage is no longer being provided (<20 VDC).

9.1.6.9.7 NetTime Technology

For a description of NetTime Technology, see "[NetTime Technology](#)" on page 3035.

9.1.6.9.8 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time |
|--------------------|
| 200 μ s |

9.1.6.9.9 Minimum I/O update time

The minimum I/O update time specifies how far the bus cycle can be reduced so that an I/O update is performed in each cycle.

| Minimum I/O update time |
|-------------------------|
| 1 ms |

9.1.7 X20AI2322

Data sheet version: 1.21

9.1.7.1 General information

The module is equipped with 2 inputs with 12-bit digital converter resolution. It is possible to select between the two current ranges 0 to 20 mA and 4 to 20 mA.

This module is designed for X20 6-pin terminal blocks. If needed (e.g. for logistical reasons), the 12-pin terminal block can also be used.

- 2 analog inputs, 0 to 20 mA or 4 to 20 mA
- 12-bit digital converter resolution

9.1.7.2 Order data

| Model number | Short description | Figure |

9.1.7.8 Register description

9.1.7.8.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section ["General data points" on page 3790](#).

9.1.7.8.2 Function model 0 - Standard

| Register | Name | Data type | Read | | Write | |
|--------------------------------------|--|-----------|--------|------------|--------|------------|
| | | | Cyclic | Non-cyclic | Cyclic | Non-cyclic |
| Analog signal - Configuration | | | | | | |
| 16 | ConfigOutput01 (Input filter) | USINT | | | | • |
| 18 | ConfigOutput02 (Channel type) | USINT | | | | • |
| 20 | ConfigOutput03 (Lower limit value) | INT | | | | • |
| 22 | ConfigOutput04 (Upper limit value) | INT | | | | • |
| Analog signal - Communication | | | | | | |
| 0 | AnalogInput01 | INT | • | | | |
| 2 | AnalogInput02 | INT | • | | | |
| 30 | StatusInput01 | USINT | • | | | |

9.1.7.8.3 Function model 254 - Bus controller

| Register | Offset ¹⁾ | Name | Data type | Read | | Write | |
|--------------------------------------|----------------------|--|-----------|--------|------------|--------|------------|
| | | | | Cyclic | Non-cyclic | Cyclic | Non-cyclic |
| Analog signal - Configuration | | | | | | | |
| 16 | - | ConfigOutput01 (Input filter) | USINT | | | | • |
| 18 | - | ConfigOutput02 (Channel type) | USINT | | | | • |
| 20 | - | ConfigOutput03 (Lower limit value) | INT | | | | • |
| 22 | - | ConfigOutput04 (Upper limit value) | INT | | | | • |
| Analog signal - Communication | | | | | | | |
| 0 | 0 | AnalogInput01 | INT | • | | | |
| 2 | 2 | AnalogInput02 | INT | • | | | |
| 30 | - | StatusInput01 | USINT | | • | | |

1) The offset specifies the position of the register within the CAN object.

9.1.7.8.3.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see ["Using I/O modules on the bus controller" on page 3789](#).

9.1.7.8.3.2 CAN I/O bus controller

The module occupies 1 analog logical slot on CAN I/O.

9.1.7.8.4 Analog inputs

The input state is collected with a fixed offset to the network cycle and transferred in the same cycle.

9.1.7.8.5 Analog input values

Name:

AnalogInput01 to AnalogInput02

The analog input values are mapped to this register.

| Data type | Value | Input signal: |
|-----------|----------------|---|
| INT | 0 to 32767 | Current signal 0 to 20 mA |
| | -8192 to 32767 | Current signal 4 to 20 mA (value 0 corresponds to 4 mA) |

9.1.7.8.6 Input filter

This module is equipped with a configurable input filter. The minimum cycle time must be $>500 \mu\text{s}$. Filtering is disabled for shorter cycle times.

If the input filter is active, then the scan rate for the channels is measured in ms. The time offset between the channels is $200 \mu\text{s}$. The conversion takes place asynchronously to the network cycle.

9.1.7.8.6.1 Input ramp limiting

Input ramp limiting can only be performed in conjunction with filtering. Input ramp limiting is performed before filtering.

The difference of the input value change is checked for exceeding the specified limit. In the event of overshoot, the tracked input value is equal to the old value \pm the limit value.

Configurable limit values:

| Value | Limit value |
|-------|---|
| 0 | The input value is used without limitation. |
| 1 | $0x3FFF = 16383$ |
| 2 | $0x1FFF = 8191$ |
| 3 | $0x0FFF = 4095$ |
| 4 | $0x07FF = 2047$ |
| 5 | $0x03FF = 1023$ |
| 6 | $0x01FF = 511$ |
| 7 | $0x00FF = 255$ |

Input ramp limiting is well suited for suppressing disturbances (spikes). The following examples show the functionality of input ramp limiting based on an input step and a disturbance.

Example 1

The input value jumps from 8000 to 17000. The diagram shows the tracked input value with the following settings:

Input ramp limiting = 4 = $0x07FF = 2047$

Filter level = 2

Figure 52: Tracked input value for input step

Example 2

A disturbance interferes with the input value. The diagram shows the tracked input value with the following settings:

Input ramp limiting = 4 = 0x07FF = 2047

Filter level = 2

Figure 53: Tracked input value for disturbance

9.1.7.8.6.2 Filter level

A filter can be defined to prevent large input jumps. This filter is used to bring the input value closer to the actual analog value over a period of several bus cycles.

Filtering takes place after input ramp limitation.

Formula for calculating the input value:

$$\text{Value}_{\text{New}} = \text{Value}_{\text{Old}} - \frac{\text{Value}_{\text{Old}}}{\text{Filter level}} + \frac{\text{Input value}}{\text{Filter level}}$$

Adjustable filter levels:

| Value | Filter level |
|-------|---------------------|
| 0 | Filter switched off |
| 1 | Filter level 2 |
| 2 | Filter level 4 |
| 3 | Filter level 8 |
| 4 | Filter level 16 |
| 5 | Filter level 32 |
| 6 | Filter level 64 |
| 7 | Filter level 128 |

The following examples show how filtering works in the event of an input jump or disturbance.

Example 1

The input value jumps from 8000 to 16000. The diagram shows the calculated value with the following settings:

Input ramp limiting = 0

Filter level = 2 or 4

Figure 54: Calculated value during input step

Example 2

A disturbance interferes with the input value. The diagram shows the calculated value with the following settings:

Input ramp limiting = 0

Filter level = 2 or 4

Figure 55: Calculated value during disturbance

9.1.7.8.7 Configuring the input filter

Name:

ConfigOutput01

The filter level and input ramp limiting of the input filter are set in this register.

| Data type | Values | Bus controller default setting |
|-----------|------------------------|--------------------------------|
| USINT | See the bit structure. | 0 |

Bit structure:

| Bit | Description | Value | Information |
|-------|-----------------------------|-------|--|
| 0 - 2 | Defines the filter level | 000 | Filter disabled (bus controller default setting) |
| | | 001 | Filter level 2 |
| | | 010 | Filter level 4 |
| | | 011 | Filter level 8 |
| | | 100 | Filter level 16 |
| | | 101 | Filter level 32 |
| | | 110 | Filter level 64 |
| | | 111 | Filter level 128 |
| 3 | Reserved | 0 | |
| 4 - 6 | Defines input ramp limiting | 000 | The input value is applied without limitation (bus controller default setting) |
| | | 001 | Limit value = 0x3FFF (16383) |
| | | 010 | Limit value = 0x1FFF (8191) |
| | | 011 | Limit value = 0x0FFF (4095) |
| | | 100 | Limit value = 0x07FF (2047) |
| | | 101 | Limit value = 0x03FF (1023) |
| | | 110 | Limit value = 0x01FF (511) |
| | | 111 | Limit value = 0x00FF (255) |
| 7 | Reserved | 0 | |

9.1.7.8.8 Channel type

Name:

ConfigOutput02

This register can be used to set the range of the current signal. This is determined by how they are configured. The following input signals can be set:

- 0 to 20 mA current signal
- 4 to 20 mA current signal

| Data type | Values | Bus controller default setting |
|-----------|------------------------|--------------------------------|
| USINT | See the bit structure. | 3 |

Bit structure:

| Bit | Description | Value | Information |
|-------|--------------------------------------|-------|--|
| 0 - 1 | Reserved | 1 | |
| 2 - 3 | Reserved | 0 | |
| 4 | Channel 1: Current measurement range | 0 | 0 to 20 mA current signal (bus controller default setting) |
| | | 1 | 4 to 20 mA current signal |
| 5 | Channel 2: Current measurement range | 0 | 0 to 20 mA current signal (bus controller default setting) |
| | | 1 | 4 to 20 mA current signal |
| 6 - 7 | Reserved | 0 | |

9.1.7.8.9 Lower limit value

Name:

ConfigOutput03

This register can be used to configure the lower limit for analog values. If the analog value goes below the limit value, it is frozen at this value and the corresponding error status bit is set.

| Data type | Values | Information |
|-----------|-----------------|--|
| INT | -32768 to 32767 | Bus controller default setting: -32767 |

Information:

- When configured as 0 to 20 mA, this value should be set to 0.
- When configured as 4 to 20 mA, this value can be set to -8192 (corresponds to 0 mA) in order to display values <4 mA.

Keep in mind that this setting applies to all channels!

9.1.7.8.10 Upper limit value

Name:

ConfigOutput04

This register can be used to configure the upper limit for analog values. If the analog value goes above the limit value, it is frozen at this value and the corresponding error status bit is set.

| Data type | Values | Information |
|-----------|-----------------|---------------------------------------|
| INT | -32768 to 32767 | Bus controller default setting: 32767 |

Information:

The default value of 32767 corresponds to the maximum default value at 20 mA.

Keep in mind that this setting applies to all channels!

9.1.7.8.11 Input status

Name:

StatusInput01

This register is used to monitor the module inputs. A change in the monitoring status generates an error message.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|-------------|-------|----------------------------|
| 0 - 1 | Channel 1 | 00 | No error |
| | | 01 | Lower limit value exceeded |
| | | 10 | Upper limit value exceeded |
| 2 - 3 | Channel 2 | 00 | No error |
| | | 01 | Lower limit value exceeded |
| | | 10 | Upper limit value exceeded |
| 4 - 7 | Reserved | 0 | |

Limiting the analog value

In addition to the status information, the analog value is set to the values listed below by default when an error occurs. The analog value is limited to the new values if the limit values were changed.

| Error status | Digital value for error (default values) | |
|----------------------------|--|----------------|
| | 0 to 20 mA | 4 to 20 mA |
| Upper limit value exceeded | +32767 (0x7FFF) | |
| Lower limit value exceeded | 0 | -8191 (0xE001) |

9.1.7.8.12 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time | |
|--------------------------|--------|
| Inputs without filtering | 100 µs |
| Inputs with filtering | 500 µs |

9.1.7.8.13 Minimum I/O update time

The minimum I/O update time specifies how far the bus cycle can be reduced so that an I/O update is performed in each cycle.

| Minimum I/O update time | |
|--------------------------|----------------------------|
| Inputs without filtering | 300 μ s for all inputs |
| Inputs with filtering | 1 ms |

9.1.8 X20AI2437

Data sheet version: 1.31

9.1.8.1 General information

The module is equipped with 2 current measurement inputs with 16-bit digital converter resolution.

Each current measurement input has its own sensor supply. The two channels with their respective sensor supplies are electrically isolated from each other. The user can select between the two measurement ranges 4 to 20 mA and 0 to 25 mA.

- 2 analog current measurement inputs
- Electrically isolated analog channels
- Electrically isolated sensor supplies
- 16-bit digital converter resolution
- NetTime timestamp: Moment of measurement

NetTime timestamp of the measurement

For many applications, not only the measured value is important, but also the exact time of the measurement. The module is equipped with a NetTime timestamp function for this that supplies a timestamp for the recorded position and trigger time with microsecond accuracy.

The timestamp function is based on synchronized timers. If a timestamp event occurs, the module immediately saves the current NetTime. After the respective data is transferred to the CPU, including this precise moment, the CPU can then evaluate the data using its own NetTime (or system time), if necessary.

9.1.8.2 Order data

| Model number | Short description | Figure |

- 1) To reduce power dissipation, B&R recommends leaving unused inputs open.
- 2) Sensor supply
- 3) Based on the current measured value.
- 4) Based on the 25 mA measurement range.

9.1.8.4 LED status indicators

For a description of the various operating modes, see "[Diagnostic LEDs](#)" on page 3787.

| Figure | LED | Color | Status | Description |
|---|------------------------|--------|------------------|---|
|  | Operating state | | | |
| | r | Green | Off | No power to module |
| | | | Single flash | UNLINK mode |
| | | | Double flash | BOOT mode (during firmware update) ¹⁾ |
| | | | Blinking quickly | SYNC mode |
| | | | Blinking slowly | PREOPERATIONAL mode |
| | | | On | RUN mode |
| | Module status | | | |
| | e | Red | Off | No power to module or everything OK |
| | | | Single flash | A conversion error has occurred. This status is output along with a double flash on the channel LED of the analog input where the error occurs. |
| | | | On | Error or reset status |
| | Sensor supply | | | |
| | V | Yellow | Off | Overload |
| | | | On | Sensor supply in its normal operating range |
| | Analog input | | | |
| | 1 - 2 | Green | Off | Indicates one of the following cases: <ul style="list-style-type: none"> • No power to module • Channel disabled • Open line |
| | | | Single flash | Input signal overflow or underflow |
| | | | Double flash | A conversion error has occurred. A single flash is output on the red "e" module status LED. |
| | | | On | Analog/digital converter running, value OK |

1) Depending on the configuration, a firmware update can take up to several minutes.

9.1.8.5 Pinout

Shielded twisted pair cables should be used to minimize coupling disturbances. Use either one cable for each channel or a multiple twisted pair cable for both channels.

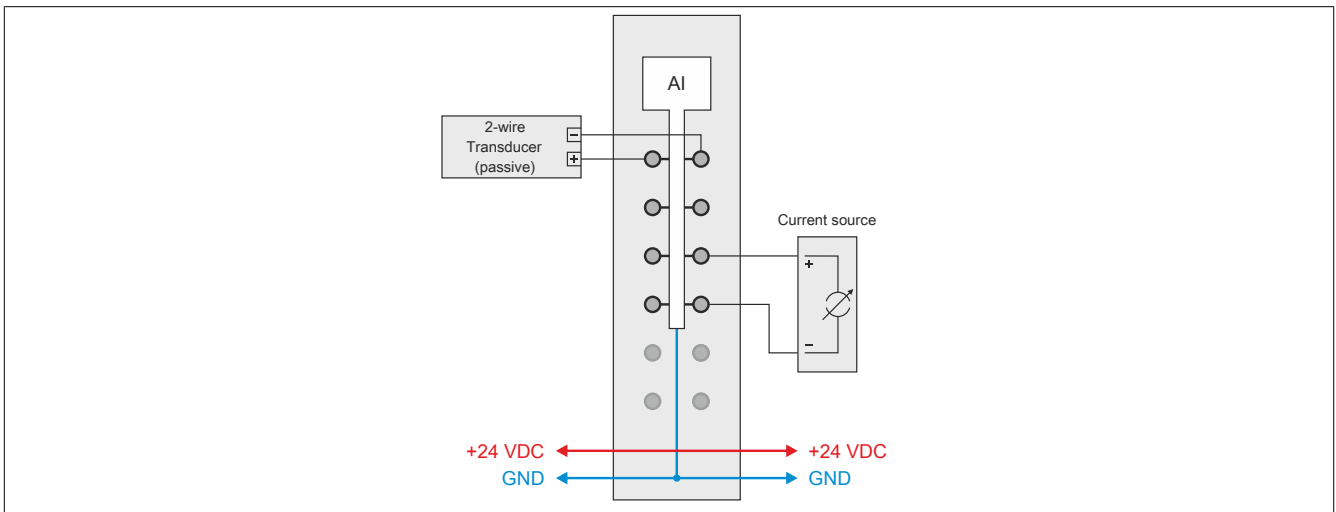

9.1.8.6 Connection examples

2-wire connections

A 2-wire connection can be implemented as follows:

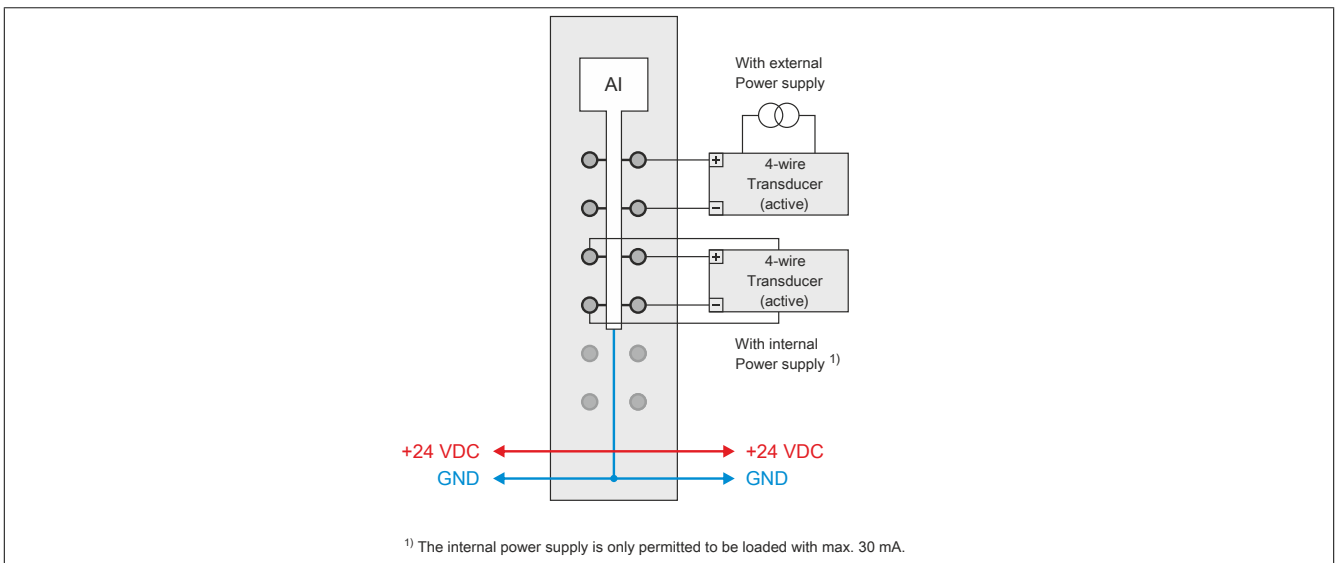

- 2-wire transducer
- Active current source

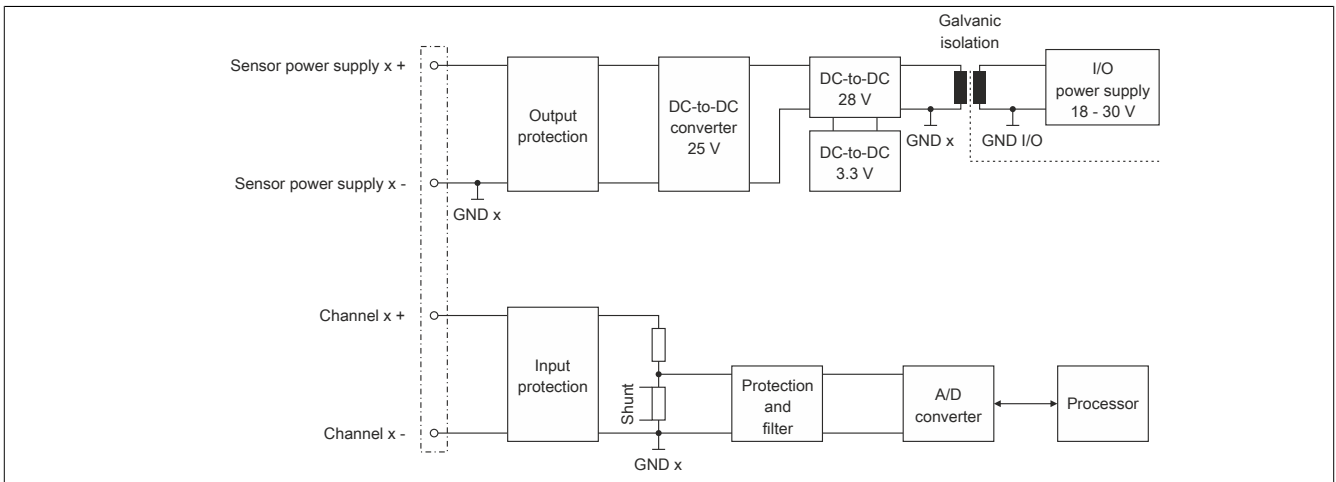

4-wire connections

A 4-wire connection can be implemented as follows:

- 4-wire transducer with external supply
- 4-wire transducer supplied by the module

9.1.8.7 Input circuit diagram

9.1.8.8 Behavior in the event of short circuit

In the event of a short circuit, the output current for the sensor supply is limited according to the following diagram.

9.1.8.9 Register description

9.1.8.9.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section "[General data points](#)" on page 3790.

9.1.8.9.2 Function model 0 - default

| Register | Name | Data type | Read | | Write | |

1) The offset specifies the position of the register within the CAN object.

9.1.8.9.3.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see ["Using I/O modules on the bus controller" on page 3789](#).

9.1.8.9.3.2 CAN I/O bus controller

The module occupies 1 analog logical slot on CAN I/O.

9.1.8.9.4 General information

The module is equipped with 2 independent electrically isolated channels. Both channels can be used to read in an analog signal. All registers necessary for this have a dual design so that the channels can be configured and operated independently of one another.

The current input signals (0 to 25 mA) can be displayed in different formats.

Specific features:

- Channels electrically isolated
- Internal supply with short circuit protection <30 mA per channel
- Configurable filter (default 50 Hz)
- Selective line monitoring can be enabled for: open line (<2 mA), underflow (<3.6 mA) or overflow (>21 mA) of a configurable threshold
- Selectable error strategy: Replacement value for the respective threshold (default) or use the last valid value

9.1.8.9.5 Analog signal - Configuration

How the analog signal is displayed can be adapted to the requirements of the application. Separate configuration registers per channel are available to aid in this.

9.1.8.9.5.1 Channel parameters

Name:

AnMode_1 to AnMode_2

These registers are used to predefine the operating parameters that the module will be using for the respective channel. Each channel must be enabled individually and can be configured and operated independently.

Information:

Different limit values must be configured for any display normalizing that needs to take place.

| Data type | Values | Bus controller default setting |
|-----------|--------------------|--------------------------------|
| UINT | See bit structure. | 29 |

Bit structure:

| Bit | Name | Value | Information |
|--------|----------------------------|-------|---|
| 0 | Channel | 0 | Channel 0x turned off |
| | | 1 | Channel 0x enabled (bus controller default setting) |
| 1 | Open line detection | 0 | Open line monitoring turned off |
| | | 1 | Open circuit monitoring enabled (bus controller default setting) |
| 2 | Underflow detection | 0 | Underflow detection turned off |
| | | 1 | Underflow detection enabled (bus controller default setting) |
| 3 | Replacement value strategy | 0 | Use replacement values in the event of error (bus controller default setting) |
| | | 1 | Keep the last valid converted value |
| 4 - 5 | Normalization | 00 | Displays 0 to 25 mA as 0 to 32767 |
| | | 01 | Display 0 to 25 mA as 0 to 25000 [µA] (bus controller default setting) |
| | | 10 | Displays 4 to 20 mA as 0 to 32767 |
| | | 11 | Displays 0 to 25 mA as 0 to 65535 |
| 6 - 15 | Reserved | - | |

9.1.8.9.5.2 Sample rate

Name:

Samplerate_1 to Samplerate_2

A sample rate can be configured for both analog inputs independently of one another. The following formula for this parameter is derived using the desired sampling frequency:

$$\text{Sampling rate for A/D converter} = (4920000 / 1024) / \text{Sampling frequency}$$

| Data type | Value | Information | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-----------|-------------|--|-------|------|-----------|-----|------------|----------|-----|------------|-----------|-----|-------------|-----------|-----|-----------|-----------|-----|-------------|-----------|----|-----------|--|----|-------------|-----------|----|-----------|------------|---|----------|------------|---|----------|-------------|
| UINT | 4 to 1023 | Sample rate Examples of configurable values <table border="1"> <thead> <tr> <th>Value</th> <th>Time</th> <th>Frequency</th> </tr> </thead> <tbody> <tr> <td>960</td> <td>... 200 ms</td> <td>... 5 Hz</td> </tr> <tr> <td>480</td> <td>... 100 ms</td> <td>... 10 Hz</td> </tr> <tr> <td>320</td> <td>... 66.7 ms</td> <td>... 15 Hz</td> </tr> <tr> <td>192</td> <td>... 40 ms</td> <td>... 25 Hz</td> </tr> <tr> <td>160</td> <td>... 33.3 ms</td> <td>... 30 Hz</td> </tr> <tr> <td>96</td> <td>... 20 ms</td> <td>... 50 Hz (bus controller default setting)</td> </tr> <tr> <td>80</td> <td>... 16.7 ms</td> <td>... 60 Hz</td> </tr> <tr> <td>48</td> <td>... 10 ms</td> <td>... 100 Hz</td> </tr> <tr> <td>9</td> <td>... 2 ms</td> <td>... 500 Hz</td> </tr> <tr> <td>4</td> <td>... 1 ms</td> <td>... 1000 Hz</td> </tr> </tbody> </table> | Value | Time | Frequency | 960 | ... 200 ms | ... 5 Hz | 480 | ... 100 ms | ... 10 Hz | 320 | ... 66.7 ms | ... 15 Hz | 192 | ... 40 ms | ... 25 Hz | 160 | ... 33.3 ms | ... 30 Hz | 96 | ... 20 ms | ... 50 Hz (bus controller default setting) | 80 | ... 16.7 ms | ... 60 Hz | 48 | ... 10 ms | ... 100 Hz | 9 | ... 2 ms | ... 500 Hz | 4 | ... 1 ms | ... 1000 Hz |
| Value | Time | Frequency | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 960 | ... 200 ms | ... 5 Hz | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 480 | ... 100 ms | ... 10 Hz | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 320 | ... 66.7 ms | ... 15 Hz | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 192 | ... 40 ms | ... 25 Hz | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 160 | ... 33.3 ms | ... 30 Hz | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 96 | ... 20 ms | ... 50 Hz (bus controller default setting) | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 80 | ... 16.7 ms | ... 60 Hz | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 48 | ... 10 ms | ... 100 Hz | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 9 | ... 2 ms | ... 500 Hz | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 4 | ... 1 ms | ... 1000 Hz | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

Setting to 1000 Hz will result in jitter when acquiring measured values. Jitter-free operation is possible up to 960 Hz (sample rate setting = 5).

9.1.8.9.5.3 Limit value for open line detection

Name:

OpenLoopLimit_1 to OpenLoopLimit_2

The limit value for the respective analog input must be set when open circuit monitoring is enabled and if required by the configured normalization.

| Data type | Value | Information |
|-----------|-----------------|---|
| INT | -32767 to 32767 | Open circuit limit value. Bus controller default setting: 2621 |
| UINT | 0 to 65535 | Open circuit limit value |

If limit value monitoring is active, the corresponding error status is output after a configured delay when falling below this value. Using a default value of 2000 μA , the following values and formulas result for this parameter:

- Displays 0 to 25 mA as 0 to 25000: 2000
- Displays 0 to 25 mA as 0 to 32767: 2621, limit value = $([\mu\text{A}] * 32767) / 25000$
- Displays 4 to 20 mA as 0 to 32767: -4096, limit value = $(([\mu\text{A}] * 1.31068) - 5242.72) * 1.5625$
- Displays 0 to 25 mA as 0 to 65535: 5243, limit value = $([\mu\text{A}] * 65535) / 25000$

9.1.8.9.5.4 Lower limit value

Name:

LowerLimit_1 to LowerLimit_2

If the value range needs to be restricted further, this register can be used to enter new user-specific lower limit values.

| Data type | Value | Information |
|-----------|-----------------|--------------------------------------|
| INT | -32767 to 32767 | Bus controller default setting: 4718 |
| UINT | 0 to 65535 | |

The limit value must be set for the respective analog input depending on the configured normalization. After the configured delay time has passed, the corresponding error status is given if the respective value is overrun or underrun. When this error state occurs, the "AnalogInput0x" on page 369 channel is evaluated according to the replacement value strategy. Using a default value of 3600 μA , the following values and formulas result for this parameter:

- Displays 0 to 25 mA as 0 to 25000: 3600
- Displays 0 to 25 mA as 0 to 32767: 4718, limit value = $([\mu\text{A}] * 32767) / 25000$
- Displays 4 to 20 mA as 0 to 32767: -819, limit value = $(([\mu\text{A}] * 1.31068) - 5242.72) * 1.5625$
- Displays 0 to 25 mA as 0 to 65535: 9437, limit value = $([\mu\text{A}] * 65535) / 25000$

9.1.8.9.5.5 Upper limit value

Name:

UpperLimit_1 to UpperLimit_2

If the value range needs to be restricted further, this register can be used to enter new user-specific upper limit values.

| Data type | Value | Information |
|-----------|-----------------|---------------------------------------|
| INT | -32767 to 32767 | Bus controller default setting: 27524 |
| UINT | 0 to 65535 | |

The limit value must be set for the respective analog input depending on the configured normalization. After the configured delay time has passed, the corresponding error status is given if the respective value is overrun or underrun. When this error state occurs, the "AnalogInput0x" on page 369 channel is evaluated according to the replacement value strategy. Using a default value of 21000 μ A, the following values and formulas result for this parameter:

- Displays 0 to 25 mA as 0 to 25000: 21000
- Displays 0 to 25 mA as 0 to 32767: 27524, limit value = $([\mu\text{A}] * 32767) / 25000$
- Displays 4 to 20 mA as 0 to 32767: 32767, limit value = $(([\mu\text{A}] * 1.31068) - 5242.72) * 1.5625$
- Displays 0 to 25 mA as 0 to 65535: 55049, limit value = $([\mu\text{A}] * 65535) / 25000$

9.1.8.9.5.6 Hysteresis

Name:

Hysteres_1 to Hysteres_2

If the user-specific limit values are being used, then a hysteresis range should also be defined. These registers configure how far a limit value can be exceeded before a response is triggered.

| Data type | Value | Information |
|-----------|-----------------|-------------------------------------|
| INT | -32767 to 32767 | Bus controller default setting: 131 |
| UINT | 0 to 65535 | |

The hysteresis value must be set for the respective analog input depending on the configured normalization. The error status is cleared if the actual analog value changes by at least this hysteresis value from the limit value in the allowed direction. Using a default value of 100 μ A, the following values and formulas result for this parameter:

- Displays 0 to 25 mA as 0 to 25000: 100
- Displays 0 to 25 mA as 0 to 32767: 131, limit value = $([\mu\text{A}] * 32767) / 25000$
- Displays 4 to 20 mA as 0 to 32767: 156, limit value = $[\mu\text{A}] * 1.5625$
- Displays 0 to 25 mA as 0 to 65535: 262, limit value = $([\mu\text{A}] * 65535) / 25000$

9.1.8.9.5.7 Lower replacement value

Name:

ReplacementLower_1 to ReplacementLower_2

This register is used to define the lower static values to be displayed instead of the current measured value when the lower limit is violated.

| Data type | Value | Information |
|-----------|-----------------|--------------------------------------|
| INT | -32767 to 32767 | Bus controller default setting: 4718 |
| UINT | 0 to 65535 | |

If the replacement strategy "Use replacement values when an error occurs" is enabled, the replacement value must be set for the respective analog input taking the configured normalization into account as well. When an overflow or underflow error status occurs, the "AnalogInput0x" on page 369 channel is replaced with the corresponding value. Using a default value of 3600 μ A, the following values and formulas result for this parameter:

- Displays 0 to 25 mA as 0 to 25000: 3600
- Displays 0 to 25 mA as 0 to 32767: 4718, limit value = $([\mu\text{A}] * 32767) / 25000$
- Displays 4 to 20 mA as 0 to 32767: -819, limit value = $(([\mu\text{A}] * 1.31068) - 5242.72) * 1.5625$
- Displays 0 to 25 mA as 0 to 65535: 9437, limit value = $([\mu\text{A}] * 65535) / 25000$

9.1.8.9.5.8 Upper replacement value

Name:

ReplacementUpper_1 to ReplacementUpper_2

This register is used to define the static values to be displayed instead of the current measured value when the upper limit is violated.

| Data type | Value | Information |
|-----------|-----------------|---------------------------------------|
| INT | -32767 to 32767 | Bus controller default setting: 27524 |
| UINT | 0 to 65535 | |

If the replacement strategy "Use replacement values when an error occurs" is activated, the replacement value must be set for the respective analog input taking the configured normalization into account as well. When an overflow or underflow error status occurs, the "[AnalogInput0x](#)" on page 369 channel is replaced with the corresponding value. Using a default value of 21000 μ A, the following values and formulas result for this parameter:

- Displays 0 to 25 mA as 0 to 25000: 21000
- Displays 0 to 25 mA as 0 to 32767: 27524, limit value = $([\mu\text{A}] * 32767) / 25000$
- Displays 4 to 20 mA as 0 to 32767: 32767, limit value = $(([\mu\text{A}] * 1.31068) - 5242.72) * 1.5625$
- Displays 0 to 25 mA as 0 to 65535: 55049, limit value = $([\mu\text{A}] * 65535) / 25000$

9.1.8.9.5.9 Delaying error messages

Name:

ErrorDelay_1 to ErrorDelay_2

This register specifies the number of consecutive conversion procedures where an error is pending until the corresponding individual error status bit is set. The delay applies to underflow, overflow and open circuit errors. This delay can be used to hide temporary measured value deviations, for example.

| Data type | Value | Information |
|-----------|---------|--|
| UINT | 0 to 10 | Error formation delay in conversion cycles. Bus controller default setting: 2 |

9.1.8.9.5.10 Time for composite error bit

Name:

SumErrorDelay_1 to SumErrorDelay_2

This register specifies the time in milliseconds that one of the individual error bits must be pending until the composite error status bit is set.

| Data type | Value | Information |
|-----------|------------|--|
| UINT | 0 to 65535 | Composite error bit delay in ms. Bus controller default setting: 4000 |

9.1.8.9.5.11 Preparation time for the measured values

Name:

PreparationInterval01 to PreparationInterval02

If the last valid measured value should be kept when violating the limit value, then PreparationInterval must be defined. The measured values continue to be acquired and converted according to the configured I/O update time. They are then checked and discarded if they do not meet the specifications. When an error does not occur, therefore, the measured value acquired 2 preparation intervals ago is constantly output.

| Data type | Value | Information |
|-----------|------------|---|
| UINT | 0 to 65535 | In 0.1 ms. Bus controller default setting: 0 |

| | | |
|---|---|---|
| <p>Functionality: Measured values are continuously converted and stored to measured value memory. The current contents of the measured value memory are checked within the configured interval. If a permissible value is present, then the contents of the buffer memory are passed to output memory and the contents of the measured value memory are passed to the buffer. If the check turns up an impermissible value, then the contents of the measured value memory are discarded. The copy direction between output and buffer memory reverses and the last valid value continues to be output.</p> <p>Information: If configured to keep the last valid value, the delay time from measuring to outputting the value will be at least twice the preparation interval. In the worst case scenario, this can also take twice the interval time plus the configured conversion rate of the A/D converter.</p> | | "Application" Value being measured (analog) |
| | ↓ | Condition: - Conversion interval (A/D converter) elapsed |
| | | "Measured value memory" Measured value (digital) |
| | ↓ | Condition: - PreparationInterval elapsed - Measured value permissible |
| | | "Buffer" Last valid value |
| | ↓ | Condition: - PreparationInterval elapsed - Measured value permissible |
| | "Output memory" Next-to-last valid/ displayed value | |

9.1.8.9.6 Analog signal - Communication

9.1.8.9.6.1 Analog input values

Name:

AnalogInput01 to AnalogInput02

The analog input value is mapped in this register.

| Data type | Value | Information |
|-----------|----------------|---|
| INT | 0 to 25000 | Normalizing option 0 to 25 mA |
| | 0 to 32,767 | Normalizing option 0 to 25 mA |
| | -8192 to 32767 | Normalizing option 4 to 20 mA (value 0 corresponds to 4 mA) |
| UINT | 0 to 65535 | Normalizing option 0 to 25 mA |

Predefining values and timing

If a replacement value strategy was configured, value "0" (zero) is output from the beginning until a valid measured value has been calculated.

The timing for acquiring measured values is determined by the converter hardware and the set sampling rate. The two channels are converted independently of each other and are not synchronized with the X2X Link.

| Conversion time |
|--------------------------|
| Channel 0x sampling rate |

9.1.8.9.6.2 Sample time

Name:

AnalogSampletime01 to AnalogSampletime02

These registers return the timestamp for when the module reads the current channel mapping. The values are provided as signed 2-byte or 4-byte values.

For more information about NetTime and timestamps, see ["NetTime Technology" on page 3035](#).

| Data type | Values | Information |
|-----------|---------------------------|---|
| INT | -32,768 to 32767 | NetTime timestamp of the current input value in μ s |
| DINT | -2147483648 to 2147483647 | NetTime timestamp of the current input value in μ s |

9.1.8.9.6.3 Status of the inputs

Name:

AnalogStatus01 to AnalogStatus02

UnderflowAnalogInput01 to UnderflowAnalogInput02

OverflowAnalogInput01 to OverflowAnalogInput02

OpenLineAnalogInput01 to OpenLineAnalogInput02

ConversionErrorAnalogInput01 to ConversionErrorAnalogInput02

SumErrorAnalogInput01 to SumErrorAnalogInput02

SensorErrorAnalogInput01 to SensorErrorAnalogInput02

IoSuppErrorAnalogInput01 to IoSuppErrorAnalogInput02

The current error state of the module channels is indicated in this register regardless of the configured replacement value strategy. Some error information is delayed according to the previously configured condition.

Setting "Format of status information" in Automation Studio makes it possible to define whether the status information is transferred as USINT or bit values.

| Data type | Values |
|-----------|--------------------|
| USINT | See bit structure. |

Bit structure:

| Bit | Name | Values | Information |
|-----|------------------------------------|--------|--------------------------------------|
| 0 | UnderflowAnalogInput01 or 02 | 0 | No error |
| | | 1 | Lower limit value undershot |
| 1 | OverflowAnalogInput01 or 02 | 0 | No error |
| | | 1 | Upper limit value overshoot |
| 2 | OpenLineAnalogInput01 or 02 | 0 | No error |
| | | 1 | Open circuit determined |
| 3 | ConversionErrorAnalogInput01 or 02 | 0 | No error |
| | | 1 | Conversion error determined |
| 4 | SumErrorAnalogInput01 or 02 | 0 | No error |
| | | 1 | Composite error determined |
| 5 | Reserved | - | |
| 6 | SensorErrorAnalogInput01 or 02 | 0 | Sensor voltage OK |
| | | 1 | Sensor load too high |
| 7 | IoSuppErrorAnalogInput01 or 02 | 0 | I/O power supply OK |
| | | 1 | Error in I/O power supply determined |

UnderflowAnalogInput

The signal underflow error state is represented here based on the configuration. This error information is enabled as a multiple of the conversion cycles only after the configurable delay time has passed (see register "[ErrorDelay](#)" on page 368).

OverflowAnalogInput

The signal overflow error status state is represented here based on the configuration. This error information is enabled as a multiple of the conversion cycles only after the configurable delay time has passed (see register "[ErrorDelay](#)" on page 368).

OpenLineAnalogInput

Based on the configuration, the measurement information is checked for values <2 mA (register "[OpenLoopLimit](#)" on page 366) to detect a failure signal. Open circuit detection is performed using a configurable hysteresis value (default: 100 µA, register "[Hysteresis](#)" on page 367). It is possible to disable open circuit detection (register "[AnalogMode](#)" on page 365) to suppress the generation of alarms when hardware is missing. This error information is enabled as a multiple of the conversion cycles only after the configurable delay time has passed (register "[ErrorDelay](#)" on page 368).

ConversionErrorAnalogInput

This error state is triggered when the hardware overshoots the conversion time.

SumErrorAnalogInput

This error information is derived from the state of individual errors and enabled only after the configurable delay time has passed [ms] (see register "[SumErrorDelay](#)" on page 368). Linking this error information in an application makes it possible to hide temporary overshoots or undershoots of the temperature value, for example.

SensorErrorAnalogInput

This error is enabled immediately after a fault is detected in the internal sensor power supply.

IoSuppErrorAnalogInput

This error is enabled immediately after a supply voltage undershoot is detected (<20 VDC).

9.1.8.9.7 NetTime Technology

For a description of NetTime Technology, see "[NetTime Technology](#)" on page 3035.

9.1.8.9.8 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time |
|--------------------|
| 200 µs |

9.1.8.9.9 Minimum I/O update time

The minimum I/O update time specifies how far the bus cycle can be reduced so that an I/O update is performed in each cycle.

| Minimum I/O update time |
|-------------------------|
| 1 ms |

9.1.9 X20(c)AI2438

Data sheet version: 1.32

9.1.9.1 General information

The module is equipped with 2 current measurement inputs with 16-bit digital converter resolution. It supports the HART communication standard for data transfer, parameter configuration and diagnostics.

Each current measurement input has its own sensor supply. The two channels with their respective sensor supplies are electrically isolated from each other. The user can select between the two measurement ranges 4 to 20 mA and 0 to 25 mA.

- 2 analog current measurement inputs
- Integrated HART protocol
- Supports HART variables
- Electrically isolated analog channels
- Electrically isolated sensor supplies
- 16-bit digital converter resolution
- NetTime timestamp: Moment of measurement, HART image

NetTime timestamp of the measurement

For many applications, not only the measured value is important, but also the exact time of the measurement. The module is equipped with a NetTime timestamp function for this that supplies a timestamp for the recorded position and trigger time with microsecond accuracy.

The timestamp function is based on synchronized timers. If a timestamp event occurs, the module immediately saves the current NetTime. After the respective data is transferred to the CPU, including this precise moment, the CPU can then evaluate the data using its own NetTime (or system time), if necessary.

9.1.9.2 Coated modules

Coated modules are X20 modules with a protective coating for the electronics component. This coating protects X20c modules from condensation and corrosive gases.

The modules' electronics are fully compatible with the corresponding X20 modules.

For simplification purposes, only images and module IDs of uncoated modules are used in this data sheet.

The coating has been certified according to the following standards:

- Condensation: BMW GS 95011-4, 2x 1 cycle
- Corrosive gas: EN 60068-2-60, method 4, exposure 21 days

9.1.9.2.1 -40°C starting temperature

The starting temperature describes the minimum permissible ambient temperature when the power is switched off at the time the coated module is switched on. This is permitted to be as low as -40°C. During operation, the conditions as specified in the technical data continue to apply.

Information:

It is important to absolutely ensure that there is no forced cooling by air currents in a closed control cabinet, for example using a fan or ventilation slots.

9.1.9.3 Order data

| Model number | Short description | Figure |
|--------------|--|--------|
| | Analog inputs | |
| X20AI2438 | X20 analog input module, 2 inputs, 4 to 20 mA, 16-bit converter resolution, single-channel isolation with separate sensor power supply, supports the HART protocol, NetTime function | |
| X20cAI2438 | X20 analog input module, coated, 2 inputs, 4 to 20 mA, 16-bit converter resolution, single-channel isolation with separate sensor power supply, supports the HART protocol, NetTime function | |
| | Required accessories | |
| | Bus modules | |
| X20BM11 | X20 bus module, 24 VDC keyed, internal I/O supply continuous | |
| X20BM15 | X20 bus module, with node number switch, 24 VDC keyed, internal I/O supply continuous | |
| X20cBM11 | X20 bus module, coated, 24 VDC keyed, internal I/O supply continuous | |
| | Terminal blocks | |
| X20TB12 | X20 terminal block, 12-pin, 24 VDC keyed | |

Table 57: X20AI2438, X20cAI2438 - Technical data

- 1) To reduce power dissipation, B&R recommends leaving unused inputs open.
- 2) Sensor supply
- 3) Based on the current measured value.
- 4) Based on the 25 mA measurement range.

9.1.9.5 LED status indicators

For a description of the various operating modes, see "[Diagnostic LEDs](#)" on page 3787.

| Figure | LED | Color | Status | Description |
|---|------------------------|--------|------------------|---|
|  | Operating state | | | |
| | r | Green | Off | No power to module |
| | | | Single flash | UNLINK mode |
| | | | Double flash | BOOT mode (during firmware update) ¹⁾ |
| | | | Blinking quickly | SYNC mode |
| | | | Blinking slowly | PREOPERATIONAL mode |
| | | | On | RUN mode |
| | Module status | | | |
| | e | Red | Off | No power to module or everything OK |
| | | | Single flash | A conversion error has occurred. This status is output along with a double flash on the channel LED of the analog input where the error occurs. |
| | | | On | Error or reset status |
| | Sensor supply | | | |
| | V | Yellow | Off | Module supply not connected or overload |
| | | | On | Sensor supply in its normal operating range |
| | Analog input | | | |
| | 1 - 2 | Green | Off | Indicates one of the following cases: <ul style="list-style-type: none"> No power to module Channel disabled Open line |
| | | | Single flash | Input signal overflow or underflow |
| | | | Double flash | A conversion error has occurred. A single flash is output on the red "e" module status LED. |
| | | | On | Analog/digital converter running, value OK |
| | HART link | | | |
| | L | Green | Off | Indicates one of the following cases: <ul style="list-style-type: none"> No power to module HART disabled for the respective channel |
| | | | Flickering | Carrier signal active (DCD or RTS) |
| | HART error | | | |
| | e | Red | Off | Indicates one of the following cases: <ul style="list-style-type: none"> Communication taking place without errors No power to module HART disabled for the respective channel |
| | | | On | Communication error |

1) Depending on the configuration, a firmware update can take up to several minutes.

9.1.9.6 Pinout

Shielded twisted pair cables should be used to minimize coupling disturbances. Use either one cable for each channel or a multiple twisted pair cable for both channels.

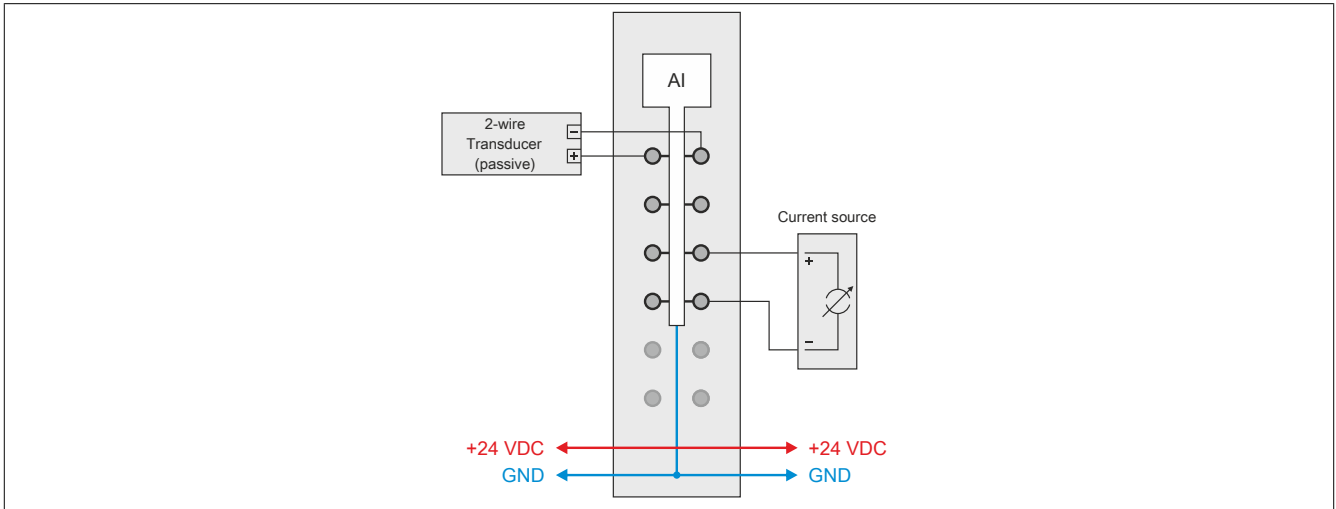

9.1.9.7 Connection examples

2-wire connections

A 2-wire connection can be implemented as follows:

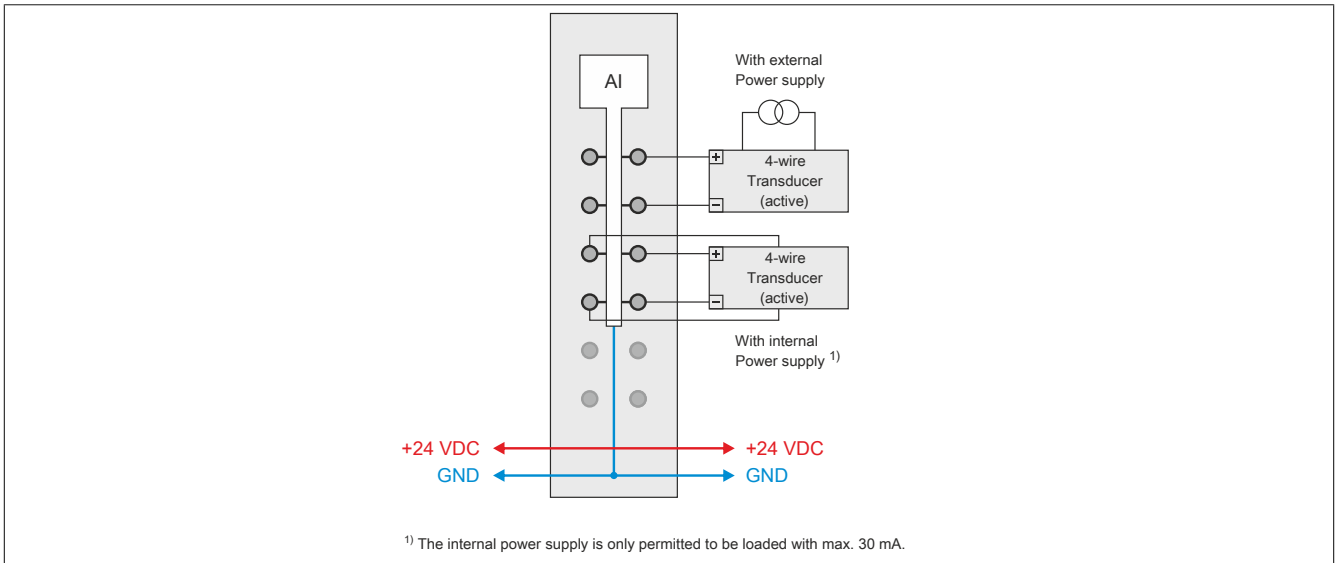

- 2-wire transducer
- Active current source

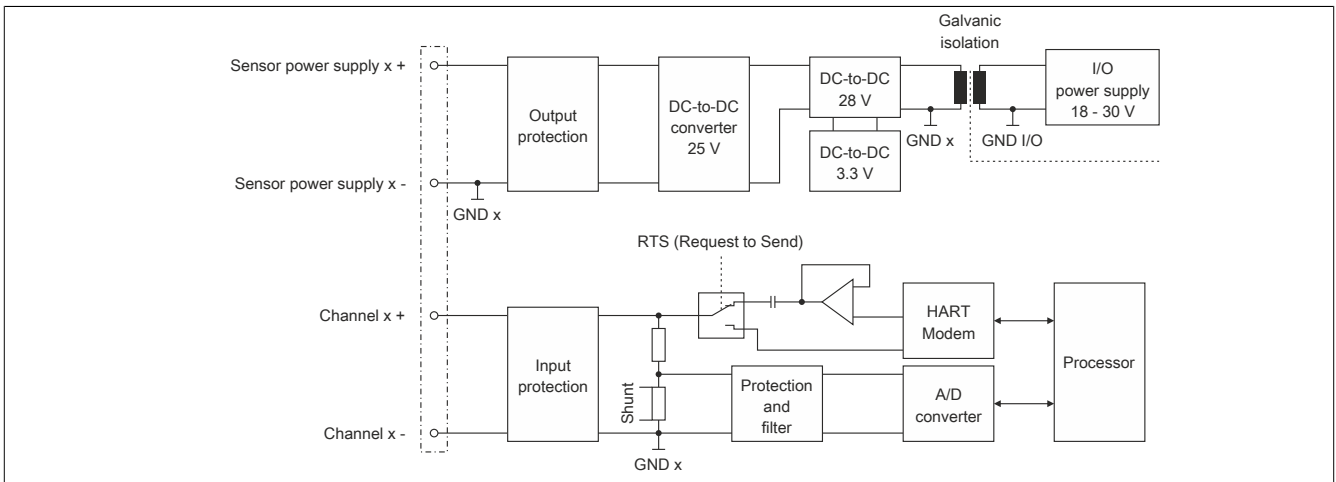

4-wire connections

A 4-wire connection can be implemented as follows:

- 4-wire transducer with external supply
- 4-wire transducer supplied by the module

9.1.9.8 Input circuit diagram

9.1.9.9 Behavior in the event of short circuit

In the event of a short circuit, the output current for the sensor supply is limited according to the following diagram.

9.1.9.10 Register description

9.1.9.10.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section "General data points" on page 3790.

9.1.9.10.2 Register overview - Function model 0 (standard)

1) The offset specifies the position of the register within the CAN object.

9.1.9.10.3.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see "Using I/O modules on the bus controller" on page 3789.

9.1.9.10.3.2 CAN I/O bus controller

The module occupies 2 analog logical slots on CAN I/O.

9.1.9.10.4 General information

This module is equipped with two independent electrically isolated channels with integrated HART modems. Both channels can be used to read in an analog signal and handle HART communication. All registers necessary for this have a dual design so that the channels can be configured and operated independently of one another. The current input signals (0 to 25 mA) can be displayed in various formats and used as conventional analog inputs. The integrated HART modems retrieve digital information from the memory on the HART slave using the same physical lines that modulate the HART signals.

When using the 0 to 25 mA current input variant, the module is conceived as a HART master for 2 channels (loops), with FSK modulation of the HART protocol and sensor supply for up to 15 slaves per channel.

Each channel can use one of the following connection variants:

- Connection of one HART node (point-to-point) with evaluation of the analog signal and output of 4 HART process variables OR
- Connection of up to 15 HART nodes in multidrop mode with output of the primary HART variable from activated nodes

Specific features:

- Channels electrically isolated
- Up to 15 HART input variables per channel
- Configurable sampling rate (input filter) to transfer HART and analog signal without interference (default: 50 Hz or 20 ms)
- Internal supply with short circuit protection <30 mA per channel
- Selective line monitoring can be enabled for: open line (<2 mA), underflow (<3.6 mA) or overflow (>21 mA) of a configurable threshold
- Selectable error strategy (static replacement value or retention of the last permitted value)
- Cyclic "HART status" polling (HART command 0), the status information received is made available for channel diagnostics
- Compatible with an additional secondary master in the HART network (module acts as the primary master)
- "HART communication error bit" (shows loss of HART connection if a connection had already been established successfully)
- Optional: Burst mode for one node per channel
- Optional: Cyclic polling of "HART variables" (HART command 3 or 9)
- Optional: Sensor power supply for max. 15 nodes per channel in the multidrop variant
- Optional: Flatstream functionality (module acts as bridge for HART packets)

Information:

Maximum number of HART nodes per channel:

- **5 nodes (when using HART nodes with a nominal current of 4 mA)**
- **Up to 15 HART nodes (taking into account the maximum permissible input signal or nominal output current of the sensor power supply of 25 mA)**

9.1.9.10.5 Analog signal - Configuration

How the analog signal is displayed can be adapted to the requirements of the application. Separate configuration registers per channel are available to aid in this.

9.1.9.10.5.1 Channel parameters

Name:

AnMode_1 to AnMode_2

These registers are used to predefine the operating parameters that the module will be using for the respective channel. Each channel must be enabled individually and can be configured and operated independently.

Information:

Different limit values must be configured for any display normalizing that needs to take place.

| Data type | Values | Bus controller default setting |
|-----------|--------------------|--------------------------------|
| UINT | See bit structure. | 29 |

Bit structure:

| Bit | Name | Value | Information |
|--------|----------------------------|-------|---|
| 0 | Channel | 0 | Channel 0x turned off |
| | | 1 | Channel 0x enabled (bus controller default setting) |
| 1 | Open line detection | 0 | Open line monitoring turned off |
| | | 1 | Open circuit monitoring enabled (bus controller default setting) |
| 2 | Underflow detection | 0 | Underflow detection turned off |
| | | 1 | Underflow detection enabled (bus controller default setting) |
| 3 | Replacement value strategy | 0 | Use replacement values in the event of error (bus controller default setting) |
| | | 1 | Keep the last valid converted value |
| 4 - 5 | Normalization | 00 | Displays 0 to 25 mA as 0 to 32767 |
| | | 01 | Display 0 to 25 mA as 0 to 25000 [μ A] (bus controller default setting) |
| | | 10 | Displays 4 to 20 mA as 0 to 32767 |
| | | 11 | Displays 0 to 25 mA as 0 to 65535 |
| 6 - 15 | Reserved | - | |

9.1.9.10.5.2 Sample rate

Name:

Samplerate_1 to Samplerate_2

A sample rate can be configured for both analog inputs independently of one another. The following formula for this parameter is derived using the desired sampling frequency:

$$\text{Sampling rate for A/D converter} = (4920000 / 1024) / \text{Sampling frequency}$$

| Data type | Value | Information | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-----------|-------------|---|--------|------|-----------|-----|------------|----------|-----|------------|-----------|-----|-------------|-----------|-----|-----------|-----------|-----|-------------|-----------|----|-----------|--|----|-------------|-----------|----|-----------|------------|---|----------|------------|---|----------|-------------|
| UINT | 4 to 1023 | Sample rate Examples of configurable values <table border="1"> <thead> <tr> <th>Val-ue</th> <th>Time</th> <th>Frequency</th> </tr> </thead> <tbody> <tr> <td>960</td> <td>... 200 ms</td> <td>... 5 Hz</td> </tr> <tr> <td>480</td> <td>... 100 ms</td> <td>... 10 Hz</td> </tr> <tr> <td>320</td> <td>... 66.7 ms</td> <td>... 15 Hz</td> </tr> <tr> <td>192</td> <td>... 40 ms</td> <td>... 25 Hz</td> </tr> <tr> <td>160</td> <td>... 33.3 ms</td> <td>... 30 Hz</td> </tr> <tr> <td>96</td> <td>... 20 ms</td> <td>... 50 Hz (bus controller default setting)</td> </tr> <tr> <td>80</td> <td>... 16.7 ms</td> <td>... 60 Hz</td> </tr> <tr> <td>48</td> <td>... 10 ms</td> <td>... 100 Hz</td> </tr> <tr> <td>9</td> <td>... 2 ms</td> <td>... 500 Hz</td> </tr> <tr> <td>4</td> <td>... 1 ms</td> <td>... 1000 Hz</td> </tr> </tbody> </table> | Val-ue | Time | Frequency | 960 | ... 200 ms | ... 5 Hz | 480 | ... 100 ms | ... 10 Hz | 320 | ... 66.7 ms | ... 15 Hz | 192 | ... 40 ms | ... 25 Hz | 160 | ... 33.3 ms | ... 30 Hz | 96 | ... 20 ms | ... 50 Hz (bus controller default setting) | 80 | ... 16.7 ms | ... 60 Hz | 48 | ... 10 ms | ... 100 Hz | 9 | ... 2 ms | ... 500 Hz | 4 | ... 1 ms | ... 1000 Hz |
| Val-ue | Time | Frequency | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 960 | ... 200 ms | ... 5 Hz | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 480 | ... 100 ms | ... 10 Hz | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 320 | ... 66.7 ms | ... 15 Hz | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 192 | ... 40 ms | ... 25 Hz | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 160 | ... 33.3 ms | ... 30 Hz | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 96 | ... 20 ms | ... 50 Hz (bus controller default setting) | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 80 | ... 16.7 ms | ... 60 Hz | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 48 | ... 10 ms | ... 100 Hz | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 9 | ... 2 ms | ... 500 Hz | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 4 | ... 1 ms | ... 1000 Hz | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

The fastest sample rate of 10 ms for the analog inputs is predefined by the cutoff frequency of the hardware filter. When using HART communication, however, a sample rate not faster than 100 ms is recommended.

9.1.9.10.5.3 Limit value for open line detection

Name:

OpenLoopLimit_1 to OpenLoopLimit_2

The limit value for the respective analog input must be set when open circuit monitoring is enabled and if required by the configured normalization.

| Data type | Value | Information |
|-----------|-----------------|---|
| INT | -32767 to 32767 | Open circuit limit value. Bus controller default setting: 2621 |
| UINT | 0 to 65535 | Open circuit limit value |

If limit value monitoring is active, the corresponding error status is output after a configured delay when falling below this value. Using a default value of 2000 μ A, the following values and formulas result for this parameter:

- Displays 0 to 25 mA as 0 to 25000: 2000
- Displays 0 to 25 mA as 0 to 32767: 2621, limit value = $([\mu\text{A}] * 32767) / 25000$
- Displays 4 to 20 mA as 0 to 32767: -4096, limit value = $(([\mu\text{A}] * 1.31068) - 5242.72) * 1.5625$
- Displays 0 to 25 mA as 0 to 65535: 5243, limit value = $([\mu\text{A}] * 65535) / 25000$

9.1.9.10.5.4 Preparation time for the measured values

Name:

PreparationInterval01 to PreparationInterval02

If the last valid measured value should be kept when violating the limit value, then PreparationInterval must be defined. The measured values continue to be acquired and converted according to the configured I/O update time. They are then checked and discarded if they do not meet the specifications. When an error does not occur, therefore, the measured value acquired 2 preparation intervals ago is constantly output.

| Data type | Value | Information |
|-----------|------------|---|
| UINT | 0 to 65535 | In 0.1 ms. Bus controller default setting: 0 |

| | |
|---|--|
| <p>Functionality: Measured values are continuously converted and stored to measured value memory. The current contents of the measured value memory are checked within the configured interval. If a permissible value is present, then the contents of the buffer memory are passed to output memory and the contents of the measured value memory are passed to the buffer. If the check turns up an impermissible value, then the contents of the measured value memory are discarded. The copy direction between output and buffer memory reverses and the last valid value continues to be output.</p> <p>Information: If configured to keep the last valid value, the delay time from measuring to outputting the value will be at least twice the preparation interval. In the worst case scenario, this can also take twice the interval time plus the configured conversion rate of the A/D converter.</p> | <p>"Application" Value being measured (analog)</p> |
| | <p>↓ Condition: - Conversion interval (A/D converter) elapsed</p> |
| | <p>"Measured value memory" Measured value (digital)</p> |
| | <p>↓ Condition: - PreparationInterval elapsed - Measured value permissible</p> |
| | <p>"Buffer" Last valid value</p> |
| <p>↓ Condition: - PreparationInterval elapsed - Measured value permissible</p> | |
| <p>"Output memory" Next-to-last valid/ displayed value</p> | |

9.1.9.10.5.5 Lower replacement value

Name:

ReplacementLower_1 to ReplacementLower_2

This register is used to define the lower static values to be displayed instead of the current measured value when the lower limit is violated.

| Data type | Value | Information |
|-----------|-----------------|--------------------------------------|
| INT | -32767 to 32767 | Bus controller default setting: 4718 |
| UINT | 0 to 65535 | |

If the replacement strategy "Use replacement values when an error occurs" is enabled, the replacement value must be set for the respective analog input taking the configured normalization into account as well. When an overflow or underflow error status occurs, the "AnalogInput0x" on page 387 channel is replaced with the corresponding value. Using a default value of 3600 μ A, the following values and formulas result for this parameter:

- Displays 0 to 25 mA as 0 to 25000: 3600
- Displays 0 to 25 mA as 0 to 32767: 4718, limit value = $([\mu\text{A}] * 32767) / 25000$
- Displays 4 to 20 mA as 0 to 32767: -819, limit value = $(([\mu\text{A}] * 1.31068) - 5242.72) * 1.5625$
- Displays 0 to 25 mA as 0 to 65535: 9437, limit value = $([\mu\text{A}] * 65535) / 25000$

9.1.9.10.5.6 Upper replacement value

Name:

ReplacementUpper_1 to ReplacementUpper_2

This register is used to define the static values to be displayed instead of the current measured value when the upper limit is violated.

| Data type | Value | Information |
|-----------|-----------------|---------------------------------------|
| INT | -32767 to 32767 | Bus controller default setting: 27524 |
| UINT | 0 to 65535 | |

If the replacement strategy "Use replacement values when an error occurs" is activated, the replacement value must be set for the respective analog input taking the configured normalization into account as well. When an overflow or underflow error status occurs, the "[AnalogInput0x](#)" on page 387 channel is replaced with the corresponding value. Using a default value of 21000 μ A, the following values and formulas result for this parameter:

- Displays 0 to 25 mA as 0 to 25000: 21000
- Displays 0 to 25 mA as 0 to 32767: 27524, limit value = $([\mu\text{A}] * 32767) / 25000$
- Displays 4 to 20 mA as 0 to 32767: 32767, limit value = $(([\mu\text{A}] * 1.31068) - 5242.72) * 1.5625$
- Displays 0 to 25 mA as 0 to 65535: 55049, limit value = $([\mu\text{A}] * 65535) / 25000$

9.1.9.10.5.7 Lower limit value

Name:

LowerLimit_1 to LowerLimit_2

If the value range needs to be restricted further, this register can be used to enter new user-specific lower limit values.

| Data type | Value | Information |
|-----------|-----------------|--------------------------------------|
| INT | -32767 to 32767 | Bus controller default setting: 4718 |
| UINT | 0 to 65535 | |

The limit value must be set for the respective analog input depending on the configured normalization. After the configured delay time has passed, the corresponding error status is given if the respective value is overrun or underrun. When this error state occurs, the "[AnalogInput0x](#)" on page 387 channel is evaluated according to the replacement value strategy. Using a default value of 3600 μ A, the following values and formulas result for this parameter:

- Displays 0 to 25 mA as 0 to 25000: 3600
- Displays 0 to 25 mA as 0 to 32767: 4718, limit value = $([\mu\text{A}] * 32767) / 25000$
- Displays 4 to 20 mA as 0 to 32767: -819, limit value = $(([\mu\text{A}] * 1.31068) - 5242.72) * 1.5625$
- Displays 0 to 25 mA as 0 to 65535: 9437, limit value = $([\mu\text{A}] * 65535) / 25000$

9.1.9.10.5.8 Upper limit value

Name:

UpperLimit_1 to UpperLimit_2

If the value range needs to be restricted further, this register can be used to enter new user-specific upper limit values.

| Data type | Value | Information |
|-----------|-----------------|---------------------------------------|
| INT | -32767 to 32767 | Bus controller default setting: 27524 |
| UINT | 0 to 65535 | |

The limit value must be set for the respective analog input depending on the configured normalization. After the configured delay time has passed, the corresponding error status is given if the respective value is overrun or underrun. When this error state occurs, the "[AnalogInput0x](#)" on page 387 channel is evaluated according to the replacement value strategy. Using a default value of 21000 μ A, the following values and formulas result for this parameter:

- Displays 0 to 25 mA as 0 to 25000: 21000
- Displays 0 to 25 mA as 0 to 32767: 27524, limit value = $([\mu\text{A}] * 32767) / 25000$
- Displays 4 to 20 mA as 0 to 32767: 32767, limit value = $(([\mu\text{A}] * 1.31068) - 5242.72) * 1.5625$
- Displays 0 to 25 mA as 0 to 65535: 55049, limit value = $([\mu\text{A}] * 65535) / 25000$

9.1.9.10.5.9 Hysteresis

Name:

Hysteres_1 to Hysteres_2

If the user-specific limit values are being used, then a hysteresis range should also be defined. These registers configure how far a limit value can be exceeded before a response is triggered.

| Data type | Value | Information |
|-----------|-----------------|-------------------------------------|
| INT | -32767 to 32767 | Bus controller default setting: 131 |
| UINT | 0 to 65535 | |

The hysteresis value must be set for the respective analog input depending on the configured normalization. The error status is cleared if the actual analog value changes by at least this hysteresis value from the limit value in the allowed direction. Using a default value of 100 μ A, the following values and formulas result for this parameter:

- Displays 0 to 25 mA as 0 to 25000: 100
- Displays 0 to 25 mA as 0 to 32767: 131, limit value = $([\mu\text{A}] * 32767) / 25000$
- Displays 4 to 20 mA as 0 to 32767: 156, limit value = $[\mu\text{A}] * 1.5625$
- Displays 0 to 25 mA as 0 to 65535: 262, limit value = $([\mu\text{A}] * 65535) / 25000$

9.1.9.10.5.10 Delaying error messages

Name:

ErrorDelay_1 to ErrorDelay_2

This register specifies the number of consecutive conversion procedures where an error is pending until the corresponding individual error status bit is set. The delay applies to underflow, overflow and open circuit errors. This delay can be used to hide temporary measured value deviations, for example.

| Data type | Value | Information |
|-----------|---------|--|
| UINT | 0 to 10 | Error formation delay in conversion cycles. Bus controller default setting: 2 |

9.1.9.10.5.11 Time for composite error bit

Name:

SumErrorDelay_1 to SumErrorDelay_2

This register specifies the time in milliseconds that one of the individual error bits must be pending until the composite error status bit is set.

| Data type | Value | Information |
|-----------|------------|--|
| UINT | 0 to 65535 | Composite error bit delay in ms. Bus controller default setting: 4000 |

9.1.9.10.6 Analog signal - Communication

9.1.9.10.6.1 Analog input values

Name:

AnalogInput01 to AnalogInput02

The analog input value is mapped in this register.

| Data type | Value | Information |
|-----------|----------------|---|
| INT | 0 to 25000 | Normalizing option 0 to 25 mA |
| | 0 to 32,767 | Normalizing option 0 to 25 mA |
| | -8192 to 32767 | Normalizing option 4 to 20 mA (value 0 corresponds to 4 mA) |
| UINT | 0 to 65535 | Normalizing option 0 to 25 mA |

Predefining values and timing

If a replacement value strategy was configured, value "0" (zero) is output from the beginning until a valid measured value has been calculated.

The timing for acquiring measured values is determined by the converter hardware and the set sampling rate. The two channels are converted independently of each other and are not synchronized with the X2X Link.

| Conversion time |
|--------------------------|
| Channel 0x sampling rate |

9.1.9.10.6.2 Sample time

Name:

AnalogSampletime01 to AnalogSampletime02

These registers return the timestamp for when the module reads the current channel mapping. The values are provided as signed 2-byte or 4-byte values.

For more information about NetTime and timestamps, see ["NetTime Technology" on page 3035](#).

| Data type | Values | Information |
|-----------|---------------------------|---|
| INT | -32,768 to 32767 | NetTime timestamp of the current input value in μ s |
| DINT | -2147483648 to 2147483647 | NetTime timestamp of the current input value in μ s |

9.1.9.10.6.3 Status of the inputs

Name:

AnalogStatus01 to AnalogStatus02
 UnderflowAnalogInput01 to UnderflowAnalogInput02
 OverflowAnalogInput01 to OverflowAnalogInput02
 OpenLineAnalogInput01 to OpenLineAnalogInput02
 ConversionErrorAnalogInput01 to ConversionErrorAnalogInput02
 SumErrorAnalogInput01 to SumErrorAnalogInput02
 SensorErrorAnalogInput01 to SensorErrorAnalogInput02
 IoSuppErrorAnalogInput01 to IoSuppErrorAnalogInput02

The current error state of the module channels is indicated in this register regardless of the configured replacement value strategy. Some error information is delayed according to the previously configured condition.

Setting "Format of status information" in Automation Studio makes it possible to define whether the status information is transferred as USINT or bit values.

| Data type | Values |
|-----------|--------------------|
| USINT | See bit structure. |

Bit structure:

| Bit | Name | Values | Information |
|-----|------------------------------------|--------|--------------------------------------|
| 0 | UnderflowAnalogInput01 or 02 | 0 | No error |
| | | 1 | Lower limit value undershot |
| 1 | OverflowAnalogInput01 or 02 | 0 | No error |
| | | 1 | Upper limit value overshoot |
| 2 | OpenLineAnalogInput01 or 02 | 0 | No error |
| | | 1 | Open circuit determined |
| 3 | ConversionErrorAnalogInput01 or 02 | 0 | No error |
| | | 1 | Conversion error determined |
| 4 | SumErrorAnalogInput01 or 02 | 0 | No error |
| | | 1 | Composite error determined |
| 5 | Reserved | - | |
| 6 | SensorErrorAnalogInput01 or 02 | 0 | Sensor voltage OK |
| | | 1 | Sensor load too high |
| 7 | IoSuppErrorAnalogInput01 or 02 | 0 | I/O power supply OK |
| | | 1 | Error in I/O power supply determined |

UnderflowAnalogInput

The signal underflow error state is represented here based on the configuration. This error information is enabled as a multiple of the conversion cycles only after the configurable delay time has passed (see register "ErrorDelay" on page 386).

OverflowAnalogInput

The signal overflow error status state is represented here based on the configuration. This error information is enabled as a multiple of the conversion cycles only after the configurable delay time has passed (see register "ErrorDelay" on page 386).

OpenLineAnalogInput

Based on the configuration, the measurement information is checked for values <2 mA (register "OpenLoopLimit" on page 384) to detect a failure signal. Open circuit detection is performed using a configurable hysteresis value (default: 100 µA, register "Hysteresis" on page 386). It is possible to disable open circuit detection (register "AnalogMode" on page 383) to suppress the generation of alarms when hardware is missing. This error information is enabled as a multiple of the conversion cycles only after the configurable delay time has passed (register "ErrorDelay" on page 386).

ConversionErrorAnalogInput

This error state is triggered when the hardware overshoots the conversion time.

SumErrorAnalogInput

This error information is derived from the state of individual errors and enabled only after the configurable delay time has passed [ms] (see register "SumErrorDelay" on page 386). Linking this error information in an application makes it possible to hide temporary overshoots or undershoots of the temperature value, for example.

SensorErrorAnalogInput

This error is enabled immediately after a fault is detected in the internal sensor power supply.

IoSuppErrorAnalogInput

This error is enabled immediately after a supply voltage undershoot is detected (<20 VDC).

9.1.9.10.7 HART

HART (Highway Addressable Remote Transducer) is a protocol for communicating with intelligent field devices. It was developed in order to more efficiently use the infrastructure for transferring analog signals. The digital HART notifications are modulated to the analog signal using Frequency Shift Keying (FSK). HART can thus use the same physical line as the analog signal without influencing the original function.

HART slaves are able to determine different process data independently and prepare HART concordantly. This protocol supports polling of the value of a process variable as well as its unit and status. Field devices usually supply their information after the master requests it. In newer revisions, it is also possible to transfer configuration data.

There are 2 different types of HART networks. In a *point-to-point* network, only one slave is connected to a HART master. Here, the analog signal and the HART signal can be transferred over the same line. Managing several slaves with HART requires what is known as a *multidrop* network. Here, each HART slave is assigned and identified by a unique address. Classic analog signals cannot be clearly traced in bus systems. As a result, the HART protocol does not support analog information transfers in multidrop networks up to and including HART Revision 5.

9.1.9.10.7.1 HART - Configuration

HART modules are analog modules equipped with a HART modem. For each channel, a separate HART network can be managed by the module, which acts as a primary master. Once configured successfully, the HART information is stored in the module where it can then be used by the PLC.

The number of HART slaves must be specified in the configuration.

If only one slave is connected to the HART channel, then it is part of a point-to-point network. The module can then prepare up to 4 process variables from the connected slave.

Multidrop mode allows up to 15 HART slaves to be connected. The primary process variable from each slave is then retrieved.

HartBurstNode

Name:

HartBurstNode_1 to HartBurstNode_2

In addition to the type of network, the user can also choose from 2 different types of communication behavior. Conventional HART communication relies on polling. The module queries the data from the HART slave individually and receives the corresponding information from the slave as a response. If a HART node should be queried in short time intervals, the user can configure burst mode for a node on each channel. In this case, the slave transmits the information from this node cyclically without a new request by the master.

The node numbers (short address) whose information should be queried using burst mode are entered by channel in the "HartBurstNode" registers. Burst mode is enabled using register "[HartMode](#)" on page 390.

| Data type | Value | Information |
|-----------|---------|--|
| USINT | 0 to 15 | Point-to-point. Bus controller default setting: 0 |

HartMode

Name:

HartMode_1 to HartMode_2

The user can use these registers to configure the communication behavior of each of the HART channels. Generally, the HART nodes are polled individually. This register can still be used to start or stop burst mode when needed. In burst mode, a node transmits its information cyclically instead of continuously. As a result, the HART standard allows the simultaneous usage of both burst mode and polling.

Information:

Register "[HartBurstNode](#)" on page 389 must be configured correctly for burst queries.

| Data type | Values | Bus controller default setting |
|-----------|--------------------|--------------------------------|
| UINT | See bit structure. | 0 |

Bit structure:

| Bit | Name | Value | Information |
|-------|------------------------|-------|--|
| 0 | Slave polling mode | 0 | Polling mode enabled (bus controller default setting) |
| | | 1 | Polling mode disabled |
| 1 | Start slave burst mode | 0 | No response to burst (bus controller default setting) |
| | | 1 | Enables burst mode in the " HartBurstNode " on page 389 node |
| 2 | Stop slave burst mode | 0 | No response to burst (bus controller default setting) |
| | | 1 | Disables burst mode, if enabled |
| 3 - 7 | Reserved | - | |

HartNodeCnt

Name:

HartCodeCnt_1 to HartCodeCnt_2

These registers tell the module how many HART slaves are connected to a channel.

Information:

If a slave is not connected to one of the HART channels, the value "0" should be defined in this register. This shortens the I/O update time and avoids superfluous error messages.

| Data type | Value | Information |
|-----------|---------|---|
| USINT | 0 | HART communication disabled for this channel |
| | 1 | Point-to-point Standard HART communication (bus controller default setting) |
| | 2 to 15 | Multidrop Number of HART slave nodes |

9.1.9.10.7.2 HART - Communication

After the configuration is completed, the information is retrieved automatically and transferred to the module registers. A separate register is implemented in the module for each piece of information. HART modules are designed to query up to 15 pieces of information per channel. The module reads in the data, stores it in temporary memory and prepares it for retrieval. When the X2X master accesses the module registers, it is irrelevant whether the HART data originates from a point-to-point or multidrop network.

Overview of internal module mapping

| | <i>Point-to-point network (1 HART slave)</i> | <i>Multidrop network (2 to 15 HART slaves)</i> |
|--------------|--|--|
| (Pv)Input_01 | Primary piece of information from HART node 1 | Primary piece of information from HART node 1 |
| (Pv)Input_02 | Secondary piece of information from HART node 1 | Primary piece of information from HART node 2 |
| ... | ... | ... |
| (Pv)Input_04 | Quaternary piece of information from HART node 1 | Primary piece of information from HART node 4 |
| (Pv)Input_05 | Reserved | Primary piece of information from HART node 5 |
| ... | ... | ... |
| (Pv)Input_15 | Reserved | Primary piece of information from HART node 15 |

The HART specifications stipulates that information from a HART node be split into various pieces. The value of a process variable is stored to the respective "PvInput" on page 391 register and has a size of 4 bytes (REAL) per the HART specification. Due to the length limitation of 30 bytes on the X2X Link network, there are limitations to the number of possible cyclic variables. It is recommended to transfer a maximum of 2 "PvInput" on page 391 registers cyclically to the X2X master. All other information should be read in a different way. To access HART information, the user can choose between the following methods:

- **Acyclic:** If library AsIOAcc is used, information is queried acyclically only when it is needed, i.e. communication can be adapted to the program sequence of the X2X master. In this way, all of the necessary module registers on the X2X Link network can be queried despite the length limitation. This type of information exchange is not real-time capable.
- **Cyclic:** Data points configured for cyclic transfer are read once per bus cycle. This procedure allows real-time capable information exchange between the module and X2X master. The length limitation may prevent all data from being queried within one cycle, however.
- **Multiplexed:** A runtime driver can be used to transfer the HART data points in the I/O mapping. In this case, the HART process data points are transferred in an alternating pattern using time-division multiplexing. Communication remains real-time capable. Multiple bus cycles are needed to update all data points, however.

Information:

"Multiplexed" data transfer is used only for HART data points.

Information from the analog inputs/outputs is always transferred cyclically (see above).

- **Flatstream:** HART modules are equipped with a Flatstream interface. When using Flatstream communication, the module is used as a bridge between the X2X master and HART slave, i.e. the X2X master communicates directly with the HART slave (see "Flatstream communication" on page 3802). Flatstream communication is also not real-time capable. It allows unrestricted access to the HART slave. The user must have sufficient knowledge of the HART protocol command set as well as the capabilities of the corresponding HART slave.

PvInput

Name:

PvInput_01 to PvInput_15

PvInput_01_01 to PvInput_01_15

PvInput_02_01 to PvInput_02_15

These registers return the current value of the process variable that has been read.

Information:

These registers are of data type REAL, which means that the available bytes on the X2X Link are filled more quickly when operated cyclically. If information from several slave nodes is needed, it must be retrieved acyclically or using Flatstream .

| Data type | Value | Information |
|-----------|-------------|---------------------------------------|
| REAL | IEEE754 SPF | 32-bit data type with valid value |
| | 0x7FA00000 | Not a number (NaN) with invalid value |

PvUnit

Name:

PvUnit_01 to PvUnit_15

PvUnit_01_01 to PvUnit_01_15

PvUnit_02_01 to PvUnit_02_15

These registers return a HART-specific code that specifies the unit for the measured value. The coding for this is established in the HART specification.

| Data type | Value |
|-----------|---|
| USINT | See description of the HART slave See HART specification |

PvSampleTime

Name:

PvSampleTime01 to PvSampleTime02

PvSampleTime01_01 to PvSampleTime01_15

PvSampleTime02_01 to PvSampleTime02_15

These registers return the timestamp for when the module reads the current channel mapping. The values are provided as signed 2-byte or 4-byte values.

For more information about NetTime and timestamps, see "[NetTime Technology](#)" on page 3035.

| Data type | Values | Information |
|-----------|---------------------------|---|
| INT | -32,768 to 32767 | NetTime timestamp of the current input value in μs |
| DINT | -2147483648 to 2147483647 | NetTime timestamp of the current input value in μs |

This refers to the point in time when the HART master receives the slave's response. This is a way to check whether new HART information has been read since the last X2X cycle.

Information:

The cycle times of a HART network are relatively long so that it is not possible to reliably determine when the measured value is retrieved with just this information.

PvNodeComStatus

Name:

PvNodeComStatus01 to PvNodeComStatus02

PvNodeComStatus01_01 to PvNodeComStatus01_15

PvNodeComStatus02_01 to PvNodeComStatus02_15

These registers provide information about whether a read value is valid. Per the HART specification, this type of status register consists of 2 parts. The "response code" is stored in the high byte; the "field device status" is stored in the low byte. This makes it possible to check the current state of a read process variable.

These registers can be checked before further processing information in temporary storage. If the current value is 0x0000, an error was not detected during the HART transfer and the information from the checked node can be used. If a different value is present, the situation in the HART network should be checked. This can be done using an extension register, for example.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|--------|---|-------|---|
| 0 | Quality - Node information 2 to n | 0 | Digital measured value okay |
| | | 1 | Measured value outside the permitted range |
| 1 | Quality - Node information 1 | 0 | Digital measured value okay |
| | | 1 | Measured value outside the permitted range |
| 2 | Limit violation | 0 | Parameter okay |
| | | 1 | Invalid measured value(s) or encoder supply value |
| 3 | Static analog signal | 0 | Normal value change/fluctuation |
| | | 1 | Constant analog value of Node 1 slave |
| 4 | Additional status information (only supported by a few slaves) | 0 | Not available |
| | | 1 | Available (only using Flatstream command #48) |
| 5 | Restart | 0 | Normal operation |
| | | 1 | Field device restarts |
| 6 | Device ID | 0 | Unchanged |
| | | 1 | Changed |
| 7 | Device error | 0 | Measured value okay |
| | | 1 | Questionable measured value information |
| 8 - 14 | Response code, if relevant | x | See HART-specific response code |
| 15 | Error - Communication | 0 | Error-free communication (response code irrelevant) |
| | | 1 | Faulty communication (response code relevant) |

HART-specific response code (excerpt):

| | |
|------------------------------------|---|
| 0x82 ... Receive buffer overflow | If a HART communication error occurs, the response code is written. Bit 15 is always set. |
| 0x88 ... Checksum incorrect | |
| 0x90 ... Faulty protocol structure | |
| 0xA0 ... Overrun | |
| 0xC0 ... Parity not allowed | |
| 0xFF ... Timeout | |

Retrieving information that has been read

After the node data has been transferred to the module registers, the information can be retrieved from the module. A separate register in the module is implemented for each piece of information.

PvCountHartRequest

This register is increased as soon as the module is ready to transmit a message on the corresponding channel.

| Data type | Value |
|-----------|------------|
| UINT | 0 to 65535 |

PvCountHartTimeout

This register is increased if the slave exceeds the maximum permissible time to respond a request from the module.

| Data type | Value |
|-----------|------------|
| UINT | 0 to 65535 |

PvCountHartRxError

This register is increased if communication errors occur on layer 1 of the OSI model (e.g. transfer error according to the parity bit).

| Data type | Value |
|-----------|------------|
| UINT | 0 to 65535 |

PvCountHartFrameError

This register is increased if communication errors occur on layer 2 of the OSI model (e.g. invalid telegram structure).

| Data type | Value |
|-----------|------------|
| UINT | 0 to 65535 |

PvNodeFound

Name:

PvNodeFound01 to PvNodeFound02

These registers provide information about which nodes were detected on which channel (slave identified successfully).

| Data type | Values |
|-----------|------------------------|
| UINT | See the bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|-----|--------------------------|-------|-----------------------|
| 0 | Node 0 (default mode) | 0 | Not detected as valid |
| | Node 1 (multidrop mode) | 1 | Detected as valid |
| 1 | Node 2 (multidrop mode) | 0 | Not detected as valid |
| | | 1 | Detected as valid |
| ... | | ... | |
| 13 | Node 14 (multidrop mode) | 0 | Not detected as valid |
| | | 1 | Detected as valid |
| 14 | Node 15 (multidrop mode) | 0 | Not detected as valid |
| | | 1 | Detected as valid |
| 15 | Reserved | - | |

PvNodeError

Name:

PvNodeError01 to PvNodeError02

These registers contain the HART communications error bits. These bits are set if the connection to a node was established successfully but the node at some point no longer responds as it should (e.g. the HART slave exceeds the configured timeout / number of retries).

| Data type | Values |
|-----------|------------------------|
| UINT | See the bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|-----|--------------------------|-------|------------------------------|
| 0 | Node 0 (default mode) | 0 | Detected as having no errors |
| | Node 1 (multidrop mode) | 1 | Detected as having errors |
| 1 | Node 2 (multidrop mode) | 0 | Detected as having no errors |
| | | 1 | Detected as having errors |
| ... | | ... | |
| 13 | Node 14 (multidrop mode) | 0 | Detected as having no errors |
| | | 1 | Detected as having errors |
| 14 | Node 15 (multidrop mode) | 0 | Detected as having no errors |
| | | 1 | Detected as having errors |
| 15 | Reserved | - | |

9.1.9.10.7.3 Extended configuration

The additional configuration registers are specified values when the module is started. In most systems, the user does not need to make any adjustments here. Register values should only be changed if HART network communication is not taking place satisfactorily.

HartNodeDisable

Name:

HartNodeDisable_1 to HartNodeDisable_2

These registers are intended for things like maintenance. They make it possible to cut off configured HART nodes to suppress error messages for a certain period of time. During normal operation, the configured nodes must be switched active to guarantee that the procedure runs smoothly.

| Data type | Values | Bus controller default setting |
|-----------|--------------------|--------------------------------|
| UINT | See bit structure. | 0x3FFF |

Bit structure:

| Bit | Name | Value | Information |
|-----|--------------------------|-------|---|
| 0 | Node 0 (default mode) | 0 | Enabled (bus controller default setting) |
| | Node 1 (multidrop mode) | 1 | Disabled |
| 1 | Node 2 (multidrop mode) | 0 | Enabled |
| | | 1 | Disabled (bus controller default setting) |
| ... | | ... | |
| 13 | Node 14 (multidrop mode) | 0 | Enabled |
| | | 1 | Disabled (bus controller default setting) |
| 14 | Node 15 (multidrop mode) | 0 | Enabled |
| | | 1 | Disabled (bus controller default setting) |
| 15 | Reserved | - | |

HartProtTimeOut

Name:

HartProtTimeOut_1 to HartProtTimeOut_2

These registers specify the time span within which the slave must respond for the response to be valid.

| Data type | Values [ms] | Information |
|-----------|-------------|--|
| UINT | 0 to 65535 | Bus controller default setting: 256 [ms] |

HartProtRetry

Name:

HartProtRetry_1 to HartProtRetry_2

These registers determine how many times the master retries a request if it receives an invalid response or no response at all.

| Data type | Value | Information |
|-----------|------------|--|
| UINT | 0 to 65535 | Bus controller default setting: 3 attempts |

HartPreamble

Name:

HartPreamble_1 to HartPreamble_2

The length of the preamble can be set in these registers. The preamble is used to synchronize the receiver to the transmitter. The longer the declared preamble, the less chance that a communication error will occur. Nevertheless, a useful signal is not transmitted during synchronization so the preamble should be kept as short as possible.

| Data type | Value | Information |
|-----------|---------|------------------------------------|
| UINT | 5 to 20 | Bus controller default setting: 20 |

9.1.9.10.8 Flatstream communication

For a description of Flatstream communication, see ["Flatstream communication" on page 3802](#)

9.1.9.10.9 HART with Flatstream

When using Flatstream communication, the module acts as a bridge between the X2X master and an intelligent field device connected to the module. Flatstream mode can be used for either point-to-point connections as well as for multidrop systems. Specific algorithms such as timeout and checksum monitoring are usually managed automatically. During normal operation, the user does not have access to these details.

HART is considered a master-slave network where half-duplex communication takes place asynchronously. Various features have been included to ensure that signals are transmitted without errors.

For example, the user can increase the length of the preamble, thus making the transmission more secure. However, this also has an effect on the percentage of payload data and overhead.

Additional information about HART can be found at www.HARTcomm.org.

How it works

The module has 2 independent channels. When using Flatstream, the channel number must therefore be specified. The general structure of a Flatstream frame is extended as follows.

| Input/Output sequence | Tx/Rx bytes | | |
|-----------------------|-----------------------------|----------------|---|
| (unchanged) | Control byte (unchanged) | Channel number | HART frame (without preamble and checksum) |

| HART frame with Flatstream | | | | | |
|----------------------------|------|-----|------|-------|--------|
| Startup | ADDR | CMD | BCNT | (STS) | (DATA) |

| | |
|---------|--|
| Startup | Start identification |
| ADDR | Address within the HART network |
| CMD | HART command |
| BCNT | Byte counters (number of remaining bytes) |
| *STS | Status of the last command received. Information about the working mode of the HART Slave and communication errors (if supported, return data from the HART Slave) |
| *DATA | Data (if necessary for the command) |

Examples of HART commands

| Command | Function |
|---------|--|
| 0x00 | Read slave ID |
| 0x03 | Read current value and up to 4 variables |
| 0x09 | Read up to 4 variables including status |
| 0x21 | Read variables |

9.1.9.10.10 NetTime Technology

For a description of NetTime Technology, see "[NetTime Technology](#)" on page 3035.

9.1.9.10.11 Minimum cycle time

The minimum cycle time defines how far the bus cycle can be reduced without causing a communication error or impaired functionality. It should be noted that very fast cycles decrease the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time |
|--------------------|
| 200 µs |

9.1.9.10.12 Minimum I/O update time

The minimum I/O update time defines how far the bus cycle can be reduced while still allowing an I/O update to take place in each cycle.

| Minimum I/O update time | |
|-------------------------|------|
| Analog inputs | 1 ms |

| Minimum I/O update time for HART communication | |
|--|-----------------------------|
| Point-to-point | 500 ms |
| Multidrop | 500 ms * Number of stations |

9.1.10 X20AI2622

Data sheet version: 3.11

9.1.10.1 General information

The module is equipped with 2 inputs with 13-bit (including sign) digital converter resolution. It is possible to select between the current and voltage signal using different terminals.

This module is designed for X20 6-pin terminal blocks. If needed (e.g. for logistical reasons), the 12-pin terminal block can also be used.

- 2 analog inputs
- Either current or voltage signal possible
- 13-bit digital converter resolution

9.1.10.2 Order data

| Model number | Short description | Figure |
|--------------|--|--|
| | Analog inputs |  |
| X20AI2622 | X20 analog input module, 2 inputs, ± 10 V or 0 to 20 mA / 4 to 20 mA, 13-bit converter resolution, configurable input filter | |
| | Required accessories | |
| | Bus modules | |

Table 59: X20AI2622 - Technical data

- 1) To reduce power dissipation, B&R recommends bridging unused inputs on the terminals or configuring them as current signals.
- 2) Based on the current measured value.
- 3) Based on the 20 V measurement range.
- 4) Based on the 20 mA measurement range.

9.1.10.4 LED status indicators

For a description of the various operating modes, see "[Diagnostic LEDs](#)" on page 3787.

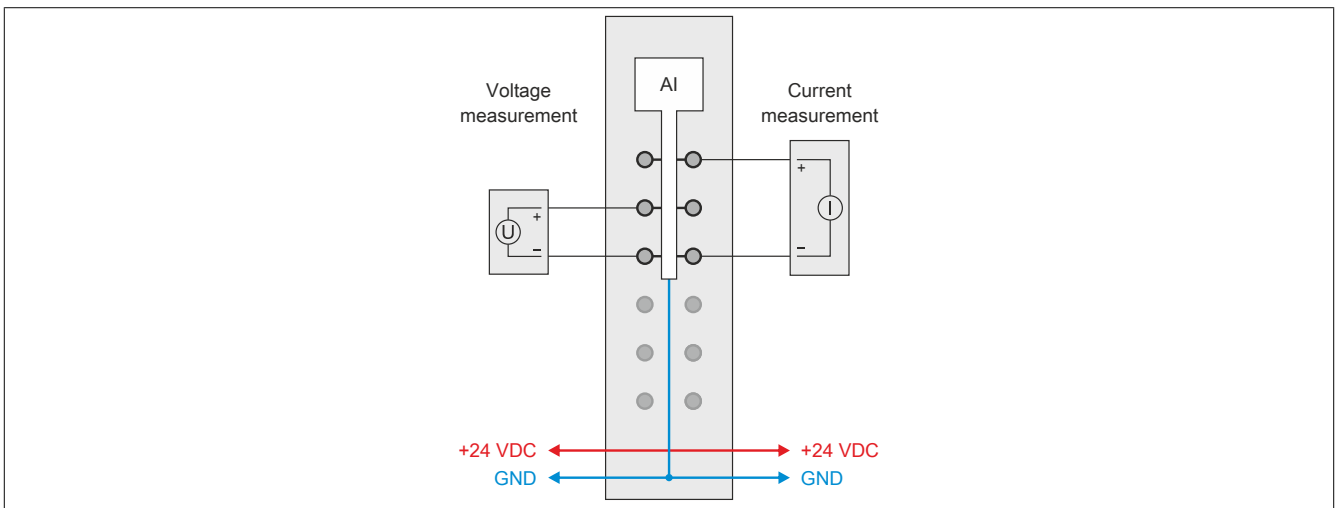

| Figure | LED | Color | Status | Description |
|---|-------|-------|-----------------------------|---|
|  | r | Green | Off | No power to module |
| | | | Single flash | RESET mode |
| | | | Blinking | PREOPERATIONAL mode |
| | | | On | RUN mode |
| | e | Red | Off | No power to module or everything OK |
| | | | On | Error or reset status |
| | e + r | | Red on / Green single flash | Invalid firmware |
| | 1 - 2 | Green | Off | Open line ¹⁾ or sensor is disconnected |
| | | | Blinking | Input signal overflow or underflow |
| | | | On | Analog/digital converter running, value OK |

- 1) Open line detection only possible when measuring voltage.

9.1.10.6 Connection example

9.1.10.7 Input circuit diagram

9.1.10.8 Register description

9.1.10.8.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section ["General data points" on page 3790](#).

9.1.10.8.2 Function model 0 - Standard

| Register | Name | Data type | Read | | Write | |
|----------------------|--|-----------|--------|---------|--------|---------|
| | | | Cyclic | Acyclic | Cyclic | Acyclic |
| Configuration | | | | | | |
| 16 | ConfigOutput01 (Input filter) | USINT | | | | • |
| 18 | ConfigOutput02 (Channel type) | USINT | | | | • |
| 20 | ConfigOutput03 (Lower value) | INT | | | | • |
| 22 | ConfigOutput04 (Upper limit value) | INT | | | | • |
| Communication | | | | | | |
| 0 | AnalogInput01 | INT | • | | | |
| 2 | AnalogInput02 | INT | • | | | |
| 30 | StatusInput01 | USINT | • | | | |

9.1.10.8.3 Function model 254 - Bus controller

| Register | Offset ¹⁾ | Name | Data type | Read | | Write | |
|----------------------|----------------------|--|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| Configuration | | | | | | | |
| 16 | - | ConfigOutput01 (Input filter) | USINT | | | | • |
| 18 | - | ConfigOutput02 (Channel type) | USINT | | | | • |
| 20 | - | ConfigOutput03 (Lower limit value) | INT | | | | • |
| 22 | - | ConfigOutput04 (Upper limit value) | INT | | | | • |
| Communication | | | | | | | |
| 0 | 0 | AnalogInput01 | INT | • | | | |
| 2 | 2 | AnalogInput02 | INT | • | | | |
| 30 | - | StatusInput01 | USINT | | • | | |

1) The offset specifies the position of the register within the CAN object.

9.1.10.8.3.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see ["Using I/O modules on the bus controller" on page 3789](#).

9.1.10.8.3.2 CAN I/O bus controller

The module occupies 1 analog logical slot on CAN I/O.

9.1.10.8.4 Analog inputs

The input state is collected with a fixed offset to the network cycle and transferred in the same cycle.

9.1.10.8.5 Analog input values

Name:

AnalogInput01 to AnalogInput02

The analog input value are mapped to this register depending on the configured operating mode.

| Data type | Value | Input signal: |
|-----------|-----------------|---|
| INT | -32768 to 32767 | Voltage signal -10 to 10 VDC |
| | 0 to 32767 | Current signal 0 to 20 mA |
| | -8192 to 32767 | Current signal 4 to 20 mA (value 0 corresponds to 4 mA) |

9.1.10.8.6 Input filter

This module is equipped with a configurable input filter. The minimum X2X cycle time must be $>500\ \mu\text{s}$. Filtering is disabled for shorter X2X cycle times.

If the input filter is active, then the channels are scanned in 1 ms cycles. The time offset between the channels is 200 μs . Conversion is performed acyclically to the X2X cycle.

Information:

The filter sampling time is fixed at 1 ms and is acyclic to the X2X cycle.

9.1.10.8.6.1 Input ramp limiting

Input ramp limiting can only be performed in conjunction with filtering. Input ramp limiting is performed before filtering.

The difference of the input value change is checked for exceeding the specified limit. In the event of overshoot, the tracked input value is equal to the old value \pm the limit value.

Configurable limit values:

| Value | Limit value |
|-------|---|
| 0 | The input value is used without limitation. |
| 1 | 0x3FFF = 16383 |
| 2 | 0x1FFF = 8191 |
| 3 | 0x0FFF = 4095 |
| 4 | 0x07FF = 2047 |
| 5 | 0x03FF = 1023 |
| 6 | 0x01FF = 511 |
| 7 | 0x00FF = 255 |

Input ramp limiting is well suited for suppressing disturbances (spikes). The following examples show the functionality of input ramp limiting based on an input step and a disturbance.

Example 1

The input value jumps from 8000 to 17000. The diagram shows the tracked input value with the following settings:

Input ramp limiting = 4 = 0x07FF = 2047

Filter level = 2

Figure 56: Tracked input value for input step

Example 2

A disturbance interferes with the input value. The diagram shows the tracked input value with the following settings:

Input ramp limiting = 4 = 0x07FF = 2047

Filter level = 2

Figure 57: Tracked input value for disturbance

9.1.10.8.6.2 Filter level

A filter can be defined to prevent large input steps. This filter is used to bring the input value closer to the actual analog value over a period of several milliseconds.

Filtering takes place after any input ramp limiting has been carried out.

Formula for calculating the input value:

$$\text{Value}_{\text{New}} = \text{Value}_{\text{Old}} - \frac{\text{Value}_{\text{Old}}}{\text{Filter level}} + \frac{\text{Input value}}{\text{Filter level}}$$

Adjustable filter levels:

| Value | Filter level |
|-------|---------------------|
| 0 | Filter switched off |
| 1 | Filter level 2 |
| 2 | Filter level 4 |
| 3 | Filter level 8 |
| 4 | Filter level 16 |
| 5 | Filter level 32 |
| 6 | Filter level 64 |
| 7 | Filter level 128 |

The following examples show the functionality of the filter based on an input step and a disturbance.

Example 1

The input value jumps from 8000 to 16000. The diagram shows the calculated value with the following settings:

Input ramp limiting = 0

Filter level = 2 or 4

Figure 58: Calculated value during input step

Example 2

A disturbance interferes with the input value. The diagram shows the calculated value with the following settings:

Input ramp limiting = 0

Filter level = 2 or 4

Figure 59: Calculated value during disturbance

9.1.10.8.7 Configuring the input filter

Name:

ConfigOutput01

The filter level and input ramp limiting of the input filter are set in this register.

| Data type | Values | Bus controller default setting |
|-----------|------------------------|--------------------------------|
| USINT | See the bit structure. | 0 |

Bit structure:

| Bit | Description | Value | Information |
|-------|-----------------------------|-------|--|
| 0 - 2 | Defines the filter level | 000 | Filter disabled (bus controller default setting) |
| | | 001 | Filter level 2 |
| | | 010 | Filter level 4 |
| | | 011 | Filter level 8 |
| | | 100 | Filter level 16 |
| | | 101 | Filter level 32 |
| | | 110 | Filter level 64 |
| | | 111 | Filter level 128 |
| 3 | Reserved | 0 | |
| 4 - 6 | Defines input ramp limiting | 000 | The input value is applied without limitation (bus controller default setting) |
| | | 001 | Limit value = 0x3FFF (16383) |
| | | 010 | Limit value = 0x1FFF (8191) |
| | | 011 | Limit value = 0x0FFF (4095) |

| 7 | Reserved | 0 | |

9.1.10.8.8 Channel type

Name:

ConfigOutput02

The type and range of signal measurement can be set in this register.

The individual channels are designed for current and voltage signals. This differentiation is made using different terminals and an integrated switch in the module. The switch is automatically activated by the module depending on the specified configuration. The following input signals can be set:

- ± 10 V voltage signal (default)
- 0 to 20 mA current signal
- 4 to 20 mA current signal

| Data type | Values | Bus controller default setting |
|-----------|------------------------|--------------------------------|
| USINT | See the bit structure. | 0 |

Bit structure:

| Bit | Description | Value | Information |
|-------|--------------------------------------|-------|--|
| 0 | Channel 1 | 0 | Voltage signal (bus controller default setting) |
| | | 1 | Current signal, measurement range corresponding to bit 4 |
| 1 | Channel 2 | 0 | Voltage signal |
| | | 1 | Current signal, measurement range corresponding to bit 5 |
| 2 - 3 | Reserved | 0 | |
| 4 | Channel 1: Current measurement range | 0 | 0 to 20 mA current signal |
| | | 1 | 4 to 20 mA current signal |
| 5 | Channel 2: Current measurement range | 0 | 0 to 20 mA current signal |
| | | 1 | 4 to 20 mA current signal |
| 6 - 7 | Reserved | 0 | |

9.1.10.8.9 Limit values

The input signal is monitored at the upper and lower limit values. These must be defined according to the operating mode:

| Limit value (default) | Voltage signal ± 10 V | | Current signal 0 to 20 mA | | Current signal 4 to 20 mA | |
|---------------------------|---------------------------|-----------------|---------------------------|-----------------|---------------------------|-----------------|
| Upper maximum limit value | +10 V | +32767 (0x7FFF) | 20 mA | +32767 (0x7FFF) | 20 mA | +32767 (0x7FFF) |
| Lower minimum limit value | -10 V | -32767 (0x8001) | 0 mA | 0 ¹⁾ | 4 mA | 0 ²⁾ |

1) The analog value is limited down to 0.

2) The analog value is limited down to 0 at currents <4 mA. The status bit for the lower limit is set.

Other limit values can be defined if necessary. The limit values apply to all channels. These are enabled automatically by writing to the limit value registers. From this point on, the analog values will be monitored and limited according to the new limits. The results of monitoring are displayed in the status register.

Examples of limit value settings

| Use case | Limit value settings |
|----------------------------------|--|
| Current signal: 4 to 20 mA | If values <4 mA should be measured for a current signal with 4 to 20 mA, a negative limit value must be set: 0 mA corresponds to value -8192 (0xE000). |
| Mixed voltage and current signal | The set limit values apply to all channels. A compromise must therefore be made for mixed operation (voltage and current signal mixed). The following setting has proven to be effective: Upper limit value = +32767, lower limit value = -32767 This also allows negative voltage values to be measured. With a lower limit value of 0, the voltage value would be limited to 0. |
| Current signal on all channels | All channels are configured for current measurement. The limit value setting in Automation Studio is not adjusted automatically. This means that +32767 is set for the upper limit value and -32767 for the lower limit value. The necessary adjustments must be made by the user, e.g. lower limit value = 0 |

9.1.10.8.9.1 Lower limit value

Name:

ConfigOutput03

The lower limit value for analog values can be set in this register. If the analog value goes below the limit value, it is frozen at this value and the corresponding error status bit is set.

| Data type | Values | Information |
|-----------|-----------------|--|
| INT | -32768 to 32767 | Bus controller default setting: -32768 |

Information:

- The default value of **-32767** corresponds to the minimum default value of **-10 VDC**.
- For a 0 to 20 mA configuration, this value should be set to **0**.
- For a 4 to 20 mA configuration, this value can be set to **-8192** (corresponds to 0 mA) in order to display values <4 mA.

Information:

It is important to note that this setting applies to all channels!

9.1.10.8.9.2 Upper limit value

Name:

ConfigOutput04

The upper limit value for analog values can be set in this register. If the analog value goes above the limit value, it is frozen at this value and the corresponding error status bit is set.

| Data type | Values | Information |
|-----------|-----------------|---------------------------------------|
| INT | -32767 to 32767 | Bus controller default setting: 32767 |

Information:

The default value **32767** corresponds to the maximum default value at **20 mA** or **+10 VDC**.

Information:

It is important to note that this setting applies to all channels!

9.1.10.8.10 Input status

Name:
StatusInput01

The module inputs are monitored in this register. A change in the monitoring status is actively transmitted as an error message. The following states are monitored depending on the settings:

| Value | Voltage signal ± 10 V | Current signal 0 to 20 mA | Current signal 4 to 20 mA |
|-------|-----------------------------|---|-----------------------------|
| 0 | No error | No error | No error |
| 1 | Lower limit value undershot | Default setting The input value has a lower limit of 0x0000. Underflow monitoring is therefore not necessary. After lower limit value change The input value is limited to the configured value. The status bit is set when the value falls below the lower limit. | Lower limit value undershot |
| 2 | Upper limit value overshoot | Upper limit value overshoot | Upper limit value overshoot |
| 3 | Open circuit | - | - |

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|-------------|-------|----------------------------|
| 0 - 1 | Channel 1 | 00 | No error |
| | | 01 | Lower limit value exceeded |
| | | 10 | Upper limit value exceeded |
| | | 11 | Open line |
| 2 - 3 | Channel 2 | 00 | No error |
| | | 01 | Lower limit value exceeded |
| | | 10 | Upper limit value exceeded |
| | | 11 | Open line |
| 4 - 7 | Reserved | 0 | |

Limiting the analog value

In addition to the status information, the analog value is fixed to the values listed below by default in an error state. The analog value is limited to the new values if the limit values were changed.

| Error state | Digital value on error (default values) |
|-----------------------------|---|
| Open circuit | +32767 (0x7FFF) |
| Upper limit value overshoot | +32767 (0x7FFF) |
| Lower limit value undershot | -32767 (0x8001) |
| Invalid value | -32768 (0x8000) |

9.1.10.8.11 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time | |
|--------------------------|-------------|
| Inputs without filtering | 100 μ s |
| Inputs with filtering | 500 μ s |

9.1.10.8.12 Minimum I/O update time

The minimum I/O update time specifies how far the bus cycle can be reduced so that an I/O update is performed in each cycle.

| Minimum I/O update time | |
|--------------------------|----------------------------|
| Inputs without filtering | 300 μ s for all inputs |
| Inputs with filtering | 1 ms |

9.1.11 X20AI2632

Data sheet version: 3.12

9.1.11.1 General information

The module is equipped with 2 inputs with 16-bit digital converter resolution. It is possible to select between the current and voltage signal using different terminals.

This module is designed for X20 6-pin terminal blocks. If needed (e.g. for logistical reasons), the 12-pin terminal block can also be used.

- 2 analog inputs
- Either current or voltage signal possible
- 16-bit digital converter resolution
- Simultaneous input conversion
- Very fast conversion time

9.1.11.2 Order data

| Model number | Short description | Figure |
|--------------|---|--|

Table 61: X20AI2632 - Technical data

- 1) To reduce power dissipation, B&R recommends bridging unused inputs on the terminals or configuring them as current signals.
- 2) Based on the current measured value.
- 3) Based on the 20 V measurement range.
- 4) Based on the 20 mA measurement range.

9.1.11.4 LED status indicators

For a description of the various operating modes, see "[Diagnostic LEDs](#)" on page 3787.

| Figure | LED | Color | Status | Description |
|---|-------|-------|--------------|---|
|  | r | Green | Off | No power to module |
| | | | Single flash | RESET mode |
| | | | Double flash | BOOT mode (during firmware update) ¹⁾ |
| | | | Blinking | PREOPERATIONAL mode |
| | | | On | RUN mode |
| | e | Red | Off | No power to module or everything OK |
| | | | On | Error or reset status |
| | | | Double flash | System error: <ul style="list-style-type: none"> • Violation of the scan time • Synchronization error |
| | 1 - 2 | Green | Off | Open line ²⁾ or sensor is disconnected |
| | | | On | Analog/digital converter running, value OK |

- 1) Depending on the configuration, a firmware update can take up to several minutes.
- 2) Open line detection only possible when measuring voltage.

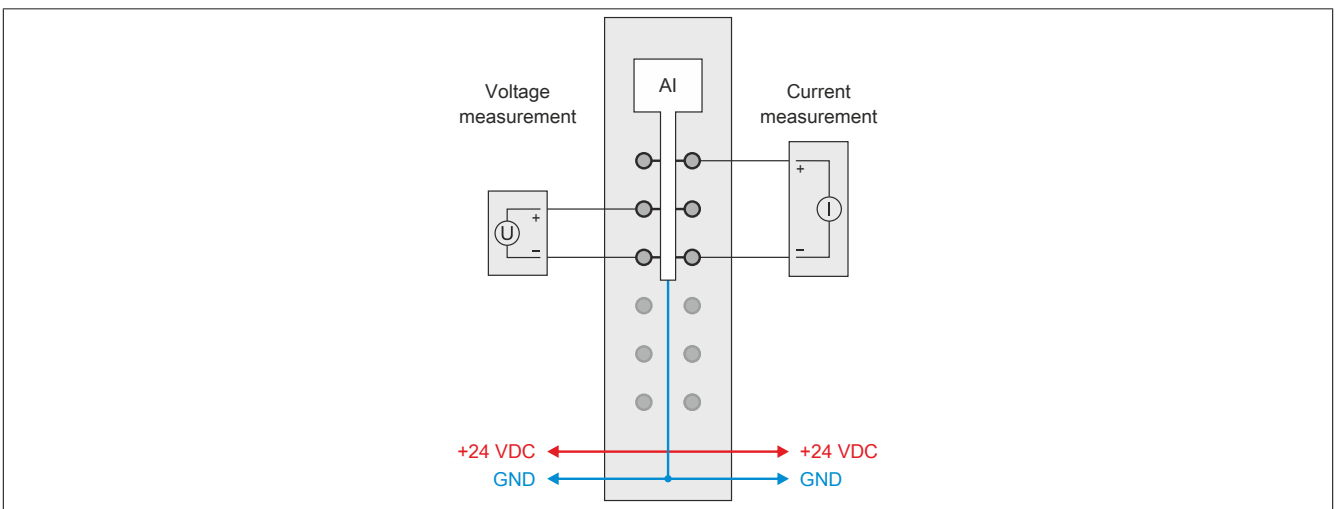

9.1.11.5 Pinout

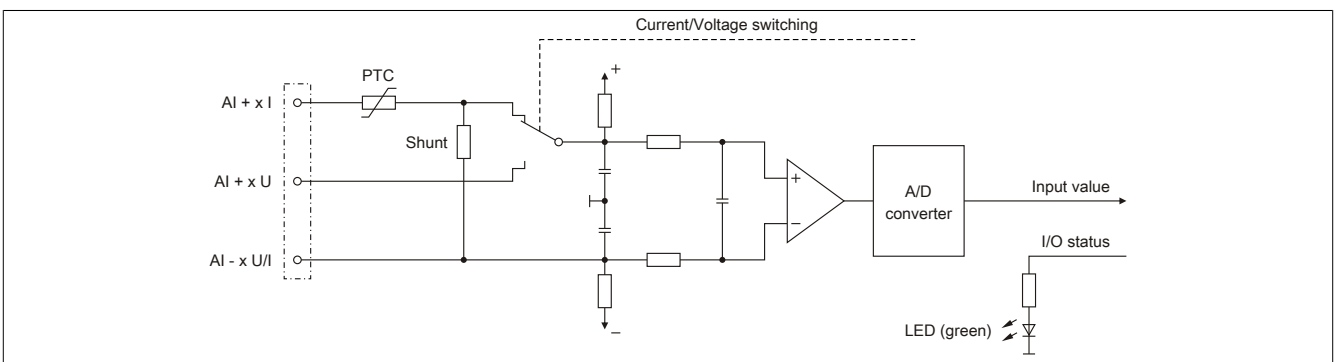

9.1.11.6 Connection example

To prevent disturbances, the following modules must be separated by at least one module:

- Bus receiver X20BR9300
- Supply module X20PS3300/X20PS3310
- Supply module X20PS9400/X20PS9402
- Supply module X20PS9500/X20PS9502
- CPU modules

9.1.11.7 Input circuit diagram

9.1.11.8 Register description

9.1.11.8.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section "General data points" on page 3790.

| Limit values | | | | | | | |
| 530 | - | MinInput01 | INT | | • | | |
| 562 | - | MinInput02 | INT | | • | | |
| 534 | - | MaxInput01 | INT | | • | | |
| 566 | - | MaxInput02 | INT | | • | | |
| 538 | - | Ch01MinMaxLatchCounter | UINT | | • | | |
| 570 | - | Ch02MinMaxLatchCounter | UINT | | • | | |

1) The offset specifies the position of the register within the CAN object.

9.1.11.8.3.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see ["Using I/O modules on the bus controller" on page 3789](#).

9.1.11.8.3.2 CAN I/O bus controller

The module occupies 1 analog logical slot on CAN I/O.

9.1.11.8.4 Configuration

This module is equipped with analog inputs with connected 16-bit A/D converters. Each of the inputs can be configured separately from one another either on the voltage or current input for the following areas:

- Permitted voltage: ± 10 V
- Permitted current: 0 to 20 mA

9.1.11.8.4.1 Channel configuration

Name:

ConfigOutput01 for channel 01

ConfigOutput06 for channel 02

The individual inputs for processing the current or voltage signal are configured in these registers. This configuration must be made in addition to using suitable terminals.

Filtering, analysis and error monitoring (bits 4 to 6) can only be used if the channel is enabled (bit 7 = 0).

| Data type | Values | Bus controller default setting |
|-----------|------------------------|--------------------------------|
| USINT | See the bit structure. | 0 |

Bit structure:

| Bit | Description | Value | Information |
|-------|---------------------------------|-------|--|
| 0 | Terminal selector | 0 | Voltage terminal for ± 10 VDC (bus controller default setting) |
| | | 1 | Current terminal for 0 to 20 mA |
| 1 | Gain selector | 0 | Voltage ± 10 VDC (bus controller default setting) |
| | | 1 | Current 0 to 20 mA |
| 2 - 3 | Reserved | - | |
| 4 | Filtering active | 0 | Inactive (bus controller default setting) |
| | | 1 | Active |
| 5 | Minimum/Maximum analysis active | 0 | Inactive (bus controller default setting) |
| | | 1 | Active |
| 6 | Error monitoring active | 0 | Inactive (bus controller default setting) |
| | | 1 | Active |
| 7 | Enables channel | 0 | Channel enabled (bus controller default setting) |
| | | 1 | Channel disabled |

9.1.11.8.4.2 Sampling and conversion

The analog signal is sampled in 2 steps.

- **Conversion task**

The A/D converter digitalizes the inputs signals for the enabled inputs once per conversion cycle. Then the results are available internally in the module. To ensure that this process is executed without delays, the corresponding task will be handled with very high priority.

The timespan needed for conversion results from the set sampling time.

- **Processing task**

The converted A/D converter values are further processed according to the user settings (filtering, scaling, limit values, error statistics, min/max analysis, hysteresis comparison). The task for this process has low priority. The timespan needed for further processing depends on the configured functions and is the second portion of the sampling time.

Cycle time violation

In normal operation, further processing is triggered after each conversion. The conversion and sampling tasks run synchronous to one another. If the predefined sampling time is not sufficient to convert all enabled channels and complete the configured functions, a cycle time violation occurs.

Sampling time

Name:

ConfigOutput24

The sampling time is set to μs in this register. This makes it possible to improve the sampling cycle (resolution = 1 μs). The lowest configurable cycle time is 50 μs .

| Data type | Value | Information |
|-----------|--------------|-------------------------------------|
| UINT | 50 to 10,000 | Bus controller default setting: 100 |

Information:

Values that are too low for the cycle time will result in cycle time violations.

9.1.11.8.4.3 Filtering (optional)

If filtering is enabled in the "Channel configuration" on page 415 register, the basic data of the A/D converter is filtered per channel. The following registers are available to specify the filter order and respective cutoff frequency for configuring the low-pass filter:

- "Filter order" on page 416
- "Filter cutoff frequency" on page 416

Filter order

Name:

ConfigOutput26 for channel 1

ConfigOutput28 for channel 2

The filter order is specified in this register. The "Filter cutoff frequency" on page 416 register is used to configure the respective cutoff frequency of the filter.

| Data type | Value | Information |
|-----------|--------|-----------------------------------|
| USINT | 1 to 4 | Bus controller default setting: 0 |

Internal filter orders greater than 1 are implemented as cascaded first-order filters.

Calculating the cutoff frequency of an nth-order filter:

$$\text{Cutoff frequency} = \text{Cutoff frequency}_N / ((2 \wedge (1 / n) - 1) \wedge 0.5)$$

Approximate calculation

$$y_n = a * x_n + b * y_{(n-1)}$$

$$a = \text{Sampling time}_{\text{Sec}} / (\text{Sampling time}_{\text{Sec}} + 1 / (2 \text{ Pi} * \text{Cutoff frequency}_{\text{Hz}}))$$

$$b = 1 - a$$

Information:

Since low-pass filtering takes place using an approximation procedure with fixed-point arithmetic, there are discrepancies to the effective cutoff frequency that depend on the sampling cycle and filter sequence.

Filter cutoff frequency

Name:

ConfigOutput27 for channel 1

ConfigOutput29 for channel 2

The cutoff frequency of the respective filter is configured in these registers.

| Data type | Value | Information |
|-----------|-------------|---|
| UINT | 1 to 65,535 | Cutoff frequency in hertz. Bus controller default setting: 0 |

Information:

The highest cutoff frequency is limited by the Nyquist Shannon sampling theorem (based on the sampling cycle time). The system does not check for violations of this sampling theorem.

9.1.11.8.4.4 Scaling (optional)

Scaling A/D converter data is an option for the user. The following registers are available for this:

- "User-defined gain" on page 417 (= ku)
- "User-defined offset" on page 417 (= du)

Scaling calculation:

Scaled value = $k * A/C \text{ value} + d$

Gain $k = k_{\text{Calibration}} * ku$

Offset $d = d_{\text{Calibration}} + du$

The value has to be limited since it can exceed the 16-bit constraints. To provide the greatest degree of flexibility, limiting is possible using the registers "Minimum limit value" on page 418 and "Maximum limit value" on page 418.

User-defined gain

Name:

ConfigOutput04 for channel 1

ConfigOutput09 for channel 2

The user-defined gain for the A/D converter data of the respective physical channel can be specified in these registers.

The value 65,536 (0x10000) corresponds to a gain of 1.

| Data type | Values | Information |
|-----------|------------------------------------|--|
| DINT | -2,147,483,648 to 2,147,483,647 | Bus controller default setting: 65,536 |

User-defined offset

Name:

ConfigOutput05 for channel 1

ConfigOutput10 for channel 2

The user-defined offset for the A/D converter data of the respective physical channel can be specified in this register.

The value 65,536 (0x10000) corresponds to an offset of 1.

| Data type | Values | Information |
|-----------|------------------------------------|-----------------------------------|
| DINT | -2,147,483,648 to 2,147,483,647 | Bus controller default setting: 0 |

9.1.11.8.4.5 User-defined limit values

If the application requires a limitation of the range of values, then the user can define his own limit values. These values will also be use for the module's error statistics. The following registers are available for this:

- "Minimum limit value" on page 418
- "Maximum limit value" on page 418

Information:

32-bit numbers are used inside the module. A limit value violation can therefore also be determined if the permitted range of values was defined from -32768 to 32767.

Minimum limit value

Name:

ConfigOutput02 for channel 1

ConfigOutput07 for channel 2

The minimum limit value is configured in this register. This limit value is also used for the underflow error statistics (see register "Ch0xUnderflow" on page 421).

| Data type | Values | Information |
|-----------|-----------------|--|
| INT | -32768 to 32767 | Bus controller default setting: -32768 |

Maximum limit value

Name:

ConfigOutput03 for channel 1

ConfigOutput08 for channel 2

The maximum limit value is configured in this register. This limit value is also used for the overflow error statistics (see register "Ch0xOverflow" on page 421).

| Data type | Values | Information |
|-----------|-----------------|---------------------------------------|
| INT | -32767 to 32767 | Bus controller default setting: 32767 |

9.1.11.8.5 Communication - General

The module's analog inputs convert current and voltage values with 16-bit resolution. This information can be used by the application with the help of the registers listed here.

9.1.11.8.5.1 Analog inputs

Name:

AnalogInput01 to AnalogInput02

The analog input value is mapped in this register depending on the configured operating mode.

| Data type | Value | Input signal: |
|-----------|-------------------|-----------------------------|
| INT | -32,768 to 32,767 | Voltage signal ± 10 VDC |
| | 0 to 32,767 | Current signal 0 to 20 mA |

9.1.11.8.5.2 Sampling cycle counter

Name:

SampleCycleCounter

The number of times the input signal has been sampled is provided in this register.

| Data type | Values |
|-----------|-------------|
| UINT | 0 to 65,535 |

9.1.11.8.5.3 Error monitoring and counters

Channel status

Name:

Channel01OK to Channel02OK

SyncStatus

ConversionCycle

This register collects error messages synchronously with the network cycle. Temporary error states that were registered in a conversion cycle remain active for at least 2 network cycles. In order to receive detailed error information, the corresponding error counters and X2X network events should also be observed.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|-------------------------------|-------|------------------|
| 0 | Channel01OK | 0 | OK |
| | | 1 | Errors |
| 1 | Channel02OK | 0 | OK |
| | | 1 | Errors |
| 2 - 5 | Reserved | - | |
| 6 | SyncStatus ¹⁾ | 0 | OK |
| | | 1 | Not synchronized |
| 7 | ConversionCycle ²⁾ | 0 | OK |
| | | 1 | Errors |

1) Identical to bit 0 of the registers "[SynchronizationViolationErrorCounter](#)" on page 419.

2) Identical to bit 0 of the registers "[SampleCycleViolationErrorCounter](#)" on page 419.

Synchronization error counter

Name:

SynchronizationViolationErrorCounter

This register counts how often the conversion task was triggered more than 5 μ s after the next-coming X2X cycle. In this case, the module is considered being no longer synchronized with X2X Link.

The counters in this register follow the rules of the event error counter, i.e. the count increased each time an error occurs or is reset. The last bit of the counter indicates the error status:

- Last bit = 1 → Error pending
- Last bit = 0 → No error

| Data type | Value | Information |
|-----------|------------|---------------------|
| UINT | 0 to 65535 | Counter value |
| | 0 to 1 | Bit 0: Error status |

Counter for faulty sampling cycles

Name:

SampleCycleViolationErrorCounter

This register is used to indicate the number of cycle time violations that have occurred thus far. A cycle time violation occurs if the conversion tasks initiates a sampling task before the last sampling cycle has finished. See "[Sampling and conversion](#)" on page 415.

The counters in this register follow the rules of the event error counter, i.e. the count increased each time an error occurs or is reset. The last bit of the counter indicates the error status:

- Last bit = 1 → Error pending
- Last bit = 0 → No error

| Data type | Value | Information |
|-----------|------------|---------------------|
| UINT | 0 to 65535 | Counter value |
| | 0 to 1 | Bit 0: Error status |

Range violation (neg. and pos.)

Name:

Channel01underflow to Channel02underflow

Channel01overflow to Channel02overflow

This register indicates whether the limit values defined by registers "[Minimum limit value](#)" on page 418 and "[Maximum limit value](#)" on page 418 have been overshoot or undershot. The individual bits in this register are identical to the values of the lowest bits of registers "[Ch0xUnderflow](#)" on page 421 and "[Ch0xOverflow](#)" on page 421.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|--------------------|-------|------------------------------------|
| 0 | Channel01underflow | 0 | No error |
| | | 1 | Range exceeded (.neg) on channel 1 |
| 1 | Channel02underflow | 0 | No error |
| | | 1 | Range exceeded (.neg) on channel 2 |
| 2 - 3 | Reserved | - | |
| 4 | Channel01overflow | 0 | No error |
| | | 1 | Range exceeded (.pos) on channel 1 |
| 5 | Channel02overflow | 0 | No error |
| | | 1 | Range exceeded (.pos) on channel 2 |
| 6 - 7 | Reserved | - | |

Working range violation (pos.)

Name:

Channel01outofrange to Channel02outofrange

This register indicates whether the input value overshoots the module's maximum measurement range. The individual bits in this register are identical to the values of the lowest bits of register "[Ch0xOutOfRange](#)" on page 420.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|---------------------|-------|---|
| 0 | Channel01outofrange | 0 | No error |
| | | 1 | Working range violation (pos.) of channel 1 |
| 1 | Channel02outofrange | 0 | No error |
| | | 1 | Working range violation (pos.) of channel 2 |
| 2 - 7 | Reserved | - | |

Counter for work range violations (pos.)

Name:

Ch01OutOfRange to Ch02OutOfRange

Errors outside of the module's maximum possible measurement range are indicated in this register. These errors lead to full-scale deflection of the A/D converter.

The counters in these registers follow the rules of the event error counter, i.e. the count increased each time an error occurs or is reset. The last bit of the counter indicates the error status:

- Last bit = 1 → Error pending
- Last bit = 0 → No error

This counter is only active if the static error counter is enabled (see register "[Channel configuration](#)" on page 415).

| Data type | Value | Information |
|-----------|------------|---------------------|
| UINT | 0 to 65535 | Counter value |
| | 0 to 1 | Bit 0: Error status |

Counter for range exceeded violations (neg.)

Name:

Ch01Underflow to Ch02Underflow

This register indicates range exceeded violations (neg.) of the value configured in the register "[Minimum limit value](#)" on page 418.

The counters in these registers follow the rules of the event error counter, i.e. the count increased each time an error occurs or is reset. The last bit of the counter indicates the error status:

- Last bit = 1 → Error pending
- Last bit = 0 → No error

This counter is only active if the static error counter is enabled (see register "[Channel configuration](#)" on page 415).

| Data type | Value | Information |
|-----------|------------|---------------------|
| UINT | 0 to 65535 | Counter value |
| | 0 to 1 | Bit 0: Error status |

Counter for range exceeded violations (pos.)

Name:

Ch01Overflow to Ch02Overflow

This register indicates range exceeded violations (pos.) of the value configured in the register "[Maximum limit value](#)" on page 418.

The counters in these registers follow the rules of the event error counter, i.e. the count increased each time an error occurs or is reset. The last bit of the counter indicates the error status:

- Last bit = 1 → Error pending
- Last bit = 0 → No error

This counter is only active if the static error counter is enabled (see register "[Channel configuration](#)" on page 415).

| Data type | Value | Information |
|-----------|------------|---------------------|
| UINT | 0 to 65535 | Counter value |
| | 0 to 1 | Bit 0: Error status |

9.1.11.8.6 Additional analysis functions

In addition to sampling the analog input signal, this module can also be used to perform additional analysis of the values obtained.

- **Limit value analysis**

If limit value analysis has been enabled for a channel, the sampled minimum and maximum values are latched internally in the module. A measurement period can be triggered using the control byte. When the respective configured edge is generated by the application, the limit values from the previous measurement period are displayed and the internal latch register is reset.

- **Recording sampled values**

If recording sampled values has been enabled for a channel, then the sampled values are additionally recorded in the module's internal FIFO memory. If the configured event occurs, the contents of the FIFO memory are transmitted to the application.

Information:

It is only possible to use the recording of sampled values if the module is operated on an X2X master that is an SG4 CPU.

9.1.11.8.6.1 Trigger condition on falling edge

Name:

ConfigOutput21

This register configures whether the falling edge is used to trigger the trace and determination of the input value in the register "Analysis control byte" on page 423.

| Data type | Values | Bus controller default setting |
|-----------|------------------------|--------------------------------|
| USINT | See the bit structure. | 0 |

Bit structure:

| Bit | Description | Value | Information |
|-------|----------------|-------|---|
| 0 | TraceTrigger01 | 0 | No trigger (bus controller default setting) |
| | | 1 | Falling edge active as trigger |
| 1 - 3 | Reserved | - | |
| 4 | MinMaxStart01 | 0 | No determination (bus controller default setting) |
| | | 1 | Falling edge determines input value of channel 1 |
| 5 | MinMaxStart02 | 0 | No determination (bus controller default setting) |
| | | 1 | Falling edge determines input value of channel 2 |
| 6 - 7 | Reserved | 0 | |

9.1.11.8.6.2 Trigger condition on rising edge

Name:

ConfigOutput22

This register configures whether the rising edge is used to trigger the trace and determination of the input value in the register "Analysis control byte" on page 423.

| Data type | Values | Bus controller default setting |
|-----------|------------------------|--------------------------------|
| USINT | See the bit structure. | 0 |

Bit structure:

| Bit | Description | Value | Information |
|-------|----------------|-------|---|
| 0 | TraceTrigger01 | 0 | Trigger not initiated on positive edge (bus controller default setting) |
| | | 1 | Rising edge active as trigger |
| 1 - 3 | Reserved | - | |
| 4 | MinMaxStart01 | 0 | No determination (bus controller default setting) |
| | | 1 | Rising edge determines input value of channel 1 |
| 5 | MinMaxStart02 | 0 | No determination (bus controller default setting) |
| | | 1 | Rising edge determines input value of channel 2 |
| 6 - 7 | Reserved | 0 | |

9.1.11.8.6.3 Analysis control byte

Name:

TraceTrigger01

MinMaxStart01 to MinMaxStart02

The trace function and determination of the minimum/maximum input values can be started in this register.

Whether the rising and/or falling edge is used to trigger the functions can be configured using the registers "[Trigger condition on falling edge](#)" on page 422 and "[Trigger condition on rising edge](#)" on page 422.

| Data type | Values | Bus controller default setting |
|-----------|------------------------|--------------------------------|
| USINT | See the bit structure. | 0 |

Bit structure:

| Bit | Description | Value | Information |
|-------|----------------|-------|--|
| 0 | TraceTrigger01 | 0 | Trigger/Trace not triggered (bus controller default setting) |
| | | 1 | Initiates trigger/trace |
| 1 - 3 | Reserved | - | |
| 4 | MinMaxStart01 | 0 | Determination not triggered (bus controller default setting) |
| | | 1 | Initiates determination of input value of channel 1 |
| 5 | MinMaxStart02 | 0 | Determination not triggered (bus controller default setting) |
| | | 1 | Initiates determination of input value of channel 2 |
| 6 - 7 | Reserved | - | |

Information:

To reduce the cyclic data transfer, this register combines the trace and limit value determination functions.

9.1.11.8.6.4 Analysis status byte

Name:

MinMaxStart01Readback to MinMaxStart02Readback

The currently requested module-internal analyses can be checked in this register.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|-----------------------|--------|---|
| 0 - 3 | Reserved | - | |
| 4 | MinMaxStart01Readback | 0 or 1 | Current state of the trigger bits for determining the limit values on the channel |
| 5 | MinMaxStart02Readback | 0 or 1 | Current state of the trigger bits for determining the limit values on the channel |
| 6 - 7 | Reserved | - | |

9.1.11.8.7 Limit values

Limit value analysis must be enabled for the desired channel. See "Channel configuration" on page 415. The sampled value of the channel is then compared to the [minimum](#) and [maximum values](#) that are stored internally in the module. If a new measurement period is initiated with the "Analysis control byte" on page 423 register, then the values of the previous measurement period can be read from the respective registers intended for this.

9.1.11.8.7.1 Minimum input values

Name:

MinInput01 to MinInput02

The minimum value of the preceding trigger period is saved in this register based on the filtered, scaled and user-defined limit values. The register value is 0 if the channel is inactive.

| Data type | Value |
|-----------|-------------------|
| INT | -32,768 to 32,767 |

9.1.11.8.7.2 Maximum input values

Name:

MaxInput01 to MaxInput02

The maximum value of the preceding trigger period is saved in this register based on the filtered, scaled and user-defined limit values. The register value is 0 if the channel is inactive.

| Data type | Value |
|-----------|-------------------|
| INT | -32,768 to 32,767 |

9.1.11.8.7.3 Limit value trigger counter

Name:

Ch01MinMaxLatchCounter to Ch02MinMaxLatchCounter

The number of valid events that trigger a new measurement period for the limit value analysis is counted in this register.

| Data type | Value |
|-----------|------------|
| UINT | 0 to 65535 |

9.1.11.8.8 Trace

If the module is operated on a SG4 CPU, the digitalized input values are recorded by the module. The module must be operated in "Supervised" mode in order to use the trace function.

Recording must be enabled for the desired channel. The enable bits can then control the recording at runtime. The sampled values are recorded in the module's internal FIFO memory.

If the previously defined state occurs on the channel, the contents of the FIFO memory are transmitted to the application. Whether the FIFO memory continued to be filled depends on how recording is configured.

Information:

The trace mechanism can only be used if the module is connected directly to the CPU, not if it is operated behind a bus controller.

9.1.11.8.8.1 Enable recording

Name:

TraceChannelEnable

The respective channel is enabled for the trace with this register.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|-------------|-------|------------------|
| 0 | Channel 1 | 0 | Channel disabled |
| | | 1 | Channel enabled |
| 1 | Channel 2 | 0 | Channel disabled |
| | | 1 | Channel enabled |
| 2 - 7 | Reserved | - | |

9.1.11.8.8.2 Number of values to be recorded

Name:

TraceSampleDepth

16 kB are available on the module for the trace. The FIFO memory limitation means that a maximum of 8192 analog values can be recorded. This memory is divided up equally among the enabled channels. The actual number of maximum possible recordings therefore depends on the number of channels enabled for trace:

1 channel enabled: Up to 8192 recordings

2 channels enabled: Up to 4096 recordings per channel

| Data type | Value | Function |
|-----------|-----------|----------------------|
| UINT | 2 to 8192 | Default value = 1024 |

9.1.11.8.8.3 Recording priority

Name:

ConfigOutput25

The priority of the trace can be increased with this register.

| Data type | Value | Function |
|-----------|-------|---|
| USINT | 3 | Standard |
| | 6 | Trace priority higher than X2X Link communication |

9.1.11.8.8.4 Starting a recording

Name:

TraceEnable01

This register starts the recording according to the specifications for edge control or the comparator.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|---------------|-------|-----------------------------|
| 0 | TraceEnable01 | 0 | Disables the trace function |
| | | 1 | Enables the trace function |
| 1 - 7 | Reserved | - | |

9.1.11.8.8.5 Recording status

Name:

TraceEnabled

TraceWriteActive

TraceReadActive

ReadyForTrigger

TriggerActive

TraceOk

TraceError

The status of the trace is represented in this register.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|-----|------------------|-------|---------------------------------------|
| 0 | TraceEnabled | 0 | Trace inactive |
| | | 1 | Trace active |
| 1 | Reserved | - | |
| 2 | TraceWriteActive | 0 | Data not recorded |
| | | 1 | Data recorded |
| 3 | TraceReadActive | 0 | Data not output/read |
| | | 1 | Data output/read |
| 4 | ReadyForTrigger | 0 | Not ready for triggering |
| | | 1 | Ready for triggering |
| 5 | TriggerActive | 0 | No trigger active or already executed |
| | | 1 | Trigger active |
| 6 | TraceOk | 0 | Overflow or inactive |
| | | 1 | No overflow |
| 7 | TraceError | 0 | No error or inactive |
| | | 1 | Trace buffer full |

9.1.11.8.8.6 Free trace buffer

Name:

FreeBufferSize

Specifies the available FIFO memory area in bytes for the trace

| Data type | Values |
|-----------|-------------|
| UINT | 0 to 65,535 |

9.1.11.8.8.7 Counter for trace triggers

Name:

TriggerCount

The number of trigger events that have occurred since [starting the trace](#) is indicated in this register.

| Data type | Values |
|-----------|-------------|
| UINT | 0 to 65,535 |

9.1.11.8.8.8 Counter for faulty recording triggers

Name:

TriggerFailCount

Counts the trigger events for which the trace could not be performed.

| Data type | Values |
|-----------|-------------|
| UINT | 0 to 65,535 |

9.1.11.8.8.9 Comparator for trigger conditions

In order to adapt the trace as closely as possible to the requirements of the application, the trace function can also be controlled using the comparator. Threshold values (hysteresis) can be defined within the permitted range of values to do so. 2 status bits are then generated for each enabled channel:

- **InRange bit**

The InRange status is "1" if the measured value falls within the defined limits.

The InRange status is "0" if the measured value falls outside the defined limits.

- **Threshold value bit**

The threshold value bit is "1" if the measured value exceeds the upper threshold value.

The threshold value bit is "0" if the measured value falls below the lower threshold value.

The InRange and threshold value bits for all channels are grouped together in the lower-value byte of the "[CompStateCollection](#)" on page 428 register. In addition, the states of the previous sampling are stored in the higher-value byte.

The 4 status messages of each channel can be linked according to the following logic via a logical connective mask using AND or OR operators and used as a trace trigger:

```
delta = (Current_HysteresisStatus ^ NominalValues)// Different between current status and preset
cond = delta & Selected_HysteresisStatusBits// Eliminate irrelevant status messages
cond = Selected_HysteresisStatusBits (Current_HysteresisStatus ^ NominalValues)
if((0==(cond & ~LogicalOperators)) &&
(0!=(~cond & LogicalOperators))) {=> Generate trigger event}
```

Selected_HysteresisStatusBits
Current_HysteresisStatus
Nominal values
Logical operators

Corresponds to register:

"cfgComp_EnableMask" on page 429
"CompStateCollection" on page 428
"cfgComp_NominalState" on page 429
"cfgComp_ConditionTypeMask" on page 430

Lower limit value for hysteresis

Name:

cfgComp_LowLimitCh01 to cfgComp_LowLimitCh02

The lower limit value for hysteresis is configured in this register.

| Data type | Values |
|-----------|-----------------|
| INT | -32768 to 32767 |

Upper limit value for hysteresis

Name:

cfgComp_HighLimitCh01 to cfgComp_HighLimitCh02

The upper limit value for hysteresis is configured in this register.

| Data type | Values |
|-----------|-----------------|
| INT | -32768 to 32767 |

Hysteresis status of the channels

Name:

CompStateCollection

The hysteresis status of the input channels for the current and last cycle are represented in this register.

| Data type | Values |
|-----------|------------------------|
| UINT | See the bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|---------|--|-------|---|
| 0 | Channel01 hysteresis status in the current cycle | 0 | Lower limit value exceeded |
| | | 1 | Upper limit value exceeded |
| 1 | Channel01 InRange status in the current cycle | 0 | Value lies outside of range defined by the limit values |
| | | 1 | Value between lower and upper limit values |
| 2 | Channel02 hysteresis status in the current cycle | 0 | Lower limit value exceeded |
| | | 1 | Upper limit value exceeded |
| 3 | Channel02 InRange status in the current cycle | 0 | Value lies outside of range defined by the limit values |
| | | 1 | Value between lower and upper limit values |
| 4 - 7 | Reserved | - | |
| 8 | Channel01 hysteresis status in the last cycle | 0 | Lower limit value exceeded |
| | | 1 | Upper limit value exceeded |
| 9 | Channel01 InRange status in the last cycle | 0 | Value lies outside of range defined by the limit values |
| | | 1 | Value between lower and upper limit values |
| 10 | Channel02 hysteresis status in the last cycle | 0 | Lower limit value exceeded |
| | | 1 | Upper limit value exceeded |
| 11 | Channel02 InRange status in the last cycle | 0 | Value lies outside of range defined by the limit values |
| | | 1 | Value between lower and upper limit values |
| 12 - 15 | Reserved | - | |

Comparison state of the channels

Name:

cfgComp_NominalState

The desired comparison state for the hysteresis status is indicated in this register.

| Data type | Values |
|-----------|------------------------|
| UINT | See the bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|---------|--|-------|---|
| 0 | Channel01 hysteresis status in the current cycle | 0 | Lower limit value exceeded |
| | | 1 | Upper limit value exceeded |
| 1 | Channel01 InRange status in the current cycle | 0 | Value lies outside of range defined by the limit values |
| | | 1 | Value between lower and upper limit values |
| 2 | Channel02 hysteresis status in the current cycle | 0 | Lower limit value exceeded |
| | | 1 | Upper limit value exceeded |
| 3 | Channel02 InRange status in the current cycle | 0 | Value lies outside of range defined by the limit values |
| | | 1 | Value between lower and upper limit values |
| 4 - 7 | Reserved | - | |
| 8 | Channel01 hysteresis status in the last cycle | 0 | Lower limit value exceeded |
| | | 1 | Upper limit value exceeded |
| 9 | Channel01 InRange status in the last cycle | 0 | Value lies outside of range defined by the limit values |
| | | 1 | Value between lower and upper limit values |
| 10 | Channel02 hysteresis status in the last cycle | 0 | Lower limit value exceeded |
| | | 1 | Upper limit value exceeded |
| 11 | Channel02 InRange status in the last cycle | 0 | Value lies outside of range defined by the limit values |
| | | 1 | Value between lower and upper limit values |
| 12 - 15 | Reserved | - | |

Information:

This is a "whitelist", i.e. the trace starts as soon as the current status message takes on the state predefined here.

One or more matches will be necessary depending on the selection of the relevant hysteresis status bits and logical connective operators.

Selecting the relevant hysteresis status bits

Name:

cfgComp_EnableMask

This register selects which status bits of the hysteresis comparison should be used to generate the trigger.

For more information about using this register, see ["Comparator for trigger conditions" on page 427](#).

| Data type | Values |
|-----------|------------------------|
| UINT | See the bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|---------|--|-------|--------------------|
| 0 | Channel01 hysteresis status in the current cycle | 0 | Do not use |
| | | 1 | Use for generation |
| 1 | Channel01 InRange status in the current cycle | 0 | Do not use |
| | | 1 | Use for generation |
| 2 | Channel02 hysteresis status in the current cycle | 0 | Do not use |
| | | 1 | Use for generation |
| 3 | Channel02 InRange status in the current cycle | 0 | Do not use |
| | | 1 | Use for generation |
| 4 - 7 | Reserved | - | |
| 8 | Channel01 hysteresis status in the last cycle | 0 | Do not use |
| | | 1 | Use for generation |
| 9 | Channel01 InRange status in the last cycle | 0 | Do not use |
| | | 1 | Use for generation |
| 10 | Channel02 hysteresis status in the last cycle | 0 | Do not use |
| | | 1 | Use for generation |
| 11 | Channel02 InRange status in the last cycle | 0 | Do not use |
| | | 1 | Use for generation |
| 12 - 15 | Reserved | - | |

Logical connective operators for hysteresis status bits

Name:

cfgComp_ConditionTypeMask

The desired state operators with which the status bits are linked to one another to generate a trigger are selected in this register.

At least one OR operation must be configured, but it does not necessarily have to be located on a channel configured with "1" in the "cfgComp_EnableMask" on page 429 register.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|---------|--|-------|-------------------|
| 0 | Channel01 hysteresis status in the current cycle | 0 | Use AND operation |
| | | 1 | Use OR operation |
| 1 | Channel01 InRange status in the current cycle | 0 | Use AND operation |
| | | 1 | Use OR operation |
| 2 | Channel02 hysteresis status in the current cycle | 0 | Use AND operation |
| | | 1 | Use OR operation |
| 3 | Channel02 InRange status in the current cycle | 0 | Use AND operation |
| | | 1 | Use OR operation |
| 4 - 7 | Reserved | - | |
| 8 | Channel01 hysteresis status in the last cycle | 0 | Use AND operation |
| | | 1 | Use OR operation |
| 9 | Channel01 InRange status in the last cycle | 0 | Use AND operation |
| | | 1 | Use OR operation |
| 10 | Channel02 hysteresis status in the last cycle | 0 | Use AND operation |
| | | 1 | Use OR operation |
| 11 | Channel02 InRange status in the last cycle | 0 | Use AND operation |
| | | 1 | Use OR operation |
| 12 - 15 | Reserved | - | |

9.1.11.8.8.10 Time-offset trace

Additional conditions for shifting the starting and stopping points can be defined if the trace should be chronologically offset to the trigger.

Starting the trace

Name:

TraceTriggerStart

The starting position is defined relative to the configured trigger condition in this register. Positive values mean that the trace takes place x samples after the trigger condition. Negative values mean that the trace takes place x samples before the trigger condition.

The value -32768 performs the trace without regard for the configured trigger condition. If the trace memory is completely full, then the oldest recorded value is overwritten (FIFO principle).

"Trace start" in the I/O configuration or the registers "[Trigger condition on falling edge](#)" on page 422 and "[Trigger condition on rising edge](#)" on page 422 determine whether a positive, negative or any edge must be triggered.

| Data type | Value | Information |
|-----------|-----------------|---|
| INT | -32767 to 32767 | |
| | -32768 | Continuous trace without a stopping point |

Stopping the trace

Name:

TraceTriggerStop

The stopping position is defined relative to the configured trigger condition in this register.

- When configuring an early trigger event, this value refers to the trigger event.
- When configuring a delayed trigger event, this value refers to the starting event.

| Data type | Values |
|-----------|-------------|
| UINT | 0 to 65,535 |

9.1.11.8.9 Acyclic frame size

Name:
AsynSize

When the stream is used, data is exchanged internally between the module and CPU. For this purpose, a defined amount of acyclic bytes is reserved for this slot.

Increasing the acyclic frame size leads to increased data throughput on this slot.

Information:

This configuration involves a driver setting that cannot be changed during runtime!

| Data type | Value | Information |
|-----------|---------|---|
| - | 8 to 28 | Acyclic frame size in bytes. Default = 24 |

9.1.11.8.10 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time | |
|-----------------------------------|--------|
| Standard priority | 200 µs |
| High priority with trace function | 300 µs |

9.1.11.8.11 Minimum I/O update time

There is no limitation or dependency on the bus cycle time.

The I/O update time is defined using the "Sampling time" register. The fastest possible sampling time depends on the number of channels to be converted and the configuration.

9.1.12 X20AI2632-1

Data sheet version: 3.12

9.1.12.1 General information

The module is equipped with 2 inputs with 16-bit digital converter resolution. It is possible to select between the current and voltage signal using different terminals.

This module is designed for X20 6-pin terminal blocks. If needed (e.g. for logistical reasons), the 12-pin terminal block can also be used.

- 2 analog inputs
- Either current or voltage signal possible
- Extended signal range
- 16-bit digital converter resolution
- Simultaneous input conversion
- Very fast conversion time

9.1.12.2 Order data

| Model number | Short description | Figure |
|--------------|---|--|
| X20AI2632-1 | X20 analog input module, 2 inputs, ± 11 V or 0 to 22 mA, 16-bit converter resolution, configurable input filter |  |
| | Analog inputs | |
| | Required accessories | |
| | Bus modules | |
| X20BM11 | X20 bus module, 24 VDC keyed, internal I/O supply continuous | |
| X20BM15 | X20 bus module, with node number switch, 24 VDC keyed, internal I/O supply continuous | |
| | Terminal blocks | |
| X20TB06 | X20 terminal block, 6-pin, 24 VDC keyed | |
| X20TB12 | X20 terminal block, 12-pin, 24 VDC keyed | |
| | | |

Table 63: X20AI2632-1 - Technical data

- 1) To reduce power dissipation, B&R recommends bridging unused inputs on the terminals or configuring them as current signals.
- 2) Based on the current measured value.
- 3) Based on the 22 V measurement range.
- 4) Based on the 22 mA measurement range.

9.1.12.4 LED status indicators

For a description of the various operating modes, see "[Diagnostic LEDs](#)" on page 3787.

| Figure | LED | Color | Status | Description |
|---|-------|-------|--------------|---|
|  | r | Green | Off | No power to module |
| | | | Single flash | RESET mode |
| | | | Double flash | BOOT mode (during firmware update) ¹⁾ |
| | | | Blinking | PREOPERATIONAL mode |
| | | | On | RUN mode |
| | e | Red | Off | No power to module or everything OK |
| | | | On | Error or reset status |
| | | | Double flash | System error: <ul style="list-style-type: none"> • Violation of the scan time • Synchronization error |
| | 1 - 2 | Green | Off | Open line ²⁾ or sensor is disconnected |
| | | | On | Analog/digital converter running, value OK |

- 1) Depending on the configuration, a firmware update can take up to several minutes.
- 2) Open line detection only possible when measuring voltage.

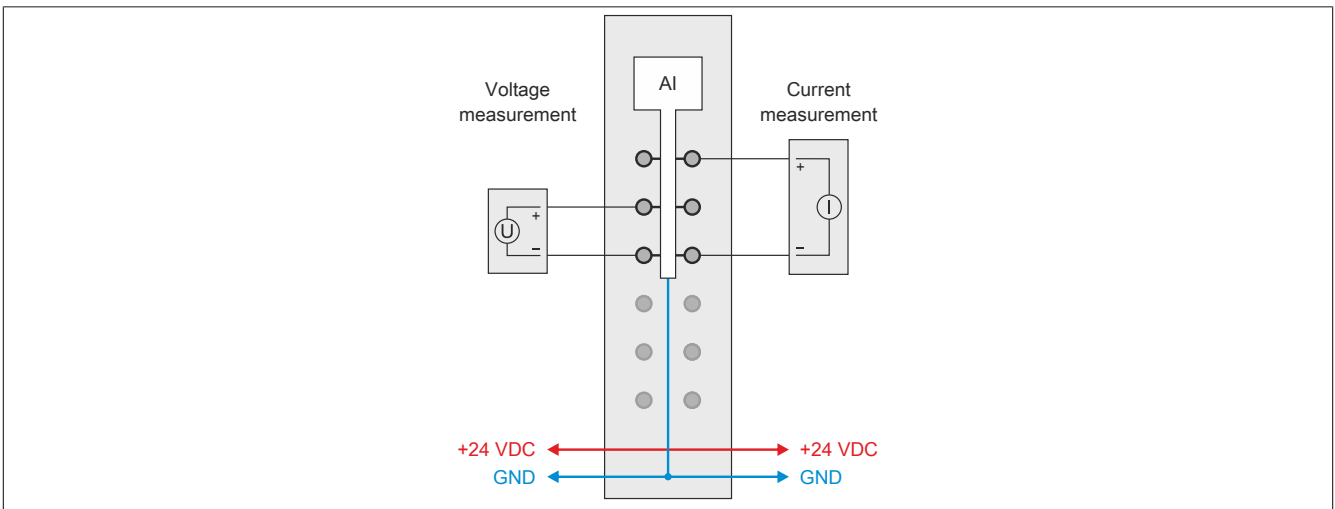

9.1.12.5 Pinout

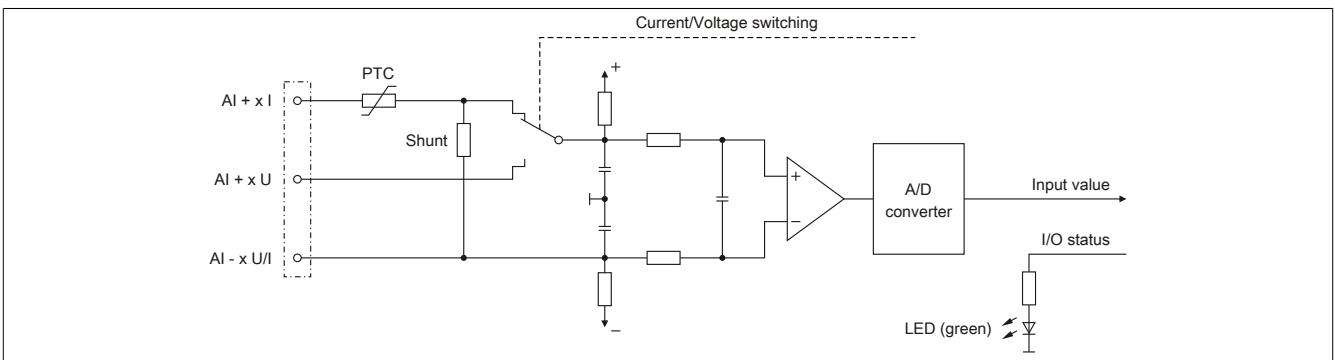

9.1.12.6 Connection example

To prevent disturbances, the following modules must be separated by at least one module:

- Bus receiver X20BR9300
- Supply module X20PS3300/X20PS3310
- Supply module X20PS9400/X20PS9402
- Supply module X20PS9500/X20PS9502
- CPU modules

9.1.12.7 Input circuit diagram

9.1.12.8 Register description

9.1.12.8.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section "General data points" on page 3790.

9.1.12.8.2 Function model 0 - default

1) The offset specifies the position of the register within the CAN object.

9.1.12.8.3.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see ["Using I/O modules on the bus controller" on page 3789](#).

9.1.12.8.3.2 CAN I/O bus controller

The module occupies 1 analog logical slot on CAN I/O.

9.1.12.8.4 Configuration

This module is equipped with analog inputs with connected 16-bit A/D converters. Each of the inputs can be configured separately from one another either on the voltage or current input for the following areas:

- Permitted voltage: ± 11 V at 20 Ω
- Permitted current: 22 mA (maximum 40 mA) (<400 Ω)

9.1.12.8.4.1 Channel configuration

Name:

ConfigOutput01 for channel 01

ConfigOutput06 for channel 02

The individual inputs for processing the current or voltage signal are configured in these registers. This configuration must be made in addition to using suitable terminals.

Filtering, analysis and error monitoring (bits 4 to 6) can only be used if the channel is enabled (bit 7 = 0).

| Data type | Values | Bus controller default setting |
|-----------|------------------------|--------------------------------|
| USINT | See the bit structure. | 0 |

Bit structure:

| Bit | Description | Value | Information |
|-------|---|-------|--|
| 0 | Terminal selector | 0 | Voltage terminal for ± 11 VDC (bus controller default setting) |
| | | 1 | Current terminal for 0 to 22 mA |
| 1 | Gain selector | 0 | Voltage ± 11 VDC (bus controller default setting) |
| | | 1 | Current 0 to 22 mA |
| 2 - 3 | Reserved | - | |
| 4 | Filtering active (only if bit 7 = 0) | 0 | Inactive (bus controller default setting) |
| | | 1 | Active |
| 5 | Minimum/Maximum analysis active (only if bit 7 = 0) | 0 | Inactive (bus controller default setting) |
| | | 1 | Active |
| 6 | Error monitoring active (only if bit 7 = 0) | 0 | Inactive (bus controller default setting) |
| | | 1 | Active |
| 7 | Enables channel | 0 | Channel enabled (bus controller default setting) |
| | | 1 | Channel disabled |

9.1.12.8.4.2 Sampling and conversion

The analog signal is sampled in 2 steps.

- **Conversion task**

The A/D converter digitalizes the inputs signals for the enabled inputs once per conversion cycle. Then the results are available internally in the module. To ensure that this process is executed without delays, the corresponding task will be handled with very high priority.

The timespan needed for conversion results from the set sampling time.

- **Processing task**

The converted A/D converter values are further processed according to the user settings (filtering, scaling, limit values, error statistics, min/max analysis, hysteresis comparison). The task for this process has low priority. The timespan needed for further processing depends on the configured functions and is the second portion of the sampling time.

Cycle time violation

In normal operation, further processing is triggered after each conversion. The conversion and sampling tasks run synchronous to one another. If the predefined sampling time is not sufficient to convert all enabled channels and complete the configured functions, a cycle time violation occurs.

Sampling time

Name:

ConfigOutput24

The sampling time is set to μs in this register. This makes it possible to improve the sampling cycle (resolution = 1 μs). The lowest configurable cycle time is 50 μs .

| Data type | Value | Information |
|-----------|--------------|-------------------------------------|
| UINT | 50 to 10,000 | Bus controller default setting: 100 |

Information:

Values that are too low for the cycle time will result in cycle time violations.

9.1.12.8.4.3 Filtering (optional)

If filtering is enabled in the "Channel configuration" on page 440 register, the basic data of the A/D converter is filtered per channel. The following registers are available to specify the filter order and respective cutoff frequency for configuring the low-pass filter:

- "Filter order" on page 441
- "Filter cutoff frequency" on page 441

Filter order

Name:

ConfigOutput26 for channel 1

ConfigOutput28 for channel 2

The filter order is specified in this register. The "Filter cutoff frequency" on page 441 register is used to configure the respective cutoff frequency of the filter.

| Data type | Value | Information |
|-----------|--------|-----------------------------------|
| USINT | 1 to 4 | Bus controller default setting: 0 |

Internal filter orders greater than 1 are implemented as cascaded first-order filters.

Calculating the cutoff frequency of an nth-order filter:

$$\text{Cutoff frequency} = \text{Cutoff frequency}_N / ((2 \wedge (1 / n) - 1) \wedge 0.5)$$

Approximate calculation

$$y_n = a * x_n + b * y_{(n-1)}$$

$$a = \text{Sampling time}_{\text{Sec}} / (\text{Sampling time}_{\text{Sec}} + 1 / (2 \text{ Pi} * \text{Cutoff frequency}_{\text{Hz}}))$$

$$b = 1 - a$$

Information:

Since low-pass filtering takes place using an approximation procedure with fixed-point arithmetic, there are discrepancies to the effective cutoff frequency that depend on the sampling cycle and filter sequence.

Filter cutoff frequency

Name:

ConfigOutput27 for channel 1

ConfigOutput29 for channel 2

The cutoff frequency of the respective filter is configured in these registers.

| Data type | Value | Information |
|-----------|-------------|---|
| UINT | 1 to 65,535 | Cutoff frequency in hertz. Bus controller default setting: 0 |

Information:

The highest cutoff frequency is limited by the Nyquist Shannon sampling theorem (based on the sampling cycle time). The system does not check for violations of this sampling theorem.

9.1.12.8.4.4 Scaling (optional)

Scaling A/D converter data is an option for the user. The following registers are available for this:

- "User-defined gain" on page 442 (= ku)
- "User-defined offset" on page 442 (= du)

Scaling calculation:

Scaled value = $k * A/C \text{ value} + d$

Gain $k = k_{\text{Calibration}} * ku$

Offset $d = d_{\text{Calibration}} + du$

The value has to be limited since it can exceed the 16-bit constraints. To provide the greatest degree of flexibility, limiting is possible using the registers "Minimum limit value" on page 443 and "Maximum limit value" on page 443.

User-defined gain

Name:

ConfigOutput04 for channel 1

ConfigOutput09 for channel 2

The user-defined gain for the A/D converter data of the respective physical channel can be specified in these registers.

The value 65,536 (0x10000) corresponds to a gain of 1.

| Data type | Values | Information |
|-----------|------------------------------------|--|
| DINT | -2,147,483,648 to 2,147,483,647 | Bus controller default setting: 65,536 |

User-defined offset

Name:

ConfigOutput05 for channel 1

ConfigOutput10 for channel 2

The user-defined offset for the A/D converter data of the respective physical channel can be specified in this register.

The value 65,536 (0x10000) corresponds to an offset of 1.

| Data type | Values | Information |
|-----------|------------------------------------|-----------------------------------|
| DINT | -2,147,483,648 to 2,147,483,647 | Bus controller default setting: 0 |

9.1.12.8.4.5 User-defined limit values

If the application requires a limitation of the range of values, then the user can define his own limit values. These values will also be use for the module's error statistics. The following registers are available for this:

- "Minimum limit value" on page 443
- "Maximum limit value" on page 443

Information:

32-bit numbers are used inside the module. A limit value violation can therefore also be determined if the permitted range of values was defined from -32768 to 32767.

Minimum limit value

Name:

ConfigOutput02 for channel 1

ConfigOutput07 for channel 2

The minimum limit value is configured in this register. This limit value is also used for the underflow error statistics (see register "Ch0xUnderflow" on page 446).

| Data type | Values | Information |
|-----------|-----------------|--|
| INT | -32768 to 32767 | Bus controller default setting: -32768 |

Maximum limit value

Name:

ConfigOutput03 for channel 1

ConfigOutput08 for channel 2

The maximum limit value is configured in this register. This limit value is also used for the overflow error statistics (see register "Ch0xOverflow" on page 446).

| Data type | Values | Information |
|-----------|-----------------|---------------------------------------|
| INT | -32767 to 32767 | Bus controller default setting: 32767 |

9.1.12.8.5 Communication - General

The module's analog inputs convert current and voltage values with 16-bit resolution. This information can be used by the application with the help of the registers listed here.

9.1.12.8.5.1 Analog input channels

Name:

AnalogInput01 to AnalogInput02

The analog input value is mapped in this register depending on the configured operating mode.

| Data type | Value | Input signal: |
|-----------|-------------------|-----------------------------|
| INT | -32,768 to 32,767 | Voltage signal ± 11 VDC |
| | 0 to 32,767 | Current signal 0 to 22 mA |

9.1.12.8.5.2 Sampling cycle counter

Name:

SampleCycleCounter

The number of times the input signal has been sampled is provided in this register.

| Data type | Values |
|-----------|-------------|
| UINT | 0 to 65,535 |

9.1.12.8.5.3 Error monitoring and counters

Channel status

Name:

Channel01OK to Channel02OK

SyncStatus

ConversionCycle

This register collects error messages synchronously with the network cycle. Temporary error states that were registered in a conversion cycle remain active for at least 2 network cycles. In order to receive detailed error information, the corresponding error counters and X2X network events should also be observed.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|-------------------------------|-------|------------------|
| 0 | Channel01OK | 0 | OK |
| | | 1 | Errors |
| 1 | Channel02OK | 0 | OK |
| | | 1 | Errors |
| 2 - 5 | Reserved | - | |
| 6 | SyncStatus ¹⁾ | 0 | OK |
| | | 1 | Not synchronized |
| 7 | ConversionCycle ²⁾ | 0 | OK |
| | | 1 | Errors |

1) Identical to bit 0 of the registers "[SynchronizationViolationErrorCounter](#)" on page 444.

2) Identical to bit 0 of the registers "[SampleCycleViolationErrorCounter](#)" on page 444.

Synchronization error counter

Name:

SynchronizationViolationErrorCounter

This register counts how often the conversion task was triggered more than 5 μ s after the next-coming X2X cycle. In this case, the module is considered being no longer synchronized with X2X Link.

The counters in this register follow the rules of the event error counter, i.e. the count increased each time an error occurs or is reset. The last bit of the counter indicates the error status:

- Last bit = 1 → Error pending
- Last bit = 0 → No error

| Data type | Value | Information |
|-----------|------------|---------------------|
| UINT | 0 to 65535 | Counter value |
| | 0 to 1 | Bit 0: Error status |

Counter for faulty sampling cycles

Name:

SampleCycleViolationErrorCounter

This register is used to indicate the number of cycle time violations that have occurred thus far. A cycle time violation occurs if the conversion tasks initiates a sampling task before the last sampling cycle has finished. See "[Sampling and conversion](#)" on page 440.

The counters in this register follow the rules of the event error counter, i.e. the count increased each time an error occurs or is reset. The last bit of the counter indicates the error status:

- Last bit = 1 → Error pending
- Last bit = 0 → No error

| Data type | Value | Information |
|-----------|------------|---------------------|
| UINT | 0 to 65535 | Counter value |
| | 0 to 1 | Bit 0: Error status |

Range violation (neg. and pos.)

Name:

Channel01underflow to Channel02underflow

Channel01overflow to Channel02overflow

This register indicates whether the limit values defined by registers "Minimum limit value" on page 443 and "Maximum limit value" on page 443 have been overshoot or undershot. The individual bits in this register are identical to the values of the lowest bits of registers "Ch0xUnderflow" on page 446 and "Ch0xOverflow" on page 446.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|--------------------|-------|------------------------------------|
| 0 | Channel01underflow | 0 | No error |
| | | 1 | Range exceeded (.neg) on channel 1 |
| 1 | Channel02underflow | 0 | No error |
| | | 1 | Range exceeded (.neg) on channel 2 |
| 2 - 3 | Reserved | - | |
| 4 | Channel01overflow | 0 | No error |
| | | 1 | Range exceeded (.pos) on channel 1 |
| 5 | Channel02overflow | 0 | No error |
| | | 1 | Range exceeded (.pos) on channel 2 |
| 6 - 7 | Reserved | - | |

Working range violation (pos.)

Name:

Channel01outofrange to Channel02outofrange

This register indicates whether the input value overshoots the module's maximum measurement range. The individual bits in this register are identical to the values of the lowest bits of register "Ch0xOutOfRange" on page 445.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|---------------------|-------|---|
| 0 | Channel01outofrange | 0 | No error |
| | | 1 | Working range violation (pos.) of channel 1 |
| 1 | Channel02outofrange | 0 | No error |
| | | 1 | Working range violation (pos.) of channel 2 |
| 2 - 7 | Reserved | - | |

Counter for work range violations (pos.)

Name:

Ch01OutOfRange to Ch02OutOfRange

Errors outside of the module's maximum possible measurement range are indicated in this register. These errors lead to full-scale deflection of the A/D converter.

The counters in these registers follow the rules of the event error counter, i.e. the count increased each time an error occurs or is reset. The last bit of the counter indicates the error status:

- Last bit = 1 → Error pending
- Last bit = 0 → No error

This counter is only active if the static error counter is enabled (see register "Channel configuration" on page 440).

| Data type | Value | Information |
|-----------|------------|---------------------|
| UINT | 0 to 65535 | Counter value |
| | 0 to 1 | Bit 0: Error status |

Counter for range exceeded violations (neg.)

Name:

Ch01Underflow to Ch02Underflow

This register indicates range exceeded violations (neg.) of the value configured in the register "[Minimum limit value](#)" on page 443.

The counters in these registers follow the rules of the event error counter, i.e. the count increased each time an error occurs or is reset. The last bit of the counter indicates the error status:

- Last bit = 1 → Error pending
- Last bit = 0 → No error

This counter is only active if the static error counter is enabled (see register "[Channel configuration](#)" on page 440).

| Data type | Value | Information |
|-----------|------------|---------------------|
| UINT | 0 to 65535 | Counter value |
| | 0 to 1 | Bit 0: Error status |

Counter for range exceeded violations (pos.)

Name:

Ch01Overflow to Ch02Overflow

This register indicates range exceeded violations (pos.) of the value configured in the register "[Maximum limit value](#)" on page 443.

The counters in these registers follow the rules of the event error counter, i.e. the count increased each time an error occurs or is reset. The last bit of the counter indicates the error status:

- Last bit = 1 → Error pending
- Last bit = 0 → No error

This counter is only active if the static error counter is enabled (see register "[Channel configuration](#)" on page 440).

| Data type | Value | Information |
|-----------|------------|---------------------|
| UINT | 0 to 65535 | Counter value |
| | 0 to 1 | Bit 0: Error status |

9.1.12.8.6 Additional analysis functions

In addition to sampling the analog input signal, this module can also be used to perform additional analysis of the values obtained.

- **Limit value analysis**

If limit value analysis has been enabled for a channel, the sampled minimum and maximum values are latched internally in the module. A measurement period can be triggered using the control byte. When the respective configured edge is generated by the application, the limit values from the previous measurement period are displayed and the internal latch register is reset.

- **Recording sampled values**

If recording sampled values has been enabled for a channel, then the sampled values are additionally recorded in the module's internal FIFO memory. If the configured event occurs, the contents of the FIFO memory are transmitted to the application.

Information:

It is only possible to use the recording of sampled values if the module is operated on an X2X master that is an SG4 CPU.

9.1.12.8.6.1 Trigger condition on falling edge

Name:

ConfigOutput21

This register configures whether the falling edge is used to trigger the trace and determination of the input value in the register "[Analysis control byte](#)" on page 448.

| Data type | Values | Bus controller default setting |
|-----------|------------------------|--------------------------------|
| USINT | See the bit structure. | 0 |

Bit structure:

| Bit | Description | Value | Information |
|-------|----------------|-------|---|
| 0 | TraceTrigger01 | 0 | No trigger (bus controller default setting) |
| | | 1 | Falling edge active as trigger |
| 1 - 3 | Reserved | - | |
| 4 | MinMaxStart01 | 0 | No determination (bus controller default setting) |
| | | 1 | Falling edge determines input value of channel 1 |
| 5 | MinMaxStart02 | 0 | No determination (bus controller default setting) |
| | | 1 | Falling edge determines input value of channel 2 |
| 6 - 7 | Reserved | 0 | |

9.1.12.8.6.2 Trigger condition on rising edge

Name:

ConfigOutput22

This register configures whether the rising edge is used to trigger the trace and determination of the input value in the register "[Analysis control byte](#)" on page 448.

| Data type | Values | Bus controller default setting |
|-----------|------------------------|--------------------------------|
| USINT | See the bit structure. | 0 |

Bit structure:

| Bit | Description | Value | Information |
|-------|----------------|-------|---|
| 0 | TraceTrigger01 | 0 | Trigger not initiated on positive edge (bus controller default setting) |
| | | 1 | Rising edge active as trigger |
| 1 - 3 | Reserved | - | |
| 4 | MinMaxStart01 | 0 | No determination (bus controller default setting) |
| | | 1 | Rising edge determines input value of channel 1 |
| 5 | MinMaxStart02 | 0 | No determination (bus controller default setting) |
| | | 1 | Rising edge determines input value of channel 2 |
| 6 - 7 | Reserved | 0 | |

9.1.12.8.6.3 Analysis control byte

Name:

TraceTrigger01

MinMaxStart01 to MinMaxStart02

The trace function and determination of the minimum/maximum input values can be started in this register. Whether the rising and/or falling edge is used to trigger the functions can be configured using the registers "[Trigger condition on falling edge](#)" on page 447 and "[Trigger condition on rising edge](#)" on page 447.

| Data type | Values | Bus controller default setting |
|-----------|------------------------|--------------------------------|
| USINT | See the bit structure. | 0 |

Bit structure:

| Bit | Description | Value | Information |
|-------|----------------|-------|--|
| 0 | TraceTrigger01 | 0 | Trigger/Trace not triggered (bus controller default setting) |
| | | 1 | Initiates trigger/trace |
| 1 - 3 | Reserved | - | |
| 4 | MinMaxStart01 | 0 | Determination not triggered (bus controller default setting) |
| | | 1 | Initiates determination of input value of channel 1 |
| 5 | MinMaxStart02 | 0 | Determination not triggered (bus controller default setting) |
| | | 1 | Initiates determination of input value of channel 2 |
| 6 - 7 | Reserved | - | |

Information:

To reduce the cyclic data transfer, this register combines the trace and limit value determination functions.

9.1.12.8.6.4 Analysis status byte

Name:

MinMaxStart01Readback to MinMaxStart02Readback

The currently requested module-internal analyses can be checked in this register.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|-----------------------|--------|---|
| 0 - 3 | Reserved | - | |
| 4 | MinMaxStart01Readback | 0 or 1 | Current state of the trigger bits for determining the limit values on the channel |
| 5 | MinMaxStart02Readback | 0 or 1 | Current state of the trigger bits for determining the limit values on the channel |
| 6 - 7 | Reserved | - | |

9.1.12.8.7 Limit values

Limit value analysis must be enabled for the desired channel. See "Channel configuration" on page 440. The sampled value of the channel is then compared to the [minimum](#) and [maximum values](#) that are stored internally in the module. If a new measurement period is initiated with the "Analysis control byte" on page 448 register, then the values of the previous measurement period can be read from the respective registers intended for this.

9.1.12.8.7.1 Maximum input values

Name:

MaxInput01 to MaxInput02

The maximum value of the preceding trigger period is saved in this register based on the filtered, scaled and user-defined limit values. The register value is 0 if the channel is inactive.

| Data type | Value |
|-----------|-------------------|
| INT | -32,768 to 32,767 |

9.1.12.8.7.2 Minimum input values

Name:

MinInput01 to MinInput02

The minimum value of the preceding trigger period is saved in this register based on the filtered, scaled and user-defined limit values. The register value is 0 if the channel is inactive.

| Data type | Value |
|-----------|-------------------|
| INT | -32,768 to 32,767 |

9.1.12.8.7.3 Limit value trigger counter

Name:

Ch01MinMaxLatchCounter to Ch02MinMaxLatchCounter

The number of valid events that trigger a new measurement period for the limit value analysis is counted in this register.

| Data type | Value |
|-----------|------------|
| UINT | 0 to 65535 |

9.1.12.8.8 Trace

If the module is operated on a SG4 CPU, the digitalized input values are recorded by the module. The module must be operated in "Supervised" mode in order to use the trace function.

Recording must be enabled for the desired channel. The enable bits can then control the recording at runtime. The sampled values are recorded in the module's internal FIFO memory.

If the previously defined state occurs on the channel, the contents of the FIFO memory are transmitted to the application. Whether the FIFO memory continued to be filled depends on how recording is configured.

Information:

The trace mechanism can only be used if the module is connected directly to the CPU, not if it is operated behind a bus controller.

9.1.12.8.8.1 Enable recording

Name:

TraceChannelEnable

The respective channel is enabled for the trace with this register.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|-------------|-------|------------------|
| 0 | Channel 1 | 0 | Channel disabled |
| | | 1 | Channel enabled |
| 1 | Channel 2 | 0 | Channel disabled |
| | | 1 | Channel enabled |
| 2 - 7 | Reserved | - | |

9.1.12.8.8.2 Number of values to be recorded

Name:

TraceSampleDepth

16 kB are available on the module for the trace. The FIFO memory limitation means that a maximum of 8192 analog values can be recorded. This memory is divided up equally among the enabled channels. The actual number of maximum possible recordings therefore depends on the number of channels enabled for trace:

1 channel enabled: Up to 8192 recordings

2 channels enabled: Up to 4096 recordings per channel

| Data type | Value | Function |
|-----------|-----------|----------------------|
| UINT | 2 to 8192 | Default value = 1024 |

9.1.12.8.8.3 Recording priority

Name:

ConfigOutput25

The priority of the trace can be increased with this register.

| Data type | Value | Function |
|-----------|-------|---|
| USINT | 3 | Standard |
| | 6 | Trace priority higher than X2X Link communication |

9.1.12.8.8.4 Starting a recording

Name:

TraceEnable01

This register starts the recording according to the specifications for edge control or the comparator.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|---------------|-------|-----------------------------|
| 0 | TraceEnable01 | 0 | Disables the trace function |
| | | 1 | Enables the trace function |
| 1 - 7 | Reserved | - | |

9.1.12.8.8.5 Recording status

Name:

TraceEnabled

TraceWriteActive

TraceReadActive

ReadyForTrigger

TriggerActive

TraceOk

TraceError

The status of the trace is represented in this register.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|-----|------------------|-------|---------------------------------------|
| 0 | TraceEnabled | 0 | Trace inactive |
| | | 1 | Trace active |
| 1 | Reserved | - | |
| 2 | TraceWriteActive | 0 | Data not recorded |
| | | 1 | Data recorded |
| 3 | TraceReadActive | 0 | Data not output/read |
| | | 1 | Data output/read |
| 4 | ReadyForTrigger | 0 | Not ready for triggering |
| | | 1 | Ready for triggering |
| 5 | TriggerActive | 0 | No trigger active or already executed |
| | | 1 | Trigger active |
| 6 | TraceOk | 0 | Overflow or inactive |
| | | 1 | No overflow |
| 7 | TraceError | 0 | No error or inactive |
| | | 1 | Trace buffer full |

9.1.12.8.8.6 Free trace buffer

Name:

FreeBufferSize

Specifies the available FIFO memory area in bytes for the trace

| Data type | Values |
|-----------|-------------|
| UINT | 0 to 65,535 |

9.1.12.8.8.7 Counter for trace triggers

Name:

TriggerCount

The number of trigger events that have occurred since [starting the trace](#) is indicated in this register.

| Data type | Values |
|-----------|-------------|
| UINT | 0 to 65,535 |

9.1.12.8.8.8 Counter for faulty recording triggers

Name:

TriggerFailCount

Counts the trigger events for which the trace could not be performed.

| Data type | Values |
|-----------|-------------|
| UINT | 0 to 65,535 |

9.1.12.8.8.9 Comparator for trigger conditions

In order to adapt the trace as closely as possible to the requirements of the application, the trace function can also be controlled using the comparator. Threshold values (hysteresis) can be defined within the permitted range of values to do so. 2 status bits are then generated for each enabled channel:

- **InRange bit**

The InRange status is "1" if the measured value falls within the defined limits.

The InRange status is "0" if the measured value falls outside the defined limits.

- **Threshold value bit**

The threshold value bit is "1" if the measured value exceeds the upper threshold value.

The threshold value bit is "0" if the measured value falls below the lower threshold value.

The InRange and threshold value bits for all channels are grouped together in the lower-value byte of the "[CompStateCollection](#)" on page 453 register. In addition, the states of the previous sampling are stored in the high-value byte.

The 4 status messages of each channel can be linked according to the following logic via a logical connective mask using AND or OR operators and used as a trace trigger:

```
delta = (Current_HysteresisStatus ^ NominalValues)// Different between current status and preset
cond = delta & Selected_HysteresisStatusBits// Eliminate irrelevant status messages
cond = Selected_HysteresisStatusBits (Current_HysteresisStatus ^ NominalValues)
if((0==(cond & ~LogicalOperators)) &&
(0!=(~cond & LogicalOperators))) {=> Generate trigger event}
```

Selected_HysteresisStatusBits
Current_HysteresisStatus
Nominal values
Logical operators

Corresponds to register:

"cfgComp_EnableMask" on page 454
"CompStateCollection" on page 453
"cfgComp_NominalState" on page 454
"cfgComp_ConditionTypeMask" on page 455

Lower limit value for hysteresis

Name:

cfgComp_LowLimitCh01 to cfgComp_LowLimitCh02

The lower limit value for hysteresis is configured in this register.

| Data type | Values |
|-----------|-----------------|
| INT | -32768 to 32767 |

Upper limit value for hysteresis

Name:

cfgComp_HighLimitCh01 to cfgComp_HighLimitCh02

The upper limit value for hysteresis is configured in this register.

| Data type | Values |
|-----------|-----------------|
| INT | -32768 to 32767 |

Hysteresis status of the channels

Name:

CompStateCollection

The hysteresis status of the input channels for the current and last cycle are represented in this register.

| Data type | Values |
|-----------|------------------------|
| UINT | See the bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|---------|--|-------|---|
| 0 | Channel01 hysteresis status in the current cycle | 0 | Lower limit value exceeded |
| | | 1 | Upper limit value exceeded |
| 1 | Channel01 InRange status in the current cycle | 0 | Value lies outside of range defined by the limit values |
| | | 1 | Value between lower and upper limit values |
| 2 | Channel02 hysteresis status in the current cycle | 0 | Lower limit value exceeded |
| | | 1 | Upper limit value exceeded |
| 3 | Channel02 InRange status in the current cycle | 0 | Value lies outside of range defined by the limit values |
| | | 1 | Value between lower and upper limit values |
| 4 - 7 | Reserved | - | |
| 8 | Channel01 hysteresis status in the last cycle | 0 | Lower limit value exceeded |
| | | 1 | Upper limit value exceeded |
| 9 | Channel01 InRange status in the last cycle | 0 | Value lies outside of range defined by the limit values |
| | | 1 | Value between lower and upper limit values |
| 10 | Channel02 hysteresis status in the last cycle | 0 | Lower limit value exceeded |
| | | 1 | Upper limit value exceeded |
| 11 | Channel02 InRange status in the last cycle | 0 | Value lies outside of range defined by the limit values |
| | | 1 | Value between lower and upper limit values |
| 12 - 15 | Reserved | - | |

Comparison state of the channels

Name:

cfgComp_NominalState

The desired comparison state for the hysteresis status is indicated in this register.

| Data type | Values |
|-----------|------------------------|
| UINT | See the bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|---------|--|-------|---|
| 0 | Channel01 hysteresis status in the current cycle | 0 | Lower limit value exceeded |
| | | 1 | Upper limit value exceeded |
| 1 | Channel01 InRange status in the current cycle | 0 | Value lies outside of range defined by the limit values |
| | | 1 | Value between lower and upper limit values |
| 2 | Channel02 hysteresis status in the current cycle | 0 | Lower limit value exceeded |
| | | 1 | Upper limit value exceeded |
| 3 | Channel02 InRange status in the current cycle | 0 | Value lies outside of range defined by the limit values |
| | | 1 | Value between lower and upper limit values |
| 4 - 7 | Reserved | - | |
| 8 | Channel01 hysteresis status in the last cycle | 0 | Lower limit value exceeded |
| | | 1 | Upper limit value exceeded |
| 9 | Channel01 InRange status in the last cycle | 0 | Value lies outside of range defined by the limit values |
| | | 1 | Value between lower and upper limit values |
| 10 | Channel02 hysteresis status in the last cycle | 0 | Lower limit value exceeded |
| | | 1 | Upper limit value exceeded |
| 11 | Channel02 InRange status in the last cycle | 0 | Value lies outside of range defined by the limit values |
| | | 1 | Value between lower and upper limit values |
| 12 - 15 | Reserved | - | |

Information:

This is a "whitelist", i.e. the trace starts as soon as the current status message takes on the state predefined here.

One or more matches will be necessary depending on the selection of the relevant hysteresis status bits and logical connective operators.

Selecting the relevant hysteresis status bits

Name:

cfgComp_EnableMask

This register selects which status bits of the hysteresis comparison should be used to generate the trigger.

For more information about using this register, see ["Comparator for trigger conditions" on page 452](#).

| Data type | Values |
|-----------|------------------------|
| UINT | See the bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|---------|--|-------|--------------------|
| 0 | Channel01 hysteresis status in the current cycle | 0 | Do not use |
| | | 1 | Use for generation |
| 1 | Channel01 InRange status in the current cycle | 0 | Do not use |
| | | 1 | Use for generation |
| 2 | Channel02 hysteresis status in the current cycle | 0 | Do not use |
| | | 1 | Use for generation |
| 3 | Channel02 InRange status in the current cycle | 0 | Do not use |
| | | 1 | Use for generation |
| 4 - 7 | Reserved | - | |
| 8 | Channel01 hysteresis status in the last cycle | 0 | Do not use |
| | | 1 | Use for generation |
| 9 | Channel01 InRange status in the last cycle | 0 | Do not use |
| | | 1 | Use for generation |
| 10 | Channel02 hysteresis status in the last cycle | 0 | Do not use |
| | | 1 | Use for generation |
| 11 | Channel02 InRange status in the last cycle | 0 | Do not use |
| | | 1 | Use for generation |
| 12 - 15 | Reserved | - | |

Logical connective operators for hysteresis status bits

Name:

cfgComp_ConditionTypeMask

The desired state operators with which the status bits are linked to one another to generate a trigger are selected in this register.

At least one OR operation must be configured, but it does not necessarily have to be located on a channel configured with "1" in the "cfgComp_EnableMask" on page 454 register.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|---------|--|-------|-------------------|
| 0 | Channel01 hysteresis status in the current cycle | 0 | Use AND operation |
| | | 1 | Use OR operation |
| 1 | Channel01 InRange status in the current cycle | 0 | Use AND operation |
| | | 1 | Use OR operation |
| 2 | Channel02 hysteresis status in the current cycle | 0 | Use AND operation |
| | | 1 | Use OR operation |
| 3 | Channel02 InRange status in the current cycle | 0 | Use AND operation |
| | | 1 | Use OR operation |
| 4 - 7 | Reserved | - | |
| 8 | Channel01 hysteresis status in the last cycle | 0 | Use AND operation |
| | | 1 | Use OR operation |
| 9 | Channel01 InRange status in the last cycle | 0 | Use AND operation |
| | | 1 | Use OR operation |
| 10 | Channel02 hysteresis status in the last cycle | 0 | Use AND operation |
| | | 1 | Use OR operation |
| 11 | Channel02 InRange status in the last cycle | 0 | Use AND operation |
| | | 1 | Use OR operation |
| 12 - 15 | Reserved | - | |

9.1.12.8.8.10 Time-offset trace

Additional conditions for shifting the starting and stopping points can be defined if the trace should be chronologically offset to the trigger.

Starting the trace

Name:

TraceTriggerStart

The starting position is defined relative to the configured trigger condition in this register. Positive values mean that the trace takes place x samples after the trigger condition. Negative values mean that the trace takes place x samples before the trigger condition.

The value -32768 performs the trace without regard for the configured trigger condition. If the trace memory is completely full, then the oldest recorded value is overwritten (FIFO principle).

"Trace start" in the I/O configuration or the registers "[Trigger condition on falling edge](#)" on page 447 and "[Trigger condition on rising edge](#)" on page 447 determine whether a positive, negative or any edge must be triggered.

| Data type | Value | Information |
|-----------|-----------------|---|
| INT | -32767 to 32767 | |
| | -32768 | Continuous trace without a stopping point |

Stopping the trace

Name:

TraceTriggerStop

The stopping position is defined relative to the configured trigger condition in this register.

- When configuring an early trigger event, this value refers to the trigger event.
- When configuring a delayed trigger event, this value refers to the starting event.

| Data type | Values |
|-----------|-------------|
| UINT | 0 to 65,535 |

9.1.12.8.9 Acyclic frame size

Name:
AsynSize

When the stream is used, data is exchanged internally between the module and CPU. For this purpose, a defined amount of acyclic bytes is reserved for this slot.

Increasing the acyclic frame size leads to increased data throughput on this slot.

Information:

This configuration involves a driver setting that cannot be changed during runtime!

| Data type | Value | Information |
|-----------|---------|---|
| - | 8 to 28 | Acyclic frame size in bytes. Default = 24 |

9.1.12.8.10 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time | |
|-----------------------------------|--------|
| Standard priority | 200 µs |
| High priority with trace function | 300 µs |

9.1.12.8.11 Minimum I/O update time

There is no limitation or dependency on the bus cycle time.

The I/O update time is defined using the "Sampling time" register. The fastest possible sampling time depends on the number of channels to be converted and the configuration.

9.1.13 X20AI2636

Data sheet version: 2.11

9.1.13.1 General information

The module is equipped with 2 inputs with 16-bit digital converter resolution. It is possible to select between the current and voltage signal using different terminals. With the oversampling function, up to 16 analog values per channel can be recorded.

This module is designed for X20 6-pin terminal blocks. If needed (e.g. for logistical reasons), the 12-pin terminal block can also be used.

- 2 analog inputs
- Current or voltage signal configuration for the entire module
- 16-bit digital converter resolution
- Minimum conversion time of 40 μ s for all inputs
- The conversion time for the entire module can be configured in 0.02 μ s steps.
- Maximum 14 samples (16-bit) for the entire module per X2X Link cycle
- Oversampling: Up to 16 analog values per channel (internal)
- Timestamp for the last conversion of an X2X Link cycle

9.1.13.2 Order data

| Model number | Short description | Figure |
|--------------|---|--|
| | Analog inputs |  |
| X20AI2636 | X20 analog input module, 2 inputs, ± 10 V or 0 to 20 mA, 16-bit converter resolution, configurable input filter, oversampling functions | |
| | Required accessories | |
| | Bus modules | |
| X20BM11 | X20 bus module, 24 VDC keyed, internal I/O supply continuous | |
| X20BM15 | X20 bus module, with node number switch, 24 VDC keyed, internal I/O supply continuous | |
| | Terminal blocks | |
| X20TB06 | X20 terminal block, 6-pin, 24 VDC keyed | |
| X20TB12 | X20 terminal block, 12-pin, 24 VDC keyed | |
| | | |

Table 65: X20AI2636 - Technical data

- 1) To reduce power dissipation, B&R recommends bridging unused inputs on the terminals.
- 2) Based on the current measured value.
- 3) Based on the 20 V measurement range.
- 4) Based on the 20 mA measurement range.

9.1.13.4 LED status indicators

For a description of the various operating modes, see "[Diagnostic LEDs](#)" on page 3787.

| Figure | LED | Color | Status | Description |
|---|-------|-------|--------------|---|
|  | r | Green | Off | No power to module |
| | | | Single flash | RESET mode |
| | | | Double flash | BOOT mode (during firmware update) ¹⁾ |
| | | | Blinking | PREOPERATIONAL mode |
| | | | On | RUN mode |
| | e | Red | Off | No power to module or everything OK |
| | | | On | Error or reset status |
| | | | Double flash | System error: <ul style="list-style-type: none"> Violation of the scan time Synchronization error |
| | 1 - 2 | Green | Off | Open line ²⁾ or sensor is disconnected |
| | | | Blinking | Channel error: Underflow, overflow or broken connection |
| | | | On | Analog/digital converter running, value OK |

1) Depending on the configuration, a firmware update can take up to several minutes.

2) Open line detection only possible when measuring voltage.

9.1.13.5 Pinout

9.1.13.6 Connection example

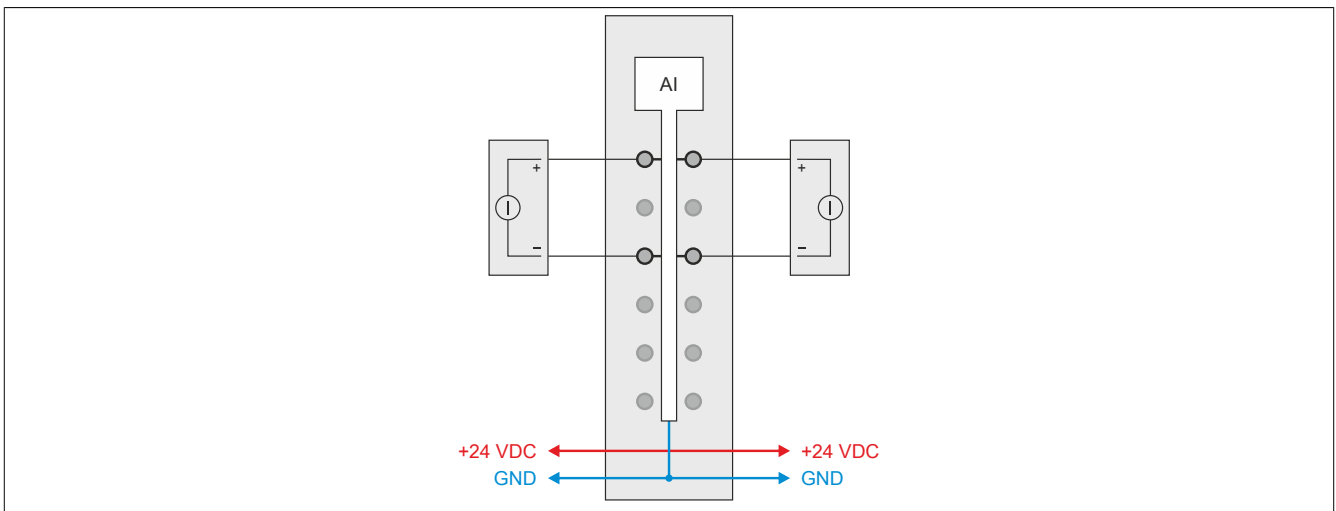

To prevent disturbances, the following modules must be separated by at least one module:

- Bus receiver X20BR9300
- Supply module X20PS3300/X20PS3310
- Supply module X20PS9400/X20PS9402
- Supply module X20PS9500/X20PS9502
- CPU modules

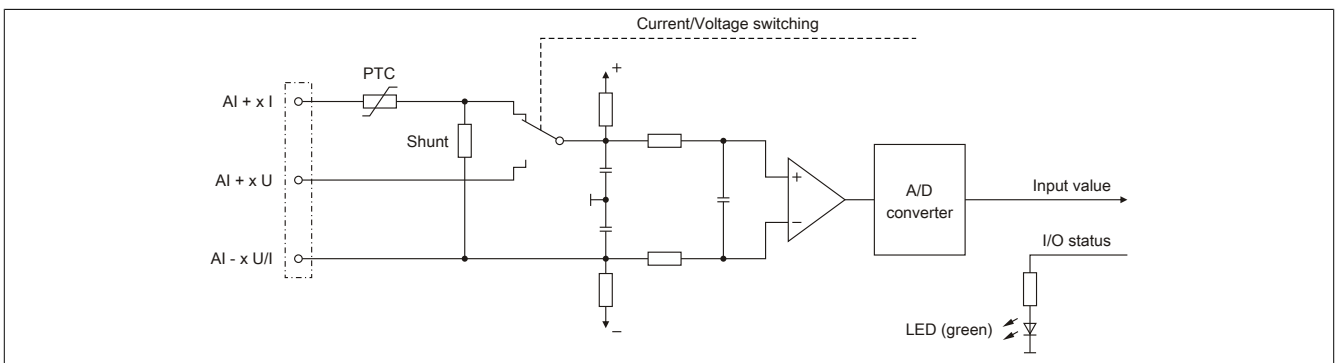

Voltage measurement

Current measurement

9.1.13.7 Input circuit diagram

9.1.13.8 Register description

9.1.13.8.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section "General data points" on page 3790.

9.1.13.8.3 Function model 254

The "Bus controller" function model has the following limitations compared to the "Standard" function model:

- No oversampling function since consistency is not possible when operating CAN-based bus controllers due to the limited data range
- The sampling cycle time is set to 100 µs.
- No timestamp function
- A range of logical functions is available for processing the physical values right on the module:
 - Output of physical values (standard)
 - Addition of two channels with scaling
 - Integral addition of two channels with scaling
 - Multiplication of two channels with scaling
 - Integral multiplication of two channels with scaling

| Register | Offset ¹⁾ | Name | Data type | Read | | Write | |

1) The offset specifies the position of the register within the CAN object.

9.1.13.8.3.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see ["Using I/O modules on the bus controller" on page 3789](#).

9.1.13.8.3.2 CAN I/O bus controller

The module occupies 1 analog logical slot on CAN I/O.

9.1.13.8.4 General information

There is a difference on the module between physical (default) and logical values:

Physical or default values

The conversion results are transferred to the higher-level system after being scaled and filtered. They are not processed further.

Logical values

The physical values can be further processed with mathematical functions and comparators. In addition, another logical channel can be used as a starting point to further process a logical function.

9.1.13.8.5 Operating mode - Oversampling

The input values are recorded with a configurable sampling cycle time and saved with timestamp to the internal physical data buffer. This data range can then be read out in the cyclic data transfer using a configurable data length.

The recording and transmission system for the logical channels is identical to that for the physical channels. The functions of the logical channels are also executed in the configured sampling cycle time and saved with timestamp to the logical data buffer. The values can also be read out from here using configurable cyclic data points.

The defined sampling cycle time may not be sufficient for the sum of all physical and logical functions if using fast X2X Link cycle times, however. If influencing the physical sampling is not permitted, then a prescaler can be used to slow down the logical processing.

Information:

The ability to adjust the sampling cycle time as needed on the module means there is basically no synchronization with X2X Link, regardless of whether standard inputs or an oversampling function is configured.

If synchronization is required, then the configured sampling cycle time must be a multiple of the X2X Link cycle time!

9.1.13.8.5.1 Analog oversampling

When using analog oversampling, the enabled channels are stored in the module within a configurable time frame independently of the X2X cycle. Space is available for 16 analog values per physical and logical channel.

These samplings are numbered from 1 to 16 for the registers. The conversions or calculations of individual channels with the same number (i.e. sample line 1 to 16, e.g. PhysCh01Sample10, PhysCh02Sample10, etc.) are derived from the same sampling cycle or logical computing cycle and therefore have the same timestamp.

The timestamp refers to the newest data value, i.e. always to sample line 1. If a timestamp for older data points is needed, it needs to be back-calculated in the application using the sampling cycle time configured on the module. The prescaler must also be taken into account for logical channels.

Calculation example

| Sample line | Calculation | |
|-------------|--------------------------------------|---------------------|
| 1 | Timestamp | Newest value |
| 2 | Timestamp - Sampling cycle time | |
| 3 | Timestamp - 2 * Sampling cycle time | |
| 4 | Timestamp - 3 * Sampling cycle time | |
| ... | ... | |
| 10 | Timestamp - 9 * Sampling cycle time | |
| ... | ... | |
| 16 | Timestamp - 15 * Sampling cycle time | Oldest value |

How the buffer is organized can be seen from this. This is not a FIFO buffer but a static buffer that the values are pushed through. Sample line 1 always contains the newest values, the next line the second newest, all the way up to sample line 16, which contains the oldest values.

The sample counter is a circular counter, with the number of new sample lines derived from the value of the last transfer cycle.

Example

A difference of 3 to the last transfer cycle means:

The data in sample line 1 and all subsequent data from the previous transfer cycle is now shifted in the current cycle beginning with sample line 4. Sample lines 1 through 3 contain the new values for further processing by the application. Sample lines 14 through 16 from the last transfer cycle are no longer in the buffer.

9.1.13.8.5.2 Comparator oversampling

When using comparator oversampling, the results of the enabled channels are stored in the module within a configurable time frame independently of the X2X cycle. 16 bits of memory space are available per logical channel.

These samplings (i.e. event bits) are consecutively numbered from 1 to 8 and 9 to 16 for the two registers. The results of individual channels with the same number (i.e. sample line 1 to 16, e.g. for channel 1 LogicCh01Sample16_9 and LogicCh01Sample8_1) are derived from the same sampling cycle or logical computing cycle and therefore have the same timestamp.

The timestamp refers to the newest data value, i.e. always to sample line 1 (i.e. bit 0 in the LogicCh01Sample8_1 register). If a timestamp for older comparator results is needed, it needs to be back-calculated in the application using the sampling cycle time configured on the module. The prescaler must also be taken into account.

Calculation example

| Sample line | (register name) | Calculation | |
|-------------|-----------------------------|--------------------------------------|---------------------|
| 1 | (LogicCh01Sample8_1 bit 0) | Timestamp | Newest value |
| 2 | (LogicCh01Sample8_1 bit 1) | Timestamp - Sampling cycle time | |
| 3 | (LogicCh01Sample8_1 bit 2) | Timestamp - 2 * Sampling cycle time | |
| 4 | (LogicCh01Sample8_1 bit 3) | Timestamp - 3 * Sampling cycle time | |
| ... | | | |
| 10 | (LogicCh01Sample16_9 bit 1) | Timestamp - 9 * Sampling cycle time | |
| ... | | | |
| 16 | (LogicCh01Sample16_9 bit 7) | Timestamp - 15 * Sampling cycle time | Oldest value |

How the buffer is organized can be seen from this. This is not a FIFO buffer but a static buffer that the values are pushed through. Sample line 1 always contains the newest values, the next line the second newest, all the way up to sample line 16, which contains the oldest values.

The sample counter is a circular counter, with the number of new sample lines derived from the value of the last transfer cycle.

Example

A difference of 3 to the last transfer cycle means:

The comparator result in sample line 1 and all subsequent data from the previous transfer cycle is now shifted in the current cycle beginning with sample line 4. Sample lines 1 through 3 contain the new bit values for further processing by the application. Sample lines 14 through 16 from the last transfer cycle are no longer in the buffer.

Data transfer

The analog conversion rate / sampling cycle time can be considerably faster than the X2X Link cycle. Saved analog or comparator data can be transferred to the higher-level system synchronously and consistently.

In the application, it's important that the relationship between cyclic data points, the sampling cycle time on the module and the transfer time is sufficient to read all of the new data points on the higher-level system.

The sample counter can be used to check how many data values are actually new since the last transfer cycle. If the counter difference to the previous cycle is larger than the number of existing cyclic data points, then values have been overlooked and the system needs to be adjusted.

The general guideline is that a cyclic data point should be configured more than is actually required computing-wise.

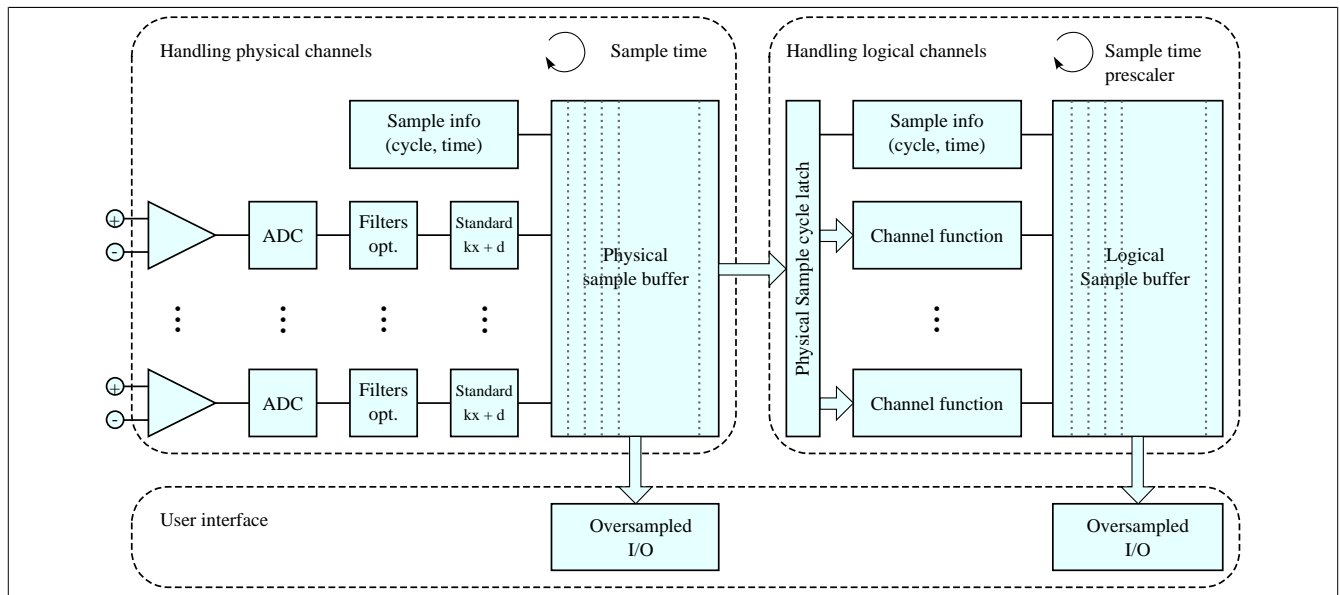

Example with synchronous settings

- Sampling cycle time = 50 μ s
- X2X Link cycle time = 500 μ s

Samples 1 to 10 of a channel are possible to calculate in this example. Sample 11 should also be configured as a cyclic data point, however.

The reason for this is the possible jitter in the module caused by interruptions, e.g. from the X2X Link transfer. For the current cycle, this can mean that only 9 new values are available and that 11 values will have to be transferred in the next cycle.

For logical comparator functions, this problem doesn't exist since the maximum number is always transferred in the cycle data range.

9.1.13.8.6 Bus controller operating mode

The input values are recorded with a configurable sampling cycle time and saved with timestamp to the internal physical data buffer. Only the newest value will be transferred in the next possible bus cycle.

Limitations in the bus controller function model:

- No oversampling function since consistency is not possible due to the limited data range
- Sampling cycle time configured to 100 µs by default
- Range of logical functions available for processing physical values directly on the module
- Timestamp not available

9.1.13.8.7 "AnalogInput" registers

Name:

AnalogInput01 to AnalogInput02

This module can be configured and operated as a normal analog input module without logical auxiliary functions. The physical values from the last sampling cycle are used as input values in this case.

The module is operated as a normal analog input module in the bus controller function model. Nevertheless, it is still possible to connect each input channel directly to a logical function. The analog data on the bus controller is mapped using the calculation abilities of the logical channels and configured automatically (see "[Operation in the bus controller function model](#)" on page 483).

Analog input values are displayed as signed 16-bit values depending on the configured operating mode.

| Data type | Value | Information |
|-----------|-------------------|------------------------------|
| INT | -32,768 to 32,767 | Voltage signal ±10 VDC |
| | 0 to 32,767 | Current signal 0 mA to 20 mA |

Information:

It is important to note that the oversampling function is not available in the bus controller function model due to the amount of data and lack of consistency!

9.1.13.8.8 Physical sampling

This module has a data buffer with 16 entries for each of the physical input channels. This buffer is processed according to the configured sampling cycle time.

A maximum of only 30 bytes is available for cyclic transfer on the X2X bus, however. Minus the status and sample counter, this allows only a selection of 14 samples (with a 16-bit data width) from the physical and logical buffer to be transferred.

Data loss can therefore occur with an imprecise selection and configuration.

Example

Displaying continuous sample lines.

- Sampling cycle time = 100 μ s
- X2X cycle time = 500 μ s

```
Sample line 1      PhysCh0xSample1
Sample line 2      PhysCh0xSample2
Sample line 3      PhysCh0xSample3
Sample line 4      PhysCh0xSample4
Sample line 5      PhysCh0xSample5
Sample line 6      PhysCh0xSample6
```

```
Difference SampleCount = 1  New value in sample line 1
Difference SampleCount = 2  New values in sample line 1 and sample line 2
...
Difference SampleCount = 5  New values in sample line 1 to sample line 5
```

Information:

It is important to note that the sample counter refers to the update of the sample lines in the data buffer and not to the number of values transferred cyclically.

Displaying each second sample line to bridge a higher recording duration:

- Sampling cycle time = 100 μ s
- X2X cycle time = 1000 μ s

```
Sample line 1      PhysCh0xSample1
Sample line 3      PhysCh0xSample3
Sample line 5      PhysCh0xSample5
Sample line 7      PhysCh0xSample7
Sample line 9      PhysCh0xSample9
Sample line 11     PhysCh0xSample11
```

```
Difference SampleCount = 1  New value in sample line 1
Difference SampleCount = 3  New values in sample line 1 and sample line 3
...
Difference SampleCount = 5  New values in sample line 1 to sample line 5
...
Difference SampleCount = 9  New values in sample line 1 to sample line 9
```

9.1.13.8.8.1 "PhysChSample" registers

Name:

PhysCh01Sample1 to PhysCh01Sample16

PhysCh02Sample1 to PhysCh02Sample16

These registers are the physical buffer registers of the analog channels. 16 registers are available for each channel. Sample 1 is the newest value; sample 16 is the oldest.

| Data type | Value | Information |
|-----------|-------------------|------------------------------|
| INT | -32,768 to 32,767 | Voltage signal \pm 10 VDC |
| | 0 to 32,767 | Current signal 0 mA to 20 mA |

9.1.13.8.8.2 "PhysSampleCount" register

Name:

PhysSampleCount

This register is an integer counter that is increased as soon as the module has saved a new physical sample line. The number of new sample lines is calculated from the difference to the previous cycle.

| Data type | Value |
|-----------|-------------------|
| SINT | -128 to 127 |
| INT | -32,768 to 32,767 |

9.1.13.8.8.3 "PhysTimestamp" register

Name:

PhysTimestamp

This register returns the timestamp of the values currently being determined as signed values in μs . This data point is the timestamp of the physical sample line 1.

| Data type | Value |
|-----------|---------------------------------|
| INT | -32768 to 32767 |
| DINT | -2,147,483,648 to 2,147,483,647 |

9.1.13.8.9 Logical sampling

The module has a data buffer with 16 entries for each of the 6 logical channels. This buffer is processed according to the configured sampling cycle time. In addition, it's also possible to adjust the logical execution cycle using a prescaler for the sampling cycle time.

A maximum of only 30 bytes is available for cyclic transfer on the X2X bus, however. Minus the status and sample counter, this allows only a selection of 14 samples (with a 16-bit data width) from the physical and logical buffer to be transferred. For the logical channels, it is also possible to configure a 32-bit data width. Data loss can therefore occur with an imprecise selection and configuration.

Example

Displaying continuous sample lines.

- Sampling cycle time = 100 μ s
- X2X cycle time = 500 μ s

```
Sample line 1      LogicCh0xSample1
Sample line 2      LogicCh0xSample2
Sample line 3      LogicCh0xSample3
Sample line 4      LogicCh0xSample4
Sample line 5      LogicCh0xSample5
Sample line 6      LogicCh0xSample6
```

```
Difference SampleCount = 1  New value in sample line 1
Difference SampleCount = 2  New values in sample line 1 and sample line 2
...
Difference SampleCount = 5  New values in sample line 1 to sample line 5
```

Information:

It is important to note that the sample counter refers to the update of the sample lines in the data buffer and not to the number of values transferred cyclically.

Displaying each second sample line to bridge a higher recording duration:

- Sampling cycle time = 100 μ s
- X2X cycle time = 1000 μ s

```
Sample line 1      LogicCh0xSample1
Sample line 3      LogicCh0xSample3
Sample line 5      LogicCh0xSample5
Sample line 7      LogicCh0xSample7
Sample line 9      LogicCh0xSample9
Sample line 11     LogicCh0xSample11
```

```
Difference SampleCount = 1  New value in sample line 1
Difference SampleCount = 3  New values in sample line 1 and sample line 3
...
Difference SampleCount = 5  New values in sample line 1 to sample line 5
...
Difference SampleCount = 9  New values in sample line 1 to sample line 9
```

9.1.13.8.9.1 "LogicChSample" registers

Name:

LogicCh01Sample1 to LogicCh01Sample16

...

LogicCh06Sample1 to LogicCh06Sample16

These registers are the buffer registers of the logical input channels. 16 registers are available for each channel. Sample 1 is the newest value; sample 16 is the oldest.

Calculated values are displayed as signed 16- or 32-bit values depending on the register being used.

| Data type | Value |
|-----------|---------------------------------|
| INT | -32768 to 32767 |
| DINT | -2,147,483,648 to 2,147,483,647 |

9.1.13.8.9.2 "LogicChSample16_9" registers

Name:

LogicCh01Sample16_9 to LogicCh06Sample16_9

These registers are used to represent the results of samples 9 to 16 of the logical digital comparator for the logical channels. Each of these bits corresponds to a sample line, with sample 9 the newest and Sample 16 the oldest comparator comparison. The results of samples 1 to 8 are represented in register "[LogicChSample8_1](#)" on page 474.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-----|-------------------|-------|-------------|
| 0 | Comparator result | x | Sample 9 |
| ... | ... | | |
| 7 | Comparator result | x | Sample 16 |

9.1.13.8.9.3 "LogicChSample8_1" registers

Name:

LogicCh01Sample8_1 to LogicCh06Sample8_1

These registers are used to represent the results of samples 1 to 8 of the logical digital comparator for the logical channels. Each of these bits corresponds to a sample line, with sample 1 the newest and Sample 8 the oldest comparator comparison. The results of samples 9 to 16 are represented in register "[LogicSample16_9](#)" on page 474.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-----|-------------------|-------|-------------|
| 0 | Comparator result | x | Sample 1 |
| ... | ... | | |
| 7 | Comparator result | x | Sample 8 |

9.1.13.8.9.4 "LogicSampleCount" register

Name:

LogicSampleCount

This register is an integer counter that is increased as soon as the module has saved a new logical sample line. The number of new sample lines is calculated from the difference to the previous cycle.

| Data type | Value |
|-----------|-------------------|
| SINT | -128 to 127 |
| INT | -32,768 to 32,767 |

9.1.13.8.9.5 "LogicTimestamp" register

Name:

LogicTimestamp

This register returns the timestamp of the values currently being determined as signed 2 or 4-byte values in μ s. This data point is the timestamp of the logical sample line 1.

| Data type | Value |
|-----------|---------------------------------|
| INT | -32768 to 32767 |
| DINT | -2,147,483,648 to 2,147,483,647 |

9.1.13.8.10 System configuration

The following registers are used to configure the module's system settings.

9.1.13.8.10.1 Register "CfO_BaseConfig"

Name:

CfO_BaseConfig

This register can be used to configure settings for handling logical oversampling and data acquisition.

| Data type | Values | Bus controller default setting |
|-----------|------------------------|--------------------------------|
| USINT | See the bit structure. | 49 |

Bit structure:

| Bit | Description | Value | Information |
|-------|---|-------|--|
| 0 | "Display configuration for logical values active/inactive" in the Automation Studio I/O configuration | 0 | Inactive |
| | | 1 | Active (bus controller default setting) |
| 1 | "Logical handling priority" in the Automation Studio I/O configuration | 0 | Low (bus controller default setting) |
| | | 1 | High |
| 2 - 3 | Reserved | - | |
| 4 | "Physical input mode" in the Automation Studio I/O configuration | 0 | Newest value |
| | | 1 | Referenced value (reference = prescaled system timer) (bus controller default setting) |
| 5 | "Logical input mode" in the Automation Studio I/O configuration | 0 | Newest value |
| | | 1 | Referenced value (reference = prescaled system timer) (bus controller default setting) |
| 6 - 7 | Reserved | - | |

Priority of logical oversampling

- Low priority setting
Logical and physical buffers are not processed in the same context. If the calculation time that results in the logical oversampling is higher than the configured sampling cycle time, this setting and a prescaler > 1 can be used to split up the logical processing over several sampling cycles. In this way, the sample lines of the physical and logical oversampling are not automatically acquired or calculated at the same point in time. If the prescaler is configured incorrectly, the logical oversampling cannot be processed successfully.
- High priority setting
Logical and physical buffers are processed in the same context. The sample lines of the physical and logical oversampling are acquired and calculated at the same point in time. It must be possible to execute all configured functions in the configured sampling cycle time; otherwise, a cycle time violation will occur and the configuration must be changed accordingly. Configuring the logical prescaler doesn't have any effect here; only the data traffic in the logical oversampling is limited.

Current or referenced values for logical or physical oversampling

In a system being used to capacity, jitter in the sampling cycle on the module can also be caused by the necessary processing of functions (X2X Link operation, logical and physical oversampling) when the cycle time is set to synchronous. This results in a varying number of sample lines in the same time period. For this reason, more samples should also be configured in the cyclic image than are actually necessary to compute.

- Current values setting
Passing on the sample lines to the higher-level system takes place as quickly as possible, with fewer or more sample lines possibly occurring.
- Referenced values setting
This setting minimizes jitter and makes it possible to expect a constant number of new sample lines per cycle when configured optimally. With regard to response time, however, delays of several sampling cycles may occur.

9.1.13.8.10.2 Register "CfO_CycleTime"

Name:

CfO_CycleTime

"Physical sample time" in the Automation Studio I/O configuration.

This register configures the module's sampling cycle time. The format is a 16.16-bit unsigned 4-byte value, with the high word representing the integer part of the μs value and the low word the decimal places. The decimal places allow a closer alignment to the X2X cycle time. The absolute resolution is 1 μs .

Input value = Time in μs * 65536 data type

| Data type | Value | Information |
|-----------|----------------------------|---|
| UDINT | 2,621,440 to 2,147,483,647 | 40 μs to 32 ms sampling cycle time. Bus controller default setting: 6,553,600 = 100 μs |

9.1.13.8.10.3 Register "CfO_Prescaler"

Name:

CfO_Prescaler

This register contains the prescaler for configuring the logical channel processing time. The actual logical cycle time will be calculated from the multiple of the sampling cycle time that is defined here. If a very short sampling cycle time is required for physical samples, then the module load can be reduced using the second time base for the logical samples.

| Data type | Value | Information |
|-----------|---------|--|
| UINT | 1 to 10 | Multiples of the physical sampling cycle for logical processing Bus controller default setting: 2 |

9.1.13.8.10.4 Register "CfO_SyncOffset"

Name:

CfO_SyncOffset

"Synchronization offset" in the Automation Studio I/O configuration.

The system cycle can be offset in 1 μs steps in this register.

| Data type | Value | Information |
|-----------|-------------------|--|
| UINT | -32,768 to 32,767 | Synchronization offset in μs . Bus controller default setting: 0 |

9.1.13.8.11 Scaling

Analog input channels are naturally aligned and normalized when delivered (gain = k, offset = d). In addition, user-defined normalization is also available (gain = k_u , offset = d_u). The calculation is optimized by grouping the factors together.

Normalization calculation:

$$\text{nom} = k * \text{RawValue} + d$$

$$k = k * k_u$$

$$d = k * d + d_u$$

The values calculated here are limited to 16 bits.

9.1.13.8.11.1 "CfO_UserGainCh" registers

Name:

CfO_UserGainCh01 to CfO_UserGainCh02

"Configuration channel 0x / gain" in the Automation Studio I/O configuration

These registers are used to configure the gain for the respective channel. The format is a 16.16-bit signed 4-byte value, with the high word the integer part and the low word the decimal places.

Input value = Gain k_u * 65536

Value 65,535 corresponds to a gain of 1.

| Data type | Value | Information |
|-----------|------------------------------------|---|
| DINT | -2,147,483,648 to 2,147,483,647 | Gain. Bus controller default setting: 65,535 |

9.1.13.8.11.2 "CfO_UserOffsetCh" registers

Name:

CfO_UserOffsetCh01 to CfO_UserOffsetCh02

"Configuration channel 0x / offset" in the Automation Studio I/O configuration

These registers are used to configure the offset for the respective channel. The format is a 16.16-bit signed 4-byte value, with the high word the integer part and the low word the decimal places.

Input value = Offset du * 65536

Value 65536 corresponds to an offset of 1.

| Data type | Value | Information |
|-----------|------------------------------------|--|
| DINT | -2,147,483,648 to 2,147,483,647 | Offset. Bus controller default setting: 0 |

9.1.13.8.12 Input filter

This module is equipped with an individually configurable input filter for each channel. The following filters can be selected:

- 1st-order low pass
- 2nd-order low pass
- 2nd-order IIR

The cutoff frequency can be configured for the 1st-order and 2nd-order low pass filters. The coefficients Alpha0, Alpha1, Alpha2, Beta1 and Beta2 must be configured for the IIR filter.

9.1.13.8.12.1 "CfO_AlphaCh" and "CfO_BetaCh" registers

Name:

CfO_Alpha0Ch01 to CfO_Alpha0Ch02

CfO_Alpha1Ch01 to CfO_Alpha1Ch02

CfO_Alpha2Ch01 to CfO_Alpha2Ch02

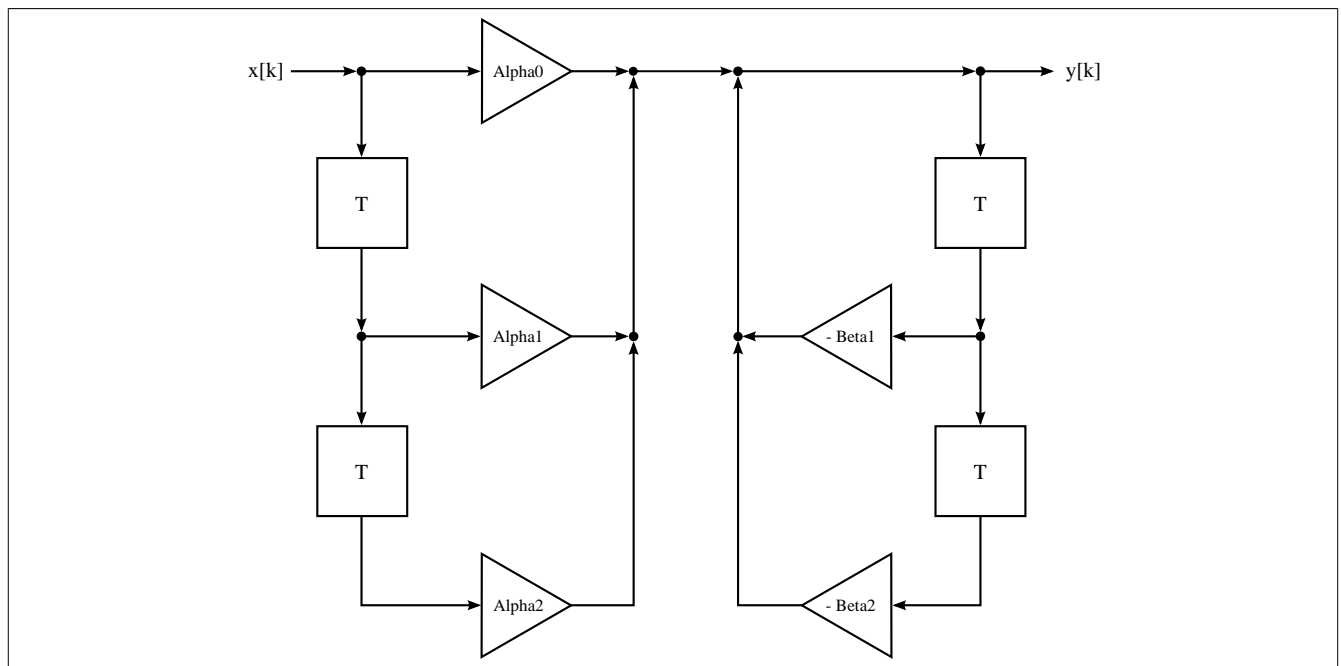

CfO_Beta1Ch01 to CfO_Beta1Ch02

CfO_Beta1Ch01 to CfO_Beta1Ch02

These registers set the coefficients for the IIR filter.

Image as a z-transfer function

The second-order z-transfer function is specified in coefficient form (denominator polynomial Beta1, Beta2 and numerator polynomial Alpha0, Alpha1, Alpha2). The transfer method is calculated with the sampling cycle time.

| Data type | Values | Information |
|-----------|------------------------------------|--|
| DINT | -2,147,483,648 to 2,147,483,647 | IIR filter coefficient. Bus controller default setting: 0 |

9.1.13.8.12.2 "CfO_CutOffFrequCh" register

Name:

CfO_CutOffFrequCh01 to CfO_CutOffFrequCh02

These registers are used to configure the limit frequency in hertz for a 1st- or 2nd-order low pass for the corresponding channel.

| Data type | Value | Information |
|-----------|------------|---|
| UINT | 0 to 65535 | Cutoff frequency for 1st- or 2nd-order low pass [Hz]. Bus controller default setting: 1000 |

9.1.13.8.13 Physical configuration

9.1.13.8.13.1 "CfO_ModeCh" registers

Name:

CfO_ModeCh01 to CfO_ModeCh02

The operating mode for each physical channel can be configured in this register.

| Data type | Values | Bus controller default setting |
|-----------|------------------------|--------------------------------|
| UINT | See the bit structure. | 256 |

Bit structure:

| Bit | Description | Value | Information |
|---------|---|------------|--|
| 0 - 2 | Connection configuration This value must be set the same for each register! | 000 | Voltage signal (bus controller default setting) |
| | | 111 | Current signal |
| 3 - 7 | Reserved | 0 | |
| 8 - 10 | Operating mode | 000 | Channel disabled |
| | | 001 | No filtering (bus controller default setting) |
| | | 010 | 2nd-order IIR (configurable Alpha and Beta coefficients) |
| | | 011 | 1st-order low pass (configurable limit frequency) |
| | | 100 | 2nd-order low pass (configurable limit frequency) |
| | | 101 to 111 | Reserved |
| 11 - 15 | Reserved | 0 | |

9.1.13.8.14 Logical configuration

9.1.13.8.14.1 Operation in the standard function model

6 logical channels are available on the module. Each channel can be configured with one of the following functions:

- ["Addition of two channels with scaling" on page 479](#)
- ["Integral addition of two channels with scaling" on page 480](#)
- ["Multiplication of two channels with scaling" on page 481](#)
- ["Integral multiplication of two channels with scaling" on page 482](#)
- ["Comparator function of two channels" on page 482](#)
- ["Hysteresis comparator of one channel " on page 482](#)

With logical oversampling, 32-bit data points are available in addition to 16-bit data points due to the possible calculated results. The Automation Studio I/O configuration or data point mapping can be opened to select which one to use.

If there is no need to use 32-bit data points, or if this would lead to too large of a limitation in the number of data points, scaling can be used to limit the range to 16 bits.

The buffer depth for the digital comparator is also able to handle 16 results. Since these are Boolean results, these 16 bits are compressed into 2-byte data points and transferred that way.

Addition

This function can be used to determine the sum or difference of two channels. To determine the difference, negative scaling must be configured for the channel.

Calculation

Sample line = (Channel 1 * Scaling 1) + (Channel 2 * Scaling 2)

The addition calculation is handled internally as a 32-bit value in 16.16 format; the data from the source channels is evaluated as integers (applied to the high word), with decimal places possible as a result of scaling. When displayed as a logical 32-bit result, these decimal places are visible. When displayed as a 16-bit value, only the integral high word is used.

Example

Channel 1 = 2000

Channel 2 = 1000

Both scalings = 1

Results

$3000.x = (2000.x * 1.0) + (1000.x * 1.0)$

32-bit representation = 196608000 = 0xBB80000

16-bit representation = 3000 = 0xBB8

Information:

The maximum value for channels 1 and 2 can only be 32767; otherwise, an additional overflow occurs. If values greater than 32767 are possible, the range of values must be limited with scaling.

Integral of addition

This function can be used in the application to establish the average value of the channels or to calculate the deviation/difference between two channels over n samples. In each cycle, the channels are added together first; then the result is added to the previous value and saved in the current sample line. Depending on the result data type being used (16-bit or 32-bit), eventually the continuous integration will cause the calculation to overflow after n samples. Because of the signed result value, it must be ensured that the number n of samples is chosen small enough so that calculating the integral component is less than half the range of values. If this is done, determining the average value can be carried out despite an overflow.

Calculation

Result: Sample line = Integral ((Channel 1 * Scaling 1) + (Channel 2 * Scaling 2))

The addition calculation is handled internally as a 32-bit value in 16.16 format; the data from the source channels is evaluated as integers (applied to the high word), with decimal places possible as a result of scaling. When displayed as a logical 32-bit result, these decimal places are visible. When displayed as a 16-bit value, only the integral high word is used.

Example

Channel 1 = 2000

Channel 2 = 1000

Both scalings = 1

Results

$3000.x = (2000.x * 1.0) + (1000.x * 1.0)$

32-bit representation = 196608000 = 0xBB80000.

16-bit representation = 3000 = 0xBB8

The average value can now be calculated as follows:

n = Number of samples / sample lines

$Value_x$ = Value from sample line x → Newer value

$Value_{(x-n)}$ = Value from sample line $x-n$ → Older value, n samples back

Average value = $(Value_x - Value_{(x-n)}) / n$

Information:

The maximum value for channels 1 and 2 can only be 32767; otherwise, an additional overflow occurs. If values greater than 32767 are possible, the range of values must be limited with scaling.

Multiplication

This function can be used to calculate the current effective power $P = U * I$.

Calculation

Sample line = Channel 1 * Channel 2 * Scaling

Multiplication is calculated internally as a 32-bit value; the 16-bit data from the source channels is passed to the low word. When displayed as a logical 32-bit value, the entire result is visible (no multiplication overflow possible when scaling ≤ 1). When displayed as a 16-bit value, only the high word is used. Though there is a loss of precision, the 16-bit values allow more data points to be transferred.

Example

Channel 1 = 2000

Channel 2 = 1000

Scaling = 1

Results

2000000 = (2000 * 1000 * 1.0)

32-bit representation = 2000000 = 0x1E8480

16-bit representation = 30 = 0x1E

Information:

If more precision is needed with the 16-bit value, scaling in steps of 2^n (... , *128, *256, ...) can be employed to shift the bits. Of course, it's important again that the input values of the source channels be limited; otherwise, an overflow will occur in the multiplication operation.

Integral of multiplication

This function can be used in the application to establish the average value of the effective power. In each cycle, the channels are multiplied together first; then the result is added to the previous value and saved in the current sample line. Depending on the result data type being used (16-bit or 32-bit), eventually the continuous integration will cause the calculation to overflow after n samples. Because the result value is signed, it is important to set the number n of samples small enough so that the integration is less than half of the value range. If this is done, determining the average value can be carried out despite an overflow.

Calculation

Sample line = Integral (Channel 1 * Channel 2 * Scaling)

Multiplication is calculated internally as a 32-bit value; the 16-bit data from the source channels is passed to the low word. When displayed as a logical 32-bit value, the entire result is visible (no multiplication overflow possible when scaling ≤ 1). When displayed as a 16-bit value, only the high word is used. Though there is a loss of precision, the 16-bit values allow more data points to be transferred.

Example

Channel 1 = 2000

Channel 2 = 1000

Scaling = 1

Results

2000000 = (2000 * 1000 * 1.0)

32-bit representation = 2000000 = 0x1E8480

16-bit representation = 30 = 0x1E

The average value can now be calculated as follows:

n = Number of samples / sample lines

Value _{x} = Value from sample line x → Newer value

Value _{x} = Value from sample line x → Older value, n samples back

Average value = (Value _{x} - Value_($x-n$)) / n

Information:

If more precision is needed with the 16-bit value, scaling in steps of 2^n (... , *128, *256, ...) can be employed to shift the bits. Of course, it's important again that the input values of the source channels be limited; otherwise, an overflow will occur in the multiplication operation.

Channel comparator

This function can be used to compare channel values. The following applies:

- Channel 1 > Channel 2 = 1
- Channel 1 < Channel 2 = 0
- Channel 1 = Channel 2 = State before values are the same

Calculation

Sample line (bit) = Comparison (channel value 1 with channel value 2)

Hysteresis comparator

This function can be used to monitor range violations by channels. The following applies:

- Channel > Upper threshold value = 1
- Channel < Lower threshold value = 0
- Channel within threshold = Value before occurrence

Calculation

Sample line (bit) = Comparison (channel value with lower threshold value) and (channel value with upper threshold value))

9.1.13.8.14.2 Operation in the bus controller function model

When used on the bus controller, there are 4 logical functions available for each of the analog input channels in addition to the physical value output. Each channel can be configured with one of the following functions:

- "Output of physical values" on page 483 (default setting)
- "Addition of two channels with scaling" on page 479
- "Integral addition of two channels with scaling" on page 480
- "Multiplication of two channels with scaling" on page 481
- "Integral multiplication of two channels with scaling" on page 482
- "Comparator function of two channels" on page 482
- "Hysteresis comparator of one channel " on page 482

In contrast to the standard function model, oversampling and the two digital comparators are not supported. As a result, there is only one newly generated value per channel in each update cycle. Another difference is that there are only 4 logical calculation channels instead of 6.

The logical functions addition, integral of addition, multiplication and integral of multiplication do not differ from the standard function model in their configuration and function when operating on the bus controller.

Physical value display

The physical value display in the bus controller function model is initialized automatically and represents a special form of the logical function "Addition" with defined scaling factors.

Calculation

Result = Channel value

Formula used for addition: $\text{Result} = (\text{Channel value } 1 * 1) + (\text{Channel value } 2 * 0)$

Information:

In this function model, only the 4 physical input channels are available, and the scaling factors have defined values.

9.1.13.8.14.3 "CfO_LogChMode" register

Name:

CfO_LogCh01Mode to CfO_LogCh06Mode

"Logical configuration channel 0x / Addition" in the Automation Studio I/O configuration.

"Logical configuration channel 0x / Integral of addition" in the Automation Studio I/O configuration.

"Logical configuration channel 0x / Multiplication" in the Automation Studio I/O configuration.

"Logical configuration channel 0x / Integral of multiplication" in the Automation Studio I/O configuration.

"Logical configuration channel 0x / Channel comparator" in the Automation Studio I/O configuration.

"Logical configuration channel 0x / Hysteresis comparator" in the Automation Studio I/O configuration.

"Logical configuration channel 0x / Physical value display" in the Automation Studio I/O configuration.

The operating mode for each logical channel can be configured in this register.

The selection of the sources to be used for each logical channel is made using the register "CfO_LogCh0NSource0x" on page 484. Any additionally needed function parameters are configured in the "CfO_LogCh0NFuncPar0x" on page 485 registers. "N" stands for the logical channel to be used, while "x" stands for either the source or function 0 or 1.

The following links can be made:

- Addition: Result = (Source 0 * Function parameter 0) + (Source 1 * Function parameter 1)
- Integral of addition: Result = Σ (Source 0 * Function parameter 0) + (Source 1 * Function parameter 1)
- Multiplication: Result = Source 0 * Source 1 * Function parameter 0
- Integral of multiplication: Result = Σ (Source 0 * Source 1 * Function parameter 0)
- Channel comparator: Result = Comparison of source 0 with source 1
- Hysteresis comparator: Result = comparison of source 0 with (Lower threshold value = Function parameter 0) and (Upper threshold value = Function parameter 1)
- Physical value display: Result = (Source 0 * 1) + (Source 1 * 0)

| Data type | Value | Information |
|-----------|-------|--|
| UINT | 0 | Channel switched off. Bus controller default setting: Channel 3 to 6 |
| | 256 | Addition or physical value display ¹⁾ . Bus controller default setting: Channel 1 to 2 |
| | 257 | Integral of addition |
| | 512 | Multiplication |
| | 513 | Integral of multiplication |
| | 768 | Channel comparator |
| | 1024 | Hysteresis comparator |

1) Only registers CfO_LogCh01Mode to CfO_LogCh02Mode are used for physical value display.

9.1.13.8.14.4 "CfO_LogChSource" register

Name:

CfO_LogCh01Source00 to CfO_LogCh06Source00

CfO_LogCh01Source01 to CfO_LogCh06Source01

These registers can be used to select the source registers for the operating mode of the logical channel configured in the register "CfO_LogCh0NMode" on page 484.

In the name, "Source00" stands for source register 0; "Source01" stands for source register 1.

In **Physical value display** mode, the same channel number is written to both source registers.

| Data type | Value | Information |
|-----------|-------|--|
| USINT | 0 | Physical channel 01. Bus controller default setting ¹⁾ |
| | 1 | Physical channel 02. Bus controller default setting ¹⁾ |
| | 8 | Logical channel 01 ¹⁾ |
| | ... | ... |
| | 13 | Logical channel 06 |

1) **Values**

Channel 1: 0
Channel 2: 1
Channels 3 to 6: 0

2) Logical channels cannot be used in the bus controller function model.

9.1.13.8.14.5 "CfO_LogChFuncPar" register

Name:

CfO_LogCh01FuncPar00 to CfO_LogCh06FuncPar00

CfO_LogCh01FuncPar01 to CfO_LogCh06FuncPar01

These registers can be used to configure additional function parameters for the operating mode of the logical channel configured in the register "CfO_LogCh0NMode" on page 484.

The effect of the function parameters is different depending on the operating mode.

| Operating mode | Parameter 1 | Parameter 2 |
|------------------------------|---------------------------------|----------------------------|
| (Integral of) addition | Scaling factor | Scaling factor |
| (Integral of) multiplication | Scaling factor | - |
| Channel comparator | - | - |
| Hysteresis comparator | Upper threshold value | Lower threshold value |
| Output of physical values | Defined scaling factor = 65,536 | Defined scaling factor = 0 |

Value 65,536 corresponds to scaling or a threshold value of 1.

| Data type | Value | Information |
|-----------|--------------------|--|
| UDINT | 0 to 4,294,967,295 | Scaling factor or threshold value. Bus controller default setting: <u>Register "...FuncPar00"</u> Channels 1 to 4 65536 Channels 5 to 6 0 <u>Register "...FuncPar01"</u> All 0 |

9.1.13.8.15 Error registers

The registers for displaying and acknowledging errors are transferred either cyclically or acyclically depending on the function model.

9.1.13.8.15.1 "CfO_ErrorID1017" register

Name:

CfO_ErrorID1017

Automatic enabling by the Automation Studio I/O configuration.

This register can be used to enable standard error messages. The channels' composite errors are derived from the individual extended error status, e.g. overflow/underflow of the input range for the analog value. Oversampling error statuses result from a cycle time violation of the configured sampling cycle time.

| Data type | Values | Bus controller default setting |
|-----------|------------------------|--------------------------------|
| USINT | See the bit structure. | 63 |

Bit structure:

| Bit | Description | Value | Information |
|-------|--------------------------------|-------|---|
| 0 | Composite errors on channel 01 | 0 | Error generation disabled |
| | | 1 | Error generation enabled (bus controller default setting) |
| 1 | Composite errors on channel 02 | 0 | Error generation disabled |
| | | 1 | Error generation enabled (bus controller default setting) |
| 2 - 3 | Reserved | 0 | |
| 4 | Physical sample error status | 0 | Error generation disabled |
| | | 1 | Error generation enabled (bus controller default setting) |
| 5 | Logical sample error status | 0 | Error generation disabled |
| | | 1 | Error generation enabled (bus controller default setting) |
| 6 - 7 | Reserved | 0 | |

9.1.13.8.15.2 "CfO_ErrorID0x0x" register

Name:

CfO_ErrorID0007

Automatic enabling in the Automation Studio I/O configuration by selecting "Extended error status information" and channel activation.

This register can be used to enable extended error messages for analog channels 1 and 2. Meaning of individual bits:

- **Range exceeded violation (pos.):** The analog input signal is outside of the specified working range.
- **Filter error:** The configured filter theorem cannot be calculated (parameter error).
- **Underflow:** The input signal is less than the lower limit value.
- **Overflow:** The input signal is greater than the upper limit value.

| Data type | Values | Bus controller default setting |
|-----------|------------------------|--------------------------------|
| USINT | See the bit structure. | 0 |

Bit structure:

| Bit | Description | Value | Information |
|-----|--|-------|--|
| 0 | Channel 1: Range exceeded violation (pos.) | 0 | Error generation disabled (bus controller default setting) |
| | | 1 | Range exceeded violation (pos.) enabled |
| 1 | Channel 1: Filter error | 0 | Error generation disabled (bus controller default setting) |
| | | 1 | Filter error enabled |
| 2 | Channel 1: Underflow | 0 | Error generation disabled (bus controller default setting) |
| | | 1 | Underflow enabled |
| 3 | Channel 1: Overrun | 0 | Error generation disabled (bus controller default setting) |
| | | 1 | Overflow enabled |
| 4 | Channel 2: Range exceeded violation (pos.) | 0 | Error generation disabled (bus controller default setting) |
| | | 1 | Range exceeded violation (pos.) enabled |
| 5 | Channel 2: Filter error | 0 | Error generation disabled (bus controller default setting) |
| | | 1 | Filter error enabled |
| 6 | Channel 2: Underflow | 0 | Error generation disabled (bus controller default setting) |
| | | 1 | Underflow enabled |
| 7 | Channel 2: Overrun | 0 | Error generation disabled (bus controller default setting) |
| | | 1 | Overflow enabled |

9.1.13.8.15.3 "StandardErrors" registers

Name:

Channel01Error to Channel02Error

PhysicalError

LogicalError

Composite errors are mapped to this register.

All configured functions of the physical and logical oversampling must be able to be carried out in the configured sampling cycle time; otherwise, these error messages occur. Settings for processing priority and the prescaler can be used to additionally adjust the system for logical oversampling.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|----------------|-------|--|
| 0 | Channel01Error | 0 | No error |
| | | 1 | Composite errors on channel 1 |
| 1 | Channel02Error | 0 | No error |
| | | 1 | Composite errors on channel 2 |
| 2 - 3 | Reserved | 0 | |
| 4 | PhysicalError | 0 | No error |
| | | 1 | Physical sample error status, sampling cycle time too short |
| 5 | LogicalError | 0 | No error |
| | | 1 | Logical sample error status, sampling cycle time too short or prescaler configured too low |
| 6 - 7 | Reserved | 0 | |

9.1.13.8.15.4 "AcknowledgeStandardErrors" registers

Name:

AckChannel01Error to AckChannel02Error

AckPhysicalError

AckLogicalError

Error messages from the "Standard errors" on page 486 register can be acknowledged by setting the corresponding bits in this register.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|-------------------|-------|-------------------|
| 0 | AckChannel01Error | 0 | No change |
| | | 1 | Acknowledge error |
| 1 | AckChannel02Error | 0 | No change |
| | | 1 | Acknowledge error |
| 2 - 3 | Reserved | 0 | |
| 4 | AckPhysicalError | 0 | No change |
| | | 1 | Acknowledge error |
| 5 | AckLogicalError | 0 | No change |
| | | 1 | Acknowledge error |
| 6 - 7 | Reserved | 0 | |

9.1.13.8.15.5 "ExtendedChannelErrorMessages" registers

Name:

Channel01OutOfRange to Channel02OutOfRange

Channel01FilterError to Channel02FilterError

Channel01Underflow to Channel02Underflow

Channel01Overflow to Channel02Overflow

The error states of input channels 1 and 2 are represented in these registers.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-----|----------------------|-------|--|
| 0 | Channel01OutOfRange | 0 | No error |
| | | 1 | Range exceeded violation (pos.) occurred |
| 1 | Channel01FilterError | 0 | No error |
| | | 1 | Filter error occurred |
| 2 | Channel01Underflow | 0 | No error |
| | | 1 | Underflow occurred |
| 3 | Channel01Overflow | 0 | No error |
| | | 1 | Overflow occurred |
| 4 | Channel02OutOfRange | 0 | No error |
| | | 1 | Range exceeded violation (pos.) occurred |
| 5 | Channel02FilterError | 0 | No error |
| | | 1 | Filter error occurred |
| 6 | Channel02Underflow | 0 | No error |
| | | 1 | Underflow occurred |
| 7 | Channel02Overflow | 0 | No error |
| | | 1 | Overflow occurred |

9.1.13.8.15.6 "AcknowledgeExtendedChannelErrorMessages" registers

Name:

AckChannel01OutOfRange to AckChannel02OutOfRange

AckChannel01FilterError to AckChannel02FilterError

AckChannel01Underflow to AckChannel02Underflow

AckChannel01Overflow to AckChannel02Overflow

These registers can be used to acknowledge the error messages from the "ExtendedChannelErrorMessages" on [page 487](#) registers by setting the corresponding bit.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-----|-------------------------|-------|-------------------|
| 0 | AckChannel01OutOfRange | 0 | No change |
| | | 1 | Acknowledge error |
| 1 | AckChannel01FilterError | 0 | No change |
| | | 1 | Acknowledge error |
| 2 | AckChannel01Underflow | 0 | No change |
| | | 1 | Acknowledge error |
| 3 | AckChannel01Overflow | 0 | No change |
| | | 1 | Acknowledge error |
| 4 | AckChannel02OutOfRange | 0 | No change |

9.1.13.8.16 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time |
|--------------------|
| 200 μ s |

9.1.13.8.17 Minimum I/O update time

There is no limitation or dependency on the bus cycle time.

The I/O update time is defined using the "Sampling time" register. The fastest possible sampling time depends on the number of channels to be converted and the configuration.

9.1.14 X20AI4222

Data sheet version: 1.21

9.1.14.1 General information

The module is equipped with 4 inputs with 13-bit (including sign) digital converter resolution. It can be used to capture voltage signals in the range from ± 10 V.

- 4 analog inputs ± 10 V
- 13-bit digital converter resolution

9.1.14.2 Order data

| Model number | Short description | Figure |
|--------------|---|---|
| X20AI4222 | X20 analog input module, 4 inputs, ± 10 V, 13-bit converter resolution, configurable input filter |  |
| | Required accessories | |

9.1.14.7 Input circuit diagram

9.1.14.8 Register description

9.1.14.8.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section ["General data points" on page 3790](#).

9.1.14.8.2 Function model 0 - Standard

| Register | Name | Data type | Read | | Write | |
|--------------------------------------|------------------------------------|-----------|--------|------------|--------|------------|
| | | | Cyclic | Non-cyclic | Cyclic | Non-cyclic |
| Analog signal - Configuration | | | | | | |
| 16 | ConfigOutput01 (Input filter) | USINT | | | | • |
| 20 | ConfigOutput03 (Lower limit value) | INT | | | | • |
| 22 | ConfigOutput04 (Upper limit value) | INT | | | | • |
| Analog signal - Communication | | | | | | |
| Index * 2 - 2 | AnalogInput0N (Index N = 1 to 4) | INT | • | | | |
| 30 | StatusInput01 | USINT | • | | | |

9.1.14.8.3 Function model 254 - Bus controller

| Register | Offset | Name | Data type | Read | | Write | |
|--------------------------------------|---------------|------------------------------------|-----------|--------|------------|--------|------------|
| | | | | Cyclic | Non-cyclic | Cyclic | Non-cyclic |
| Analog signal - Configuration | | | | | | | |
| 16 | - | ConfigOutput01 (Input filter) | USINT | | | | • |
| 20 | - | ConfigOutput03 (Lower limit value) | INT | | | | • |
| 22 | - | ConfigOutput04 (Upper limit value) | INT | | | | • |
| Analog signal - Communication | | | | | | | |
| Index * 2 - 2 | Index * 2 - 2 | AnalogInput0N (Index N = 1 to 4) | INT | • | | | |
| 30 | - | StatusInput01 | USINT | | • | | |

1) The offset specifies the position of the register within the CAN object.

9.1.14.8.3.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see ["Using I/O modules on the bus controller" on page 3789](#).

9.1.14.8.3.2 CAN I/O bus controller

The module occupies 1 analog logical slot on CAN I/O.

9.1.14.8.4 Analog inputs

The input state is collected with a fixed offset to the network cycle and transferred in the same cycle.

9.1.14.8.5 Analog input values

Name:

AnalogInput01 to AnalogInput04

The analog input values are mapped to this register.

| Data type | Value | Input signal: |
|-----------|-------------------|------------------------------|
| INT | -32,768 to 32,767 | Voltage signal -10 to 10 VDC |

9.1.14.8.6 Input filter

This module is equipped with a configurable input filter. The minimum cycle time must be $>500 \mu\text{s}$. Filtering is disabled for shorter cycle times.

If the input filter is active, then the scan rate for the channels is measured in ms. The time offset between the channels is $200 \mu\text{s}$. The conversion takes place asynchronously to the network cycle.

9.1.14.8.6.1 Input ramp limiting

Input ramp limiting can only be performed in conjunction with filtering. Input ramp limiting is performed before filtering.

The difference of the input value change is checked for exceeding the specified limit. In the event of overshoot, the tracked input value is equal to the old value \pm the limit value.

Configurable limit values:

| Value | Limit value |
|-------|---|
| 0 | The input value is used without limitation. |
| 1 | $0x3FFF = 16383$ |
| 2 | $0x1FFF = 8191$ |
| 3 | $0x0FFF = 4095$ |
| 4 | $0x07FF = 2047$ |
| 5 | $0x03FF = 1023$ |
| 6 | $0x01FF = 511$ |
| 7 | $0x00FF = 255$ |

Input ramp limiting is well suited for suppressing disturbances (spikes). The following examples show the functionality of input ramp limiting based on an input step and a disturbance.

Example 1

The input value jumps from 8000 to 17000. The diagram shows the tracked input value with the following settings:

Input ramp limiting = 4 = $0x07FF = 2047$

Filter level = 2

Figure 60: Tracked input value for input step

Example 2

A disturbance interferes with the input value. The diagram shows the tracked input value with the following settings:

Input ramp limiting = 4 = 0x07FF = 2047

Filter level = 2

Figure 61: Tracked input value for disturbance

9.1.14.8.6.2 Filter level

A filter can be defined to prevent large input jumps. This filter is used to bring the input value closer to the actual analog value over a period of several bus cycles.

Filtering takes place after input ramp limitation.

Formula for calculating the input value:

$$\text{Value}_{\text{New}} = \text{Value}_{\text{Old}} - \frac{\text{Value}_{\text{Old}}}{\text{Filter level}} + \frac{\text{Input value}}{\text{Filter level}}$$

Adjustable filter levels:

| Value | Filter level |
|-------|---------------------|
| 0 | Filter switched off |
| 1 | Filter level 2 |
| 2 | Filter level 4 |
| 3 | Filter level 8 |
| 4 | Filter level 16 |
| 5 | Filter level 32 |
| 6 | Filter level 64 |
| 7 | Filter level 128 |

The following examples show how filtering works in the event of an input jump or disturbance.

Example 1

The input value jumps from 8000 to 16000. The diagram shows the calculated value with the following settings:

Input ramp limiting = 0

Filter level = 2 or 4

Figure 62: Calculated value during input step

Example 2

A disturbance interferes with the input value. The diagram shows the calculated value with the following settings:

Input ramp limiting = 0

Filter level = 2 or 4

Figure 63: Calculated value during disturbance

9.1.14.8.7 Configuring the input filter

Name:

ConfigOutput01

The filter level and input ramp limiting of the input filter are set in this register.

| Data type | Values | Bus controller default setting |
|-----------|------------------------|--------------------------------|
| USINT | See the bit structure. | 0 |

Bit structure:

| Bit | Description | Value | Information |
|-------|-----------------------------|-------|--|
| 0 - 2 | Defines the filter level | 000 | Filter disabled (bus controller default setting) |
| | | 001 | Filter level 2 |
| | | 010 | Filter level 4 |
| | | 011 | Filter level 8 |
| | | 100 | Filter level 16 |
| | | 101 | Filter level 32 |
| | | 110 | Filter level 64 |
| | | 111 | Filter level 128 |
| 3 | Reserved | 0 | |
| 4 - 6 | Defines input ramp limiting | 000 | The input value is applied without limitation (bus controller default setting) |
| | | 001 | Limit value = 0x3FFF (16383) |
| | | 010 | Limit value = 0x1FFF (8191) |
| | | 011 | Limit value = 0x0FFF (4095) |
| | | 100 | Limit value = 0x07FF (2047) |
| | | 101 | Limit value = 0x03FF (1023) |
| | | 110 | Limit value = 0x01FF (511) |
| | | 111 | Limit value = 0x00FF (255) |
| 7 | Reserved | 0 | |

9.1.14.8.8 Lower limit value

Name:

ConfigOutput03

This register can be used to configure the lower limit for analog values. If the analog value goes below the limit value, it is frozen at this value and the corresponding error status bit is set.

| Data type | Values | Information |
|-----------|-----------------|--|
| INT | -32767 to 32767 | Bus controller default setting: -32767 |

Information:

The default value of -32767 corresponds to the minimum default value of -10 VDC.

Keep in mind that this setting applies to all channels!

9.1.14.8.9 Upper limit value

Name:

ConfigOutput04

This register can be used to configure the upper limit for analog values. If the analog value goes above the limit value, it is frozen at this value and the corresponding error status bit is set.

| Data type | Values | Information |
|-----------|-----------------|---------------------------------------|
| INT | -32767 to 32767 | Bus controller default setting: 32767 |

Information:

The default value of 32767 corresponds to the maximum default value at +10 VDC.

Keep in mind that this setting applies to all channels!

9.1.14.8.10 Input status

Name:
StatusInput01

This register is used to monitor the module inputs. A change in the monitoring status generates an error message.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|-------------|-------|----------------------------|
| 0 - 1 | Channel 1 | 00 | No error |
| | | 01 | Lower limit value exceeded |
| | | 10 | Upper limit value exceeded |
| | | 11 | Open line |
| ... | | ... | |
| 6 - 7 | Channel 4 | 00 | No error |
| | | 01 | Lower limit value exceeded |
| | | 10 | Upper limit value exceeded |
| | | 11 | Open line |

Limiting the analog value

In addition to the status information, the analog value is fixed to the values listed below by default in an error state. The analog value is limited to the new values if the limit values were changed.

| Error state | Digital value on error (default values) |
|-----------------------------|---|
| Open circuit | +32767 (0x7FFF) |
| Upper limit value overshoot | +32767 (0x7FFF) |
| Lower limit value undershot | -32767 (0x8001) |
| Invalid value | -32768 (0x8000) |

9.1.14.8.11 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time | |
|--------------------------|--------|
| Inputs without filtering | 100 µs |
| Inputs with filtering | 500 µs |

9.1.14.8.12 Minimum I/O update time

The minimum I/O update time specifies how far the bus cycle can be reduced so that an I/O update is performed in each cycle.

| Minimum I/O update time | |
|--------------------------|-----------------------|
| Inputs without filtering | 400 µs for all inputs |
| Inputs with filtering | 1 ms |

9.1.15 X20AI4322

Data sheet version: 1.21

9.1.15.1 General information

The module is equipped with 4 inputs with 12-bit digital converter resolution. It is possible to select between the two current ranges 0 to 20 mA and 4 to 20 mA.

- 4 analog inputs, 0 to 20 mA or 4 to 20 mA
- 12-bit digital converter resolution

9.1.15.2 Order data

| Model number | Short description | Figure |

9.1.15.8 Register description

9.1.15.8.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section ["General data points" on page 3790](#).

9.1.15.8.2 Function model 0 - Standard

| Register | Name | Data type | Read | | Write | |
|--------------------------------------|--|-----------|--------|------------|--------|------------|
| | | | Cyclic | Non-cyclic | Cyclic | Non-cyclic |
| Analog signal - Configuration | | | | | | |
| 16 | ConfigOutput01 (Input filter) | USINT | | | | • |
| 18 | ConfigOutput02 (Channel type) | USINT | | | | • |
| 20 | ConfigOutput03 (Lower limit value) | INT | | | | • |
| 22 | ConfigOutput04 (Upper limit value) | INT | | | | • |
| Analog signal - Communication | | | | | | |
| Index * 2 - 2 | AnalogInput0N (Index N = 1 to 4) | INT | • | | | |
| 30 | StatusInput01 | USINT | • | | | |

9.1.15.8.3 Function model 254 - Bus controller

| Register | Offset ¹⁾ | Name | Data type | Read | | Write | |
|--------------------------------------|----------------------|--|-----------|--------|------------|--------|------------|
| | | | | Cyclic | Non-cyclic | Cyclic | Non-cyclic |
| Analog signal - Configuration | | | | | | | |

| 18 | - | ConfigOutput02 (Channel type) | USINT | | | | • |
| 20 | - | ConfigOutput03 (Lower limit value) | INT | | | | • |
| 22 | - | ConfigOutput04 (Upper limit value) | INT | | | | • |
| Analog signal - Communication | | | | | | | |
| Index * 2 - 2 | Index * 2 - 2 | AnalogInput0N (Index N = 1 to 4) | INT | • | | | |
| 30 | - | StatusInput01 | USINT | | • | | |

1) The offset specifies the position of the register within the CAN object.

9.1.15.8.3.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see ["Using I/O modules on the bus controller" on page 3789](#).

9.1.15.8.3.2 CAN I/O bus controller

The module occupies 1 analog logical slot on CAN I/O.

9.1.15.8.4 Analog inputs

The input state is collected with a fixed offset to the network cycle and transferred in the same cycle.

9.1.15.8.5 Analog input values

Name:

AnalogInput01 to AnalogInput04

The analog input values are mapped to this register.

| Data type | Value | Input signal: |
|-----------|----------------|---|
| INT | 0 to 32767 | Current signal 0 to 20 mA |
| | -8192 to 32767 | Current signal 4 to 20 mA (value 0 corresponds to 4 mA) |

9.1.15.8.6 Input filter

This module is equipped with a configurable input filter. The minimum cycle time must be $>500 \mu\text{s}$. Filtering is disabled for shorter cycle times.

If the input filter is active, then the scan rate for the channels is measured in ms. The time offset between the channels is $200 \mu\text{s}$. The conversion takes place asynchronously to the network cycle.

9.1.15.8.6.1 Input ramp limiting

Input ramp limiting can only be performed in conjunction with filtering. Input ramp limiting is performed before filtering.

The difference of the input value change is checked for exceeding the specified limit. In the event of overshoot, the tracked input value is equal to the old value \pm the limit value.

Configurable limit values:

| Value | Limit value |
|-------|---|
| 0 | The input value is used without limitation. |
| 1 | $0x3FFF = 16383$ |
| 2 | $0x1FFF = 8191$ |
| 3 | $0x0FFF = 4095$ |
| 4 | $0x07FF = 2047$ |
| 5 | $0x03FF = 1023$ |
| 6 | $0x01FF = 511$ |
| 7 | $0x00FF = 255$ |

Input ramp limiting is well suited for suppressing disturbances (spikes). The following examples show the functionality of input ramp limiting based on an input step and a disturbance.

Example 1

The input value jumps from 8000 to 17000. The diagram shows the tracked input value with the following settings:

Input ramp limiting = 4 = $0x07FF = 2047$

Filter level = 2

Figure 64: Tracked input value for input step

Example 2

A disturbance interferes with the input value. The diagram shows the tracked input value with the following settings:

Input ramp limiting = 4 = 0x07FF = 2047

Filter level = 2

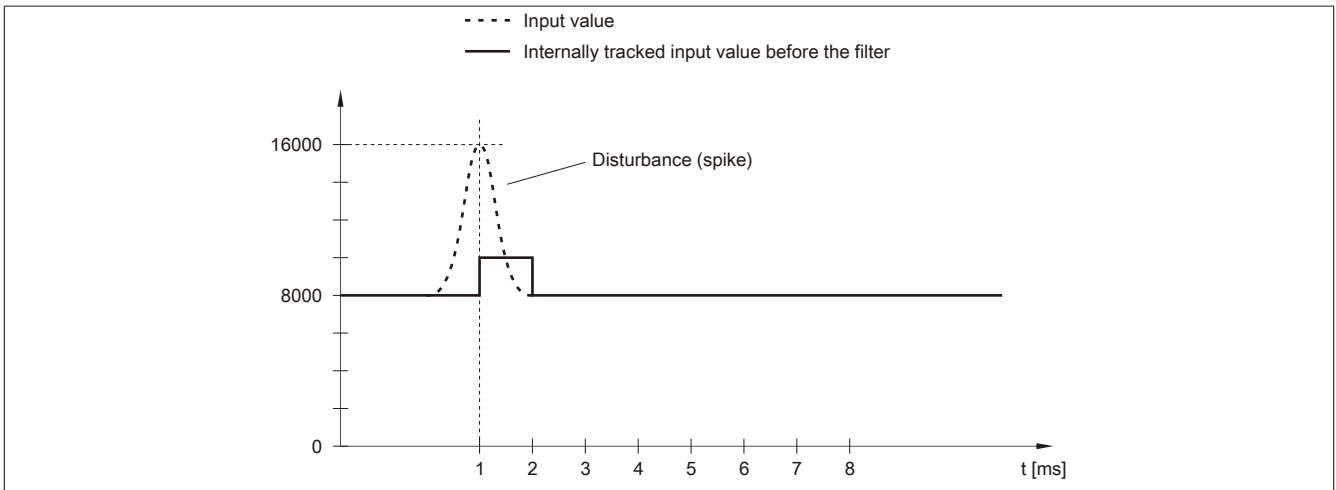

Figure 65: Tracked input value for disturbance

9.1.15.8.6.2 Filter level

A filter can be defined to prevent large input jumps. This filter is used to bring the input value closer to the actual analog value over a period of several bus cycles.

Filtering takes place after input ramp limitation.

Formula for calculating the input value:

$$\text{Value}_{\text{New}} = \text{Value}_{\text{Old}} - \frac{\text{Value}_{\text{Old}}}{\text{Filter level}} + \frac{\text{Input value}}{\text{Filter level}}$$

Adjustable filter levels:

| Value | Filter level |
|-------|---------------------|
| 0 | Filter switched off |
| 1 | Filter level 2 |
| 2 | Filter level 4 |
| 3 | Filter level 8 |
| 4 | Filter level 16 |
| 5 | Filter level 32 |
| 6 | Filter level 64 |
| 7 | Filter level 128 |

The following examples show how filtering works in the event of an input jump or disturbance.

Example 1

The input value jumps from 8000 to 16000. The diagram shows the calculated value with the following settings:

Input ramp limiting = 0

Filter level = 2 or 4

Figure 66: Calculated value during input step

Example 2

A disturbance interferes with the input value. The diagram shows the calculated value with the following settings:

Input ramp limiting = 0

Filter level = 2 or 4

Figure 67: Calculated value during disturbance

9.1.15.8.7 Configuring the input filter

Name:

ConfigOutput01

The filter level and input ramp limiting of the input filter are set in this register.

| Data type | Values | Bus controller default setting |
|-----------|------------------------|--------------------------------|
| USINT | See the bit structure. | 0 |

Bit structure:

| Bit | Description | Value | Information |
|-------|-----------------------------|-------|--|
| 0 - 2 | Defines the filter level | 000 | Filter disabled (bus controller default setting) |
| | | 001 | Filter level 2 |
| | | 010 | Filter level 4 |
| | | 011 | Filter level 8 |
| | | 100 | Filter level 16 |
| | | 101 | Filter level 32 |
| | | 110 | Filter level 64 |
| | | 111 | Filter level 128 |
| 3 | Reserved | 0 | |
| 4 - 6 | Defines input ramp limiting | 000 | The input value is applied without limitation (bus controller default setting) |
| | | 001 | Limit value = 0x3FFF (16383) |
| | | 010 | Limit value = 0x1FFF (8191) |
| | | 011 | Limit value = 0x0FFF (4095) |
| | | 100 | Limit value = 0x07FF (2047) |
| | | 101 | Limit value = 0x03FF (1023) |
| | | 110 | Limit value = 0x01FF (511) |
| | | 111 | Limit value = 0x00FF (255) |
| 7 | Reserved | 0 | |

9.1.15.8.8 Channel type

Name:

ConfigOutput02

This register can be used to set the range of the current signal. This is determined by how they are configured. The following input signals can be set:

- 0 to 20 mA current signal
- 4 to 20 mA current signal

| Data type | Values | Bus controller default setting |
|-----------|------------------------|--------------------------------|
| USINT | See the bit structure. | 15 |

Bit structure:

| Bit | Description | Value | Information |
|-------|--------------------------------------|-------|--|
| 0 - 3 | Reserved | 1 | |
| 4 | Channel 1: Current measurement range | 0 | 0 to 20 mA current signal (bus controller default setting) |
| | | 1 | 4 to 20 mA current signal |
| ... | | ... | |
| 7 | Channel 4: Current measurement range | 0 | 0 to 20 mA current signal (bus controller default setting) |
| | | 1 | 4 to 20 mA current signal |

9.1.15.8.9 Lower limit value

Name:

ConfigOutput03

This register can be used to configure the lower limit for analog values. If the analog value goes below the limit value, it is frozen at this value and the corresponding error status bit is set.

| Data type | Values | Information |
|-----------|-----------------|--|
| INT | -32768 to 32767 | Bus controller default setting: -32767 |

Information:

- When configured as 0 to 20 mA, this value should be set to 0.
- When configured as 4 to 20 mA, this value can be set to -8192 (corresponds to 0 mA) in order to display values <4 mA.

Keep in mind that this setting applies to all channels!

9.1.15.8.10 Upper limit value

Name:

ConfigOutput04

This register can be used to configure the upper limit for analog values. If the analog value goes above the limit value, it is frozen at this value and the corresponding error status bit is set.

| Data type | Values | Information |
|-----------|-----------------|---------------------------------------|
| INT | -32768 to 32767 | Bus controller default setting: 32767 |

Information:

The default value of 32767 corresponds to the maximum default value at 20 mA.

Keep in mind that this setting applies to all channels!

9.1.15.8.11 Input status

Name:

StatusInput01

This register is used to monitor the module inputs. A change in the monitoring status generates an error message.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|-------------|-------|----------------------------|
| 0 - 1 | Channel 1 | 00 | No error |
| | | 01 | Lower limit value exceeded |
| | | 10 | Upper limit value exceeded |
| ... | ... | ... | ... |
| 6 - 7 | Channel 4 | 00 | No error |
| | | 01 | Lower limit value exceeded |
| | | 10 | Upper limit value exceeded |

Limiting the analog value

In addition to the status information, the analog value is set to the values listed below by default when an error occurs. The analog value is limited to the new values if the limit values were changed.

| Error status | Digital value for error (default values) | |
|----------------------------|--|----------------|
| | 0 to 20 mA | 4 to 20 mA |
| Upper limit value exceeded | +32767 (0x7FFF) | |
| Lower limit value exceeded | 0 | -8191 (0xE001) |

9.1.15.8.12 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time | |
|--------------------------|--------|
| Inputs without filtering | 100 µs |
| Inputs with filtering | 500 µs |

9.1.15.8.13 Minimum I/O update time

The minimum I/O update time specifies how far the bus cycle can be reduced so that an I/O update is performed in each cycle.

| Minimum I/O update time | |
|--------------------------|-----------------------|
| Inputs without filtering | 400 µs for all inputs |
| Inputs with filtering | 1 ms |

9.1.16 X20(c)AI4622

Data sheet version: 3.32

9.1.16.1 General information

The module is equipped with 4 inputs with 13-bit (including sign) digital converter resolution. It is possible to select between the current and voltage signal using different terminals.

- 4 analog inputs
- Either current or voltage signal possible
- 13-bit digital converter resolution

9.1.16.2 Coated modules

Coated modules are X20 modules with a protective coating for the electronics component. This coating protects X20c modules from condensation and corrosive gases.

The modules' electronics are fully compatible with the corresponding X20 modules.

For simplification purposes, only images and module IDs of uncoated modules are used in this data sheet.

The coating has been certified according to the following standards:

- Condensation: BMW GS 95011-4, 2x 1 cycle
- Corrosive gas: EN 60068-2-60, method 4, exposure 21 days

9.1.16.2.1 -40°C starting temperature

The starting temperature describes the minimum permissible ambient temperature when the power is switched off at the time the coated module is switched on. This is permitted to be as low as -40°C. During operation, the conditions as specified in the technical data continue to apply.

Information:

It is important to absolutely ensure that there is no forced cooling by air currents in a closed control cabinet, for example using a fan or ventilation slots.

9.1.16.3 Order data

| Model number | Short description | Figure |

- 1) To reduce power dissipation, B&R recommends bridging unused inputs on the terminals or configuring them as current signals.
- 2) Based on the current measured value.
- 3) Based on the 20 V measurement range.
- 4) Based on the 20 mA measurement range.

9.1.16.5 LED status indicators

For a description of the various operating modes, see "[Diagnostic LEDs](#)" on page 3787.

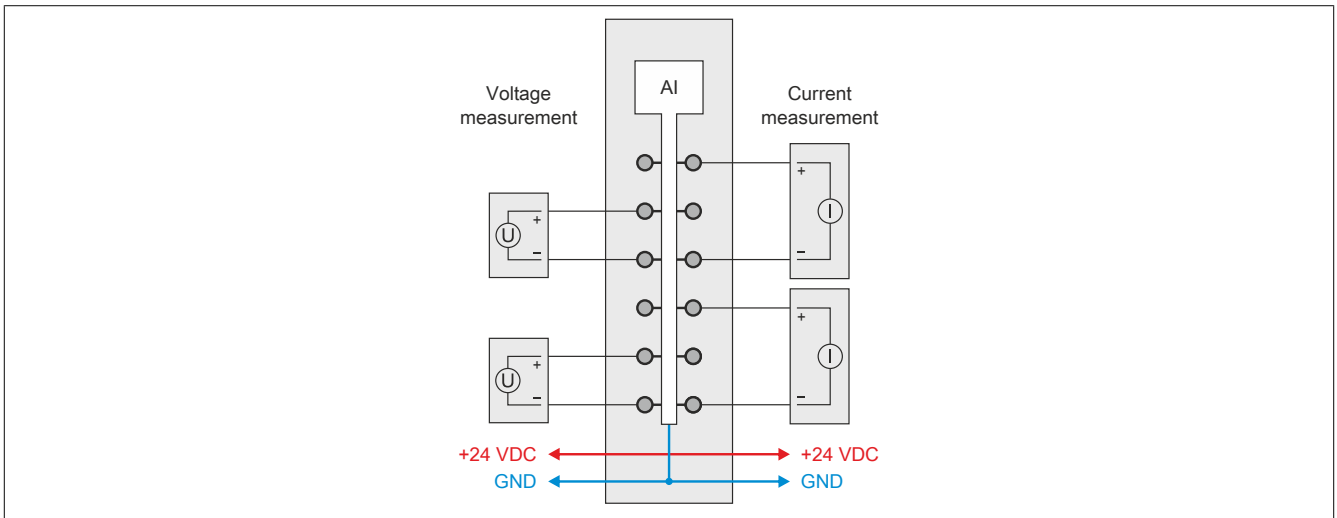

| Figure | LED | Color | Status | Description |
|---|-------|-------|-----------------------------|---|
|  | r | Green | Off | No power to module |
| | | | Single flash | RESET mode |
| | | | Blinking | PREOPERATIONAL mode |
| | | | On | RUN mode |
| | e | Red | Off | No power to module or everything OK |
| | | | On | Error or reset status |
| | e + r | | Red on / Green single flash | Invalid firmware |
| | 1 - 4 | Green | Off | Open line ¹⁾ or sensor is disconnected |
| | | | Blinking | Input signal overflow or underflow |
| | | | On | Analog/digital converter running, value OK |

- 1) Open line detection only possible when measuring voltage.

9.1.16.8 Input circuit diagram

9.1.16.9 Register description

9.1.16.9.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section ["General data points" on page 3790](#).

9.1.16.9.2 Function model 0 - Standard

| Register | Name | Data type | Read | | Write | |
|----------------------|------------------------------------|-----------|--------|---------|--------|---------|
| | | | Cyclic | Acyclic | Cyclic | Acyclic |
| Configuration | | | | | | |
| 16 | ConfigOutput01 (input filter) | USINT | | | | • |
| 18 | ConfigOutput02 (channel type) | USINT | | | | • |
| 20 | ConfigOutput03 (lower limit value) | INT | | | | • |
| 22 | ConfigOutput04 (upper limit value) | INT | | | | • |
| Communication | | | | | | |
| 0 | AnalogInput01 | INT | • | | | |
| 2 | AnalogInput02 | INT | • | | | |
| 4 | AnalogInput03 | INT | • | | | |
| 6 | AnalogInput04 | INT | • | | | |
| 30 | StatusInput01 | USINT | • | | | |

9.1.16.9.3 Function model 254 - Bus controller

| Register | Offset ¹⁾ | Name | Data type | Read | | Write | |
|----------------------|----------------------|------------------------------------|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| Configuration | | | | | | | |
| 16 | - | ConfigOutput01 (input filter) | USINT | | | | • |
| 18 | - | ConfigOutput02 (channel type) | USINT | | | | • |
| 20 | - | ConfigOutput03 (lower limit value) | INT | | | | • |
| 22 | - | ConfigOutput04 (upper limit value) | INT | | | | • |
| Communication | | | | | | | |
| 0 | 0 | AnalogInput01 | INT | • | | | |
| 2 | 2 | AnalogInput02 | INT | • | | | |
| 4 | 4 | AnalogInput03 | INT | • | | | |
| 6 | 6 | AnalogInput04 | INT | • | | | |
| 30 | - | StatusInput01 | USINT | | • | | |

1) The offset specifies the position of the register within the CAN object.

9.1.16.9.3.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see ["Using I/O modules on the bus controller" on page 3789](#).

9.1.16.9.3.2 CAN I/O bus controller

The module occupies 1 analog logical slot on CAN I/O.

9.1.16.9.4 Analog inputs

The input state is collected with a fixed offset to the network cycle and transferred in the same cycle.

9.1.16.9.5 Input values of analog inputs

Name:

AnalogInput01 to AnalogInput04

This register contains the analog input value depending on the configured operating mode.

| Data type | Values | Input signal: |
|-----------|-----------------|---|
| INT | -32768 to 32767 | Voltage signal -10 to 10 VDC |
| | 0 to 32767 | Current signal 0 to 20 mA |
| | -8192 to 32767 | Current signal 4 to 20 mA (value 0 corresponds to 4 mA) |

9.1.16.9.6 Input filter

This module is equipped with a configurable input filter. The minimum X2X cycle time must be $>500 \mu\text{s}$. Filtering is disabled for shorter X2X cycle times.

If the input filter is active, then the channels are scanned in 1 ms cycles. The time offset between the channels is 200 μs . Conversion is performed acyclically to the X2X cycle.

Information:

The filter sampling time is fixed at 1 ms and is acyclic to the X2X cycle.

9.1.16.9.6.1 Input ramp limiting

Input ramp limiting can only be performed in conjunction with filtering. Input ramp limiting is performed before filtering.

The difference of the input value change is checked for exceeding the specified limit. In the event of overshoot, the tracked input value is equal to the old value \pm the limit value.

Configurable limit values:

| Value | Limit value |
|-------|---|
| 0 | The input value is used without limitation. |
| 1 | 0x3FFF = 16383 |
| 2 | 0x1FFF = 8191 |
| 3 | 0x0FFF = 4095 |
| 4 | 0x07FF = 2047 |
| 5 | 0x03FF = 1023 |
| 6 | 0x01FF = 511 |
| 7 | 0x00FF = 255 |

Input ramp limiting is well suited for suppressing disturbances (spikes). The following examples show the functionality of input ramp limiting based on an input step and a disturbance.

Example 1

The input value jumps from 8000 to 17000. The diagram shows the tracked input value with the following settings:

Input ramp limiting = 4 = 0x07FF = 2047

Filter level = 2

Figure 68: Tracked input value for input step

Example 2

A disturbance interferes with the input value. The diagram shows the tracked input value with the following settings:

Input ramp limiting = 4 = 0x07FF = 2047

Filter level = 2

Figure 69: Tracked input value for disturbance

9.1.16.9.6.2 Filter level

A filter can be defined to prevent large input steps. This filter is used to bring the input value closer to the actual analog value over a period of several milliseconds.

Filtering takes place after any input ramp limiting has been carried out.

Formula for calculating the input value:

$$\text{Value}_{\text{New}} = \text{Value}_{\text{Old}} - \frac{\text{Value}_{\text{Old}}}{\text{Filter level}} + \frac{\text{Input value}}{\text{Filter level}}$$

Adjustable filter levels:

| Value | Filter level |
|-------|---------------------|
| 0 | Filter switched off |
| 1 | Filter level 2 |
| 2 | Filter level 4 |
| 3 | Filter level 8 |
| 4 | Filter level 16 |
| 5 | Filter level 32 |
| 6 | Filter level 64 |
| 7 | Filter level 128 |

The following examples show the functionality of the filter based on an input step and a disturbance.

Example 1

The input value jumps from 8000 to 16000. The diagram shows the calculated value with the following settings:

Input ramp limiting = 0

Filter level = 2 or 4

Figure 70: Calculated value during input step

Example 2

A disturbance interferes with the input value. The diagram shows the calculated value with the following settings:

Input ramp limiting = 0

Filter level = 2 or 4

Figure 71: Calculated value during disturbance

9.1.16.9.7 Configuring the input filter

Name:

ConfigOutput01

The filter level and input ramp limiting of the input filter are set in this register.

| Data type | Values | Bus controller default setting |
|-----------|------------------------|--------------------------------|
| USINT | See the bit structure. | 0 |

Bit structure:

| Bit | Description | Value | Information |
|-------|-----------------------------|-------|--|
| 0 - 2 | Defines the filter level | 000 | Filter disabled (bus controller default setting) |
| | | 001 | Filter level 2 |
| | | 010 | Filter level 4 |
| | | 011 | Filter level 8 |
| | | 100 | Filter level 16 |
| | | 101 | Filter level 32 |
| | | 110 | Filter level 64 |
| | | 111 | Filter level 128 |
| 3 | Reserved | 0 | |
| 4 - 6 | Defines input ramp limiting | 000 | The input value is applied without limitation (bus controller default setting) |
| | | 001 | Limit value = 0x3FFF (16383) |
| | | 010 | Limit value = 0x1FFF (8191) |
| | | 011 | Limit value = 0x0FFF (4095) |
| | | 100 | Limit value = 0x07FF (2047) |
| | | 101 | Limit value = 0x03FF (1023) |
| | | 110 | Limit value = 0x01FF (511) |
| | | 111 | Limit value = 0x00FF (255) |
| 7 | Reserved | 0 | |

9.1.16.9.8 Channel type

Name:

ConfigOutput02

The type and range of signal measurement can be set in this register.

The individual channels are designed for current and voltage signals. This differentiation is made using different terminals and an integrated switch in the module. The switch is automatically activated by the module depending on the specified configuration. The following input signals can be set:

- ± 10 V voltage signal (default)
- 0 to 20 mA current signal
- 4 to 20 mA current signal

| Data type | Values | Bus controller default setting |
|-----------|------------------------|--------------------------------|
| USINT | See the bit structure. | 0 |

Bit structure:

| Bit | Description | Value | Information |
|-----|--------------------------------------|-------|--|
| 0 | Channel 1 | 0 | Voltage signal (bus controller default setting) |
| | | 1 | Current signal, measurement range corresponding to bit 4 |
| ... | | ... | |
| 3 | Channel 4 | 0 | Voltage signal (bus controller default setting) |
| | | 1 | Current signal, measurement range corresponding to bit 7 |
| 4 | Channel 1: Current measurement range | 0 | 0 to 20 mA current signal (bus controller default setting) |
| | | 1 | 4 to 20 mA current signal |
| ... | | ... | |
| 7 | Channel 4: Current measurement range | 0 | 0 to 20 mA current signal (bus controller default setting) |
| | | 1 | 4 to 20 mA current signal |

9.1.16.9.9 Limit values

The input signal is monitored at the upper and lower limit values. These must be defined according to the operating mode:

| Limit value (default) | Voltage signal ± 10 V | | Current signal 0 to 20 mA | | Current signal 4 to 20 mA | |
|---------------------------|---------------------------|-----------------|---------------------------|-----------------|---------------------------|-----------------|
| Upper maximum limit value | +10 V | +32767 (0x7FFF) | 20 mA | +32767 (0x7FFF) | 20 mA | +32767 (0x7FFF) |
| Lower minimum limit value | -10 V | -32767 (0x8001) | 0 mA | 0 ¹⁾ | 4 mA | 0 ²⁾ |

1) The analog value is limited down to 0.

2) The analog value is limited down to 0 at currents <4 mA. The status bit for the lower limit is set.

Other limit values can be defined if necessary. The limit values apply to all channels. These are enabled automatically by writing to the limit value registers. From this point on, the analog values will be monitored and limited according to the new limits. The results of monitoring are displayed in the status register.

Examples of limit value settings

| Use case | Limit value settings |
|----------------------------------|--|
| Current signal: 4 to 20 mA | If values <4 mA should be measured for a current signal with 4 to 20 mA, a negative limit value must be set: 0 mA corresponds to value -8192 (0xE000). |
| Mixed voltage and current signal | The set limit values apply to all channels. A compromise must therefore be made for mixed operation (voltage and current signal mixed). The following setting has proven to be effective: Upper limit value = +32767, lower limit value = -32767 This also allows negative voltage values to be measured. With a lower limit value of 0, the voltage value would be limited to 0. |
| Current signal on all channels | All channels are configured for current measurement. The limit value setting in Automation Studio is not adjusted automatically. This means that +32767 is set for the upper limit value and -32767 for the lower limit value. The necessary adjustments must be made by the user, e.g. lower limit value = 0 |

9.1.16.9.9.1 Lower limit value

Name:

ConfigOutput03

The lower limit value for analog values can be set in this register. If the analog value goes below the limit value, it is frozen at this value and the corresponding error status bit is set.

| Data type | Values | Information |
|-----------|-----------------|--|
| INT | -32768 to 32767 | Bus controller default setting: -32768 |

Information:

- The default value of **-32767** corresponds to the minimum default value of **-10 VDC**.
- For a **0 to 20 mA** configuration, this value should be set to **0**.
- For a **4 to 20 mA** configuration, this value can be set to **-8192** (corresponds to **0 mA**) in order to display values <4 mA.

Information:

It is important to note that this setting applies to all channels!

9.1.16.9.9.2 Upper limit value

Name:

ConfigOutput04

The upper limit value for analog values can be set in this register. If the analog value goes above the limit value, it is frozen at this value and the corresponding error status bit is set.

| Data type | Values | Information |
|-----------|-----------------|---------------------------------------|
| INT | -32767 to 32767 | Bus controller default setting: 32767 |

Information:

The default value **32767** corresponds to the maximum default value at **20 mA** or **+10 VDC**.

Information:

It is important to note that this setting applies to all channels!

9.1.16.9.10 Status of the inputs

Name:
StatusInput01

The module inputs are monitored in this register. A change in the monitoring status is actively transmitted as an error message. The following states are monitored depending on the settings:

| Value | Voltage signal ± 10 V | Current signal 0 to 20 mA | Current signal 4 to 20 mA |
|-------|-----------------------------|---|-----------------------------|
| 0 | No error | No error | No error |
| 1 | Lower limit value undershot | Default setting The input value has a lower limit of 0x0000. Underflow monitoring is therefore not necessary. After lower limit value change The input value is limited to the configured value. The status bit is set when the value falls below the lower limit. | Lower limit value undershot |
| 2 | Upper limit value overshoot | Upper limit value overshoot | Upper limit value overshoot |
| 3 | Open circuit | - | - |

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|-------------|-------|-----------------------------|
| 0 - 1 | Channel 1 | 00 | No error |
| | | 01 | Lower limit value undershot |
| | | 10 | Upper limit value overshoot |
| | | 11 | Open circuit |
| ... | | ... | |
| 6 - 7 | Channel 4 | 00 | No error |
| | | 01 | Lower limit value undershot |
| | | 10 | Upper limit value overshoot |
| | | 11 | Open circuit |

Limiting the analog value

In addition to the status information, the analog value is fixed to the values listed below by default in an error state. The analog value is limited to the new values if the limit values were changed.

| Error state | Digital value on error (default values) |
|-----------------------------|---|
| Open circuit | +32767 (0x7FFF) |
| Upper limit value overshoot | +32767 (0x7FFF) |
| Lower limit value undershot | -32767 (0x8001) |
| Invalid value | -32768 (0x8000) |

9.1.16.9.11 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time | |
|--------------------------|-------------|
| Inputs without filtering | 100 μ s |
| Inputs with filtering | 500 μ s |

9.1.16.9.12 Minimum I/O update time

The minimum I/O update time specifies how far the bus cycle can be reduced so that an I/O update is performed in each cycle.

| Minimum I/O update time | |
|--------------------------|----------------------------|
| Inputs without filtering | 300 μ s for all inputs |
| Inputs with filtering | 1 ms |

9.1.17 X20(c)AI4632

Data sheet version: 3.11

9.1.17.1 General information

The module is equipped with 4 inputs with 16-bit digital converter resolution. It is possible to select between the current and voltage signal using different terminals.

- 4 analog inputs
- Either current or voltage signal possible
- 16-bit digital converter resolution
- Simultaneous input conversion
- Very fast conversion time

9.1.17.2 Coated modules

Coated modules are X20 modules with a protective coating for the electronics component. This coating protects X20c modules from condensation and corrosive gases.

The modules' electronics are fully compatible with the corresponding X20 modules.

For simplification purposes, only images and module IDs of uncoated modules are used in this data sheet.

The coating has been certified according to the following standards:

- Condensation: BMW GS 95011-4, 2x 1 cycle
- Corrosive gas: EN 60068-2-60, method 4, exposure 21 days

9.1.17.2.1 -40°C starting temperature

The starting temperature describes the minimum permissible ambient temperature when the power is switched off at the time the coated module is switched on. This is permitted to be as low as -40°C. During operation, the conditions as specified in the technical data continue to apply.

Information:

It is important to absolutely ensure that there is no forced cooling by air currents in a closed control cabinet, for example using a fan or ventilation slots.

9.1.17.3 Order data

| Model number | Short description | Figure |
|--------------|--|---|
| | Analog inputs |  |
| X20AI4632 | X20 analog input module, 4 inputs, ±10 V or 0 to 20 mA, 16-bit converter resolution, configurable input filter, oscilloscope functions | |
| X20cAI4632 | X20 analog input module, coated, 4 inputs, ±10 V or 0 to 20 mA, 16-bit converter resolution, configurable input filter, oscilloscope functions | |
| | Required accessories | |
| | Bus modules | |
| X20BM11 | X20 bus module, 24 VDC keyed, internal I/O supply continuous | |
| X20BM15 | X20 bus module, with node number switch, 24 VDC keyed, internal I/O supply continuous | |
| X20cBM11 | X20 bus module, coated, 24 VDC keyed, internal I/O supply continuous | |
| | Terminal blocks | |
| X20TB12 | X20 terminal block, 12-pin, 24 VDC keyed | |

Table 73: X20AI4632, X20cAI4632 - Technical data

- 1) To reduce power dissipation, B&R recommends bridging unused inputs on the terminals or configuring them as current signals.
- 2) Based on the current measured value.
- 3) Based on the 20 V measurement range.
- 4) Based on the 20 mA measurement range.

9.1.17.5 LED status indicators

For a description of the various operating modes, see "[Diagnostic LEDs](#)" on page 3787.

| Figure | LED | Color | Status | Description |
|---|-------|-------|--------------|---|
|  | r | Green | Off | No power to module |
| | | | Single flash | RESET mode |
| | | | Double flash | BOOT mode (during firmware update) ¹⁾ |
| | | | Blinking | PREOPERATIONAL mode |
| | e | Red | On | RUN mode |
| | | | Off | No power to module or everything OK |
| | | | On | Error or reset status |
| | | | Double flash | System error: <ul style="list-style-type: none"> • Violation of the scan time • Synchronization error |
| | 1 - 4 | Green | Off | Open line ²⁾ or sensor is disconnected |
| | | | On | Analog/digital converter running, value OK |

- 1) Depending on the configuration, a firmware update can take up to several minutes.
 2) Open line detection only possible when measuring voltage.

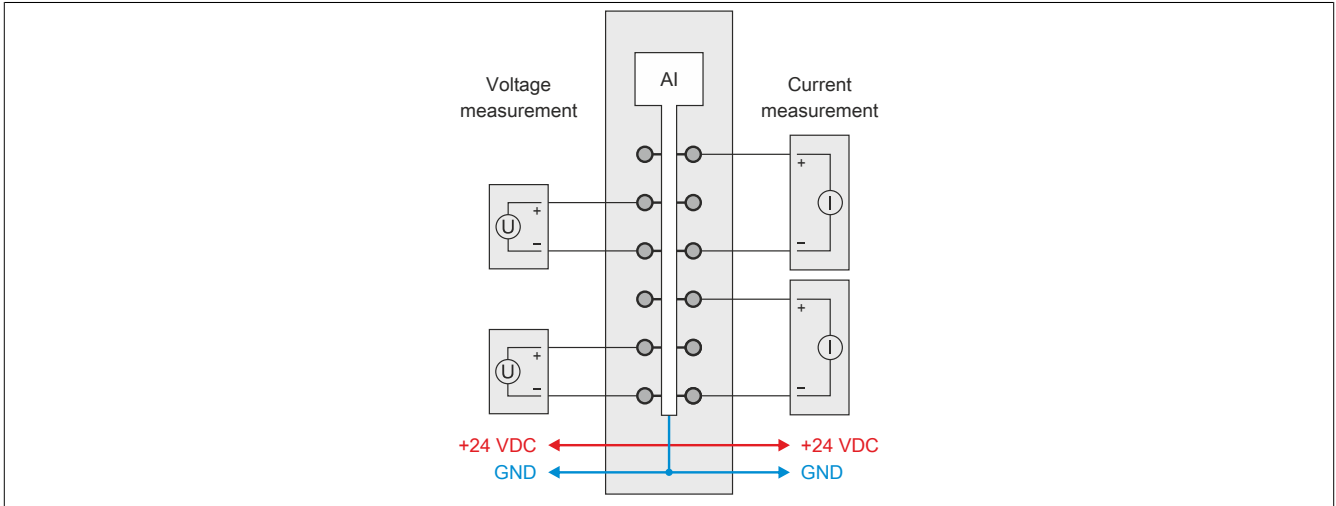

9.1.17.6 Pinout

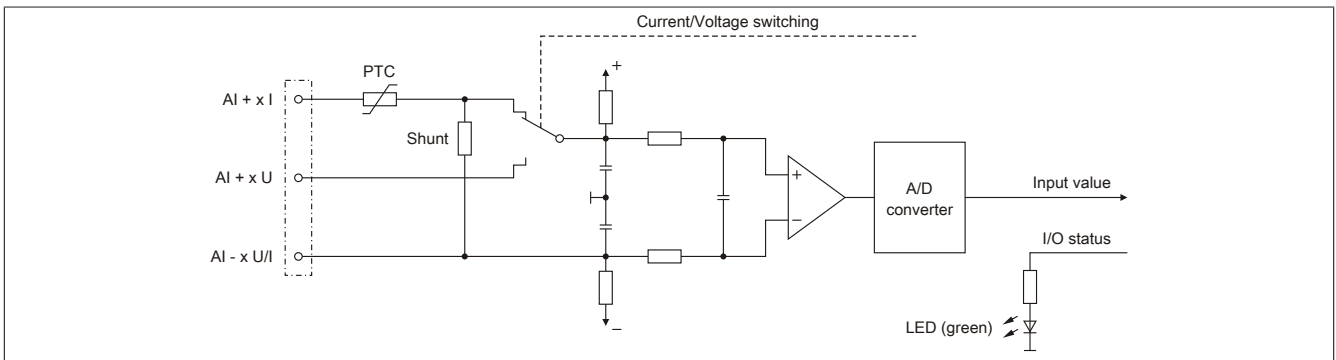

9.1.17.7 Connection example

To prevent disturbances, the following modules must be separated by at least one module:

- Bus receiver X20BR9300
- Supply module X20PS3300/X20PS3310
- Supply module X20PS9400/X20PS9402
- Supply module X20PS9500/X20PS9502
- CPU modules

9.1.17.8 Input circuit diagram

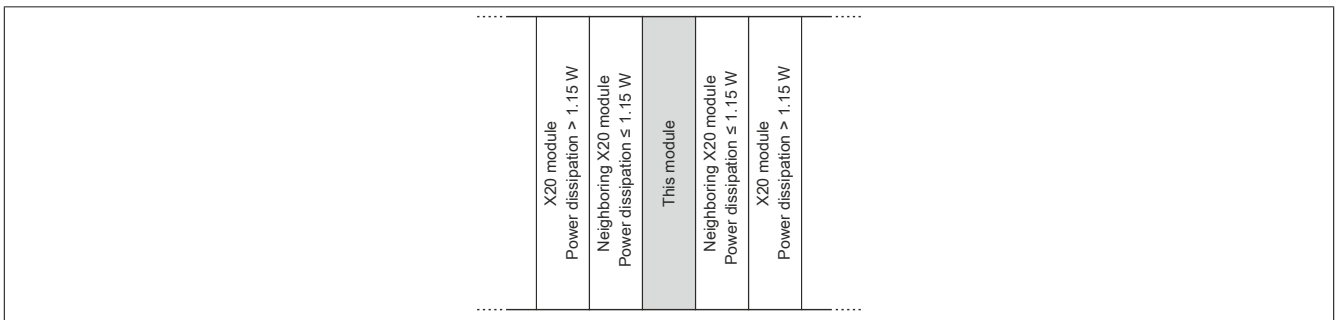

9.1.17.9 Derating

There is no derating when operated below 55°C.

During operation over 55°C, the power dissipation of the modules to the left and right of this module is not permitted to exceed 1.15 W!

For an example of calculating the power dissipation of I/O modules, see section "[Power dissipation calculation of I/O modules](#)" on page 101.

9.1.17.10 Register description

9.1.17.10.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section "General data points" on page 3790.

| | | MinMaxStart01Readback | Bit 4 | | • | | |
| | | ... | ... | | | | |
| | | MinMaxStart04Readback | Bit 7 | | | | |
| Limit values | | | | | | | |
| 530 + (N-1) * 32 | - | MinInput0N (index N = 1 to 4) | INT | | • | | |
| 534 + (N-1) * 32 | - | MaxInput0N (index N = 1 to 4) | INT | | • | | |
| 538 + (N-1) * 32 | - | Ch0NMinMaxLatchCounter (index N = 1 to 4) | UINT | | • | | |

1) The offset specifies the position of the register within the CAN object.

9.1.17.10.3.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see "Using I/O modules on the bus controller" on page 3789.

9.1.17.10.3.2 CAN I/O bus controller

The module occupies 1 analog logical slot on CAN I/O.

9.1.17.10.4 Configuration

This module is equipped with analog inputs with connected 16-bit A/D converters. Each of the inputs can be configured separately from one another either on the voltage or current input for the following areas:

- Permitted voltage: ± 10 V
- Permitted current: 0 to 20 mA

9.1.17.10.4.1 Channel configuration

Name:

ConfigOutput01 for channel 1
 ConfigOutput06 for channel 2
 ConfigOutput11 for channel 3
 ConfigOutput16 for channel 4

The individual inputs for processing the current or voltage signal are configured in these registers. This configuration must be made in addition to using suitable terminals.

Filtering, analysis and error monitoring (bits 4 to 6) can only be used if the channel is enabled (bit 7 = 0).

| Data type | Values | Bus controller default setting |
|-----------|------------------------|--------------------------------|
| USINT | See the bit structure. | 0 |

Bit structure:

| Bit | Description | Value | Information |
|-------|---------------------------------|-------|--|
| 0 | Terminal selector | 0 | Voltage terminal for ± 10 VDC (bus controller default setting) |
| | | 1 | Current terminal for 0 to 20 mA |
| 1 | Gain selector | 0 | Voltage ± 10 VDC (bus controller default setting) |
| | | 1 | Current 0 to 20 mA |
| 2 - 3 | Reserved | - | |
| 4 | Filtering active | 0 | Inactive (bus controller default setting) |
| | | 1 | Active |
| 5 | Minimum/Maximum analysis active | 0 | Inactive (bus controller default setting) |
| | | 1 | Active |
| 6 | Error monitoring active | 0 | Inactive (bus controller default setting) |
| | | 1 | Active |
| 7 | Enables channel | 0 | Channel enabled (bus controller default setting) |
| | | 1 | Channel disabled |

9.1.17.10.4.2 Sampling and conversion

The analog signal is sampled in 2 steps.

- **Conversion task**

The A/D converter digitalizes the inputs signals for the enabled inputs once per conversion cycle. Then the results are available internally in the module. To ensure that this process is executed without delays, the corresponding task will be handled with very high priority.

The timespan needed for conversion results from the set sampling time.

- **Processing task**

The converted A/D converter values are further processed according to the user settings (filtering, scaling, limit values, error statistics, min/max analysis, hysteresis comparison). The task for this process has low priority. The timespan needed for further processing depends on the configured functions and is the second portion of the sampling time.

Cycle time violation

In normal operation, further processing is triggered after each conversion. The conversion and sampling tasks run synchronous to one another. If the predefined sampling time is not sufficient to convert all enabled channels and complete the configured functions, a cycle time violation occurs.

Sampling time

Name:

ConfigOutput24

The sampling time is set to μs in this register. This makes it possible to improve the sampling cycle (resolution = $1 \mu\text{s}$). The lowest configurable cycle time is $50 \mu\text{s}$.

| Data type | Value | Information |
|-----------|--------------|-------------------------------------|
| UINT | 50 to 10,000 | Bus controller default setting: 100 |

Information:

Values that are too low for the cycle time will result in cycle time violations.

9.1.17.10.4.3 Filtering (optional)

If filtering is enabled in the "Channel configuration" on page 528 register, the basic data of the A/D converter is filtered per channel. The following registers are available to specify the filter order and respective cutoff frequency for configuring the low-pass filter:

- "Filter order" on page 530
- "Filter cutoff frequency" on page 530

Filter order

Name:

ConfigOutput26 for channel 1

ConfigOutput28 for channel 2

ConfigOutput30 for channel 3

ConfigOutput32 for channel 4

The filter order is specified in this register. The "Filter cutoff frequency" on page 530 register is used to configure the respective cutoff frequency of the filter.

| Data type | Value | Information |
|-----------|--------|-----------------------------------|
| USINT | 1 to 4 | Bus controller default setting: 0 |

Internal filter orders greater than 1 are implemented as cascaded first-order filters.

Calculating the cutoff frequency of an nth-order filter:

Cutoff frequency = Cutoff frequency_N / ((2 ^ (1 / n) - 1) ^ 0.5)

Approximate calculation

$y_n = a * x_n + b * y_{(n-1)}$

$a = \text{Sampling time}_{\text{Sec}} / (\text{Sampling time}_{\text{Sec}} + 1 / (2 \text{ Pi} * \text{Cutoff frequency}_{\text{Hz}}))$

$b = 1 - a$

Information:

Since low-pass filtering takes place using an approximation procedure with fixed-point arithmetic, there are discrepancies to the effective cutoff frequency that depend on the sampling cycle and filter sequence.

Filter cutoff frequency

Name:

ConfigOutput27 for channel 1

ConfigOutput29 for channel 2

ConfigOutput31 for channel 3

ConfigOutput33 for channel 4

The cutoff frequency of the respective filter is configured in these registers.

| Data type | Value | Information |
|-----------|-------------|---|
| UINT | 1 to 65,535 | Cutoff frequency in hertz. Bus controller default setting: 0 |

Information:

The highest cutoff frequency is limited by the Nyquist Shannon sampling theorem (based on the sampling cycle time). The system does not check for violations of this sampling theorem.

9.1.17.10.4.4 Scaling (optional)

Scaling A/D converter data is an option for the user. The following registers are available for this:

- "User-defined gain" on page 531 (= ku)
- "User-defined offset" on page 531 (= du)

Scaling calculation:

Scaled value = k * A/C value + d

Gain k = k_{Calibration} * ku

Offset d = d_{Calibration} + du

The value has to be limited since it can exceed the 16-bit constraints. To provide the greatest degree of flexibility, limiting is possible using the registers "Minimum limit value" on page 532 and "Maximum limit value" on page 532.

User-defined gain

Name:

ConfigOutput04 for channel 1

ConfigOutput09 for channel 2

ConfigOutput14 for channel 3

ConfigOutput19 for channel 4

The user-defined gain for the A/D converter data of the respective physical channel can be specified in these registers.

The value 65,536 (0x10000) corresponds to a gain of 1.

| Data type | Values | Information |
|-----------|------------------------------------|--|
| DINT | -2,147,483,648 to 2,147,483,647 | Bus controller default setting: 65,536 |

User-defined offset

Name:

ConfigOutput05 for channel 1

ConfigOutput10 for channel 2

ConfigOutput15 for channel 3

ConfigOutput20 for channel 4

The user-defined offset for the A/D converter data of the respective physical channel can be specified in this register.

The value 65,536 (0x10000) corresponds to an offset of 1.

| Data type | Values | Information |
|-----------|------------------------------------|-----------------------------------|
| DINT | -2,147,483,648 to 2,147,483,647 | Bus controller default setting: 0 |

9.1.17.10.4.5 Limit values

If the application requires a limitation of the range of values, then the user can define his own limit values. These values will also be use for the module's error statistics. The following registers are available for this:

- "Minimum limit value" on page 532
- "Maximum limit value" on page 532

Information:

32-bit numbers are used inside the module. A limit value violation can therefore also be determined if the permitted range of values was defined from -32768 to 32767.

Minimum limit value

Name:

ConfigOutput02 for channel 1

ConfigOutput07 for channel 2

ConfigOutput12 for channel 3

ConfigOutput17 for channel 4

The minimum limit value is configured in this register. This limit value is also used for the underflow error statistics (see register "Ch0xUnderflow" on page 535).

| Data type | Values | Information |
|-----------|-----------------|--|
| INT | -32768 to 32767 | Bus controller default setting: -32768 |

Maximum limit value

Name:

ConfigOutput03 for channel 1

ConfigOutput08 for channel 2

ConfigOutput13 for channel 3

ConfigOutput18 for channel 4

The maximum limit value is configured in this register. This limit value is also used for the overflow error statistics (see register "Ch0xOverflow" on page 535).

| Data type | Values | Information |
|-----------|-----------------|---------------------------------------|
| INT | -32767 to 32767 | Bus controller default setting: 32767 |

9.1.17.10.5 Communication - General

The module's analog inputs convert current and voltage values with 16-bit resolution. This information can be used by the application with the help of the registers listed here.

9.1.17.10.5.1 Analog input channels

Name:

AnalogInput01 to AnalogInput04

The analog input value is mapped in this register depending on the configured operating mode.

| Data type | Value | Input signal: |
|-----------|-------------------|-----------------------------|
| INT | -32,768 to 32,767 | Voltage signal ± 10 VDC |
| | 0 to 32,767 | Current signal 0 to 20 mA |

9.1.17.10.5.2 Sampling cycle counter

Name:

SampleCycleCounter

The number of times the input signal has been sampled is provided in this register.

| Data type | Values |
|-----------|-------------|
| UINT | 0 to 65,535 |

9.1.17.10.5.3 Error monitoring and counters

Channel status

Name:

Channel01OK to Channel04OK

SyncStatus

ConversionCycle

This register collects error messages synchronously with the network cycle. Temporary error states that were registered in a conversion cycle remain active for at least 2 network cycles. In order to receive detailed error information, the corresponding error counters and X2X network events should also be observed.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|-------------------------------|-------|--|
| 0 | Channel01OK | 0 | OK |
| | | 1 | Errors <ul style="list-style-type: none"> Range overshoot Range undershot Working range overshoot |
| ... | | ... | |
| 3 | Channel04OK | 0 | OK |
| | | 1 | Errors See description for bit 0. |
| 4 - 5 | Reserved | - | |
| 6 | SyncStatus ¹⁾ | 0 | OK |
| | | 1 | Not synchronized |
| 7 | ConversionCycle ²⁾ | 0 | OK |
| | | 1 | Errors |

1) Identical to bit 0 of the registers "SynchronizationViolationErrorCounter" on page 533.

2) Identical to bit 0 of the registers "SampleCycleViolationErrorCounter" on page 533.

Synchronization error counter

Name:

SynchronizationViolationErrorCounter

This register counts how often the conversion task was triggered more than 5 μ s after the next-coming X2X cycle. In this case, the module is considered being no longer synchronized with X2X Link.

The counters in this register follow the rules of the event error counter, i.e. the count increased each time an error occurs or is reset. The last bit of the counter indicates the error status:

- Last bit = 1 → Error pending
- Last bit = 0 → No error

| Data type | Value | Information |
|-----------|------------|---------------------|
| UINT | 0 to 65535 | Counter value |
| | 0 to 1 | Bit 0: Error status |

Counter for faulty sampling cycles

Name:

SampleCycleViolationErrorCounter

This register is used to indicate the number of cycle time violations that have occurred thus far. A cycle time violation occurs if the conversion tasks initiates a sampling task before the last sampling cycle has finished. See "Sampling and conversion" on page 529.

The counters in this register follow the rules of the event error counter, i.e. the count increased each time an error occurs or is reset. The last bit of the counter indicates the error status:

- Last bit = 1 → Error pending
- Last bit = 0 → No error

| Data type | Value | Information |
|-----------|------------|---------------------|
| UINT | 0 to 65535 | Counter value |
| | 0 to 1 | Bit 0: Error status |

Range violation (neg. and pos.)

Name:

Channel01underflow to Channel04underflow

Channel01overflow to Channel04overflow

This register indicates whether the limit values defined by registers "Minimum limit value" on page 532 and "Maximum limit value" on page 532 have been overshoot or undershot. The individual bits in this register are identical to the values of the lowest bits of registers "Ch0xUnderflow" on page 535 and "Ch0xOverflow" on page 535.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-----|--------------------|-------|------------------------------------|
| 0 | Channel01underflow | 0 | No error |
| | | 1 | Range exceeded (.neg) on channel 1 |
| ... | | ... | |
| 3 | Channel04underflow | 0 | No error |
| | | 1 | Range exceeded (.neg) on channel 4 |
| 4 | Channel01overflow | 0 | No error |
| | | 1 | Range exceeded (.pos) on channel 1 |
| ... | | ... | |
| 7 | Channel04overflow | 0 | No error |
| | | 1 | Range exceeded (.pos) on channel 4 |

Working range violation (pos.)

Name:

Channel01outofrange to Channel04outofrange

This register indicates whether the input value overshoots the module's maximum measurement range. The individual bits in this register are identical to the values of the lowest bits of register "Ch0xOutOfRange" on page 534.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|---------------------|-------|---|
| 0 | Channel01outofrange | 0 | No error |
| | | 1 | Working range violation (pos.) of channel 1 |
| ... | | ... | |
| 3 | Channel04outofrange | 0 | No error |
| | | 1 | Working range violation (pos.) of channel 4 |
| 4 - 7 | Reserved | - | |

Counter for work range violations (pos.)

Name:

Ch01OutOfRange to Ch04OutOfRange

Errors outside of the module's maximum possible measurement range are indicated in this register. These errors lead to full-scale deflection of the A/D converter.

The counters in these registers follow the rules of the event error counter, i.e. the count increased each time an error occurs or is reset. The last bit of the counter indicates the error status:

- Last bit = 1 → Error pending
- Last bit = 0 → No error

This counter is only active if the static error counter is enabled (see register "Channel configuration" on page 528).

| Data type | Value | Information |
|-----------|------------|---------------------|
| UINT | 0 to 65535 | Counter value |
| | 0 to 1 | Bit 0: Error status |

Counter for range exceeded violations (neg.)

Name:

Ch01Underflow to Ch04Underflow

This register indicates range exceeded violations (neg.) of the value configured in the register "[Minimum limit value](#)" on page 532.

The counters in these registers follow the rules of the event error counter, i.e. the count increased each time an error occurs or is reset. The last bit of the counter indicates the error status:

- Last bit = 1 → Error pending
- Last bit = 0 → No error

This counter is only active if the static error counter is enabled (see register "[Channel configuration](#)" on page 528).

| Data type | Value | Information |
|-----------|------------|---------------------|
| UINT | 0 to 65535 | Counter value |
| | 0 to 1 | Bit 0: Error status |

Counter for range exceeded violations (pos.)

Name:

Ch01Overflow to Ch04Overflow

This register indicates range exceeded violations (pos.) of the value configured in the register "[Maximum limit value](#)" on page 532.

The counters in these registers follow the rules of the event error counter, i.e. the count increased each time an error occurs or is reset. The last bit of the counter indicates the error status:

- Last bit = 1 → Error pending
- Last bit = 0 → No error

This counter is only active if the static error counter is enabled (see register "[Channel configuration](#)" on page 528).

| Data type | Value | Information |
|-----------|------------|---------------------|
| UINT | 0 to 65535 | Counter value |
| | 0 to 1 | Bit 0: Error status |

9.1.17.10.6 Additional analysis functions

In addition to sampling the analog input signal, this module can also be used to perform additional analysis of the values obtained.

- **Limit value analysis**

If limit value analysis has been enabled for a channel, the sampled minimum and maximum values are latched internally in the module. A measurement period can be triggered using the control byte. When the respective configured edge is generated by the application, the limit values from the previous measurement period are displayed and the internal latch register is reset.

- **Recording sampled values**

If recording sampled values has been enabled for a channel, then the sampled values are additionally recorded in the module's internal FIFO memory. If the configured event occurs, the contents of the FIFO memory are transmitted to the application.

Information:

It is only possible to use the recording of sampled values if the module is operated on an X2X master that is an SG4 CPU.

9.1.17.10.6.1 Trigger condition on falling edge

Name:

ConfigOutput21

This register configures whether the falling edge is used to trigger the trace and determination of the input value in the register "Analysis control byte" on page 537.

| Data type | Values | Bus controller default setting |
|-----------|------------------------|--------------------------------|
| USINT | See the bit structure. | 0 |

Bit structure:

| Bit | Description | Value | Information |
|-------|----------------|-------|---|
| 0 | TraceTrigger01 | 0 | No trigger (bus controller default setting) |
| | | 1 | Falling edge active as trigger |
| 1 - 3 | Reserved | - | |
| 4 | MinMaxStart01 | 0 | No determination (bus controller default setting) |
| | | 1 | Falling edge determines input value of channel 1 |
| ... | ... | ... | |
| 7 | MinMaxStart04 | 0 | No determination (bus controller default setting) |
| | | 1 | Falling edge determines input value of channel 4 |

9.1.17.10.6.2 Trigger condition on rising edge

Name:

ConfigOutput22

This register configures whether the rising edge is used to trigger the trace and determination of the input value in the register "Analysis control byte" on page 537.

| Data type | Values | Bus controller default setting |
|-----------|------------------------|--------------------------------|
| USINT | See the bit structure. | 0 |

Bit structure:

| Bit | Description | Value | Information |
|-------|----------------|-------|---|
| 0 | TraceTrigger01 | 0 | Trigger not initiated on positive edge (bus controller default setting) |
| | | 1 | Rising edge active as trigger |
| 1 - 3 | Reserved | - | |
| 4 | MinMaxStart01 | 0 | No determination (bus controller default setting) |
| | | 1 | Rising edge determines input value of channel 1 |
| ... | ... | ... | |
| 7 | MinMaxStart04 | 0 | No determination (bus controller default setting) |
| | | 1 | Rising edge determines input value of channel 4 |

9.1.17.10.6.3 Analysis control byte

Name:

TraceTrigger01

MinMaxStart01 to MinMaxStart04

The trace function and determination of the minimum/maximum input values can be started in this register. Whether the rising and/or falling edge is used to trigger the functions can be configured using the registers "[Trigger condition on falling edge](#)" on page 536 and "[Trigger condition on rising edge](#)" on page 536.

| Data type | Values | Bus controller default setting |
|-----------|------------------------|--------------------------------|
| USINT | See the bit structure. | 0 |

Bit structure:

| Bit | Description | Value | Information |
|-------|----------------|-------|--|
| 0 | TraceTrigger01 | 0 | Trigger/Trace not triggered (bus controller default setting) |
| | | 1 | Initiates trigger/trace |
| 1 - 3 | Reserved | - | |
| 4 | MinMaxStart01 | 0 | Determination not triggered (bus controller default setting) |
| | | 1 | Initiates determination of input value of channel 1 |
| ... | ... | ... | |
| 7 | MinMaxStart04 | 0 | Determination not triggered (bus controller default setting) |
| | | 1 | Initiates determination of input value of channel 4 |

Information:

To reduce the cyclic data transfer, this register combines the trace and limit value determination functions.

9.1.17.10.6.4 Analysis status byte

Name:

MinMaxStart01Readback to MinMaxStart04Readback

The currently requested module-internal analyses can be checked in this register.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|-----------------------|--------|---|
| 0 - 3 | Reserved | - | |
| 4 | MinMaxStart01Readback | 0 or 1 | Current state of the trigger bits for determining the limit values on the channel |
| ... | ... | ... | |
| 7 | MinMaxStart04Readback | 0 or 1 | Current state of the trigger bits for determining the limit values on the channel |

9.1.17.10.7 Limit values

Limit value analysis must be enabled for the desired channel (see "Channel configuration" on page 528). The sampled value of the channel is then compared to the minimum and maximum values that are stored internally in the module. If a new measurement period is initiated with the "Analysis control byte" on page 537 register, then the values determined from the previous measurement period can be taken from the respective registers intended for this.

9.1.17.10.7.1 Minimum input values

Name:

MinInput01 to MinInput04

The minimum value of the preceding trigger period is saved in this register based on the filtered, scaled and user-defined limit values. The register value is 0 if the channel is inactive.

| Data type | Value |
|-----------|-------------------|
| INT | -32,768 to 32,767 |

9.1.17.10.7.2 Maximum input values

Name:

MaxInput01 to MaxInput04

The maximum value of the preceding trigger period is saved in this register based on the filtered, scaled and user-defined limit values. The register value is 0 if the channel is inactive.

| Data type | Value |
|-----------|-------------------|
| INT | -32,768 to 32,767 |

9.1.17.10.7.3 Limit value trigger counter

Name:

Ch01MinMaxLatchCounter to Ch04MinMaxLatchCounter

The number of valid events that trigger a new measurement period for the limit value analysis is counted in this register.

| Data type | Value |
|-----------|------------|
| UINT | 0 to 65535 |

9.1.17.10.8 Trace

If the module is operated on a SG4 CPU, the digitalized input values are recorded by the module. The module must be operated in "Supervised" mode in order to use the trace function.

Recording must be enabled for the desired channel. The enable bits can then control the recording at runtime. The sampled values are recorded in the module's internal FIFO memory.

If the previously defined state occurs on the channel, the contents of the FIFO memory are transmitted to the application. Whether the FIFO memory continued to be filled depends on how recording is configured.

Information:

The trace mechanism can only be used if the module is connected directly to the CPU, not if it is operated behind a bus controller.

9.1.17.10.8.1 Enable recording

Name:

TraceChannelEnable

The respective channel is enabled for the trace with this register.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|-------------|-------|------------------|
| 0 | Channel 1 | 0 | Channel disabled |
| | | 1 | Channel enabled |
| ... | ... | ... | |
| 3 | Channel 4 | 0 | Channel disabled |
| | | 1 | Channel enabled |
| 4 - 7 | Reserved | - | |

9.1.17.10.8.2 Number of values to be recorded

Name:

TraceSampleDepth

16 kB are available on the module for the trace. The FIFO memory limitation means that a maximum of 8192 analog values can be recorded. This memory is divided up equally among the enabled channels. The actual number of maximum possible recordings therefore depends on the number of channels enabled for trace:

- 1 channel enabled: Up to 8192 recordings
- 2 channels enabled: Up to 4096 recordings per channel
- 3 channels enabled: Up to 2730 recordings per channel
- 4 channels enabled: Up to 2048 recordings per channel

| Data type | Value |
|-----------|-----------|
| UINT | 2 to 8192 |

9.1.17.10.8.3 Recording priority

Name:

ConfigOutput25

The priority of the trace can be increased with this register.

| Data type | Value | Function |
|-----------|-------|---|
| USINT | 3 | Standard |
| | 6 | Trace priority higher than X2X Link communication |

9.1.17.10.8.4 Starting a recording

Name:

TraceEnable01

This register starts the recording according to the specifications for edge control or the comparator.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|---------------|-------|-----------------------------|
| 0 | TraceEnable01 | 0 | Disables the trace function |
| | | 1 | Enables the trace function |
| 1 - 7 | Reserved | - | |

9.1.17.10.8.5 Recording status

Name:

TraceEnabled

TraceWriteActive

TraceReadActive

ReadyForTrigger

TriggerActive

TraceOk

TraceError

The status of the trace is represented in this register.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|-----|------------------|-------|---------------------------------------|
| 0 | TraceEnabled | 0 | Trace inactive |
| | | 1 | Trace active |
| 1 | Reserved | - | |
| 2 | TraceWriteActive | 0 | Data not recorded |
| | | 1 | Data recorded |
| 3 | TraceReadActive | 0 | Data not output/read |
| | | 1 | Data output/read |
| 4 | ReadyForTrigger | 0 | Not ready for triggering |
| | | 1 | Ready for triggering |
| 5 | TriggerActive | 0 | No trigger active or already executed |
| | | 1 | Trigger active |
| 6 | TraceOk | 0 | Overflow or inactive |
| | | 1 | No overflow |
| 7 | TraceError | 0 | No error or inactive |
| | | 1 | Trace buffer full |

9.1.17.10.8.6 Free trace buffer

Name:

FreeBufferSize

Specifies the available FIFO memory area in bytes for the trace

| Data type | Values |
|-----------|-------------|
| UINT | 0 to 65,535 |

9.1.17.10.8.7 Counter for trace triggers

Name:

TriggerCount

This register indicates the number of triggers that have occurred since [starting the trace](#).

| Data type | Values |
|-----------|-------------|
| UINT | 0 to 65,535 |

9.1.17.10.8.8 Counter for faulty recording triggers

Name:

TriggerFailCount

Counts the trigger events for which the trace could not be performed.

| Data type | Values |
|-----------|-------------|
| UINT | 0 to 65,535 |

9.1.17.10.8.9 Comparator for trigger conditions

In order to adapt the trace as closely as possible to the requirements of the application, the trace function can also be controlled using the comparator. Threshold values (hysteresis) can be defined within the permitted range of values to do so. 2 status bits are then generated for each enabled channel:

- **InRange bit**

The InRange status is "1" if the measured value falls within the defined limits.

The InRange status is "0" if the measured value falls outside the defined limits.

- **Threshold value bit**

The threshold value bit is "1" if the measured value exceeds the upper threshold value.

The threshold value bit is "0" if the measured value falls below the lower threshold value.

The InRange and threshold value bits for all channels are grouped together in the lower-value byte of the "[CompStateCollection](#)" on page 542 register. In addition, the states of the previous sampling are stored in the higher-value byte.

The 4 status messages of each channel can be linked according to the following logic via a logical connective mask using AND or OR operators and used as a trace trigger:

```
delta = (Current_HysteresisStatus ^ NominalValues)// Different between current status and preset
cond = delta & Selected_HysteresisStatusBits// Eliminate irrelevant status messages
ccond = Selected_HysteresisStatusBits (Current_HysteresisStatus ^ NominalValues)
if((0==(cond & ~LogicalOperators)) &&
(0!=(~cond & LogicalOperators))) {=> Generate trigger event}
```

| | |
|-------------------------------|--|
| Selected_HysteresisStatusBits | Corresponds to register: "cfgComp_EnableMask" on page 543 |
| Current_HysteresisStatus | "CompStateCollection" on page 542 |

| Logical operators | "cfgComp_ConditionTypeMask" on page 543 |

Lower limit value for hysteresis

Name:

cfgComp_LowLimitCh01 to cfgComp_LowLimitCh04

The lower limit value for hysteresis is configured in this register.

| Data type | Values |
|-----------|-----------------|
| INT | -32768 to 32767 |

Upper limit value for hysteresis

Name:

cfgComp_HighLimitCh01 to cfgComp_HighLimitCh04

The upper limit value for hysteresis is configured in this register.

| Data type | Values |
|-----------|-----------------|
| INT | -32768 to 32767 |

Hysteresis status of the channels

Name:

CompStateCollection

The hysteresis status of the input channels for the current and last cycle are represented in this register.

| Data type | Values |
|-----------|------------------------|
| UINT | See the bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|-----|--|-------|---|
| 0 | Channel01 hysteresis status in the current cycle | 0 | Lower limit value exceeded |
| | | 1 | Upper limit value exceeded |
| 1 | Channel01 InRange status in the current cycle | 0 | Value lies outside of range defined by the limit values |
| | | 1 | Value between lower and upper limit values |
| ... | ... | ... | |
| 6 | Channel04 hysteresis status in the current cycle | 0 | Lower limit value exceeded |
| | | 1 | Upper limit value exceeded |
| 7 | Channel04 InRange status in the current cycle | 0 | Value lies outside of range defined by the limit values |
| | | 1 | Value between lower and upper limit values |
| 8 | Channel01 hysteresis status in the last cycle | 0 | Lower limit value exceeded |
| | | 1 | Upper limit value exceeded |
| 9 | Channel01 InRange status in the last cycle | 0 | Value lies outside of range defined by the limit values |
| | | 1 | Value between lower and upper limit values |
| ... | ... | ... | |
| 14 | Channel04 hysteresis status in the last cycle | 0 | Lower limit value exceeded |
| | | 1 | Upper limit value exceeded |
| 15 | Channel04 InRange status in the last cycle | 0 | Value lies outside of range defined by the limit values |
| | | 1 | Value between lower and upper limit values |

Comparison state of the channels

Name:

cfgComp_NominalState

The desired comparison state for the hysteresis status is indicated in this register.

| Data type | Values |
|-----------|------------------------|
| UINT | See the bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|-----|--|-------|---|
| 0 | Channel01 hysteresis status in the current cycle | 0 | Lower limit value exceeded |
| | | 1 | Upper limit value exceeded |
| 1 | Channel01 InRange status in the current cycle | 0 | Value lies outside of range defined by the limit values |
| | | 1 | Value between lower and upper limit values |
| ... | ... | ... | |
| 6 | Channel04 hysteresis status in the current cycle | 0 | Lower limit value exceeded |
| | | 1 | Upper limit value exceeded |
| 7 | Channel04 InRange status in the current cycle | 0 | Value lies outside of range defined by the limit values |
| | | 1 | Value between lower and upper limit values |
| 8 | Channel01 hysteresis status in the last cycle | 0 | Lower limit value exceeded |
| | | 1 | Upper limit value exceeded |
| 9 | Channel01 InRange status in the last cycle | 0 | Value lies outside of range defined by the limit values |
| | | 1 | Value between lower and upper limit values |
| ... | ... | ... | |
| 14 | Channel04 hysteresis status in the last cycle | 0 | Lower limit value exceeded |
| | | 1 | Upper limit value exceeded |
| 15 | Channel04 InRange status in the last cycle | 0 | Value lies outside of range defined by the limit values |
| | | 1 | Value between lower and upper limit values |

Information:

This is a "whitelist", i.e. the trace starts as soon as the current status message takes on the state predefined here.

One or more matches will be necessary depending on the selection of the relevant hysteresis status bits and logical connective operators.

Selecting the relevant hysteresis status bits

Name:

cfgComp_EnableMask

This register selects which status bits of the hysteresis comparison should be used to generate the trigger.

For more information about using this register, see ["Comparator for trigger conditions"](#) on page 541.

| Data type | Values |
|-----------|------------------------|
| UINT | See the bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|-----|--|-------|--------------------|
| 0 | Channel01 hysteresis status in the current cycle | 0 | Do not use |
| | | 1 | Use for generation |
| 1 | Channel01 InRange status in the current cycle | 0 | Do not use |
| | | 1 | Use for generation |
| ... | ... | ... | |
| 6 | Channel04 hysteresis status in the current cycle | 0 | Do not use |
| | | 1 | Use for generation |
| 7 | Channel04 InRange status in the current cycle | 0 | Do not use |
| | | 1 | Use for generation |
| 8 | Channel01 hysteresis status in the last cycle | 0 | Do not use |
| | | 1 | Use for generation |
| 9 | Channel01 InRange status in the last cycle | 0 | Do not use |
| | | 1 | Use for generation |
| ... | ... | ... | |
| 14 | Channel04 hysteresis status in the last cycle | 0 | Do not use |
| | | 1 | Use for generation |
| 15 | Channel04 InRange status in the last cycle | 0 | Do not use |
| | | 1 | Use for generation |

Logical connective operators for hysteresis status bits

Name:

cfgComp_ConditionTypeMask

The desired state operators with which the respective status bit is linked to others to generate a trigger are selected in this register.

At least one OR operation must be configured, but it does not necessarily have to be located on a channel configured with "1" in the ["cfgComp_EnableMask"](#) on page 543 register.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|-----|--|-------|-------------------|
| 0 | Channel01 hysteresis status in the current cycle | 0 | Use AND operation |
| | | 1 | Use OR operation |
| 1 | Channel01 InRange status in the current cycle | 0 | Use AND operation |
| | | 1 | Use OR operation |
| ... | ... | ... | |
| 6 | Channel04 hysteresis status in the current cycle | 0 | Use AND operation |
| | | 1 | Use OR operation |
| 7 | Channel04 InRange status in the current cycle | 0 | Use AND operation |
| | | 1 | Use OR operation |
| 8 | Channel01 hysteresis status in the last cycle | 0 | Use AND operation |
| | | 1 | Use OR operation |
| 9 | Channel01 InRange status in the last cycle | 0 | Use AND operation |
| | | 1 | Use OR operation |
| ... | ... | ... | |
| 14 | Channel04 hysteresis status in the last cycle | 0 | Use AND operation |
| | | 1 | Use OR operation |
| 15 | Channel04 InRange status in the last cycle | 0 | Use AND operation |
| | | 1 | Use OR operation |

9.1.17.10.8.10 Time-offset trace

Additional conditions for shifting the starting and stopping points can be defined if the trace should be chronologically offset to the trigger.

Starting the trace

Name:

TraceTriggerStart

The starting position is defined relative to the configured trigger condition (rising/falling edge) in this register. Positive values mean that the trace takes place x samples after the trigger condition. Negative values mean that the trace takes place x samples before the trigger condition.

The value -32768 performs the trace without regard for the configured trigger condition. If the trace memory is completely full, then the oldest recorded value is overwritten (FIFO principle).

"Trace start" in the I/O configuration or the registers "[Trigger condition on falling edge](#)" on page 536 and "[Trigger condition on rising edge](#)" on page 536 determine whether a positive, negative or any edge must be triggered.

| Data type | Values |
|-----------|-----------------|
| INT | -32768 to 32767 |

Stopping the trace

Name:

TraceTriggerStop

The stopping position is defined relative to the configured trigger condition in this register.

- When configuring an early trigger event, this value refers to the trigger event.
- When configuring a delayed trigger event, this value refers to the starting event.

| Data type | Values |
|-----------|-------------|
| UINT | 0 to 65,535 |

9.1.17.10.9 Acyclic frame size

Name:

AsynSize

When the stream is used, data is exchanged internally between the module and CPU. For this purpose, a defined amount of acyclic bytes is reserved for this slot.

Increasing the acyclic frame size leads to increased data throughput on this slot.

Information:

This configuration involves a driver setting that cannot be changed during runtime!

| Data type | Value | Information |
|-----------|---------|---|
| - | 8 to 28 | Acyclic frame size in bytes. Default = 24 |

9.1.17.10.10 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time | |
|-----------------------------------|--------|
| Standard priority | 200 µs |
| High priority with trace function | 300 µs |

9.1.17.10.11 Minimum I/O update time

There is no limitation or dependency on the bus cycle time.

The I/O update time is defined using the "Sampling time" register. The fastest possible sampling time depends on the number of channels to be converted and the configuration.

9.1.18 X20(c)AI4632-1

Data sheet version: 3.11

9.1.18.1 General information

The module is equipped with 4 inputs with 16-bit digital converter resolution. It is possible to select between the current and voltage signal using different terminals.

- 4 analog inputs
- Either current or voltage signal possible
- Extended signal range
- 16-bit digital converter resolution
- Simultaneous input conversion
- Very fast conversion time

9.1.18.2 Coated modules

Coated modules are X20 modules with a protective coating for the electronics component. This coating protects X20c modules from condensation and corrosive gases.

The modules' electronics are fully compatible with the corresponding X20 modules.

For simplification purposes, only images and module IDs of uncoated modules are used in this data sheet.

The coating has been certified according to the following standards:

- Condensation: BMW GS 95011-4, 2x 1 cycle
- Corrosive gas: EN 60068-2-60, method 4, exposure 21 days

9.1.18.2.1 Starting temperature

The starting temperature describes the minimum permissible ambient temperature when the power is switched off at the time the coated module is switched on. This is permitted to be as low as -40°C . During operation, the conditions as specified in the technical data continue to apply.

Information:

It is important to absolutely ensure that there is no forced cooling by air currents in a closed control cabinet, for example using a fan or ventilation slots.

9.1.18.3 Order data

| Model number | Short description | Figure |
|--------------|--|--------|
| | Analog inputs | |
| X20AI4632-1 | X20 analog input module, 4 inputs, $\pm 11\text{ V}$ or 0 to 22 mA, 16-bit converter resolution, configurable input filter, oscilloscope functions | |

Table 75: X20AI4632-1, X20cAI4632-1 - Technical data

- 1) To reduce power dissipation, B&R recommends bridging unused inputs on the terminals or configuring them as current signals.
- 2) Based on the current measured value.
- 3) Based on the 22 V measurement range.
- 4) Based on the 22 mA measurement range.

9.1.18.5 LED status indicators

For a description of the various operating modes, see "[Diagnostic LEDs](#)" on page 3787.

| Figure | LED | Color | Status | Description |
|---|-------|-------|--------------|---|
|  | r | Green | Off | No power to module |
| | | | Single flash | RESET mode |
| | | | Double flash | BOOT mode (during firmware update) ¹⁾ |
| | | | Blinking | PREOPERATIONAL mode |
| | e | Red | On | RUN mode |
| | | | Off | No power to module or everything OK |
| | | | On | Error or reset status |
| | | | Double flash | System error: <ul style="list-style-type: none"> • Violation of the scan time • Synchronization error |
| | 1 - 4 | Green | Off | Open line ²⁾ or sensor is disconnected |
| | | | On | Analog/digital converter running, value OK |

- 1) Depending on the configuration, a firmware update can take up to several minutes.
- 2) Open line detection only possible when measuring voltage.

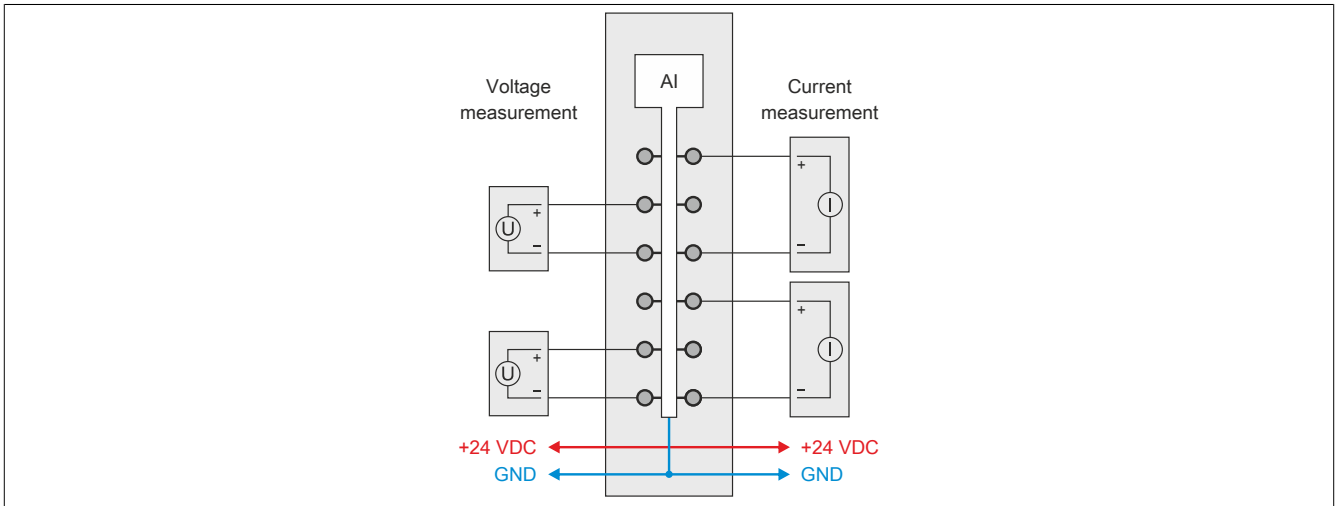

9.1.18.6 Pinout

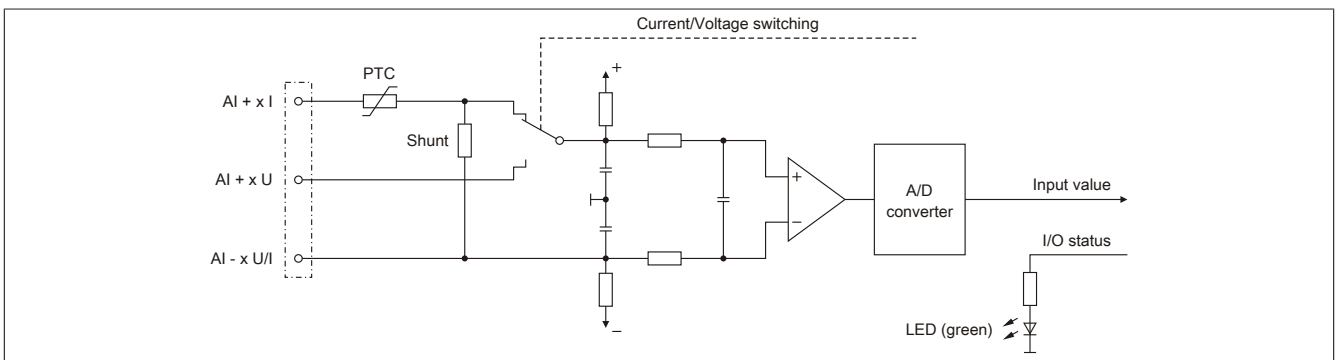

9.1.18.7 Connection example

To prevent disturbances, the following modules must be separated by at least one module:

- Bus receiver X20BR9300
- Supply module X20PS3300/X20PS3310
- Supply module X20PS9400/X20PS9402
- Supply module X20PS9500/X20PS9502
- CPU modules

9.1.18.8 Input circuit diagram

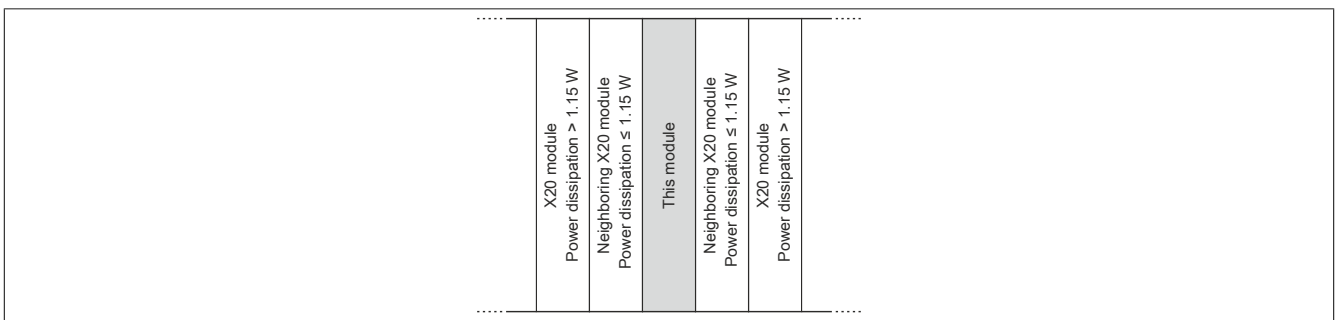

9.1.18.9 Derating

There is no derating when operated below 55°C.

During operation over 55°C, the power dissipation of the modules to the left and right of this module is not permitted to exceed 1.15 W!

For an example of calculating the power dissipation of I/O modules, see section "[Power dissipation calculation of I/O modules](#)" on page 101.

9.1.18.10 Register description

9.1.18.10.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section "General data points" on page 3790.

| 538 + (N-1) * 32 | - | Ch0NMinMaxLatchCounter (index N = 1 to 4) | UINT | | • | | |

1) The offset specifies the position of the register within the CAN object.

9.1.18.10.3.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see "Using I/O modules on the bus controller" on page 3789.

9.1.18.10.3.2 CAN I/O bus controller

The module occupies 1 analog logical slot on CAN I/O.

9.1.18.10.4 Configuration

This module is equipped with analog inputs with connected 16-bit A/D converters. Each of the inputs can be configured separately from one another either on the voltage or current input for the following areas:

- Permitted voltage: ± 11 V at 20 Ω
- Permitted current: 22 mA (maximum 40 mA) (<400 Ω)

9.1.18.10.4.1 Channel configuration

Name:

ConfigOutput01 for channel 01

ConfigOutput06 for channel 02

ConfigOutput11 for channel 03

ConfigOutput16 for channel 04

The individual inputs for processing the current or voltage signal are configured in these registers. This configuration must be made in addition to using suitable terminals.

Filtering, analysis and error monitoring (bits 4 to 6) can only be used if the channel is enabled (bit 7 = 0).

| Data type | Values | Bus controller default setting |
|-----------|------------------------|--------------------------------|
| USINT | See the bit structure. | 0 |

Bit structure:

| Bit | Description | Value | Information |
|-------|---|-------|--|
| 0 | Terminal selector | 0 | Voltage terminal for ± 11 VDC (bus controller default setting) |
| | | 1 | Current terminal for 0 to 22 mA |
| 1 | Gain selector | 0 | Voltage ± 11 VDC (bus controller default setting) |
| | | 1 | Current 0 to 22 mA |
| 2 - 3 | Reserved | - | |
| 4 | Filtering active (only if bit 7 = 0) | 0 | Inactive (bus controller default setting) |
| | | 1 | Active |
| 5 | Minimum/Maximum analysis active (only if bit 7 = 0) | 0 | Inactive (bus controller default setting) |
| | | 1 | Active |
| 6 | Error monitoring active (only if bit 7 = 0) | 0 | Inactive (bus controller default setting) |
| | | 1 | Active |
| 7 | Enables channel | 0 | Channel enabled (bus controller default setting) |
| | | 1 | Channel disabled |

9.1.18.10.4.2 Sampling and conversion

The analog signal is sampled in 2 steps.

- **Conversion task**

The A/D converter digitalizes the inputs signals for the enabled inputs once per conversion cycle. Then the results are available internally in the module. To ensure that this process is executed without delays, the corresponding task will be handled with very high priority.

The timespan needed for conversion results from the set sampling time.

- **Processing task**

The converted A/D converter values are further processed according to the user settings (filtering, scaling, limit values, error statistics, min/max analysis, hysteresis comparison). The task for this process has low priority. The timespan needed for further processing depends on the configured functions and is the second portion of the sampling time.

Cycle time violation

In normal operation, further processing is triggered after each conversion. The conversion and sampling tasks run synchronous to one another. If the predefined sampling time is not sufficient to convert all enabled channels and complete the configured functions, a cycle time violation occurs.

Sampling time

Name:

ConfigOutput24

The sampling time is set to μs in this register. This makes it possible to improve the sampling cycle (resolution = 1 μs). The lowest configurable cycle time is 50 μs .

| Data type | Value | Information |
|-----------|--------------|-------------------------------------|
| UINT | 50 to 10,000 | Bus controller default setting: 100 |

Information:

Values that are too low for the cycle time will result in cycle time violations.

9.1.18.10.4.3 Filtering (optional)

If filtering is enabled in the "Channel configuration" on page 553 register, the basic data of the A/D converter is filtered per channel. The following registers are available to specify the filter order and respective cutoff frequency for configuring the low-pass filter:

- "Filter order" on page 555
- "Filter cutoff frequency" on page 555

Filter order

Name:

ConfigOutput26 for channel 1

ConfigOutput28 for channel 2

ConfigOutput30 for channel 3

ConfigOutput32 for channel 4

The filter order is specified in this register. The "Filter cutoff frequency" on page 555 register is used to configure the respective cutoff frequency of the filter.

| Data type | Value | Information |
|-----------|--------|-----------------------------------|
| USINT | 1 to 4 | Bus controller default setting: 0 |

Internal filter orders greater than 1 are implemented as cascaded first-order filters.

Calculating the cutoff frequency of an nth-order filter:

Cutoff frequency = Cutoff frequency_N / ((2 ^ (1 / n) - 1) ^ 0.5)

Approximate calculation

$y_n = a * x_n + b * y_{(n-1)}$

$a = \text{Sampling time}_{\text{Sec}} / (\text{Sampling time}_{\text{Sec}} + 1 / (2 \text{ Pi} * \text{Cutoff frequency}_{\text{Hz}}))$

$b = 1 - a$

Information:

Since low-pass filtering takes place using an approximation procedure with fixed-point arithmetic, there are discrepancies to the effective cutoff frequency that depend on the sampling cycle and filter sequence.

Filter cutoff frequency

Name:

ConfigOutput27 for channel 1

ConfigOutput29 for channel 2

ConfigOutput31 for channel 3

ConfigOutput33 for channel 4

The cutoff frequency of the respective filter is configured in these registers.

| Data type | Value | Information |
|-----------|-------------|---|
| UINT | 1 to 65,535 | Cutoff frequency in hertz. Bus controller default setting: 0 |

Information:

The highest cutoff frequency is limited by the Nyquist Shannon sampling theorem (based on the sampling cycle time). The system does not check for violations of this sampling theorem.

9.1.18.10.4.4 User-defined scaling

The raw and filtered A/D converter data is compared and normalized (gain = k, offset = d). In addition, user-defined normalization is available using the following registers:

- "User-defined gain" on page 556 (= ku)
- "User-defined offset" on page 556 (= du)

The execution time is optimized by grouping the factors together.

System scaling calculation:

$$\text{nom} = k * \text{RawValue} + d$$

$$k = k * k_u$$

$$d = k * d + d_u$$

The value has to be limited since it can exceed the 16-bit constraints. To provide the greatest degree of flexibility, limiting is possible using the registers "Minimum limit value" on page 557 and "Maximum limit value" on page 557.

User-defined gain

Name:

ConfigOutput04 for channel 1

ConfigOutput09 for channel 2

ConfigOutput14 for channel 3

ConfigOutput19 for channel 4

The user-defined gain for the A/D converter data of the respective physical channel can be specified in these registers.

The value 65,536 (0x10000) corresponds to a gain of 1.

| Data type | Values | Information |
|-----------|------------------------------------|--|
| DINT | -2,147,483,648 to 2,147,483,647 | Bus controller default setting: 65,536 |

User-defined offset

Name:

ConfigOutput05 for channel 1

ConfigOutput10 for channel 2

ConfigOutput15 for channel 3

ConfigOutput20 for channel 4

The user-defined offset for the A/D converter data of the respective physical channel can be specified in this register.

The value 65,536 (0x10000) corresponds to an offset of 1.

| Data type | Values | Information |
|-----------|------------------------------------|-----------------------------------|
| DINT | -2,147,483,648 to 2,147,483,647 | Bus controller default setting: 0 |

9.1.18.10.4.5 Limit values

If the application requires a limitation of the range of values, then the user can define his own limit values. These values will also be use for the module's error statistics. The following registers are available for this:

- "Minimum limit value" on page 557
- "Maximum limit value" on page 557

Information:

32-bit numbers are used inside the module. A limit value violation can therefore also be determined if the permitted range of values was defined from -32768 to 32767.

Minimum limit value

Name:

ConfigOutput02 for channel 1
 ConfigOutput07 for channel 2
 ConfigOutput12 for channel 3
 ConfigOutput17 for channel 4

The minimum limit value is configured in this register. This limit value is also used for the underflow error statistics (see register "Ch0xUnderflow" on page 560).

| Data type | Values | Information |
|-----------|-----------------|--|
| INT | -32768 to 32767 | Bus controller default setting: -32768 |

Maximum limit value

Name:

ConfigOutput03 for channel 1
 ConfigOutput08 for channel 2
 ConfigOutput13 for channel 3
 ConfigOutput18 for channel 4

The maximum limit value is configured in this register. This limit value is also used for the overflow error statistics (see register "Ch0xOverflow" on page 560).

| Data type | Values | Information |
|-----------|-----------------|---------------------------------------|
| INT | -32767 to 32767 | Bus controller default setting: 32767 |

9.1.18.10.5 Communication - General

The module's analog inputs convert current and voltage values with 16-bit resolution. This information can be used by the application with the help of the registers listed here.

9.1.18.10.5.1 Analog input channels

Name:

AnalogInput01 to AnalogInput04

The analog input value is mapped in this register depending on the configured operating mode.

| Data type | Value | Input signal: |
|-----------|-------------------|-----------------------------|
| INT | -32,768 to 32,767 | Voltage signal ± 11 VDC |
| | 0 to 32,767 | Current signal 0 to 22 mA |

9.1.18.10.5.2 Sampling cycle counter

Name:

SampleCycleCounter

The number of times the input signal has been sampled is provided in this register.

| Data type | Values |
|-----------|-------------|
| UINT | 0 to 65,535 |

9.1.18.10.5.3 Error monitoring and counters

Channel status

Name:

Channel01OK to Channel04OK

SyncStatus

ConversionCycle

This register collects error messages synchronously with the network cycle. Temporary error states that were registered in a conversion cycle remain active for at least 2 network cycles. In order to receive detailed error information, the corresponding error counters and X2X network events should also be observed.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|-------------------------------|-------|--|
| 0 | Channel01OK | 0 | OK |
| | | 1 | Errors <ul style="list-style-type: none"> Range overshoot Range undershot Working range overshoot |
| ... | | ... | |
| 3 | Channel04OK | 0 | OK |
| | | 1 | Errors See description for bit 0. |
| 4 - 5 | Reserved | - | |
| 6 | SyncStatus ¹⁾ | 0 | OK |
| | | 1 | Not synchronized |
| 7 | ConversionCycle ²⁾ | 0 | OK |
| | | 1 | Errors |

1) Identical to bit 0 of the registers "SynchronizationViolationErrorCounter" on page 558.

2) Identical to bit 0 of the registers "SampleCycleViolationErrorCounter" on page 558.

Synchronization error counter

Name:

SynchronizationViolationErrorCounter

This register counts how often the conversion task was triggered more than 5 µs after the next-coming X2X cycle. In this case, the module is considered being no longer synchronized with X2X Link.

The counters in this register follow the rules of the event error counter, i.e. the count increased each time an error occurs or is reset. The last bit of the counter indicates the error status:

- Last bit = 1 → Error pending
- Last bit = 0 → No error

| Data type | Value | Information |
|-----------|------------|---------------------|
| UINT | 0 to 65535 | Counter value |
| | 0 to 1 | Bit 0: Error status |

Counter for faulty sampling cycles

Name:

SampleCycleViolationErrorCounter

This register is used to indicate the number of cycle time violations that have occurred thus far. A cycle time violation occurs if the conversion tasks initiates a sampling task before the last sampling cycle has finished. See "Sampling and conversion" on page 554.

The counters in this register follow the rules of the event error counter, i.e. the count increased each time an error occurs or is reset. The last bit of the counter indicates the error status:

- Last bit = 1 → Error pending
- Last bit = 0 → No error

| Data type | Value | Information |
|-----------|------------|---------------------|
| UINT | 0 to 65535 | Counter value |
| | 0 to 1 | Bit 0: Error status |

Range violation (neg. and pos.)

Name:

Channel01underflow to Channel04underflow

Channel01overflow to Channel04overflow

This register indicates whether the limit values defined by registers "Minimum limit value" on page 557 and "Maximum limit value" on page 557 have been overshoot or undershot. The individual bits in this register are identical to the values of the lowest bits of registers "Ch0xUnderflow" on page 560 and "Ch0xOverflow" on page 560.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-----|--------------------|-------|------------------------------------|
| 0 | Channel01underflow | 0 | No error |
| | | 1 | Range exceeded (.neg) on channel 1 |
| ... | | ... | |
| 3 | Channel04underflow | 0 | No error |
| | | 1 | Range exceeded (.neg) on channel 4 |
| 4 | Channel01overflow | 0 | No error |
| | | 1 | Range exceeded (.pos) on channel 1 |
| ... | | ... | |
| 7 | Channel04overflow | 0 | No error |
| | | 1 | Range exceeded (.pos) on channel 4 |

Working range violation (pos.)

Name:

Channel01outofrange to Channel04outofrange

This register indicates whether the input value overshoots the module's maximum measurement range. The individual bits in this register are identical to the values of the lowest bits of register "Ch0xOutOfRange" on page 559.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|---------------------|-------|---|
| 0 | Channel01outofrange | 0 | No error |
| | | 1 | Working range violation (pos.) of channel 1 |
| ... | | ... | |
| 3 | Channel04outofrange | 0 | No error |
| | | 1 | Working range violation (pos.) of channel 4 |
| 4 - 7 | Reserved | - | |

Counter for work range violations (pos.)

Name:

Ch01OutOfRange to Ch04OutOfRange

Errors outside of the module's maximum possible measurement range are indicated in this register. These errors lead to full-scale deflection of the A/D converter.

The counters in these registers follow the rules of the event error counter, i.e. the count increased each time an error occurs or is reset. The last bit of the counter indicates the error status:

- Last bit = 1 → Error pending
- Last bit = 0 → No error

This counter is only active if the static error counter is enabled (see register "Channel configuration" on page 553).

| Data type | Value | Information |
|-----------|------------|---------------------|
| UINT | 0 to 65535 | Counter value |
| | 0 to 1 | Bit 0: Error status |

Counter for range exceeded violations (neg.)

Name:

Ch01Underflow to Ch04Underflow

This register indicates range exceeded violations (neg.) of the value configured in the register "[Minimum limit value](#)" on page 557.

The counters in these registers follow the rules of the event error counter, i.e. the count increased each time an error occurs or is reset. The last bit of the counter indicates the error status:

- Last bit = 1 → Error pending
- Last bit = 0 → No error

This counter is only active if the static error counter is enabled (see register "[Channel configuration](#)" on page 553).

| Data type | Value | Information |
|-----------|------------|---------------------|
| UINT | 0 to 65535 | Counter value |
| | 0 to 1 | Bit 0: Error status |

Counter for range exceeded violations (pos.)

Name:

Ch01Overflow to Ch04Overflow

This register indicates range exceeded violations (pos.) of the value configured in the register "[Maximum limit value](#)" on page 557.

The counters in these registers follow the rules of the event error counter, i.e. the count increased each time an error occurs or is reset. The last bit of the counter indicates the error status:

- Last bit = 1 → Error pending
- Last bit = 0 → No error

This counter is only active if the static error counter is enabled (see register "[Channel configuration](#)" on page 553).

| Data type | Value | Information |
|-----------|------------|---------------------|
| UINT | 0 to 65535 | Counter value |
| | 0 to 1 | Bit 0: Error status |

9.1.18.10.6 Additional analysis functions

In addition to sampling the analog input signal, this module can also be used to perform additional analysis of the values obtained.

- **Limit value analysis**

If limit value analysis has been enabled for a channel, the sampled minimum and maximum values are latched internally in the module. A measurement period can be triggered using the control byte. When the respective configured edge is generated by the application, the limit values from the previous measurement period are displayed and the internal latch register is reset.

- **Recording sampled values**

If recording sampled values has been enabled for a channel, then the sampled values are additionally recorded in the module's internal FIFO memory. If the configured event occurs, the contents of the FIFO memory are transmitted to the application.

Information:

It is only possible to use the recording of sampled values if the module is operated on an X2X master that is an SG4 CPU.

9.1.18.10.6.1 Trigger condition on falling edge

Name:

ConfigOutput21

This register configures whether the falling edge is used to trigger the trace and determination of the input value in the register "Analysis control byte" on page 562.

| Data type | Values | Bus controller default setting |
|-----------|------------------------|--------------------------------|
| USINT | See the bit structure. | 0 |

Bit structure:

| Bit | Description | Value | Information |
|-------|----------------|-------|---|
| 0 | TraceTrigger01 | 0 | No trigger (bus controller default setting) |
| | | 1 | Falling edge active as trigger |
| 1 - 3 | Reserved | - | |
| 4 | MinMaxStart01 | 0 | No determination (bus controller default setting) |
| | | 1 | Falling edge determines input value of channel 1 |
| ... | ... | ... | |
| 7 | MinMaxStart04 | 0 | No determination (bus controller default setting) |
| | | 1 | Falling edge determines input value of channel 4 |

9.1.18.10.6.2 Trigger condition on rising edge

Name:

ConfigOutput22

This register configures whether the rising edge is used to trigger the trace and determination of the input value in the register "Analysis control byte" on page 562.

| Data type | Values | Bus controller default setting |
|-----------|------------------------|--------------------------------|
| USINT | See the bit structure. | 0 |

Bit structure:

| Bit | Description | Value | Information |
|-------|----------------|-------|---|
| 0 | TraceTrigger01 | 0 | Trigger not initiated on positive edge (bus controller default setting) |
| | | 1 | Rising edge active as trigger |
| 1 - 3 | Reserved | - | |
| 4 | MinMaxStart01 | 0 | No determination (bus controller default setting) |
| | | 1 | Rising edge determines input value of channel 1 |
| ... | ... | ... | |
| 7 | MinMaxStart04 | 0 | No determination (bus controller default setting) |
| | | 1 | Rising edge determines input value of channel 4 |

9.1.18.10.6.3 Analysis control byte

Name:

TraceTrigger01

MinMaxStart01 to MinMaxStart04

The trace function and determination of the minimum/maximum input values can be started in this register. Whether the rising and/or falling edge is used to trigger the functions can be configured using the registers "[Trigger condition on falling edge](#)" on page 561 and "[Trigger condition on rising edge](#)" on page 561.

| Data type | Values | Bus controller default setting |
|-----------|------------------------|--------------------------------|
| USINT | See the bit structure. | 0 |

Bit structure:

| Bit | Description | Value | Information |
|-------|----------------|-------|--|
| 0 | TraceTrigger01 | 0 | Trigger/Trace not triggered (bus controller default setting) |
| | | 1 | Initiates trigger/trace |
| 1 - 3 | Reserved | - | |
| 4 | MinMaxStart01 | 0 | Determination not triggered (bus controller default setting) |
| | | 1 | Initiates determination of input value of channel 1 |
| ... | ... | ... | |
| 7 | MinMaxStart04 | 0 | Determination not triggered (bus controller default setting) |
| | | 1 | Initiates determination of input value of channel 4 |

Information:

To reduce the cyclic data transfer, this register combines the trace and limit value determination functions.

9.1.18.10.6.4 Analysis status byte

Name:

MinMaxStart01Readback to MinMaxStart04Readback

The currently requested module-internal analyses can be checked in this register.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|-----------------------|--------|---|
| 0 - 3 | Reserved | - | |
| 4 | MinMaxStart01Readback | 0 or 1 | Current state of the trigger bits for determining the limit values on the channel |
| ... | ... | ... | |
| 7 | MinMaxStart04Readback | 0 or 1 | Current state of the trigger bits for determining the limit values on the channel |

9.1.18.10.7 Limit values

Limit value analysis must be enabled for the desired channel (see "Channel configuration" on page 553). The sampled value of the channel is then compared to the minimum and maximum values that are stored internally in the module. If a new measurement period is initiated with the "Analysis control byte" on page 562 register, then the values determined from the previous measurement period can be taken from the respective registers intended for this.

9.1.18.10.7.1 Minimum input values

Name:

MinInput01 to MinInput04

The minimum value of the preceding trigger period is saved in this register based on the filtered, scaled and user-defined limit values. The register value is 0 if the channel is inactive.

| Data type | Value |
|-----------|-------------------|
| INT | -32,768 to 32,767 |

9.1.18.10.7.2 Maximum input values

Name:

MaxInput01 to MaxInput04

The maximum value of the preceding trigger period is saved in this register based on the filtered, scaled and user-defined limit values. The register value is 0 if the channel is inactive.

| Data type | Value |
|-----------|-------------------|
| INT | -32,768 to 32,767 |

9.1.18.10.7.3 Limit value trigger counter

Name:

Ch01MinMaxLatchCounter to Ch04MinMaxLatchCounter

The number of valid events that trigger a new measurement period for the limit value analysis is counted in this register.

| Data type | Value |
|-----------|------------|
| UINT | 0 to 65535 |

9.1.18.10.8 Trace

If the module is operated on a SG4 CPU, the digitalized input values are recorded by the module. The module must be operated in "Supervised" mode in order to use the trace function.

Recording must be enabled for the desired channel. The enable bits can then control the recording at runtime. The sampled values are recorded in the module's internal FIFO memory.

If the previously defined state occurs on the channel, the contents of the FIFO memory are transmitted to the application. Whether the FIFO memory continued to be filled depends on how recording is configured.

Information:

The trace mechanism can only be used if the module is connected directly to the CPU, not if it is operated behind a bus controller.

9.1.18.10.8.1 Enable recording

Name:

TraceChannelEnable

The respective channel is enabled for the trace with this register.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|-------------|-------|------------------|
| 0 | Channel 1 | 0 | Channel disabled |
| | | 1 | Channel enabled |
| ... | ... | ... | |
| 3 | Channel 4 | 0 | Channel disabled |
| | | 1 | Channel enabled |
| 4 - 7 | Reserved | - | |

9.1.18.10.8.2 Number of values to be recorded

Name:

TraceSampleDepth

16 kB are available on the module for the trace. The FIFO memory limitation means that a maximum of 8192 analog values can be recorded. This memory is divided up equally among the enabled channels. The actual number of maximum possible recordings therefore depends on the number of channels enabled for trace:

- 1 channel enabled: Up to 8192 recordings
- 2 channels enabled: Up to 4096 recordings per channel
- 3 channels enabled: Up to 2730 recordings per channel
- 4 channels enabled: Up to 2048 recordings per channel

| Data type | Value |
|-----------|-----------|
| UINT | 2 to 8192 |

9.1.18.10.8.3 Recording priority

Name:

ConfigOutput25

The priority of the trace can be increased with this register.

| Data type | Value | Function |
|-----------|-------|---|
| USINT | 3 | Standard |
| | 6 | Trace priority higher than X2X Link communication |

9.1.18.10.8.4 Starting a recording

Name:

TraceEnable01

This register starts the recording according to the specifications for edge control or the comparator.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|---------------|-------|-----------------------------|
| 0 | TraceEnable01 | 0 | Disables the trace function |
| | | 1 | Enables the trace function |
| 1 - 7 | Reserved | - | |

9.1.18.10.8.5 Recording status

Name:

TraceEnabled

TraceWriteActive

TraceReadActive

ReadyForTrigger

TriggerActive

TraceOk

TraceError

The status of the trace is represented in this register.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|-----|------------------|-------|---------------------------------------|
| 0 | TraceEnabled | 0 | Trace inactive |
| | | 1 | Trace active |
| 1 | Reserved | - | |
| 2 | TraceWriteActive | 0 | Data not recorded |
| | | 1 | Data recorded |
| 3 | TraceReadActive | 0 | Data not output/read |
| | | 1 | Data output/read |
| 4 | ReadyForTrigger | 0 | Not ready for triggering |
| | | 1 | Ready for triggering |
| 5 | TriggerActive | 0 | No trigger active or already executed |
| | | 1 | Trigger active |
| 6 | TraceOk | 0 | Overflow or inactive |
| | | 1 | No overflow |
| 7 | TraceError | 0 | No error or inactive |
| | | 1 | Trace buffer full |

9.1.18.10.8.6 Free trace buffer

Name:

FreeBufferSize

Specifies the available FIFO memory area in bytes for the trace

| Data type | Values |
|-----------|-------------|
| UINT | 0 to 65,535 |

9.1.18.10.8.7 Counter for trace triggers

Name:

TriggerCount

This register indicates the number of triggers that have occurred since [starting the trace](#).

| Data type | Values |
|-----------|-------------|
| UINT | 0 to 65,535 |

9.1.18.10.8.8 Counter for faulty recording triggers

Name:

TriggerFailCount

Counts the trigger events for which the trace could not be performed.

| Data type | Values |
|-----------|-------------|
| UINT | 0 to 65,535 |

9.1.18.10.8.9 Comparator for trigger conditions

In order to adapt the trace as closely as possible to the requirements of the application, the trace function can also be controlled using the comparator. Threshold values (hysteresis) can be defined within the permitted range of values to do so. 2 status bits are then generated for each enabled channel:

- **InRange bit**

The InRange status is "1" if the measured value falls within the defined limits.

The InRange status is "0" if the measured value falls outside the defined limits.

- **Threshold value bit**

The threshold value bit is "1" if the measured value exceeds the upper threshold value.

The threshold value bit is "0" if the measured value falls below the lower threshold value.

The InRange and threshold value bits for all channels are grouped together in the lower-value byte of the "[CompStateCollection](#)" on page 567 register. In addition, the states of the previous sampling are stored in the high-value byte.

The 4 status messages of each channel can be linked according to the following logic via a logical connective mask using AND or OR operators and used as a trace trigger:

```
delta = (Current_HysteresisStatus ^ NominalValues)// Different between current status and preset
cond = delta & Selected_HysteresisStatusBits// Eliminate irrelevant status messages
ccond = Selected_HysteresisStatusBits (Current_HysteresisStatus ^ NominalValues)
if((0==(cond & ~LogicalOperators)) &&
(0!=(~cond & LogicalOperators))) {=> Generate trigger event}
```

| | |
|-------------------------------|---|
| Selected_HysteresisStatusBits | Corresponds to register: "cfgComp_EnableMask" on page 568 |
| Current_HysteresisStatus | "CompStateCollection" on page 567 |
| Nominal values | "cfgComp_NominalState" on page 567 |
| Logical operators | "cfgComp_ConditionTypeMask" on page 568 |

Lower limit value for hysteresis

Name:

cfgComp_LowLimitCh01 to cfgComp_LowLimitCh04

The lower limit value for hysteresis is configured in this register.

| Data type | Values |
|-----------|-----------------|
| INT | -32768 to 32767 |

Upper limit value for hysteresis

Name:

cfgComp_HighLimitCh01 to cfgComp_HighLimitCh04

The upper limit value for hysteresis is configured in this register.

| Data type | Values |
|-----------|-----------------|
| INT | -32768 to 32767 |

Hysteresis status of the channels

Name:

CompStateCollection

The hysteresis status of the input channels for the current and last cycle are represented in this register.

| Data type | Values |
|-----------|------------------------|
| UINT | See the bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|-----|--|-------|---|
| 0 | Channel01 hysteresis status in the current cycle | 0 | Lower limit value exceeded |
| | | 1 | Upper limit value exceeded |
| 1 | Channel01 InRange status in the current cycle | 0 | Value lies outside of range defined by the limit values |
| | | 1 | Value between lower and upper limit values |
| ... | ... | ... | |
| 6 | Channel04 hysteresis status in the current cycle | 0 | Lower limit value exceeded |
| | | 1 | Upper limit value exceeded |
| 7 | Channel04 InRange status in the current cycle | 0 | Value lies outside of range defined by the limit values |
| | | 1 | Value between lower and upper limit values |
| 8 | Channel01 hysteresis status in the last cycle | 0 | Lower limit value exceeded |
| | | 1 | Upper limit value exceeded |
| 9 | Channel01 InRange status in the last cycle | 0 | Value lies outside of range defined by the limit values |
| | | 1 | Value between lower and upper limit values |
| ... | ... | ... | |
| 14 | Channel04 hysteresis status in the last cycle | 0 | Lower limit value exceeded |
| | | 1 | Upper limit value exceeded |
| 15 | Channel04 InRange status in the last cycle | 0 | Value lies outside of range defined by the limit values |
| | | 1 | Value between lower and upper limit values |

Comparison state of the channels

Name:

cfgComp_NominalState

The desired comparison state for the hysteresis status is indicated in this register.

| Data type | Values |
|-----------|------------------------|
| UINT | See the bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|-----|--|-------|---|
| 0 | Channel01 hysteresis status in the current cycle | 0 | Lower limit value exceeded |
| | | 1 | Upper limit value exceeded |
| 1 | Channel01 InRange status in the current cycle | 0 | Value lies outside of range defined by the limit values |
| | | 1 | Value between lower and upper limit values |
| ... | ... | ... | |
| 6 | Channel04 hysteresis status in the current cycle | 0 | Lower limit value exceeded |
| | | 1 | Upper limit value exceeded |
| 7 | Channel04 InRange status in the current cycle | 0 | Value lies outside of range defined by the limit values |
| | | 1 | Value between lower and upper limit values |
| 8 | Channel01 hysteresis status in the last cycle | 0 | Lower limit value exceeded |
| | | 1 | Upper limit value exceeded |
| 9 | Channel01 InRange status in the last cycle | 0 | Value lies outside of range defined by the limit values |
| | | 1 | Value between lower and upper limit values |
| ... | ... | ... | |
| 14 | Channel04 hysteresis status in the last cycle | 0 | Lower limit value exceeded |
| | | 1 | Upper limit value exceeded |
| 15 | Channel04 InRange status in the last cycle | 0 | Value lies outside of range defined by the limit values |
| | | 1 | Value between lower and upper limit values |

Information:

This is a "whitelist", i.e. the trace starts as soon as the current status message takes on the state predefined here.

One or more matches will be necessary depending on the selection of the relevant hysteresis status bits and logical connective operators.

Selecting the relevant hysteresis status bits

Name:

cfgComp_EnableMask

This register selects which status bits of the hysteresis comparison should be used to generate the trigger.

For more information about using this register, see ["Comparator for trigger conditions" on page 566](#).

| Data type | Values |
|-----------|------------------------|
| UINT | See the bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|-----|--|-------|--------------------|
| 0 | Channel01 hysteresis status in the current cycle | 0 | Do not use |
| | | 1 | Use for generation |
| 1 | Channel01 InRange status in the current cycle | 0 | Do not use |
| | | 1 | Use for generation |
| ... | ... | ... | |
| 6 | Channel04 hysteresis status in the current cycle | 0 | Do not use |
| | | 1 | Use for generation |
| 7 | Channel04 InRange status in the current cycle | 0 | Do not use |
| | | 1 | Use for generation |
| 8 | Channel01 hysteresis status in the last cycle | 0 | Do not use |
| | | 1 | Use for generation |
| 9 | Channel01 InRange status in the last cycle | 0 | Do not use |
| | | 1 | Use for generation |
| ... | ... | ... | |
| 14 | Channel04 hysteresis status in the last cycle | 0 | Do not use |
| | | 1 | Use for generation |
| 15 | Channel04 InRange status in the last cycle | 0 | Do not use |
| | | 1 | Use for generation |

Logical connective operators for hysteresis status bits

Name:

cfgComp_ConditionTypeMask

The desired state operators with which the respective status bit is linked to others to generate a trigger are selected in this register.

At least one OR operation must be configured, but it does not necessarily have to be located on a channel configured with "1" in the ["cfgComp_EnableMask" on page 568](#) register.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|-----|--|-------|-------------------|
| 0 | Channel01 hysteresis status in the current cycle | 0 | Use AND operation |
| | | 1 | Use OR operation |
| 1 | Channel01 InRange status in the current cycle | 0 | Use AND operation |
| | | 1 | Use OR operation |
| ... | ... | ... | |
| 6 | Channel04 hysteresis status in the current cycle | 0 | Use AND operation |
| | | 1 | Use OR operation |
| 7 | Channel04 InRange status in the current cycle | 0 | Use AND operation |
| | | 1 | Use OR operation |
| 8 | Channel01 hysteresis status in the last cycle | 0 | Use AND operation |
| | | 1 | Use OR operation |
| 9 | Channel01 InRange status in the last cycle | 0 | Use AND operation |
| | | 1 | Use OR operation |
| ... | ... | ... | |
| 14 | Channel04 hysteresis status in the last cycle | 0 | Use AND operation |
| | | 1 | Use OR operation |
| 15 | Channel04 InRange status in the last cycle | 0 | Use AND operation |
| | | 1 | Use OR operation |

9.1.18.10.8.10 Time-offset trace

Additional conditions for shifting the starting and stopping points can be defined if the trace should be chronologically offset to the trigger.

Starting the trace

Name:

TraceTriggerStart

The starting position is defined relative to the configured trigger condition (rising/falling edge) in this register. Positive values mean that the trace takes place x samples after the trigger condition. Negative values mean that the trace takes place x samples before the trigger condition.

The value -32768 performs the trace without regard for the configured trigger condition. If the trace memory is completely full, then the oldest recorded value is overwritten (FIFO principle).

"Trace start" in the I/O configuration or the registers "[Trigger condition on falling edge](#)" on page 561 and "[Trigger condition on rising edge](#)" on page 561 determine whether a positive, negative or any edge must be triggered.

| Data type | Values |
|-----------|-----------------|
| INT | -32768 to 32767 |

Stopping the trace

Name:

TraceTriggerStop

The stopping position is defined relative to the configured trigger condition in this register.

- When configuring an early trigger event, this value refers to the trigger event.
- When configuring a delayed trigger event, this value refers to the starting event.

| Data type | Values |
|-----------|-------------|
| UINT | 0 to 65,535 |

9.1.18.10.9 Acyclic frame size

Name:

AsynSize

When the stream is used, data is exchanged internally between the module and CPU. For this purpose, a defined amount of acyclic bytes is reserved for this slot.

Increasing the acyclic frame size leads to increased data throughput on this slot.

Information:

This configuration involves a driver setting that cannot be changed during runtime!

| Data type | Value | Information |
|-----------|---------|---|
| - | 8 to 28 | Acyclic frame size in bytes. Default = 24 |

9.1.18.10.10 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time | |
|-----------------------------------|--------|
| Standard priority | 200 µs |
| High priority with trace function | 300 µs |

9.1.18.10.11 Minimum I/O update time

There is no limitation or dependency on the bus cycle time.

The I/O update time is defined using the "Sampling time" register. The fastest possible sampling time depends on the number of channels to be converted and the configuration.

9.1.19 X20AI4636

Data sheet version: 2.11

9.1.19.1 General information

The module is equipped with 4 inputs with 16-bit digital converter resolution. It is possible to select between the current and voltage signal using different terminals. With the oversampling function, up to 16 analog values per channel can be recorded.

- 4 analog inputs
- Current or voltage signal configuration for the entire module
- 16-bit digital converter resolution
- Minimum conversion time of 40 μ s for all inputs
- The conversion time for the entire module can be configured in 0.02 μ s steps.
- Maximum 14 samples (16-bit) for the entire module per X2X Link cycle
- Oversampling: Up to 16 analog values per channel (internal)
- Timestamp for the last conversion of an X2X Link cycle

9.1.19.2 Order data

| Model number | Short description | Figure |
|--------------|---|--|
| X20AI4636 | Analog inputs X20 analog input module, 4 inputs, ± 10 V or 0 to 20 mA, 16-bit converter resolution, configurable input filter, oversampling functions |  |

- 1) To reduce power dissipation, B&R recommends bridging unused inputs on the terminals.
- 2) Based on the current measured value.
- 3) Based on the 20 V measurement range.
- 4) Based on the 20 mA measurement range.

9.1.19.4 Status LEDs

For a description of the various operating modes, see "[Diagnostic LEDs](#)" on page 3787.

| Figure | LED | Color | Status | Description |
|---|-----|-------|--------------|---|
|  | r | Green | Off | No power to module |
| | | | Single flash | RESET mode |
| | | | Double flash | BOOT mode (during firmware update) ¹⁾ |
| | | | Blinking | PREOPERATIONAL mode |
| | | | On | RUN mode |
| | e | Red | Off | No power to module or everything OK |
| | | | On | Error or reset status |
| | | | Double flash | System error: <ul style="list-style-type: none"> • Violation of the sampling cycle time • Synchronization error |
| | | Green | Off | Open line ²⁾ or sensor is disconnected |
| | | | Blinking | Channel error: Underflow, overflow or broken connection |
| | | | On | Analog/digital converter running, value OK |

- 1) Depending on the configuration, a firmware update can take up to several minutes.
 2) Open line detection only possible when measuring voltage.

9.1.19.5 Pinout

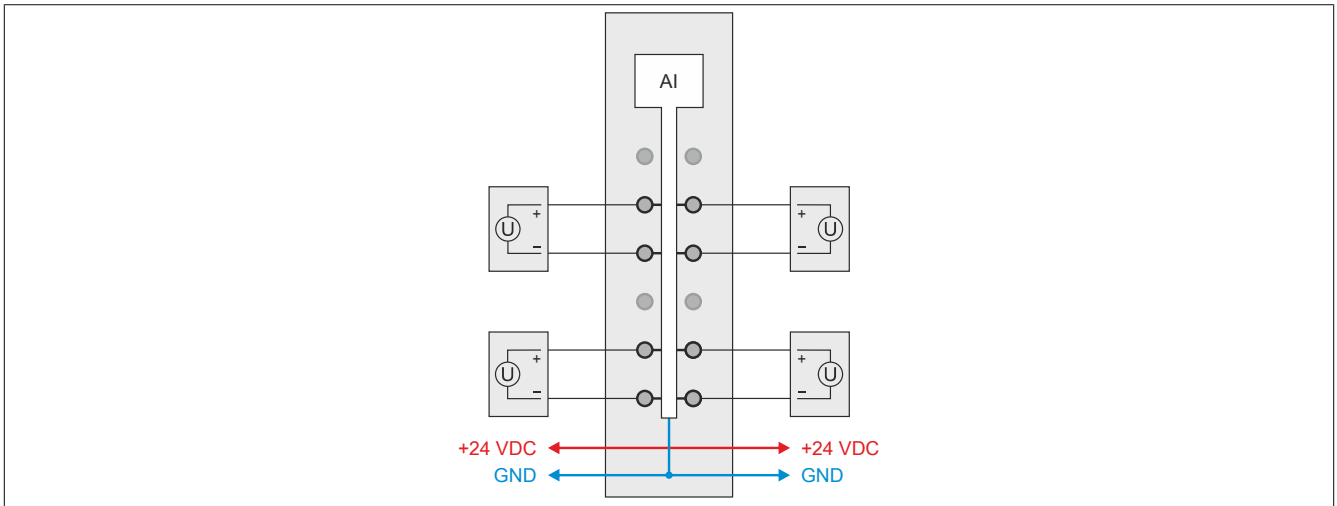

9.1.19.6 Connection example

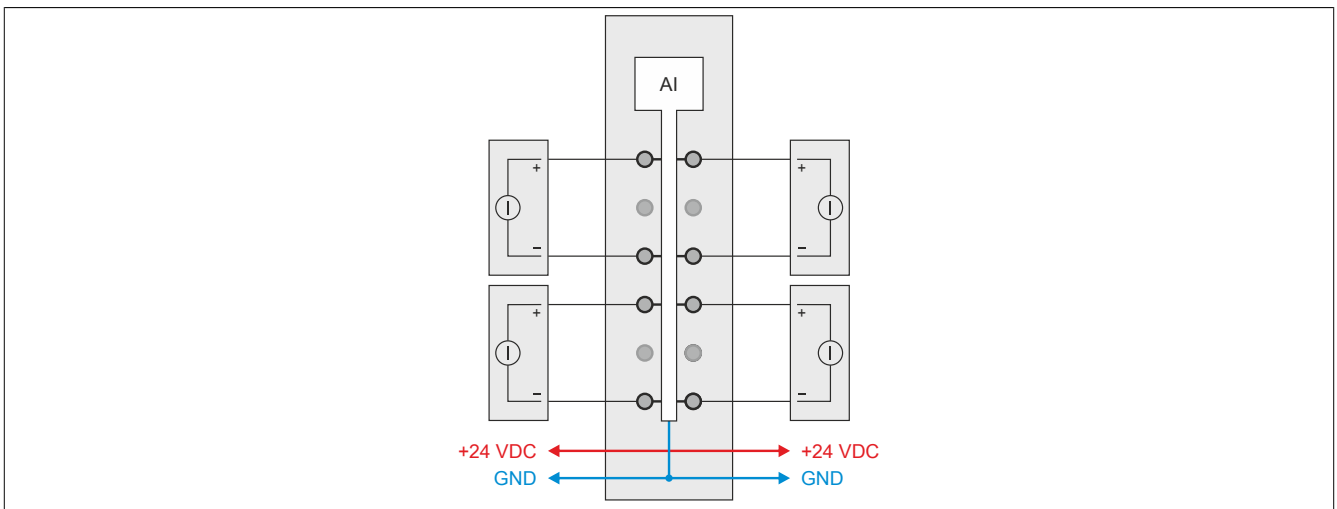

To prevent disturbances, the following modules must be separated by at least one module:

- Bus receiver X20BR9300
- Supply module X20PS3300/X20PS3310
- Supply module X20PS9400/X20PS9402
- Supply module X20PS9500/X20PS9502
- CPU modules

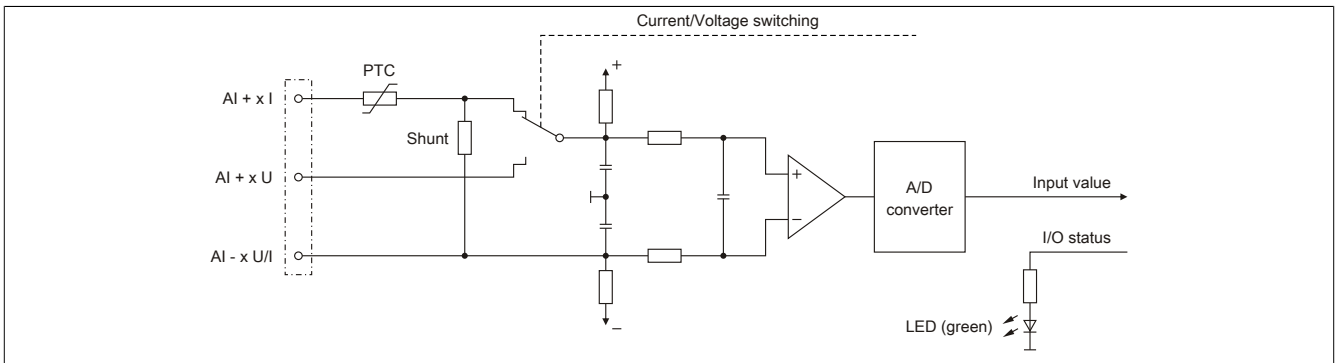

Voltage measurement

Current measurement

9.1.19.7 Input circuit diagram

9.1.19.8 Derating

There is no derating when operated below 55°C.

During operation over 55°C, the power dissipation of the modules to the left and right of this module is not permitted to exceed 1.15 W!

For an example of calculating the power dissipation of I/O modules, see section "[Power dissipation calculation of I/O modules](#)" on page 101.

| | | | | |
|--|--|-------------|--|--|
| X20 module Power dissipation > 1.15 W | Neighboring X20 module Power dissipation ≤ 1.15 W | This module | Neighboring X20 module Power dissipation ≤ 1.15 W | X20 module Power dissipation > 1.15 W |
|--|--|-------------|--|--|

9.1.19.9 Register description

9.1.19.9.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section "General data points" on page 3790.

9.1.19.9.2 Function model 0 - Standard

| Register | Name | Data type | Read | | Write | |

9.1.19.9.3 Function model 254 - Bus controller

The "Bus controller" function model has the following limitations compared to the "Standard" function model:

- No oversampling function since consistency is not possible when operating CAN-based bus controllers due to the limited data range
- The sampling cycle time is set to 100 µs.
- No timestamp function
- A range of logical functions is available for processing the physical values right on the module:
 - Output of physical values (standard)
 - Addition of two channels with scaling
 - Integral addition of two channels with scaling
 - Multiplication of two channels with scaling
 - Integral multiplication of two channels with scaling

1) The offset specifies the position of the register within the CAN object.

9.1.19.9.3.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see ["Using I/O modules on the bus controller" on page 3789](#).

9.1.19.9.3.2 CAN I/O bus controller

The module occupies 1 analog logical slot on CAN I/O.

9.1.19.9.4 General information

There is a difference on the module between physical (default) and logical values:

Physical or default values

The conversion results are transferred to the higher-level system after being scaled and filtered. They are not processed further.

Logical values

The physical values can be further processed with mathematical functions and comparators. In addition, another logical channel can be used as a starting point to further process a logical function.

9.1.19.9.5 Operating mode - Oversampling

The input values are recorded with a configurable sampling cycle time and saved with timestamp to the internal physical data buffer. This data range can then be read out in the cyclic data transfer using a configurable data length.

The recording and transmission system for the logical channels is identical to that for the physical channels. The functions of the logical channels are also executed in the configured sampling cycle time and saved with timestamp to the logical data buffer. The values can also be read out from here using configurable cyclic data points.

The defined sampling cycle time may not be sufficient for the sum of all physical and logical functions if using fast X2X Link cycle times, however. If influencing the physical sampling is not permitted, then a prescaler can be used to slow down the logical processing.

Information:

The ability to adjust the sampling cycle time as needed on the module means there is basically no synchronization with X2X Link, regardless of whether standard inputs or an oversampling function is configured.

If synchronization is required, then the configured sampling cycle time must be a multiple of the X2X Link cycle time!

9.1.19.9.5.1 Analog oversampling

When using analog oversampling, the enabled channels are stored in the module within a configurable time frame independently of the X2X cycle. Space is available for 16 analog values per physical and logical channel.

These samplings are numbered from 1 to 16 for the registers. The conversions or calculations of individual channels with the same number (i.e. sample line 1 to 16, e.g. PhysCh01Sample10, PhysCh02Sample10, etc.) are derived from the same sampling cycle or logical computing cycle and therefore have the same timestamp.

The timestamp refers to the newest data value, i.e. always to sample line 1. If a timestamp for older data points is needed, it needs to be back-calculated in the application using the sampling cycle time configured on the module. The prescaler must also be taken into account for logical channels.

Calculation example

| Sample line | Calculation | |
|-------------|--------------------------------------|---------------------|
| 1 | Timestamp | Newest value |
| 2 | Timestamp - Sampling cycle time | |
| 3 | Timestamp - 2 * Sampling cycle time | |
| 4 | Timestamp - 3 * Sampling cycle time | |
| ... | ... | |
| 10 | Timestamp - 9 * Sampling cycle time | |
| ... | ... | |
| 16 | Timestamp - 15 * Sampling cycle time | Oldest value |

How the buffer is organized can be seen from this. This is not a FIFO buffer but a static buffer that the values are pushed through. Sample line 1 always contains the newest values, the next line the second newest, all the way up to sample line 16, which contains the oldest values.

The sample counter is a circular counter, with the number of new sample lines derived from the value of the last transfer cycle.

Example

A difference of 3 to the last transfer cycle means:

The data in sample line 1 and all subsequent data from the previous transfer cycle is now shifted in the current cycle beginning with sample line 4. Sample lines 1 through 3 contain the new values for further processing by the application. Sample lines 14 through 16 from the last transfer cycle are no longer in the buffer.

9.1.19.9.5.2 Comparator oversampling

When using comparator oversampling, the results of the enabled channels are stored in the module within a configurable time frame independently of the X2X cycle. 16 bits of memory space are available per logical channel.

These samplings (i.e. event bits) are consecutively numbered from 1 to 8 and 9 to 16 for the two registers. The results of individual channels with the same number (i.e. sample line 1 to 16, e.g. for channel 1 LogicCh01Sample16_9 and LogicCh01Sample8_1) are derived from the same sampling cycle or logical computing cycle and therefore have the same timestamp.

The timestamp refers to the newest data value, i.e. always to sample line 1 (i.e. bit 0 in the LogicCh01Sample8_1 register). If a timestamp for older comparator results is needed, it needs to be back-calculated in the application using the sampling cycle time configured on the module. The prescaler must also be taken into account.

Calculation example

| Sample line | (register name) | Calculation | |
|-------------|-----------------------------|--------------------------------------|---------------------|
| 1 | (LogicCh01Sample8_1 bit 0) | Timestamp | Newest value |
| 2 | (LogicCh01Sample8_1 bit 1) | Timestamp - Sampling cycle time | |
| 3 | (LogicCh01Sample8_1 bit 2) | Timestamp - 2 * Sampling cycle time | |
| 4 | (LogicCh01Sample8_1 bit 3) | Timestamp - 3 * Sampling cycle time | |
| ... | | | |
| 10 | (LogicCh01Sample16_9 bit 1) | Timestamp - 9 * Sampling cycle time | |
| ... | | | |
| 16 | (LogicCh01Sample16_9 bit 7) | Timestamp - 15 * Sampling cycle time | Oldest value |

How the buffer is organized can be seen from this. This is not a FIFO buffer but a static buffer that the values are pushed through. Sample line 1 always contains the newest values, the next line the second newest, all the way up to sample line 16, which contains the oldest values.

The sample counter is a circular counter, with the number of new sample lines derived from the value of the last transfer cycle.

Example

A difference of 3 to the last transfer cycle means:

The comparator result in sample line 1 and all subsequent data from the previous transfer cycle is now shifted in the current cycle beginning with sample line 4. Sample lines 1 through 3 contain the new bit values for further processing by the application. Sample lines 14 through 16 from the last transfer cycle are no longer in the buffer.

Data transfer

The analog conversion rate / sampling cycle time can be considerably faster than the X2X Link cycle. Saved analog or comparator data can be transferred to the higher-level system synchronously and consistently.

In the application, it's important that the relationship between cyclic data points, the sampling cycle time on the module and the transfer time is sufficient to read all of the new data points on the higher-level system.

The sample counter can be used to check how many data values are actually new since the last transfer cycle. If the counter difference to the previous cycle is larger than the number of existing cyclic data points, then values have been overlooked and the system needs to be adjusted.

The general guideline is that a cyclic data point should be configured more than is actually required computing-wise.

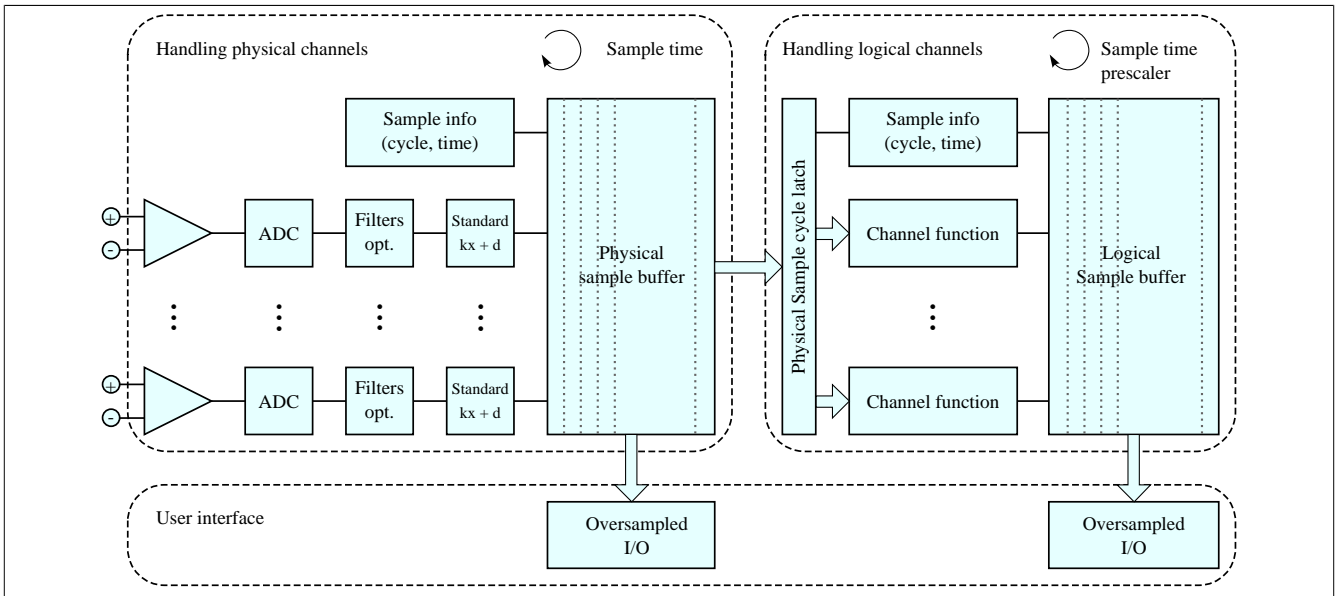

Example with synchronous settings

- Sampling cycle time = 50 µs
- X2X Link cycle time = 500 µs

Samples 1 to 10 of a channel are possible to calculate in this example. Sample 11 should also be configured as a cyclic data point, however.

The reason for this is the possible jitter in the module caused by interruptions, e.g. from the X2X Link transfer. For the current cycle, this can mean that only 9 new values are available and that 11 values will have to be transferred in the next cycle.

For logical comparator functions, this problem doesn't exist since the maximum number is always transferred in the cycle data range.

9.1.19.9.6 Bus controller operating mode

The input values are recorded with a configurable sampling cycle time and saved with timestamp to the internal physical data buffer. Only the newest value will be transferred in the next possible bus cycle.

Limitations in the bus controller function model:

- No oversampling function since consistency is not possible due to the limited data range
- Sampling cycle time configured to 100 µs by default
- Range of logical functions available for processing physical values directly on the module
- Timestamp not available

9.1.19.9.7 "AnalogInput" registers

Name:

AnalogInput01 to AnalogInput04

This module can be configured and operated as a normal analog input module without logical auxiliary functions. The physical values from the last sampling cycle are used as input values in this case.

The module is operated as a normal analog input module in the bus controller function model. Nevertheless, it is still possible to connect each input channel directly to a logical function. The analog data on the bus controller is mapped using the calculation abilities of the logical channels and configured automatically (see "[Operation in the bus controller function model](#)" on page 596).

Analog input values are displayed as signed 16-bit values depending on the configured operating mode.

| Data type | Value | Information |
|-----------|-------------------|------------------------------|
| INT | -32,768 to 32,767 | Voltage signal ±10 VDC |
| | 0 to 32,767 | Current signal 0 mA to 20 mA |

Information:

It is important to note that the oversampling function is not available in the bus controller function model due to the amount of data and lack of consistency!

9.1.19.9.8 Physical sampling

This module has a data buffer with 16 entries for each of the physical input channels. This buffer is processed according to the configured sampling cycle time.

A maximum of only 30 bytes is available for cyclic transfer on the X2X bus, however. Minus the status and sample counter, this allows only a selection of 14 samples (with a 16-bit data width) from the physical and logical buffer to be transferred.

Data loss can therefore occur with an imprecise selection and configuration.

Example

Displaying continuous sample lines.

- Sampling cycle time = 100 μ s
- X2X cycle time = 500 μ s

| | |
|---------------|-----------------|
| Sample line 1 | PhysCh0xSample1 |
| Sample line 2 | PhysCh0xSample2 |
| Sample line 3 | PhysCh0xSample3 |
| Sample line 4 | PhysCh0xSample4 |
| Sample line 5 | PhysCh0xSample5 |
| Sample line 6 | PhysCh0xSample6 |

| | |
|----------------------------|---|
| Difference SampleCount = 1 | New value in sample line 1 |
| Difference SampleCount = 2 | New values in sample line 1 and sample line 2 |
| ... | |
| Difference SampleCount = 5 | New values in sample line 1 to sample line 5 |

Information:

It is important to note that the sample counter refers to the update of the sample lines in the data buffer and not to the number of values transferred cyclically.

Displaying each second sample line to bridge a higher recording duration:

- Sampling cycle time = 100 μ s
- X2X cycle time = 1000 μ s

| | |
|----------------|------------------|
| Sample line 1 | PhysCh0xSample1 |
| Sample line 3 | PhysCh0xSample3 |
| Sample line 5 | PhysCh0xSample5 |
| Sample line 7 | PhysCh0xSample7 |
| Sample line 9 | PhysCh0xSample9 |
| Sample line 11 | PhysCh0xSample11 |

| | |
|----------------------------|---|
| Difference SampleCount = 1 | New value in sample line 1 |
| Difference SampleCount = 3 | New values in sample line 1 and sample line 3 |
| ... | |
| Difference SampleCount = 5 | New values in sample line 1 to sample line 5 |
| ... | |
| Difference SampleCount = 9 | New values in sample line 1 to sample line 9 |

9.1.19.9.8.1 "PhysChSample" registers

Name:

PhysCh01Sample1 to PhysCh01Sample16

...

PhysCh04Sample1 to PhysCh04Sample16

These registers are the physical buffer registers of the analog channels. 16 registers are available for each channel. Sample 1 is the newest value; sample 16 is the oldest.

Analog input values are displayed as signed 16-bit values.

| Data type | Value | Information |
|-----------|-------------------|------------------------------|
| INT | -32,768 to 32,767 | Voltage signal ± 10 VDC |
| | 0 to 32,767 | Current signal 0 mA to 20 mA |

9.1.19.9.8.2 "PhysSampleCount" register

Name:

PhysSampleCount

This register is an integer counter that is increased as soon as the module has saved a new physical sample line. The number of new sample lines is calculated from the difference to the previous cycle.

| Data type | Value |
|-----------|-------------------|
| SINT | -128 to 127 |
| INT | -32,768 to 32,767 |

9.1.19.9.8.3 "PhysTimestamp" register

Name:

PhysTimestamp

This register returns the timestamp of the values currently being determined as signed values in μs . This data point is the timestamp of the physical sample line 1.

| Data type | Value |
|-----------|---------------------------------|
| INT | -32768 to 32767 |
| DINT | -2,147,483,648 to 2,147,483,647 |

9.1.19.9.9 Logical sampling

The module has a data buffer with 16 entries for each of the 6 logical channels. This buffer is processed according to the configured sampling cycle time. In addition, it's also possible to adjust the logical execution cycle using a prescaler for the sampling cycle time.

A maximum of only 30 bytes is available for cyclic transfer on the X2X bus, however. Minus the status and sample counter, this allows only a selection of 14 samples (with a 16-bit data width) from the physical and logical buffer to be transferred. For the logical channels, it is also possible to configure a 32-bit data width. Data loss can therefore occur with an imprecise selection and configuration.

Example

Displaying continuous sample lines.

- Sampling cycle time = 100 μ s
- X2X cycle time = 500 μ s

```
Sample line 1      LogicCh0xSample1
Sample line 2      LogicCh0xSample2
Sample line 3      LogicCh0xSample3
Sample line 4      LogicCh0xSample4
Sample line 5      LogicCh0xSample5
Sample line 6      LogicCh0xSample6
```

```
Difference SampleCount = 1  New value in sample line 1
Difference SampleCount = 2  New values in sample line 1 and sample line 2
...
Difference SampleCount = 5  New values in sample line 1 to sample line 5
```

Information:

It is important to note that the sample counter refers to the update of the sample lines in the data buffer and not to the number of values transferred cyclically.

Displaying each second sample line to bridge a higher recording duration:

- Sampling cycle time = 100 μ s
- X2X cycle time = 1000 μ s

```
Sample line 1      LogicCh0xSample1
Sample line 3      LogicCh0xSample3

9.1.19.9.9.1 "LogicChSample8_1" registers

Name:

LogicCh01Sample8_1 to LogicCh06Sample8_1

These registers are used to represent the results of samples 1 to 8 of the logical digital comparator for the logical channels. Each of these bits corresponds to a sample line, with sample 1 the newest and Sample 8 the oldest comparator comparison. The results of samples 9 to 16 are represented in register "[LogicSample16_9](#)" on page 587.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-----|-------------------|-------|-------------|
| 0 | Comparator result | x | Sample 1 |
| ... | ... | | |
| 7 | Comparator result | x | Sample 8 |

9.1.19.9.2 "LogicChSample16_9" registers

Name:

LogicCh01Sample16_9 to LogicCh06Sample16_9

These registers are used to represent the results of samples 9 to 16 of the logical digital comparator for the logical channels. Each of these bits corresponds to a sample line, with sample 9 the newest and Sample 16 the oldest comparator comparison. The results of samples 1 to 8 are represented in register "[LogicChSample8_1](#)" on page 586.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-----|-------------------|-------|-------------|
| 0 | Comparator result | x | Sample 9 |
| ... | ... | | |
| 7 | Comparator result | x | Sample 16 |

9.1.19.9.3 "LogicChSample" registers

Name:

LogicCh01Sample1 to LogicCh01Sample16

...

LogicCh06Sample1 to LogicCh06Sample16

These registers are the buffer registers of the logical input channels. 16 registers are available for each channel. Sample 1 is the newest value; sample 16 is the oldest.

Calculated values are displayed as signed 16- or 32-bit values depending on the register being used.

| Data type | Value |
|-----------|---------------------------------|
| INT | -32768 to 32767 |
| DINT | -2,147,483,648 to 2,147,483,647 |

9.1.19.9.4 "LogicSampleCount" register

Name:

LogicSampleCount

This register is an integer counter that is increased as soon as the module has saved a new logical sample line. The number of new sample lines is calculated from the difference to the previous cycle.

| Data type | Value |
|-----------|-------------------|
| SINT | -128 to 127 |
| INT | -32,768 to 32,767 |

9.1.19.9.5 "LogicTimestamp" register

Name:

LogicTimestamp

This register returns the timestamp of the values currently being determined as signed 2 or 4-byte values in μs . This data point is the timestamp of the logical sample line 1.

| Data type | Value |
|-----------|---------------------------------|
| INT | -32768 to 32767 |
| DINT | -2,147,483,648 to 2,147,483,647 |

9.1.19.9.10 System configuration

The following registers are used to configure the module's system settings.

9.1.19.9.10.1 Register "CfO_BaseConfig"

Name:

CfO_BaseConfig

This register can be used to configure settings for handling logical oversampling and data acquisition.

| Data type | Values | Bus controller default setting |
|-----------|------------------------|--------------------------------|
| USINT | See the bit structure. | 49 |

Bit structure:

| Bit | Description | Value | Information |
|-------|---|-------|--|
| 0 | "Display configuration for logical values active/inactive" in the Automation Studio I/O configuration | 0 | Inactive |
| | | 1 | Active (bus controller default setting) |
| 1 | "Logical handling priority" in the Automation Studio I/O configuration | 0 | Low (bus controller default setting) |
| | | 1 | High |
| 2 - 3 | Reserved | - | |
| 4 | "Physical input mode" in the Automation Studio I/O configuration | 0 | Newest value |
| | | 1 | Referenced value (reference = prescaled system timer) (bus controller default setting) |
| 5 | "Logical input mode" in the Automation Studio I/O configuration | 0 | Newest value |
| | | 1 | Referenced value (reference = prescaled system timer) (bus controller default setting) |
| 6 - 7 | Reserved | - | |

Priority of logical oversampling

- Low priority setting
Logical and physical buffers are not processed in the same context. If the calculation time that results in the logical oversampling is higher than the configured sampling cycle time, this setting and a prescaler > 1 can be used to split up the logical processing over several sampling cycles. In this way, the sample lines of the physical and logical oversampling are not automatically acquired or calculated at the same point in time. If the prescaler is configured incorrectly, the logical oversampling cannot be processed successfully.
- High priority setting
Logical and physical buffers are processed in the same context. The sample lines of the physical and logical oversampling are acquired and calculated at the same point in time. It must be possible to execute all configured functions in the configured sampling cycle time; otherwise, a cycle time violation will occur and the configuration must be changed accordingly. Configuring the logical prescaler doesn't have any effect here; only the data traffic in the logical oversampling is limited.

Current or referenced values for logical or physical oversampling

In a system being used to capacity, jitter in the sampling cycle on the module can also be caused by the necessary processing of functions (X2X Link operation, logical and physical oversampling) when the cycle time is set to synchronous. This results in a varying number of sample lines in the same time period. For this reason, more samples should also be configured in the cyclic image than are actually necessary to compute.

- Current values setting
Passing on the sample lines to the higher-level system takes place as quickly as possible, with fewer or more sample lines possibly occurring.
- Referenced values setting
This setting minimizes jitter and makes it possible to expect a constant number of new sample lines per cycle when configured optimally. With regard to response time, however, delays of several sampling cycles may occur.

9.1.19.9.10.2 Register "CfO_CycleTime"

Name:

CfO_CycleTime

"Physical sample time" in the Automation Studio I/O configuration.

This register configures the module's sampling cycle time. The format is a 16.16-bit unsigned 4-byte value, with the high word representing the integer part of the μs value and the low word the decimal places. The decimal places allow a closer alignment to the X2X cycle time. The absolute resolution is 1 μs .

Input value = Time in μs * 65536 data type

| Data type | Value | Information |
|-----------|----------------------------|---|
| UDINT | 2,621,440 to 2,147,483,647 | 40 μs to 32 ms sampling cycle time. Bus controller default setting: 6,553,600 = 100 μs |

9.1.19.9.10.3 Register "CfO_Prescaler"

Name:

CfO_Prescaler

This register contains the prescaler for configuring the logical channel processing time. The actual logical cycle time will be calculated from the multiple of the sampling cycle time that is defined here. If a very short sampling cycle time is required for physical samples, then the module load can be reduced using the second time base for the logical samples.

| Data type | Value | Information |
|-----------|---------|--|
| UINT | 1 to 10 | Multiples of the physical sampling cycle for logical processing Bus controller default setting: 2 |

9.1.19.9.10.4 Register "CfO_SyncOffset"

Name:

CfO_SyncOffset

"Synchronization offset" in the Automation Studio I/O configuration.

The system cycle can be offset in 1 μs steps in this register.

| Data type | Value | Information |
|-----------|-------------------|--|
| UINT | -32,768 to 32,767 | Synchronization offset in μs . Bus controller default setting: 0 |

9.1.19.9.11 Scaling

Analog input channels are naturally aligned and normalized when delivered ($\text{gain} = k$; $\text{offset} = d$). In addition, user-defined standardization is also available ($\text{gain} = k_u$, $\text{offset} = d_u$). The calculation is optimized by grouping the factors together.

Normalization calculation:

$$\text{nom} = k * \text{RawValue} + d$$

$$k = k * k_u$$

$$d = k * d + d_u$$

The values calculated here are limited to 16 bits.

9.1.19.9.11.1 "CfO_UserGainCh" registers

Name:

CfO_UserGainCh01 to CfO_UserGainCh04

"Configuration channel 0x / gain" in the Automation Studio I/O configuration

These registers are used to configure the gain for the respective channel. The format is a 16.16-bit signed 4-byte value, with the high word the integer part and the low word the decimal places.

$$\text{Input value} = \text{Gain } k_u * 65536$$

Value 65,535 corresponds to a gain of 1.

| Data type | Value | Information |
|-----------|------------------------------------|---|
| DINT | -2,147,483,648 to 2,147,483,647 | Gain. Bus controller default setting: 65,535 |

9.1.19.9.11.2 "CfO_UserOffsetCh" registers

Name:

CfO_UserOffsetCh01 to CfO_UserOffsetCh04

"Configuration channel 0x / offset" in the Automation Studio I/O configuration

These registers are used to configure the offset for the respective channel. The format is a 16.16-bit signed 4-byte value, with the high word the integer part and the low word the decimal places.

$$\text{Input value} = \text{Offset } d_u * 65536$$

Value 65536 corresponds to an offset of 1.

| Data type | Value | Information |
|-----------|------------------------------------|--|
| DINT | -2,147,483,648 to 2,147,483,647 | Offset. Bus controller default setting: 0 |

9.1.19.9.12 Input filter

This module is equipped with an individually configurable input filter for each channel. The following filters can be selected:

- 1st-order low pass
- 2nd-order low pass
- 2nd-order IIR

The cutoff frequency can be configured for the 1st-order and 2nd-order low pass filters. The coefficients Alpha0, Alpha1, Alpha2, Beta1 and Beta2 must be configured for the IIR filter.

9.1.19.9.12.1 "CfO_CutOffFrequCh" register

Name:

CfO_CutOffFrequCh01 to CfO_CutOffFrequCh04

These registers are used to configure the limit frequency in hertz for a 1st- or 2nd-order low pass for the corresponding channel.

| Data type | Value | Information |
|-----------|------------|---|
| UINT | 0 to 65535 | Cutoff frequency for 1st- or 2nd-order low pass [Hz]. Bus controller default setting: 1000 |

9.1.19.9.12.2 "CfO_AlphaCh" and "CfO_BetaCh" registers

Name:

CfO_Alpha0Ch01 to CfO_Alpha0Ch04

CfO_Alpha1Ch01 to CfO_Alpha1Ch04

CfO_Alpha2Ch01 to CfO_Alpha2Ch04

CfO_Beta1Ch01 to CfO_Beta1Ch04

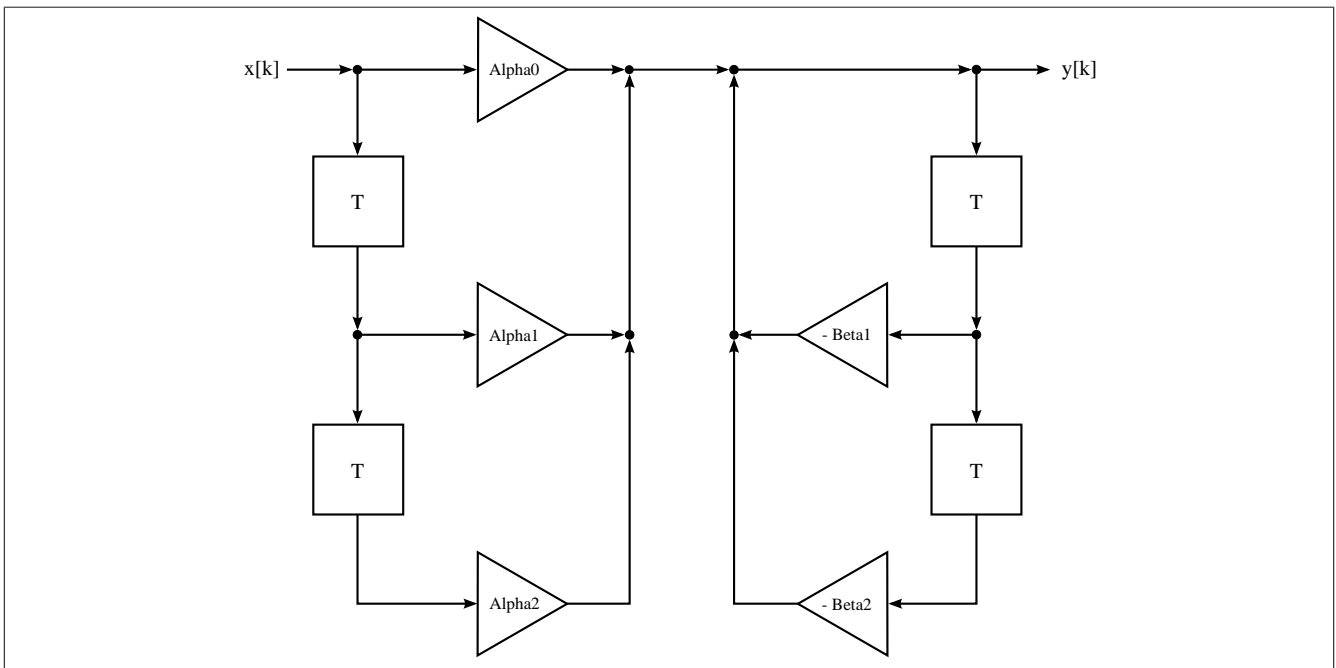

CfO_Beta2Ch01 to CfO_Beta2Ch04

These registers set the coefficients for the IIR filter.

Image as a z-transfer function

The second-order z-transfer function is specified in coefficient form (denominator polynomial Beta1, Beta2 and numerator polynomial Alpha0, Alpha1, Alpha2). The transfer method is calculated with the sampling cycle time.

$$S(Z) = \frac{a(Z)}{b(Z)} = \frac{\text{Alpha0} + \text{Alpha1} * Z^{-1} + \text{Alpha2} * Z^{-2}}{1 + \text{Beta1} * Z^{-1} + \text{Beta2} * Z^{-2}}$$

| Data type | Values | |
|-----------|------------------------------------|--|
| DINT | -2,147,483,648 to 2,147,483,647 | IIR filter coefficient. Bus controller default setting: 0 |

9.1.19.9.13 Physical configuration

9.1.19.9.13.1 "CfO_ModeCh" registers

Name:

CfO_ModeCh01 to CfO_ModeCh04

The operating mode for each physical channel can be configured in this register.

| Data type | Values | Bus controller default setting |
|-----------|------------------------|--------------------------------|
| UINT | See the bit structure. | 256 |

Bit structure:

| Bit | Description | Value | Information |
|---------|---|------------|--|
| 0 - 2 | Connection configuration This value must be set the same for each register! | 000 | Voltage signal (bus controller default setting) |
| | | 111 | Current signal |
| 3 - 7 | Reserved | 0 | |
| 8 - 10 | Operating mode | 000 | Channel disabled |
| | | 001 | No filtering (bus controller default setting) |
| | | 010 | 2nd-order IIR (configurable Alpha and Beta coefficients) |
| | | 011 | 1st-order low pass (configurable limit frequency) |
| | | 100 | 2nd-order low pass (configurable limit frequency) |
| | | 101 to 111 | Reserved |
| 11 - 15 | Reserved | 0 | |

9.1.19.9.14 Logical configuration

9.1.19.9.14.1 Operation in the standard function model

6 logical channels are available on the module. Each channel can be configured with one of the following functions:

- "Addition of two channels with scaling" on page 592
- "Integral addition of two channels with scaling" on page 593
- "Multiplication of two channels with scaling" on page 594
- "Integral multiplication of two channels with scaling" on page 595
- "Comparator function of two channels" on page 595
- "Hysteresis comparator of one channel " on page 595

With logical oversampling, 32-bit data points are available in addition to 16-bit data points due to the possible calculated results. The Automation Studio I/O configuration or data point mapping can be opened to select which one to use.

If there is no need to use 32-bit data points, or if this would lead to too large of a limitation in the number of data points, scaling can be used to limit the range to 16 bits.

The buffer depth for the digital comparator is also able to handle 16 results. Since these are Boolean results, these 16 bits are compressed into 2-byte data points and transferred that way.

Addition

This function can be used to determine the sum or difference of two channels. To determine the difference, negative scaling must be configured for the channel.

Calculation

Sample line = (Channel 1 * Scaling 1) + (Channel 2 * Scaling 2)

The addition calculation is handled internally as a 32-bit value in 16.16 format; the data from the source channels is evaluated as integers (applied to the high word), with decimal places possible as a result of scaling. When displayed as a logical 32-bit result, these decimal places are visible. When displayed as a 16-bit value, only the integral high word is used.

Example

Channel 1 = 2000

Channel 2 = 1000

Both scalings = 1

Results

$3000.x = (2000.x * 1.0) + (1000.x * 1.0)$

32-bit representation = 196608000 = 0xBB80000

16-bit representation = 3000 = 0xBB8

Information:

The maximum value for channels 1 and 2 can only be 32767; otherwise, an additional overflow occurs. If values greater than 32767 are possible, the range of values must be limited with scaling.

Integral of addition

This function can be used in the application to establish the average value of the channels or to calculate the deviation/difference between two channels over n samples. In each cycle, the channels are added together first; then the result is added to the previous value and saved in the current sample line. Depending on the result data type being used (16-bit or 32-bit), eventually the continuous integration will cause the calculation to overflow after n samples. Because of the signed result value, it must be ensured that the number n of samples is chosen small enough so that calculating the integral component is less than half the range of values. If this is done, determining the average value can be carried out despite an overflow.

Calculation

Result: Sample line = Integral ((Channel 1 * Scaling 1) + (Channel 2 * Scaling 2))

The addition calculation is handled internally as a 32-bit value in 16.16 format; the data from the source channels is evaluated as integers (applied to the high word), with decimal places possible as a result of scaling. When displayed as a logical 32-bit result, these decimal places are visible. When displayed as a 16-bit value, only the integral high word is used.

Example

Channel 1 = 2000

Channel 2 = 1000

Both scalings = 1

Results

$3000.x = (2000.x * 1.0) + (1000.x * 1.0)$

32-bit representation = 196608000 = 0xBB80000.

16-bit representation = 3000 = 0xBB8

The average value can now be calculated as follows:

n = Number of samples / sample lines

$Value_x$ = Value from sample line x → Newer value

$Value_{(x-n)}$ = Value from sample line $x-n$ → Older value, n samples back

Average value = $(Value_x - Value_{(x-n)}) / n$

Information:

The maximum value for channels 1 and 2 can only be 32767; otherwise, an additional overflow occurs. If values greater than 32767 are possible, the range of values must be limited with scaling.

Multiplication

This function can be used to calculate the current effective power $P = U * I$.

Calculation

Sample line = Channel 1 * Channel 2 * Scaling

Multiplication is calculated internally as a 32-bit value; the 16-bit data from the source channels is passed to the low word. When displayed as a logical 32-bit value, the entire result is visible (no multiplication overflow possible when scaling ≤ 1). When displayed as a 16-bit value, only the high word is used. Though there is a loss of precision, the 16-bit values allow more data points to be transferred.

Example

Channel 1 = 2000

Channel 2 = 1000

Scaling = 1

Results

2000000 = (2000 * 1000 * 1.0)

32-bit representation = 2000000 = 0x1E8480

16-bit representation = 30 = 0x1E

Information:

If more precision is needed with the 16-bit value, scaling in steps of 2^n (... , *128, *256, ...) can be employed to shift the bits. Of course, it's important again that the input values of the source channels be limited; otherwise, an overflow will occur in the multiplication operation.

Integral of multiplication

This function can be used in the application to establish the average value of the effective power. In each cycle, the channels are multiplied together first; then the result is added to the previous value and saved in the current sample line. Depending on the result data type being used (16-bit or 32-bit), eventually the continuous integration will cause the calculation to overflow after n samples. Because the result value is signed, it is important to set the number n of samples small enough so that the integration is less than half of the value range. If this is done, determining the average value can be carried out despite an overflow.

Calculation

Sample line = Integral (Channel 1 * Channel 2 * Scaling)

Multiplication is calculated internally as a 32-bit value; the 16-bit data from the source channels is passed to the low word. When displayed as a logical 32-bit value, the entire result is visible (no multiplication overflow possible when scaling ≤ 1). When displayed as a 16-bit value, only the high word is used. Though there is a loss of precision, the 16-bit values allow more data points to be transferred.

Example

Channel 1 = 2000

Channel 2 = 1000

Scaling = 1

Results

$2000000 = (2000 * 1000 * 1.0)$

32-bit representation = $2000000 = 0x1E8480$

16-bit representation = $30 = 0x1E$

The average value can now be calculated as follows:

n = Number of samples / sample lines

$Value_x$ = Value from sample line $x \rightarrow$ Newer value

$Value_x$ = Value from sample line $x \rightarrow$ Older value, n samples back

Average value = $(Value_x - Value_{(x-n)}) / n$

Information:

If more precision is needed with the 16-bit value, scaling in steps of 2^n (... , *128, *256, ...) can be employed to shift the bits. Of course, it's important again that the input values of the source channels be limited; otherwise, an overflow will occur in the multiplication operation.

Channel comparator

This function can be used to compare channel values. The following applies:

- Channel 1 > Channel 2 = 1
- Channel 1 < Channel 2 = 0
- Channel 1 = Channel 2 = State before values are the same

Calculation

Sample line (bit) = Comparison (channel value 1 with channel value 2)

Hysteresis comparator

This function can be used to monitor range violations by channels. The following applies:

- Channel > Upper threshold value = 1
- Channel < Lower threshold value = 0
- Channel within threshold = Value before occurrence

Calculation

Sample line (bit) = Comparison (channel value with lower threshold value) and (channel value with upper threshold value))

9.1.19.9.14.2 Operation in the bus controller function model

When used on the bus controller, there are 4 logical functions available for each of the analog input channels in addition to the physical value output. Each channel can be configured with one of the following functions:

- "Output of physical values" on page 596 (default setting)
- "Addition of two channels with scaling" on page 592
- "Integral addition of two channels with scaling" on page 593
- "Multiplication of two channels with scaling" on page 594
- "Integral multiplication of two channels with scaling" on page 595
- "Comparator function of two channels" on page 595
- "Hysteresis comparator of one channel " on page 595

In contrast to the standard function model, oversampling and the two digital comparators are not supported. As a result, there is only one newly generated value per channel in each update cycle. Another difference is that there are only 4 logical calculation channels instead of 6.

The logical functions addition, integral of addition, multiplication and integral of multiplication do not differ from the standard function model in their configuration and function when operating on the bus controller.

Physical value display

The physical value display in the bus controller function model is initialized automatically and represents a special form of the logical function "Addition" with defined scaling factors.

Calculation

Result = Channel value

Formula used for addition: $\text{Result} = (\text{Channel value } 1 * 1) + (\text{Channel value } 2 * 0)$

Information:

In this function model, only the 4 physical input channels are available, and the scaling factors have defined values.

9.1.19.9.14.3 "CfO_LogChMode" register

Name:

CfO_LogCh01Mode to CfO_LogCh06Mode

"Logical configuration channel 0x / Addition" in the Automation Studio I/O configuration.

"Logical configuration channel 0x / Integral of addition" in the Automation Studio I/O configuration.

"Logical configuration channel 0x / Multiplication" in the Automation Studio I/O configuration.

"Logical configuration channel 0x / Integral of multiplication" in the Automation Studio I/O configuration.

"Logical configuration channel 0x / Channel comparator" in the Automation Studio I/O configuration.

"Logical configuration channel 0x / Hysteresis comparator" in the Automation Studio I/O configuration.

"Logical configuration channel 0x / Physical value display" in the Automation Studio I/O configuration.

The operating mode for each logical channel can be configured in this register.

The selection of the sources to be used for each logical channel is made using the register "CfO_LogCh0NSource0x" on page 597. Any additionally needed function parameters are configured in the "CfO_LogCh0NFuncPar0x" on page 598 registers. "N" stands for the logical channel to be used, while "x" stands for either the source or function 0 or 1.

The following links can be made:

- Addition: Result = (Source 0 * Function parameter 0) + (Source 1 * Function parameter 1)
- Integral of addition: Result = Σ (Source 0 * Function parameter 0) + (Source 1 * Function parameter 1)
- Multiplication: Result = Source 0 * Source 1 * Function parameter 0
- Integral of multiplication: Result = Σ (Source 0 * Source 1 * Function parameter 0)
- Channel comparator: Result = Comparison of source 0 with source 1
- Hysteresis comparator: Result = comparison of source 0 with (Lower threshold value = Function parameter 0) and (Upper threshold value = Function parameter 1)
- Physical value display: Result = (Source 0 * 1) + (Source 1 * 0)

| Data type | Value | Information |
|-----------|-------|--|
| UINT | 0 | Channel switched off. Bus controller default setting: Channel 5 to 6 |
| | 256 | Addition or physical value display ¹⁾ . Bus controller default setting: Channel 1 to 4 |
| | 257 | Integral of addition |
| | 512 | Multiplication |
| | 513 | Integral of multiplication |
| | 768 | Channel comparator |
| | 1024 | Hysteresis comparator |

1) Only registers CfO_LogCh01Mode to CfO_LogCh04Mode are used for physical value display.

9.1.19.9.14.4 "CfO_LogChSource" register

Name:

CfO_LogCh01Source00 to CfO_LogCh06Source00

CfO_LogCh01Source01 to CfO_LogCh06Source01

These registers can be used to select the source registers for the operating mode of the logical channel configured in the register "CfO_LogCh0NMode" on page 597.

In the name, "Source00" stands for source register 0; "Source01" stands for source register 1.

In **Physical value display** mode, the same channel number is written to both source registers.

| Data type | Value | Information |
|-----------|-------|--|
| USINT | 0 | Physical channel 01. Bus controller default setting ¹⁾ |
| | ... | ... |
| | 3 | Physical channel 04. Bus controller default setting ¹⁾ |
| | 8 | Logical channel 01 ¹⁾ |
| | ... | ... |
| | 13 | Logical channel 06 |

1) **Values**

Channels 1 to 4: Channel number - 1
Channels 5 to 6: 0

2) Logical channels cannot be used in the bus controller function model.

9.1.19.9.14.5 "CfO_LogChFuncPar" register

Name:

CfO_LogCh01FuncPar00 to CfO_LogCh06FuncPar00

CfO_LogCh01FuncPar01 to CfO_LogCh06FuncPar01

These registers can be used to configure additional function parameters for the operating mode of the logical channel configured in the register "CfO_LogCh0NMode" on page 597.

The effect of the function parameters is different depending on the operating mode.

| Operating mode | Parameter 1 | Parameter 2 |
|------------------------------|---------------------------------|----------------------------|
| (Integral of) addition | Scaling factor | Scaling factor |
| (Integral of) multiplication | Scaling factor | - |
| Channel comparator | - | - |
| Hysteresis comparator | Upper threshold value | Lower threshold value |
| Output of physical values | Defined scaling factor = 65,536 | Defined scaling factor = 0 |

Value 65,536 corresponds to scaling or a threshold value of 1.

| Data type | Value | Information |
|-----------|--------------------|--|
| UDINT | 0 to 4,294,967,295 | Scaling factor or threshold value. Bus controller default setting: <u>Register "...FuncPar00"</u> Channels 1 to 4 65536 Channels 5 to 6 0 <u>Register "...FuncPar01"</u> All 0 |

9.1.19.9.15 Error registers

The registers for displaying and acknowledging errors are transferred either cyclically or acyclically depending on the function model.

9.1.19.9.15.1 "CfO_ErrorID1017" register

Name:

CfO_ErrorID1017

Automatic enabling by the Automation Studio I/O configuration.

This register can be used to enable standard error messages. The channels' composite errors are derived from the individual extended error status, e.g. overflow/underflow of the input range for the analog value. Oversampling error statuses result from a cycle time violation of the configured sampling cycle time.

| Data type | Values | Bus controller default setting |
|-----------|------------------------|--------------------------------|
| USINT | See the bit structure. | 63 |

Bit structure:

| Bit | Description | Value | Information |
|-------|--------------------------------|-------|---|
| 0 | Composite errors on channel 01 | 0 | Error generation disabled |
| | | 1 | Error generation enabled (bus controller default setting) |
| ... | | ... | |
| 3 | Composite errors on channel 04 | 0 | Error generation disabled |
| | | 1 | Error generation enabled (bus controller default setting) |
| 4 | Physical sample error status | 0 | Error generation disabled |
| | | 1 | Error generation enabled (bus controller default setting) |
| 5 | Logical sample error status | 0 | Error generation disabled |
| | | 1 | Error generation enabled (bus controller default setting) |
| 6 - 7 | Reserved | 0 | |

9.1.19.9.15.2 "CfO_ErrorID0x0x" register

Name:

CfO_ErrorID0007 (for channels 1 and 2)

CfO_ErrorID080F (for channels 3 and 4)

Automatic enabling in the Automation Studio I/O configuration by selecting "Extended error status information" and channel activation.

These registers can be used to enable extended error messages for analog channels 1 and 2 as well as channels 3 and 4. Meaning of individual bits:

- **Range exceeded violation (pos.):** The analog input signal is outside of the specified working range.
- **Filter error:** The configured filter theorem cannot be calculated (parameter error).
- **Underflow:** The input signal is less than the lower limit value.
- **Overflow:** The input signal is greater than the upper limit value.

| Data type | Values | Bus controller default setting |
|-----------|------------------------|--------------------------------|
| USINT | See the bit structure. | 0 |

Bit structure:

| Bit | Description | Value | Information |
|-----|---|-------|--|
| 0 | Channel 1 or 3: Range exceeded violation (pos.) | 0 | Error generation disabled (bus controller default setting) |
| | | 1 | Range exceeded violation (pos.) enabled |
| 1 | Channel 1 or 3: Filter error | 0 | Error generation disabled (bus controller default setting) |
| | | 1 | Filter error enabled |
| 2 | Channel 1 or 3: Underflow | 0 | Error generation disabled (bus controller default setting) |
| | | 1 | Underflow enabled |
| 3 | Channel 1 or 3: Overrun | 0 | Error generation disabled (bus controller default setting) |
| | | 1 | Overflow enabled |
| 4 | Channel 2 or 4: Range exceeded violation (pos.) | 0 | Error generation disabled (bus controller default setting) |
| | | 1 | Range exceeded violation (pos.) enabled |
| 5 | Channel 2 or 4: Filter error | 0 | Error generation disabled (bus controller default setting) |
| | | 1 | Filter error enabled |
| 6 | Channel 2 or 4: Underflow | 0 | Error generation disabled (bus controller default setting) |
| | | 1 | Underflow enabled |
| 7 | Channel 2 or 4: Overrun | 0 | Error generation disabled (bus controller default setting) |
| | | 1 | Overflow enabled |

9.1.19.9.15.3 "StandardErrors" registers

Name:

Channel01Error to Channel04Error

PhysicalError

LogicalError

Composite errors are mapped to this register.

All configured functions of the physical and logical oversampling must be able to be carried out in the configured sampling cycle time; otherwise, these error messages occur. Settings for processing priority and the prescaler can be used to additionally adjust the system for logical oversampling.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-----|----------------|-------|--|
| 0 | Channel01Error | 0 | No error |
| | | 1 | Composite errors on channel 1 |
| ... | ... | ... | ... |
| 3 | Channel04Error | 0 | No error |
| | | 1 | Composite errors on channel 4 |
| 4 | PhysicalError | 0 | No error |
| | | 1 | Physical sample error status, sampling cycle time too short |
| 5 | LogicalError | 0 | No error |
| | | 1 | Logical sample error status, sampling cycle time too short or prescaler configured too low |

9.1.19.9.15.4 "AcknowledgeStandardErrors" registers

Name:

AckChannel01Error to AckChannel04Error

AckPhysicalError

AckLogicalError

Error messages from the "StandardErrors" on page 599 register can be acknowledged by setting the corresponding bits in this register.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-----|-------------------|-------|-------------------|
| 0 | AckChannel01Error | 0 | No change |
| | | 1 | Acknowledge error |
| ... | | ... | |
| 3 | AckChannel04Error | 0 | No change |
| | | 1 | Acknowledge error |
| 4 | AckPhysicalError | 0 | No change |
| | | 1 | Acknowledge error |
| 5 | AckLogicalError | 0 | No change |
| | | 1 | Acknowledge error |

9.1.19.9.15.5 "ExtendedChannelErrorMessages" registers

Name:

Channel01OutOfRange to Channel04OutOfRange

Channel01FilterError to Channel04FilterError

Channel01Underflow to Channel04Underflow

Channel01Overflow to Channel04Overflow

The error states of the input channels are represented in these registers. Input channels 1 and 2 as well as 3 and 4 are each grouped together in one register.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-----|---|-------|--|
| 0 | Channel01OutOfRange or Channel03OutOfRange | 0 | No error |
| | | 1 | Range exceeded violation (pos.) occurred |
| 1 | Channel01FilterError or Channel03FilterError | 0 | No error |
| | | 1 | Filter error occurred |
| 2 | Channel01Underflow or Channel03underflow | 0 | No error |
| | | 1 | Underflow occurred |
| 3 | Channel01Overflow or Channel03Overflow | 0 | No error |
| | | 1 | Overflow occurred |
| 4 | Channel02OutOfRange or Channel04OutOfRange | 0 | No error |
| | | 1 | Range exceeded violation (pos.) occurred |
| 5 | Channel02FilterError or Channel04FilterError | 0 | No error |
| | | 1 | Filter error occurred |
| 6 | Channel02Underflow or Channel04Underflow | 0 | No error |
| | | 1 | Underflow occurred |
| 7 | Channel02Overflow or Channel04Overflow | 0 | No error |
| | | 1 | Overflow occurred |

9.1.19.9.15.6 "AcknowledgeExtendedChannelErrorMessages" registers

Name:

AckChannel01OutOfRange to AckChannel04OutOfRange

AckChannel01FilterError to AckChannel04FilterError

AckChannel01Underflow to AckChannel04Underflow

AckChannel01Overflow to AckChannel04Overflow

These registers can be used to acknowledge the error messages from the "ExtendedChannelErrorMessages" on page 600 registers by setting the corresponding bit. The acknowledgment of input channels 1 and 2 as well as 3 and 4 are each grouped together in one register.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-----|---|-------|-------------------|
| 0 | AckChannel01OutOfRange or AckChannel03OutOfRange | 0 | No change |
| | | 1 | Acknowledge error |
| 1 | AckChannel01FilterError or AckChannel03FilterError | 0 | No change |
| | | 1 | Acknowledge error |
| 2 | AckChannel01Underflow or AckChannel03Underflow | 0 | No change |
| | | 1 | Acknowledge error |
| 3 | AckChannel01Overflow or AckChannel03Overflow | 0 | No change |
| | | 1 | Acknowledge error |
| 4 | AckChannel02OutOfRange or AckChannel04OutOfRange | 0 | No change |
| | | 1 | Acknowledge error |
| 5 | AckChannel02FilterError or AckChannel04FilterError | 0 | No change |
| | | 1 | Acknowledge error |
| 6 | AckChannel02Underflow or AckChannel04Underflow | 0 | No change |
| | | 1 | Acknowledge error |
| 7 | AckChannel02Overflow or AckChannel04Overflow | 0 | No change |
| | | 1 | Acknowledge error |

9.1.19.9.16 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time |
|--------------------|
| 200 µs |

9.1.19.9.17 Minimum I/O update time

There is no limitation or dependency on the bus cycle time.

The I/O update time is defined using the "Sampling time" register. The fastest possible sampling time depends on the number of channels to be converted and the configuration.

9.1.20 X20AI8221

Data sheet version: 1.21

9.1.20.1 General information

The module is equipped with 8 inputs with 13-bit (including sign) digital converter resolution. It can be used to capture voltage signals in the range from ± 10 V.

- 8 analog inputs ± 10 V
- 13-bit digital converter resolution

9.1.20.2 Order data

| Model number | Short description | Figure |
|--------------|---|---|
| X20AI8221 | X20 analog input module, 8 inputs, ± 10 V, 13-bit converter resolution |  |
| | Required accessories | |
| | Bus modules | |

- 3) Based on the 20 V measurement range.

9.1.20.4 LED status indicators

For a description of the various operating modes, see "[Diagnostic LEDs](#)" on page 3787.

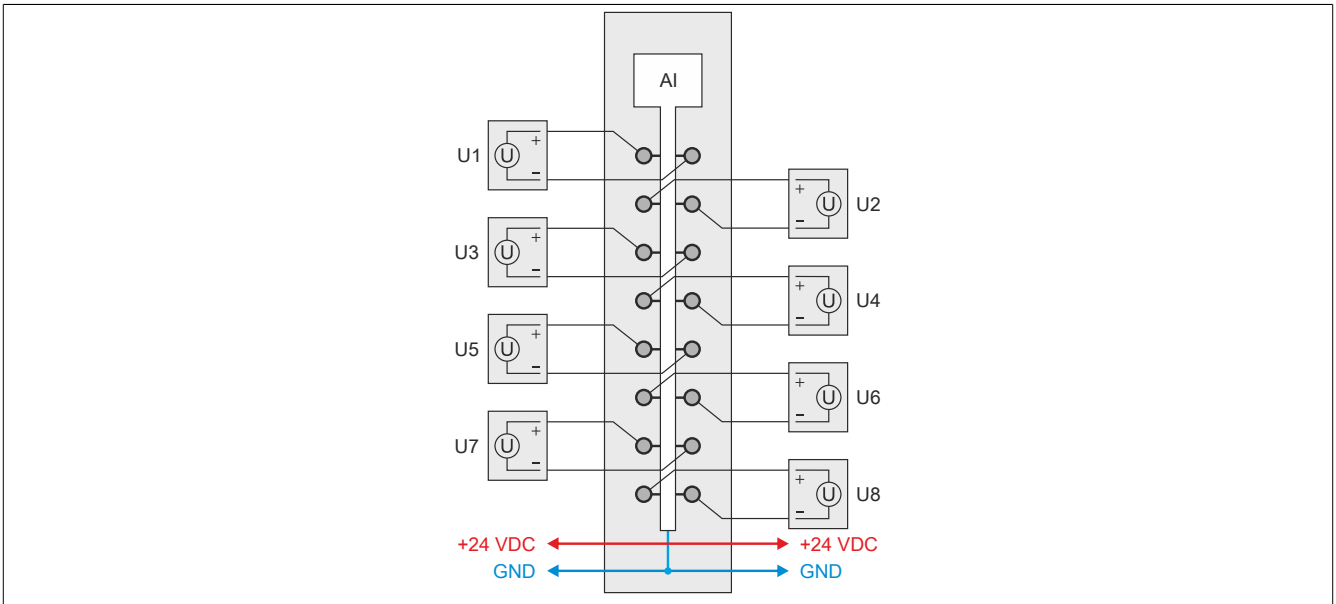

| Figure | LED | Color | Status | Description | |
|--|-------|-------|------------------|--|---|
|  | S | Green | Off | No power to module | |
| | | | Single flash | UNLINK mode | |
| | | | Double flash | BOOT mode (during firmware update) ¹⁾ | |
| | | | Blinking quickly | SYNC mode | |
| | | | Blinking slowly | PREOPERATIONAL mode | |
| | | | On | RUN mode | |
| | | | Red | Off | No power to module or everything OK |
| | | | | On | Error or reset status |
| | 1 - 8 | Green | | Off | Indicates one of the following cases: <ul style="list-style-type: none"> • No power to module • Open line |
| | | | | Single flash | Input signal overflow or underflow |
| On | | | | Analog/digital converter running, value OK | |

- 1) Depending on the configuration, a firmware update can take up to several minutes.

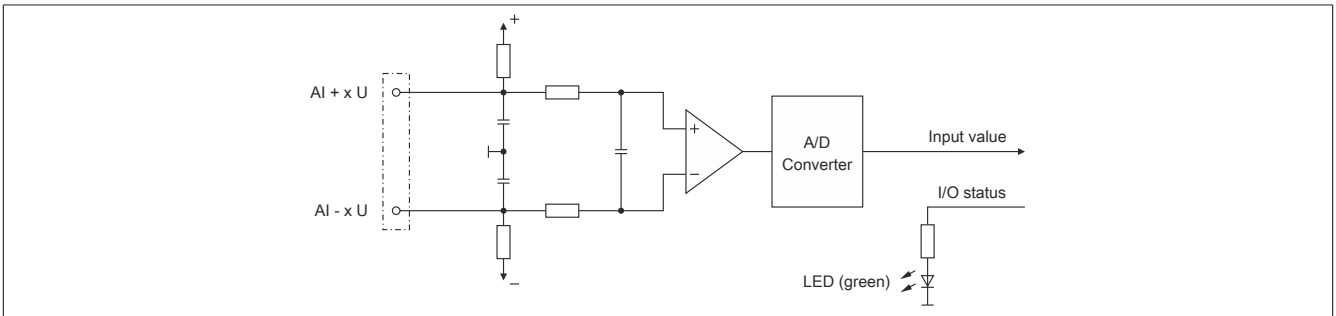

9.1.20.5 Pinout

9.1.20.6 Connection example

9.1.20.7 Input circuit diagram

9.1.20.8 Register description

9.1.20.8.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section "[General data points](#)" on page 3790.

9.1.20.8.2 Function model 0 - Standard

| Register | Name | Data type | Read | | Write | |
|--------------------------------------|--|-----------|--------|------------|--------|------------|
| | | | Cyclic | Non-cyclic | Cyclic | Non-cyclic |
| Analog signal - Configuration | | | | | | |
| 16 | ConfigOutput01 (Input filter) | USINT | | | | • |
| 20 | ConfigOutput03 (Lower limit value) | INT | | | | • |
| 22 | ConfigOutput04 (Upper limit value) | INT | | | | • |
| Analog signal - Communication | | | | | | |
| Index * 2 - 2 | AnalogInput0N (Index N = 1 to 8) | INT | • | | | |
| 30 | StatusInput01 | USINT | • | | | |
| 31 | StatusInput02 | USINT | • | | | |

9.1.20.8.3 Function model 254 - Bus controller

| Register | Offset ¹⁾ | Name | Data type | Read | | Write | |
|--------------------------------------|----------------------|--|-----------|--------|------------|--------|------------|
| | | | | Cyclic | Non-cyclic | Cyclic | Non-cyclic |
| Analog signal - Configuration | | | | | | | |
| 16 | - | ConfigOutput01 (Input filter) | USINT | | | | • |
| 20 | - | ConfigOutput03 (Lower limit value) | INT | | | | • |
| 22 | - | ConfigOutput04 (Upper limit value) | INT | | | | • |
| Analog signal - Communication | | | | | | | |
| Index * 2 - 2 | Index * 2 - 2 | AnalogInput0N (Index N = 1 to 8) | INT | • | | | |
| 30 | - | StatusInput01 | USINT | | • | | |
| 31 | - | StatusInput02 | USINT | | • | | |

1) The offset specifies the position of the register within the CAN object.

9.1.20.8.3.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see "[Using I/O modules on the bus controller](#)" on page 3789.

9.1.20.8.3.2 CAN I/O bus controller

The module occupies 2 analog logical slots on CAN I/O.

9.1.20.8.4 Analog inputs

Input signals are converted asynchronously in a 1 ms interval.

9.1.20.8.5 Analog input values

Name:

AnalogInput01 to AnalogInput08

The analog input values are mapped to this register.

| Data type | Value | Input signal: |
|-----------|-------------------|------------------------------|
| INT | -32,768 to 32,767 | Voltage signal -10 to 10 VDC |

9.1.20.8.6 Input filter

This module is equipped with a configurable input filter.

Information:

The filter sampling time is fixed at 1 ms and is acyclic to the X2X cycle.

9.1.20.8.6.1 Input ramp limiting

Input ramp limiting can only be performed in conjunction with filtering. Input ramp limiting is performed before filtering.

The difference of the input value change is checked for exceeding the specified limit. In the event of overshoot, the tracked input value is equal to the old value \pm the limit value.

Configurable limit values:

| Value | Limit value |
|-------|---|
| 0 | The input value is used without limitation. |
| 1 | 0x3FFF = 16383 |
| 2 | 0x1FFF = 8191 |
| 3 | 0x0FFF = 4095 |
| 4 | 0x07FF = 2047 |
| 5 | 0x03FF = 1023 |
| 6 | 0x01FF = 511 |
| 7 | 0x00FF = 255 |

Input ramp limiting is well suited for suppressing disturbances (spikes). The following examples show the functionality of input ramp limiting based on an input step and a disturbance.

Example 1

The input value jumps from 8000 to 17000. The diagram shows the tracked input value with the following settings:

Input ramp limiting = 4 = 0x07FF = 2047

Filter level = 2

Figure 72: Tracked input value for input step

Example 2

A disturbance interferes with the input value. The diagram shows the tracked input value with the following settings:

Input ramp limiting = 4 = 0x07FF = 2047

Filter level = 2

Figure 73: Tracked input value for disturbance

9.1.20.8.6.2 Filter level

A filter can be defined to prevent large input steps. This filter is used to bring the input value closer to the actual analog value over a period of several milliseconds.

Filtering takes place after any input ramp limiting has been carried out.

Formula for calculating the input value:

$$Value_{New} = Value_{Old} - \frac{Value_{Old}}{Filter\ level} + \frac{Input\ value}{Filter\ level}$$

Adjustable filter levels:

| Value | Filter level |
|-------|---------------------|
| 0 | Filter switched off |
| 1 | Filter level 2 |
| 2 | Filter level 4 |
| 3 | Filter level 8 |
| 4 | Filter level 16 |
| 5 | Filter level 32 |
| 6 | Filter level 64 |
| 7 | Filter level 128 |

The following examples show the functionality of the filter based on an input step and a disturbance.

Example 1

The input value jumps from 8000 to 16000. The diagram shows the calculated value with the following settings:

Input ramp limiting = 0

Filter level = 2 or 4

Figure 74: Calculated value during input step

Example 2

A disturbance interferes with the input value. The diagram shows the calculated value with the following settings:

Input ramp limiting = 0

Filter level = 2 or 4

Figure 75: Calculated value during disturbance

9.1.20.8.7 Configuring the input filter

Name:

ConfigOutput01

This register is used to define the filter level and input ramp limitation of the input filter.

| Data type | Values | Bus controller default setting |
|-----------|------------------------|--------------------------------|
| USINT | See the bit structure. | 0 |

Bit structure:

| Bit | Description | Value | Information |
|--------|-----------------------------------|-------|--|
| 0 - 2 | Defines the filter level | 000 | Filter disabled (bus controller default setting) |
| | | 001 | Filter level 2 |
| | | 010 | Filter level 4 |
| | | 011 | Filter level 8 |
| | | 100 | Filter level 16 |
| | | 101 | Filter level 32 |
| | | 110 | Filter level 64 |
| | | 111 | Filter level 128 |
| 3 | Reserved | 0 | |
| 4 - 6 | Defines the input ramp limitation | 000 | The input value is applied without limitation (bus controller default setting) |
| | | 001 | Limit value = 0x3FFF (16383) |
| | | 010 | Limit value = 0x1FFF (8191) |
| | | 011 | Limit value = 0x0FFF (4095) |
| | | 100 | Limit value = 0x07FF (2047) |
| | | 101 | Limit value = 0x03FF (1023) |
| | | 110 | Limit value = 0x01FF (511) |
| | | 111 | Limit value = 0x00FF (255) |
| 7 - 15 | Reserved | 0 | |

9.1.20.8.8 Lower limit value

Name:

ConfigOutput03

This register can be used to configure the lower limit for analog values. If the analog value goes below the limit value, it is frozen at this value and the corresponding error status bit is set.

| Data type | Values | Information |
|-----------|-----------------|--|
| INT | -32767 to 32767 | Bus controller default setting: -32767 |

Information:

The default value of -32767 corresponds to the minimum default value of -10 VDC.

Keep in mind that this setting applies to all channels!

9.1.20.8.9 Upper limit value

Name:

ConfigOutput04

This register can be used to configure the upper limit for analog values. If the analog value goes above the limit value, it is frozen at this value and the corresponding error status bit is set.

| Data type | Values | Information |
|-----------|-----------------|---------------------------------------|
| INT | -32767 to 32767 | Bus controller default setting: 32767 |

Information:

The default value of 32767 corresponds to the maximum default value at +10 VDC.

Keep in mind that this setting applies to all channels!

9.1.20.8.10 Input status

Name:

StatusInput01 to StatusInput02

This register is used to monitor the module inputs. A change in the monitoring status generates an error message.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

StatusInput01 monitors Channels 1 to 4

StatusInput02 monitors Channels 5 to 8

| Bit | Description | Value | Information |
|-------|----------------|-------|----------------------------|
| 0 - 1 | Channel 1 or 5 | 00 | No error |
| | | 01 | Lower limit value exceeded |
| | | 10 | Upper limit value exceeded |
| | | 11 | Open line |
| ... | | ... | |
| 6 - 7 | Channel 4 or 8 | 00 | No error |
| | | 01 | Lower limit value exceeded |
| | | 10 | Upper limit value exceeded |
| | | 11 | Open line |

Limiting the analog value

In addition to the status information, the analog value is fixed to the values listed below by default in an error state. The analog value is limited to the new values if the limit values were changed.

| Error state | Digital value on error (default values) |
|-----------------------------|---|
| Open circuit | +32767 (0x7FFF) |
| Upper limit value overshoot | +32767 (0x7FFF) |
| Lower limit value undershot | -32767 (0x8001) |
| Invalid value | -32768 (0x8000) |

9.1.20.8.11 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time |
|--------------------|
| 150 μ s |

9.1.20.8.12 Minimum I/O update time

The minimum I/O update time specifies how far the bus cycle can be reduced so that an I/O update is performed in each cycle.

| Minimum I/O update time |
|-------------------------|
| 1 ms |

9.1.21 X20AI8321

Data sheet version: 1.21

9.1.21.1 General information

The module is equipped with 8 inputs with 12-bit digital converter resolution. It is possible to select between the two current ranges 0 to 20 mA and 4 to 20 mA.

- 8 analog inputs, 0 to 20 mA or 4 to 20 mA
- 12-bit digital converter resolution

9.1.21.2 Order data

| Model number | Short description | Figure |
|--------------|---|---|

9.1.21.6 Connection example

9.1.21.7 Input circuit diagram

9.1.21.8 Register description

9.1.21.8.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section ["General data points" on page 3790](#).

9.1.21.8.2 Function model 0 - Standard

| Register | Name | Data type | Read | | Write | |
|--------------------------------------|------------------------------------|-----------|--------|------------|--------|------------|
| | | | Cyclic | Non-cyclic | Cyclic | Non-cyclic |
| Analog signal - Configuration | | | | | | |
| 16 | ConfigOutput01 (Input filter) | USINT | | | | • |
| 18 | ConfigOutput02 (Channel type) | UINT | | | | • |
| 20 | ConfigOutput03 (Lower limit value) | INT | | | | • |
| 22 | ConfigOutput04 (Upper limit value) | INT | | | | • |
| Analog signal - Communication | | | | | | |
| Index * 2 - 2 | AnalogInput0N (Index N = 1 to 8) | INT | • | | | |
| 30 | StatusInput01 | USINT | • | | | |
| 31 | StatusInput02 | USINT | • | | | |

9.1.21.8.3 Function model 254 - Bus controller

| Register | Offset ¹⁾ | Name | Data type | Read | | Write | |
|--------------------------------------|----------------------|------------------------------------|-----------|--------|------------|--------|------------|
| | | | | Cyclic | Non-cyclic | Cyclic | Non-cyclic |
| Analog signal - Configuration | | | | | | | |
| 16 | - | ConfigOutput01 (Input filter) | USINT | | | | • |
| 18 | - | ConfigOutput02 (Channel type) | UINT | | | | • |
| 20 | - | ConfigOutput03 (Lower limit value) | INT | | | | • |
| 22 | - | ConfigOutput04 (Upper limit value) | INT | | | | • |
| Analog signal - Communication | | | | | | | |
| Index * 2 - 2 | Index * 2 - 2 | AnalogInput0N (Index N = 1 to 8) | INT | • | | | |
| 30 | - | StatusInput01 | USINT | | • | | |
| 31 | - | StatusInput02 | USINT | | • | | |

1) The offset specifies the position of the register within the CAN object.

9.1.21.8.3.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see ["Using I/O modules on the bus controller" on page 3789](#).

9.1.21.8.3.2 CAN I/O bus controller

The module occupies 2 analog logical slots on CAN I/O.

9.1.21.8.4 Analog inputs

Input signals are converted asynchronously in a 1 ms interval.

9.1.21.8.5 Analog input values

Name:

AnalogInput01 to AnalogInput08

The analog input values are mapped to this register.

| Data type | Value | Input signal: |
|-----------|------------|---|
| INT | 0 to 32767 | Current signal 0 to 20 mA or 4 to 20 mA |

9.1.21.8.6 Input filter

This module is equipped with a configurable input filter.

Information:

The filter sampling time is fixed at 1 ms and is acyclic to the X2X cycle.

9.1.21.8.6.1 Input ramp limiting

Input ramp limiting can only be performed in conjunction with filtering. Input ramp limiting is performed before filtering.

The difference of the input value change is checked for exceeding the specified limit. In the event of overshoot, the tracked input value is equal to the old value \pm the limit value.

Configurable limit values:

| Value | Limit value |
|-------|---|
| 0 | The input value is used without limitation. |
| 1 | 0x3FFF = 16383 |
| 2 | 0x1FFF = 8191 |
| 3 | 0x0FFF = 4095 |
| 4 | 0x07FF = 2047 |
| 5 | 0x03FF = 1023 |
| 6 | 0x01FF = 511 |
| 7 | 0x00FF = 255 |

Input ramp limiting is well suited for suppressing disturbances (spikes). The following examples show the functionality of input ramp limiting based on an input step and a disturbance.

Example 1

The input value jumps from 8000 to 17000. The diagram shows the tracked input value with the following settings:

Input ramp limiting = 4 = 0x07FF = 2047

Filter level = 2

Figure 76: Tracked input value for input step

Example 2

A disturbance interferes with the input value. The diagram shows the tracked input value with the following settings:

Input ramp limiting = 4 = 0x07FF = 2047

Filter level = 2

Figure 77: Tracked input value for disturbance

9.1.21.8.6.2 Filter level

A filter can be defined to prevent large input steps. This filter is used to bring the input value closer to the actual analog value over a period of several milliseconds.

Filtering takes place after any input ramp limiting has been carried out.

Formula for calculating the input value:

$$\text{Value}_{\text{New}} = \text{Value}_{\text{Old}} - \frac{\text{Value}_{\text{Old}}}{\text{Filter level}} + \frac{\text{Input value}}{\text{Filter level}}$$

Adjustable filter levels:

| Value | Filter level |
|-------|---------------------|
| 0 | Filter switched off |
| 1 | Filter level 2 |
| 2 | Filter level 4 |
| 3 | Filter level 8 |
| 4 | Filter level 16 |
| 5 | Filter level 32 |
| 6 | Filter level 64 |
| 7 | Filter level 128 |

The following examples show the functionality of the filter based on an input step and a disturbance.

Example 1

The input value jumps from 8000 to 16000. The diagram shows the calculated value with the following settings:

Input ramp limiting = 0

Filter level = 2 or 4

Figure 78: Calculated value during input step

Example 2

A disturbance interferes with the input value. The diagram shows the calculated value with the following settings:

Input ramp limiting = 0

Filter level = 2 or 4

Figure 79: Calculated value during disturbance

9.1.21.8.7 Configuring the input filter

Name:

ConfigOutput01

This register is used to define the filter level and input ramp limitation of the input filter.

| Data type | Values | Bus controller default setting |
|-----------|------------------------|--------------------------------|
| USINT | See the bit structure. | 0 |

Bit structure:

| Bit | Description | Value | Information |
|--------|-----------------------------------|-------|--|
| 0 - 2 | Defines the filter level | 000 | Filter disabled (bus controller default setting) |
| | | 001 | Filter level 2 |
| | | 010 | Filter level 4 |
| | | 011 | Filter level 8 |
| | | 100 | Filter level 16 |
| | | 101 | Filter level 32 |
| | | 110 | Filter level 64 |
| | | 111 | Filter level 128 |
| 3 | Reserved | 0 | |
| 4 - 6 | Defines the input ramp limitation | 000 | The input value is applied without limitation (bus controller default setting) |
| | | 001 | Limit value = 0x3FFF (16383) |
| | | 010 | Limit value = 0x1FFF (8191) |
| | | 011 | Limit value = 0x0FFF (4095) |
| | | 100 | Limit value = 0x07FF (2047) |
| | | 101 | Limit value = 0x03FF (1023) |
| | | 110 | Limit value = 0x01FF (511) |
| | | 111 | Limit value = 0x00FF (255) |
| 7 - 15 | Reserved | 0 | |

9.1.21.8.8 Channel type

Name:

ConfigOutput02

This register can be used to set the range of the current signal. This is determined by how they are configured. The following input signals can be set:

- 0 to 20 mA current signal
- 4 to 20 mA current signal

| Data type | Values | Bus controller default setting |
|-----------|------------------------|--------------------------------|
| USINT | See the bit structure. | 0 |

Bit structure:

| Bit | Description | Value | Information |
|-----|--------------------------------------|-------|--|
| 0 | Channel 1: Current measurement range | 0 | 0 to 20 mA current signal (bus controller default setting) |
| | | 1 | 4 to 20 mA current signal |
| ... | | ... | |
| 7 | Channel 8: Current measurement range | 0 | 0 to 20 mA current signal (bus controller default setting) |
| | | 1 | 4 to 20 mA current signal |

9.1.21.8.9 Lower limit value

Name:

ConfigOutput03

This register can be used to configure the lower limit for analog values. If the analog value goes below the limit value, it is frozen at this value and the corresponding error status bit is set.

| Data type | Values | Information |
|-----------|-----------------|--|
| INT | -32768 to 32767 | Bus controller default setting: -32767 |

Information:

- When configured as 0 to 20 mA, this value should be set to 0.
- When configured as 4 to 20 mA, this value can be set to -8192 (corresponds to 0 mA) in order to display values <4 mA.

Keep in mind that this setting applies to all channels!

9.1.21.8.10 Upper limit value

Name:
ConfigOutput04

This register can be used to configure the upper limit for analog values. If the analog value goes above the limit value, it is frozen at this value and the corresponding error status bit is set.

| Data type | Values | Information |
|-----------|-----------------|---------------------------------------|
| INT | -32768 to 32767 | Bus controller default setting: 32767 |

Information:

The default value of 32767 corresponds to the maximum default value at 20 mA.

Keep in mind that this setting applies to all channels!

9.1.21.8.11 Input status

Name:
StatusInput01 to StatusInput02

This register is used to monitor the module inputs. A change in the monitoring status generates an error message.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

StatusInput01 monitors Channels 1 to 4

StatusInput02 monitors Channels 5 to 8

| Bit | Description | Value | Information |
|-------|----------------|-------|----------------------------|
| 0 - 1 | Channel 1 or 5 | 00 | No error |
| | | 01 | Lower limit value exceeded |
| | | 10 | Upper limit value exceeded |
| ... | | ... | |
| 6 - 7 | Channel 4 or 8 | 00 | No error |
| | | 01 | Lower limit value exceeded |
| | | 10 | Upper limit value exceeded |

Limiting the analog value

In addition to the status information, the analog value is set to the values listed below by default when an error occurs. The analog value is limited to the new values if the limit values were changed.

| Error status | Digital value for error (default values) | |
|----------------------------|--|----------------|
| | 0 to 20 mA | 4 to 20 mA |
| Upper limit value exceeded | +32767 (0x7FFF) | |
| Lower limit value exceeded | 0 | -8191 (0xE001) |

9.1.21.8.12 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time |
|--------------------|
| 150 μ s |

9.1.21.8.13 Minimum I/O update time

The minimum I/O update time specifies how far the bus cycle can be reduced so that an I/O update is performed in each cycle.

| Minimum I/O update time |
|-------------------------|
| 1 ms |

9.1.22 X20AIA744

Data sheet version: 1.30

9.1.22.1 General information

This module works with 4-wire strain gauge load cells. The concept applied by the module requires compensation in the measurement system. This compensation eliminates the absolute uncertainty in the measurement circuit, such as component tolerances, effective bridge voltage or zero offset. The measurement precision refers to the absolute (compensated) value, which will only change as a result of changes in the operating temperature.

- 2 full-bridge strain gauge inputs
- 5 kHz data output rate for both channels
- Independently configurable strain gauge factor and filter level for each of the 2 channels

9.1.22.2 Order data

| Model number | Short description | Figure |

| | | Red | Off | No power to module or everything OK |
| | Double flash | | I/O supply outside limits | |
| | On | | Error or reset status | |
| | 1 - 2 | Green | Off | Possible causes: • Supply error • Channel not yet configured |
| | | | Blinking | Possible causes: • Open line • Overvoltage • Undervoltage |
| Green | | On | Analog/digital converter running, value OK | |

1) Depending on the configuration, a firmware update can take up to several minutes.

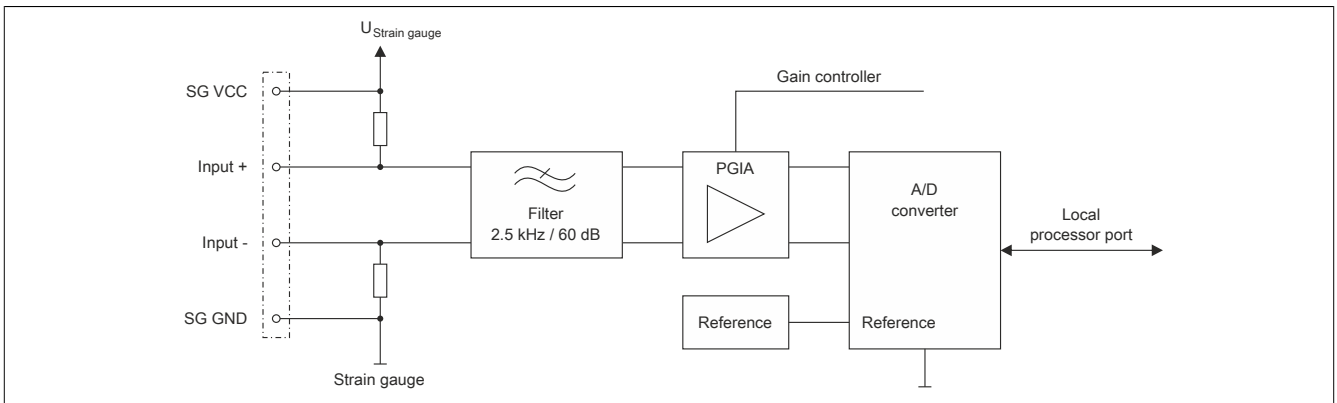

9.1.22.5 Pinout

9.1.22.6 Connection example

9.1.22.7 Input circuit diagram

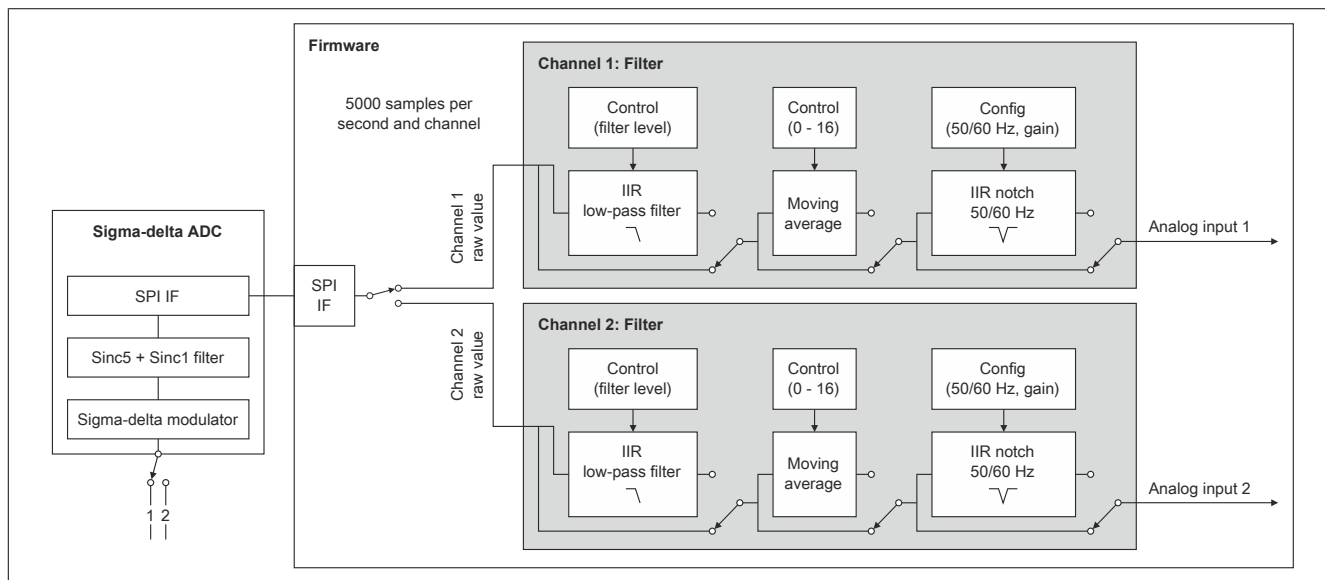

9.1.22.8 Software filters

An independent cascade of filters is available for each channel. They can be individually enabled and configured at runtime. By default, all filters are disabled when the device is switched on. Filters are controlled and configured using the "ControlPacked0N" on page 637 and "ConfigChannel0N" on page 638 (N = 1 to 2) registers.

In order to allow the filter behavior to be adapted to the measuring situation or machine cycle (high dynamics and low precision or low dynamics and high precision), the filter characteristics of both the IIR low-pass filter as well as the moving average filter can be changed synchronously at any time.

Filter diagram

9.1.22.8.1 IIR low-pass filter

9.1.22.8.1.1 General information

The IIR low-pass filter is used to generally smooth and increase the resolution of the analog value. The filter works according to the following formula:

$$y = y_{Old} + \frac{x - y_{Old}}{2^{Filter\ level}}$$

- x ... current filter input value
- y_{Old} ... old filter output value
- y ... new filter output value

The "Filter level" parameter in the formula above is configured with the help of the "ControlPacked0N" on page 637 register. "Filter level" = 0 if the IIR low-pass filter is disabled.

9.1.22.8.1.2 Filter characteristics of the 1st-order IIR low-pass filter

Limit frequency f_c

The following table provides an overview of the -3 dB limit frequency f_c depending on the configured filter level.

| IIR low-pass filter level | f _c [Hz] |
|---------------------------|---------------------|
| 1 | 575 |
| 2 | 230 |
| 3 | 106 |
| 4 | 51 |
| 5 | 25 |
| 6 | 12.5 |
| 7 | 6.2 |
| 8 | 3.1 |

Gain of the IIR low-pass filter

Phase shift of the IIR low-pass filter

Step response of the IIR low-pass filter

Group delay of the IIR low-pass filter

9.1.22.8.2 Sinc1 / Moving average filter

Like the low-pass filter, the moving average filter can also be used to smooth out the signal and increase its resolution. In addition, configuring the filter length accordingly makes it possible to target and efficiently filter out individual interference frequencies. The source of these interference frequencies may be mechanical or electromagnetic. Multiples of these are also filtered out (as long as they are a whole-number factor of the data output rate of 5000 samples per second and channel).

Example:

Data output rate = 5000 samples/s/channel, averaging over 4 values -> "Notch" at 1.25 kHz (and 2.5 kHz)

When reconfiguring the filter length from "n" to "m", it takes $|m-n| * 200 \mu\text{s}$ until the desired filter length setpoint is reached again. As long as the filter length setpoint is not reached, this situation will be indicated by the bit 7 status bit in the "StatusPacked0N" on page 639 register.

9.1.22.8.2.1 Filter characteristics of the moving average filter

| Filter configuration | Filter length | f_{Notch} [Hz] ¹⁾ | f_c [Hz] ²⁾ |
|----------------------|---------------|---------------------------------------|--------------------------|
| 0 | 1 | | |
| 1 | 2 | 2500 | 1244 |
| 2 | 4 | 1250 | 568 |
| 3 | 5 | 1000 | 450 |
| 4 | 10 | 500 | 222 |
| 5 | 20 | 250 | 111 |
| 6 | 25 | 200 | 88.4 |
| 7 | 50 | 100 | 44.0 |
| 8 | 83 | 60.24 | 26.5 |
| 9 | 100 | 50 | 21.9 |
| 10 | 125 | 40 | 17.5 |
| 11 | 167 | 29.94 | 13.0 |
| 12 | 200 | 25 | 10.9 |
| 13 | 250 | 20 | 8.6 |
| 14 | 300 | 16.67 | 7.1 |
| 15 | 500 | 10 | 4.3 |
| 16 | 1000 | 5 | 2.0 |

1) Mid-band frequency of the first attenuation maximum.

2) -3 dB limit frequency.

9.1.22.8.2.2 Examples for the gain of the moving average filter

Example 1

Filter setting = 3:

- $f_{\text{Notch}} = 1000 \text{ Hz}$
- $f_c = 449.6 \text{ Hz}$

Example 2

Filter setting = 9:

- $f_{\text{Notch}} = 50 \text{ Hz}$
- $f_c = 21.9 \text{ Hz}$

9.1.22.8.3 50/60 Hz IIR notch filter

The IIR notch filter is used for narrow-band suppression of interference caused by the mains frequency.

This is an 8th-order IIR notch filter implemented in the form of a cascade of 4 2nd-order IIR notch filters.

Information:

The IIR notch filter should only be enabled if there is actually interference being caused by the mains frequency. You should always check whether sufficiently low and sufficiently narrow band filtering at 50 Hz / 60 Hz can be implemented using a moving average filter (see "[Filter characteristics of the moving average filter](#)" on page 629).

This is because, like every higher-order IIR notch filter, this filter also has a tendency to respond to an input step with an attenuating vibration. The higher the dynamics of the expected measurement signal, the greater the potential interfering effect of this vibration tendency. In extreme cases, the vibration can temporarily be greater than the mains interference that is supposed to be filtered out.

9.1.22.8.3.1 Filter characteristics of the IIR notch filter

There are 3 different filter characteristics that can be selected for both 50 Hz and 60 Hz (-40 dB, -60 dB and -80 dB). The higher the attenuation, the narrower the stopband.

Example 1

Filter characteristics for the following settings:

- Gain = -40 dB
- Frequency = 50 Hz
- Passband = 5 Hz
- Stopband = ± 1 Hz

Example 2

Filter characteristics for the following settings:

- Gain = -80 dB
- Frequency = 50 Hz
- Passband = 5 Hz
- Stopband = ± 0.25 Hz

Example 3

Filter characteristics for the following settings:

- Gain = -60 dB
- Frequency = 60 Hz
- Passband = 5 Hz
- Stopband = ± 0.5 Hz

Step response of an 8th-order IIR notch filter, including the deviation in bits:

9.1.22.9 Hardware configuration

9.1.22.9.1 Hardware configuration for horizontal installation starting at 55°C ambient temperature

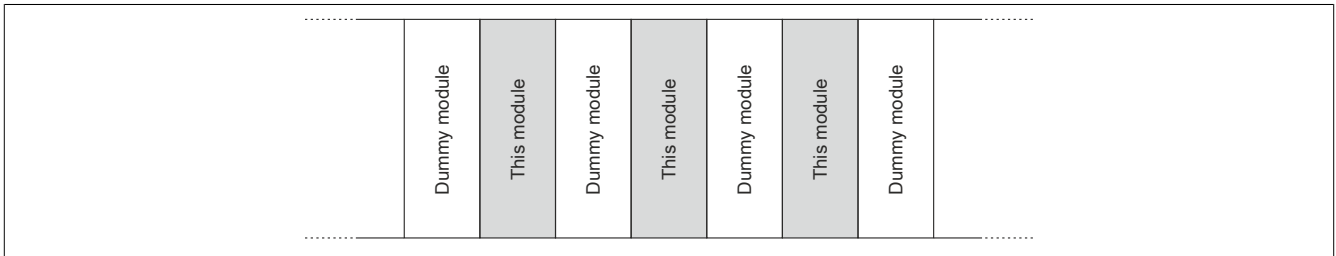

Operating a strain gauge module

Starting at an ambient temperature of 55°C, a dummy module must be connected to the left and right of the strain gauge module in a horizontal mounting orientation.

Operating multiple strain gauge modules side by side

If 2 or more horizontal strain gauge modules are being operated in a cluster, the following arrangement of modules must be observed.

9.1.22.9.2 Hardware configuration for vertical installation starting at 45°C ambient temperature

Operating a strain gauge module

Starting at an ambient temperature of 45°C, a dummy module must be connected to the left and right of the strain gauge module in a vertical mounting orientation.

Operating multiple strain gauge modules side by side

If 2 or more vertical strain gauge modules are being operated in a cluster, the following arrangement of modules must be observed.

9.1.22.10 Register description

9.1.22.10.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section ["General data points" on page 3790](#).

9.1.22.10.2 Function model 0 - default

| Register | Name | Data type | Read | | Write | |
|--------------------------------------|--|-----------|--------|---------|--------|---------|
| | | | Cyclic | Acyclic | Cyclic | Acyclic |
| Analog signal - Configuration | | | | | | |
| 2 | ControlPacked01 (configuration of strain gauge inputs) | UINT | | | • | |
| 6 | ControlPacked02 (configuration of strain gauge inputs) | UINT | | | • | |
| 514 | ConfigChannel01 (channel configuration) | UINT | | | | • |
| 578 | ConfigChannel02 (channel configuration) | UINT | | | | • |
| Analog signal - Communication | | | | | | |
| 4 | AnalogInput01 | DINT | • | | | |
| 12 | AnalogInput02 | DINT | • | | | |
| 33 | StatusPacked01 | USINT | • | | | |
| 35 | StatusPacked02 | USINT | • | | | |
| 257 | AdcConvCtr01 | SINT | • | | | |
| 268 | AdcConvTimeStamp01 | DINT | • | | | |

9.1.22.10.3 Function model 254 - Bus controller

| Register | Offset ¹⁾ | Name | Data type | Read | | Write | |
|--------------------------------------|----------------------|--|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| Analog signal - Configuration | | | | | | | |
| 2 | 2 | ControlPacked01 (configuration of strain gauge inputs) | UINT | | | • | |
| 6 | 10 | ControlPacked02 (configuration of strain gauge inputs) | UINT | | | • | |
| 514 | 514 | ConfigChannel01 (channel configuration) | UINT | | | | • |
| 578 | 578 | ConfigChannel02 (channel configuration) | UINT | | | | • |
| Analog signal - Communication | | | | | | | |
| 4 | 4 | AnalogInput01 | DINT | • | | | |
| 12 | 12 | AnalogInput02 | DINT | • | | | |
| 33 | 0 | StatusPacked01 | USINT | • | | | |
| 35 | 8 | StatusPacked02 | USINT | • | | | |

1) The offset specifies the position of the register within the CAN object.

9.1.22.10.3.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see ["Using I/O modules on the bus controller" on page 3789](#).

9.1.22.10.3.2 CAN I/O bus controller

The module occupies 4 analog logical slots on CAN I/O.

9.1.22.10.4 Configuration

9.1.22.10.4.1 Configuration of strain gauge inputs

Name:

ControlPacked01 and ControlPacked02

The strain gauge inputs are configured in these registers:

- Strain gauge factor of strain gauge load cell
- Enabling of filters

| Data type | Values |
|-----------|------------------------|
| UINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information | |
|---------|-----------------------|-------------------------------------|---|-------------------------|
| 0 - 2 | Strain gauge factor | 000 | Default: 256 mV/V | |
| | | 001 | 128 mV/V | |
| | | 010 | 64 mV/V | |
| | | 011 | 32 mV/V | |
| | | 100 | 16 mV/V | |
| | | 101 | 8 mV/V | |
| | | 110 | 4 mV/V | |
| | | 111 | 2 mV/V | |
| 3 - 7 | Moving average | | Averaging | 1. Notch frequency [Hz] |
| | | 00000 | Default: Moving average disabled (bypass) | |
| | | 00001 | 2 | 2500 |
| | | 00010 | 4 | 1250 |
| | | 00011 | 5 | 1000 |
| | | 00100 | 10 | 500 |
| | | 00101 | 20 | 250 |
| | | 00110 | 25 | 200 |
| | | 00111 | 50 | 100 |
| | | 01000 | 83 | 60 |
| | | 01001 | 100 | 50 |
| | | 01010 | 125 | 40 |
| | | 01011 | 167 | 30 |
| | | 01100 | 200 | 25 |
| | | 01101 | 250 | 20 |
| | | 01110 | 300 | 16.66 |
| | | 01111 | 500 | 10 |
| 10000 | 1000 | 5 | | |
| | 10001 to 11111 | Reserved (firmware limited to 1000) | | |
| 8 | Notch filter | 0 | Default: IIR notch filter disabled (bypass) | |
| | | 1 | IIR notch filter enabled | |
| 9 | Reserved | 0 | | |
| 10 - 11 | Low-pass filter mode | 00 | IIR low-pass filter disabled (bypass) | |
| | | 01 | 1st-order IIR low-pass filter (see "IIR low-pass filter" on page 626) | |
| | | 10 - 11 | Reserved: No IIR low-pass filter active | |
| | | | Filter level | -3 db frequency [Hz] |
| 12 - 14 | Low-pass filter level | 000 | 1 | 575 |
| | | 001 | 2 | 230 |
| | | 010 | 3 | 106 |
| | | 011 | 4 | 51 |
| | | 100 | 5 | 25 |
| | | 101 | 6 | 12.5 |
| | | 110 | 7 | 6.2 |
| | | 111 | 8 | 3.1 |
| 15 | Reserved | 0 | | |

9.1.22.10.4.2 Channel configuration

Name:

ConfigChannel01 and ConfigChannel02

The IIR notch filter is configured individually for each channel in these registers.

| Data type | Values | Bus controller default setting |
|-----------|------------------------|--------------------------------|
| UINT | See the bit structure. | 0 |

Bit structure:

| Bit | Description | Value | Information |
|---------|--------------------------|-------|--|
| 0 - 11 | Reserved | 0 | |
| 12 - 13 | Notch filter attenuation | 00 | Gain: -40 dB Pass: ± 5 Hz Stop: ± 1 Hz (Bus controller default setting) |
| | | 01 | Gain: -60 dB Pass: ± 5 Hz Stop: ± 0.5 Hz |
| | | 10 | Gain: -80 dB Pass: ± 5 Hz Stop: ± 0.25 Hz |
| | | 11 | Reserved |
| 14 | Notch filter frequency | 0 | With 50 Hz (bus controller default setting) |
| | | 1 | At 60 Hz |
| 15 | Reserved | 0 | |

9.1.22.10.5 Communication

9.1.22.10.5.1 Analog input values

Name:

AnalogInput01 and AnalogInput02

The analog input value is mapped in this register.

| Data type | Value | Input signal: |
|-----------|-------------------------|---|
| DINT | -8,388,608 | Negative invalid value |
| | -8,388,607 | Negative full-scale deflection / Underflow |
| | -8,388,606 to 8,388,606 | Valid range |
| | 8,388,607 | Positive full-scale deflection / Overflow / Open line |

9.1.22.10.5.2 Module status

Name:

StatusPacked01 and StatusPacked02

These registers contain the current state of the module.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|-----------------------------|-------|--|
| 0 | I/O power supply | 0 | No error |
| | | 1 | Error in power supply |
| 1 | Bypass current | 0 | No error |
| | | 1 | Overcurrent (sum from all sensors) |
| 2 - 3 | Reserved | 0 | |
| 4 | A/D converter configuration | 0 | Already configured |
| | | 1 | Not yet configured |
| 5 | Analog values | 0 | Analog value valid |
| | | 1 | Analog value invalid (analog value = -8,388,608 = 0xFF800000). Possible causes: <ul style="list-style-type: none"> Internal transfer error (XOR checksum verification) Error in strain gauge supply (bit 1) Error in I/O voltage supply (bit 0) A/D converter not (yet) configured |
| 6 | Analog value range overrun | 0 | Analog value valid |
| | | 1 | Analog value invalid. Possible causes: <ul style="list-style-type: none"> Overflow / Open circuit (analog value = 8,388,607 = 0x007FFFFFFF) Underflow (analog value = -8,388,607 = 0xFF800001) |
| 7 | Moving average filter | 0 | Moving average filter engaged |
| | | 1 | Moving average filter not engaged Possible causes: <ul style="list-style-type: none"> After changing the filter length Consequence of the filter being reset by another error |

9.1.22.10.5.3 A/D conversion counter

Name:

AdcConvCtr01

Instead of being measured simultaneously, the strain gauge channels of the module are measured according to the multiplexing procedure. The "[AdcConvTimestamp01](#)" on page 640 register contains the timestamp of the encoded last channel converted in the "AdcConvCtr01" register. The timestamp of the other channels can then be calculated later using this information.

| Data type | Value |
|-----------|--------------------|
| SINT | See bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|-------------------------------------|-------|---|
| 0 - 1 | Index of the last converted channel | 0 | Analog input 1 |
| | | 1 | Analog input 2 |
| | | 2 | Reserved |
| | | 3 | Reserved |
| 2 - 7 | Rotating cycle counter | x | Incremented at the end of a conversion cycle. All channels are converted in a conversion cycle. |

9.1.22.10.5.4 ADC conversion timestamp

Name:

AdcConvTimestamp01

The timestamp of the last converted channel is stored in this register (see bits 0 and 1 in the "AdcConvCtr01" on page 639 register). This is always the point in time (in μs) at which the conversion of the latest A/D converter raw value is completed.

| Data type | Value | Function |
|-----------|---------------------------|--|
| DINT | -2147483648 to 2147483647 | Timestamp (in μs) of the last converted channel (see bits 0 and 1 in the A/D conversion counter) |

The timestamp of the remaining channels can be determined in the application using the number and timestamp of the last converted channel according to the following table.

| Channel | Age difference |
|---------|-------------------|
| 2 - 1 | 47 μs |
| 1 - 2 | 153 μs |

Example 1:

- Latest channel (bit 0 - 1 in the AdcConvCtr01 register) = 01 (analog input 2):
- Timestamp: "AdcConvTimestamp01" register = 0 μs

| Channel | Timestamp |
|---------|-------------------|
| 2 | 0 μs |
| 1 | -47 μs |

Example 2:

- Latest channel (bit 0 - 1 in the AdcConvCtr01 register) = 00 (analog input 1):
- Timestamp: "AdcConvTimestamp01" register = 0 μs

| Channel | Timestamp |
|---------|--------------------|
| 1 | 0 μs |
| 2 | -153 μs |

9.1.22.10.6 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time |
|--------------------|
| 200 μs |

9.1.22.10.7 Minimum I/O update time

The minimum I/O update time specifies how far the bus cycle can be reduced so that an I/O update is performed in each cycle.

| Minimum I/O update time |
|-------------------------|
| 200 μs |

9.1.23 X20AIB744

Data sheet version: 1.30

9.1.23.1 General information

This module works with 4-wire strain gauge load cells. The concept applied by the module requires compensation in the measurement system. This compensation eliminates the absolute uncertainty in the measurement circuit, such as component tolerances, effective bridge voltage or zero offset. The measurement precision refers to the absolute (compensated) value, which will only change as a result of changes in the operating temperature.

- 4 full-bridge strain gauge inputs
- 5 kHz data output rate for all 4 channels
- Independently configurable strain gauge factor and filter level for each of the 4 channels

9.1.23.2 Order data

| Model number | Short description | Figure |

| | | | Blinking | Possible causes: <ul style="list-style-type: none"> • Open line • Overvoltage • Undervoltage |
| Green | | On | Analog/digital converter running, value OK | |
| | | On | Analog/digital converter running, value OK | |

- 1) Depending on the configuration, a firmware update can take up to several minutes.

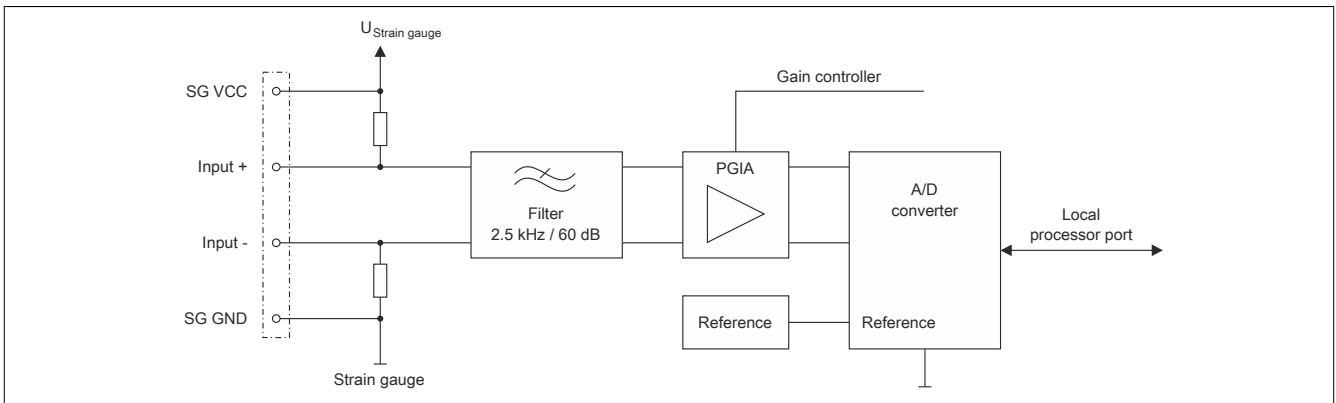

9.1.23.5 Pinout

9.1.23.6 Connection example

9.1.23.7 Input circuit diagram

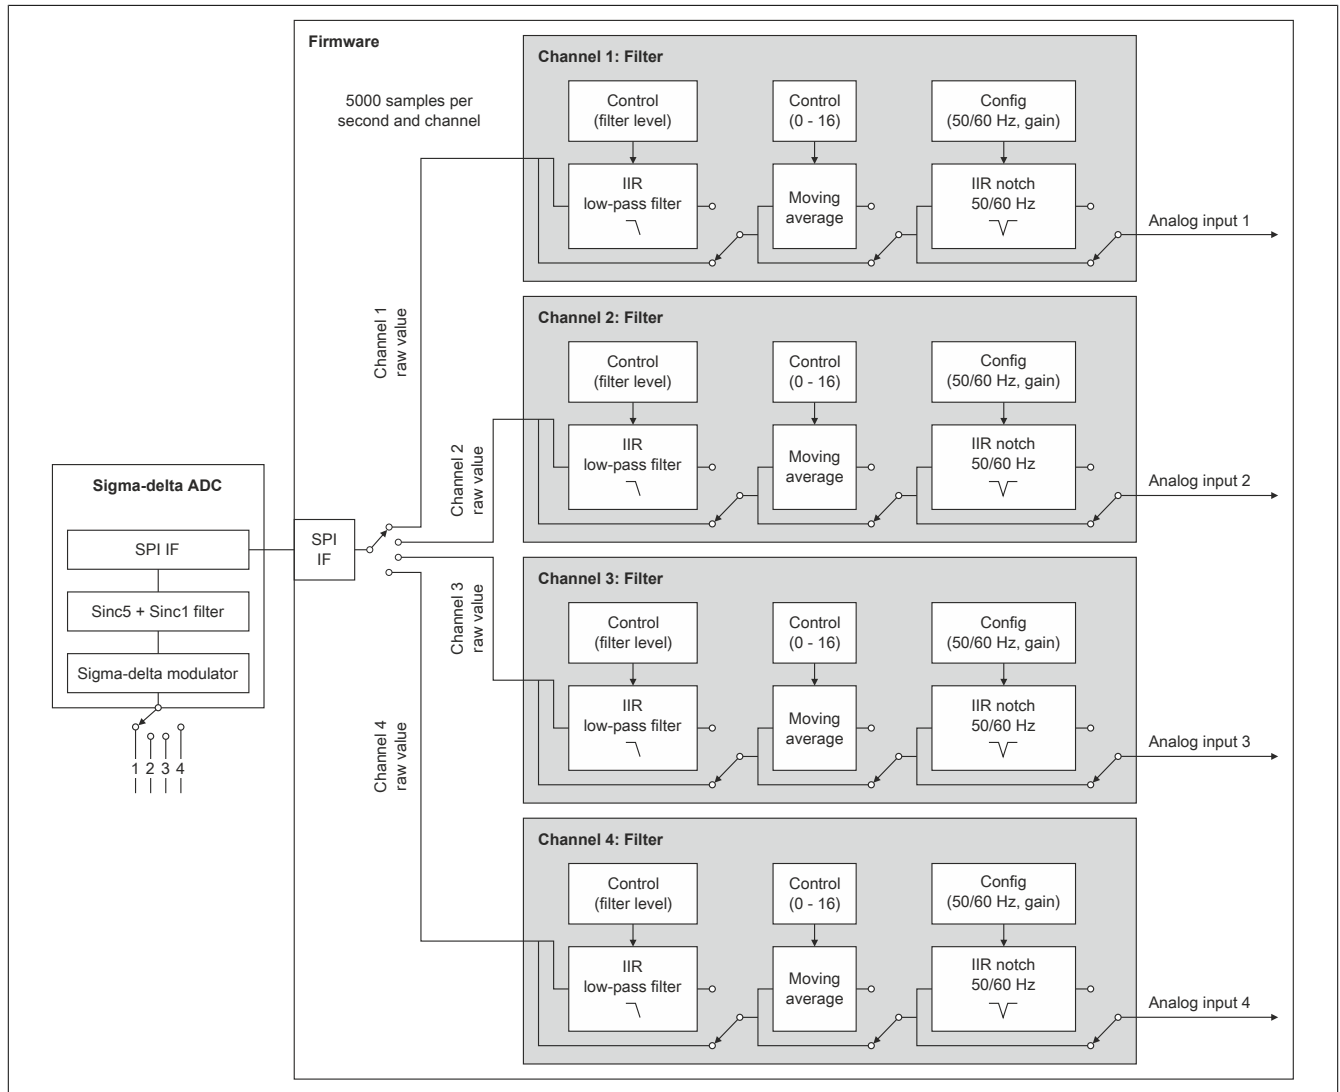

9.1.23.8 Software filters

An independent cascade of filters is available for each channel. They can be individually enabled and configured at runtime. By default, all filters are disabled when the device is switched on. Filters are controlled and configured using the "ControlPacked0N" on page 656 and "ConfigChannel0N" on page 657 (N = 1 to 4) registers.

In order to allow the filter behavior to be adapted to the measuring situation or machine cycle (high dynamics and low precision or low dynamics and high precision), the filter characteristics of both the IIR low-pass filter as well as the moving average filter can be changed synchronously at any time.

Filter diagram

9.1.23.8.1 IIR low-pass filter

9.1.23.8.1.1 General information

The IIR low-pass filter is used to generally smooth and increase the resolution of the analog value. The filter works according to the following formula:

$$y = y_{Old} + \frac{x - y_{Old}}{2^{Filter\ level}}$$

- x ... current filter input value
- y_{Old} ... old filter output value
- y ... new filter output value

The "Filter level" parameter in the formula above is configured with the help of the "ControlPacked0N" on page 656 register. "Filter level" = 0 if the IIR low-pass filter is disabled.

9.1.23.8.1.2 Filter characteristics of the 1st-order IIR low-pass filter

Limit frequency f_c

The following table provides an overview of the -3 dB limit frequency f_c depending on the configured filter level.

| IIR low-pass filter level | f_c [Hz] |
|---------------------------|------------|
| 1 | 575 |
| 2 | 230 |
| 3 | 106 |
| 4 | 51 |
| 5 | 25 |
| 6 | 12.5 |
| 7 | 6.2 |
| 8 | 3.1 |

Gain of the IIR low-pass filter

Phase shift of the IIR low-pass filter

Step response of the IIR low-pass filter

Group delay of the IIR low-pass filter

9.1.23.8.2 Sinc1 / Moving average filter

Like the low-pass filter, the moving average filter can also be used to smooth out the signal and increase its resolution. In addition, configuring the filter length accordingly makes it possible to target and efficiently filter out individual interference frequencies. The source of these interference frequencies may be mechanical or electromagnetic. Multiples of these are also filtered out (as long as they are a whole-number factor of the data output rate of 5000 samples per second and channel).

Example:

Data output rate = 5000 samples/s/channel, averaging over 4 values -> "Notch" at 1.25 kHz (and 2.5 kHz)

When reconfiguring the filter length from "n" to "m", it takes $|m-n| * 200 \mu\text{s}$ until the desired filter length setpoint is reached again. As long as the filter length setpoint is not reached, this situation will be indicated by the bit 7 status bit in the "StatusPacked0N" on page 658 register.

9.1.23.8.2.1 Filter characteristics of the moving average filter

| Filter configuration | Filter length | f_{Notch} [Hz] ¹⁾ | f_c [Hz] ²⁾ |
|----------------------|---------------|---------------------------------------|--------------------------|
| 0 | 1 | | |
| 1 | 2 | 2500 | 1244 |
| 2 | 4 | 1250 | 568 |
| 3 | 5 | 1000 | 450 |
| 4 | 10 | 500 | 222 |
| 5 | 20 | 250 | 111 |
| 6 | 25 | 200 | 88.4 |
| 7 | 50 | 100 | 44.0 |
| 8 | 83 | 60.24 | 26.5 |
| 9 | 100 | 50 | 21.9 |
| 10 | 125 | 40 | 17.5 |
| 11 | 167 | 29.94 | 13.0 |
| 12 | 200 | 25 | 10.9 |
| 13 | 250 | 20 | 8.6 |
| 14 | 300 | 16.67 | 7.1 |
| 15 | 500 | 10 | 4.3 |
| 16 | 1000 | 5 | 2.0 |

- 1) Mid-band frequency of the first attenuation maximum.
- 2) -3 dB limit frequency.

9.1.23.8.2.2 Examples for the gain of the moving average filter

Example 1

Filter setting = 3:

- $f_{\text{Notch}} = 1000 \text{ Hz}$
- $f_c = 449.6 \text{ Hz}$

Example 2

Filter setting = 9:

- $f_{\text{Notch}} = 50 \text{ Hz}$
- $f_c = 21.9 \text{ Hz}$

9.1.23.8.3 50/60 Hz IIR notch filter

The IIR notch filter is used for narrow-band suppression of interference caused by the mains frequency.

This is an 8th-order IIR notch filter implemented in the form of a cascade of 4 2nd-order IIR notch filters.

Information:

The IIR notch filter should only be enabled if there is actually interference being caused by the mains frequency. You should always check whether sufficiently low and sufficiently narrow band filtering at 50 Hz / 60 Hz can be implemented using a moving average filter (see "[Filter characteristics of the moving average filter](#)" on page 648).

This is because, like every higher-order IIR notch filter, this filter also has a tendency to respond to an input step with an attenuating vibration. The higher the dynamics of the expected measurement signal, the greater the potential interfering effect of this vibration tendency. In extreme cases, the vibration can temporarily be greater than the mains interference that is supposed to be filtered out.

9.1.23.8.3.1 Filter characteristics of the IIR notch filter

There are 3 different filter characteristics that can be selected for both 50 Hz and 60 Hz (-40 dB, -60 dB and -80 dB). The higher the attenuation, the narrower the stopband.

Example 1

Filter characteristics for the following settings:

- Gain = -40 dB
- Frequency = 50 Hz
- Passband = 5 Hz
- Stopband = ± 1 Hz

Example 2

Filter characteristics for the following settings:

- Gain = -80 dB
- Frequency = 50 Hz
- Passband = 5 Hz
- Stopband = ± 0.25 Hz

Example 3

Filter characteristics for the following settings:

- Gain = -60 dB
- Frequency = 60 Hz
- Passband = 5 Hz
- Stopband = ± 0.5 Hz

Step response of an 8th-order IIR notch filter, including the deviation in bits:

9.1.23.9 Hardware configuration

9.1.23.9.1 Hardware configuration for horizontal installation starting at 55°C ambient temperature

Operating a strain gauge module

Starting at an ambient temperature of 55°C, a dummy module must be connected to the left and right of the strain gauge module in a horizontal mounting orientation.

Operating multiple strain gauge modules side by side

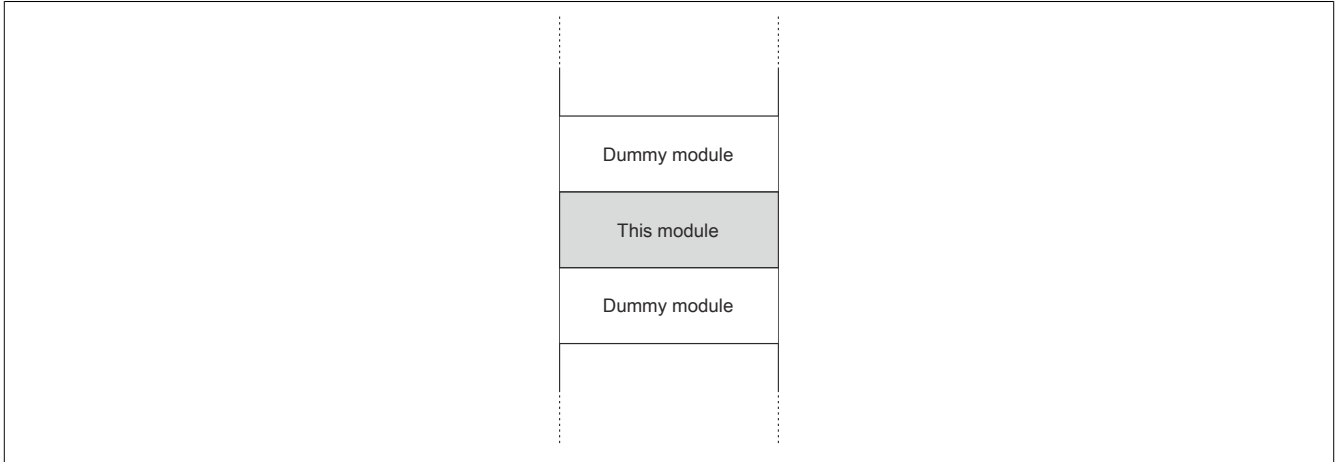

If 2 or more horizontal strain gauge modules are being operated in a cluster, the following arrangement of modules must be observed.

9.1.23.9.2 Hardware configuration for vertical installation starting at 45°C ambient temperature

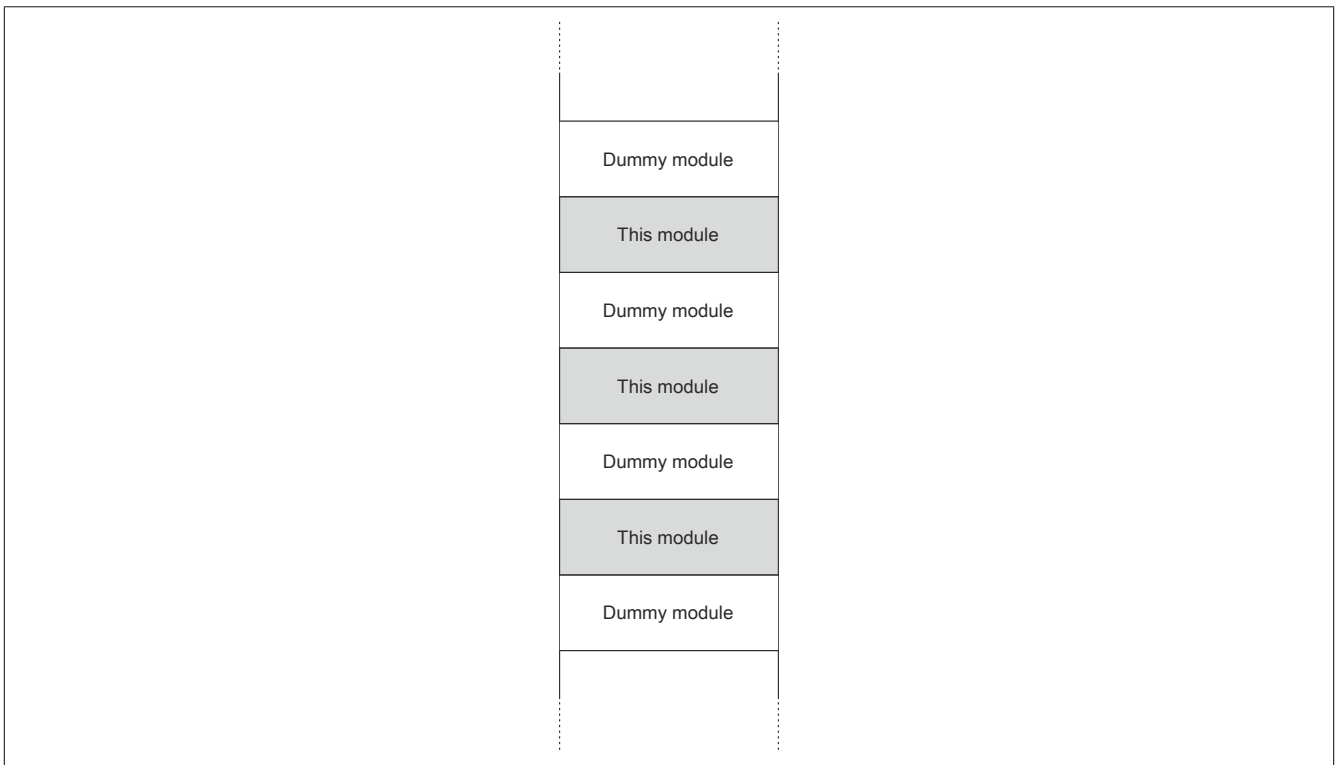

Operating a strain gauge module

Starting at an ambient temperature of 45°C, a dummy module must be connected to the left and right of the strain gauge module in a vertical mounting orientation.

Operating multiple strain gauge modules side by side

If 2 or more vertical strain gauge modules are being operated in a cluster, the following arrangement of modules must be observed.

9.1.23.10 Register description

9.1.23.10.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section ["General data points" on page 3790](#).

9.1.23.10.2 Function model 0 - Standard

1) The offset specifies the position of the register within the CAN object.

9.1.23.10.3.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see ["Using I/O modules on the bus controller" on page 3789](#).

9.1.23.10.3.2 CAN I/O bus controller

The module occupies 4 analog logical slots on CAN I/O.

9.1.23.10.4 Configuration

9.1.23.10.4.1 Configuration of strain gauge inputs

Name:

ControlPacked01 to ControlPacked04

The strain gauge inputs are configured in these registers:

- Strain gauge factor of strain gauge load cell
- Enabling of filters

| Data type | Values |
|-----------|------------------------|
| UINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information | |
|---------|-----------------------|-------------------------------------|---|-------------------------|
| 0 - 2 | Strain gauge factor | 000 | Default: 256 mV/V | |
| | | 001 | 128 mV/V | |
| | | 010 | 64 mV/V | |
| | | 011 | 32 mV/V | |
| | | 100 | 16 mV/V | |
| | | 101 | 8 mV/V | |
| | | 110 | 4 mV/V | |
| | | 111 | 2 mV/V | |
| 3 - 7 | Moving average | | Averaging | 1. Notch frequency [Hz] |
| | | 00000 | Default: Moving average disabled (bypass) | |
| | | 00001 | 2 | 2500 |
| | | 00010 | 4 | 1250 |
| | | 00011 | 5 | 1000 |
| | | 00100 | 10 | 500 |
| | | 00101 | 20 | 250 |
| | | 00110 | 25 | 200 |
| | | 00111 | 50 | 100 |

| | | 01111 | 500 | 10 |
| 10000 | 1000 | 5 | | |
| | 10001 to 11111 | Reserved (firmware limited to 1000) | | |
| 8 | Notch filter | 0 | Default: IIR notch filter disabled (bypass) | |
| | | 1 | IIR notch filter enabled | |
| 9 | Reserved | 0 | | |
| 10 - 11 | Low-pass filter mode | 00 | IIR low-pass filter disabled (bypass) | |
| | | 01 | 1st-order IIR low-pass filter (see "IIR low-pass filter" on page 645) | |
| | | 10 - 11 | Reserved: No IIR low-pass filter active | |
| | | | Filter level | -3 db frequency [Hz] |
| 12 - 14 | Low-pass filter level | 000 | 1 | 575 |
| | | 001 | 2 | 230 |
| | | 010 | 3 | 106 |
| | | 011 | 4 | 51 |
| | | 100 | 5 | 25 |
| | | 101 | 6 | 12.5 |
| | | 110 | 7 | 6.2 |
| | | 111 | 8 | 3.1 |
| 15 | Reserved | 0 | | |

9.1.23.10.4.2 Channel configuration

Name:

ConfigChannel01 to ConfigChannel04

The IIR notch filter is configured individually for each channel in these registers.

| Data type | Values | Bus controller default setting |
|-----------|------------------------|--------------------------------|
| UINT | See the bit structure. | 0 |

Bit structure:

| Bit | Description | Value | Information |
|---------|--------------------------|-------|--|
| 0 - 11 | Reserved | 0 | |
| 12 - 13 | Notch filter attenuation | 00 | Gain: -40 dB Pass: ± 5 Hz Stop: ± 1 Hz (Bus controller default setting) |
| | | 01 | Gain: -60 dB Pass: ± 5 Hz Stop: ± 0.5 Hz |
| | | 10 | Gain: -80 dB Pass: ± 5 Hz Stop: ± 0.25 Hz |
| | | 11 | Reserved |
| 14 | Notch filter frequency | 0 | With 50 Hz (bus controller default setting) |
| | | 1 | At 60 Hz |
| 15 | Reserved | 0 | |

9.1.23.10.5 Communication

9.1.23.10.5.1 Analog input values

Name:

AnalogInput01 to AnalogInput04

The analog input value is mapped in this register.

| Data type | Value | Input signal: |
|-----------|-------------------------|---|
| DINT | -8,388,608 | Negative invalid value |
| | -8,388,607 | Negative full-scale deflection / Underflow |
| | -8,388,606 to 8,388,606 | Valid range |
| | 8,388,607 | Positive full-scale deflection / Overflow / Open line |

9.1.23.10.5.2 Module status

Name:

StatusPacked01 to StatusPacked04

These registers contain the current state of the module.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|-----------------------------|-------|--|
| 0 | I/O power supply | 0 | No error |
| | | 1 | Error in power supply |
| 1 | Bypass current | 0 | No error |
| | | 1 | Overcurrent (sum from all sensors) |
| 2 - 3 | Reserved | 0 | |
| 4 | A/D converter configuration | 0 | Already configured |
| | | 1 | Not yet configured |
| 5 | Analog values | 0 | Analog value valid |
| | | 1 | Analog value invalid (analog value = -8,388,608 = 0xFF800000). Possible causes: <ul style="list-style-type: none"> Internal transfer error (XOR checksum verification) Error in strain gauge supply (bit 1) Error in I/O voltage supply (bit 0) A/D converter not (yet) configured |
| 6 | Analog value range overrun | 0 | Analog value valid |
| | | 1 | Analog value invalid. Possible causes: <ul style="list-style-type: none"> Overflow / Open circuit (analog value = 8,388,607 = 0x007FFFFFFF) Underflow (analog value = -8,388,607 = 0xFF800001) |
| 7 | Moving average filter | 0 | Moving average filter engaged |
| | | 1 | Moving average filter not engaged Possible causes: <ul style="list-style-type: none"> After changing the filter length Consequence of the filter being reset by another error |

9.1.23.10.5.3 A/D conversion counter

Name:

AdcConvCtr01

Instead of being measured simultaneously, the strain gauge channels of the module are measured according to the multiplexing procedure. The "[AdcConvTimestamp01](#)" on page 659 register contains the timestamp of the encoded last channel converted in the "AdcConvCtr01" register. The timestamp of the other channels can then be calculated later using this information.

| Data type | Value |
|-----------|--------------------|
| SINT | See bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|-------------------------------------|-------|---|
| 0 - 1 | Index of the last converted channel | 0 | Analog input 1 |
| | | 1 | Analog input 2 |
| | | 2 | Analog input 3 |
| | | 3 | Analog input 4 |
| 2 - 7 | Rotating cycle counter | x | Incremented at the end of a conversion cycle. All channels are converted in a conversion cycle. |

9.1.23.10.5.4 A/D conversion timestamp

Name:

AdcConvTimestamp01

The timestamp of the last converted channel is stored in this register (see bits 0 and 1 in the "AdcConvCtr01" on page 658 register). This is always the point in time (in μs) at which the conversion of the latest A/D converter raw value is completed.

| Data type | Value | Function |
|-----------|---------------------------|--|
| DINT | -2147483648 to 2147483647 | Timestamp (in μs) of the last converted channel (see bits 0 and 1 in the A/D conversion counter) |

The timestamp of the remaining channels can be determined in the application using the number and timestamp of the last converted channel according to the following table.

| Channel | Age difference |
|---------|------------------|
| 4 - 3 | 47 μs |
| 3 - 2 | 47 μs |
| 2 - 1 | 47 μs |
| 1 - 4 | 59 μs |

Example:

- Latest channel (bit 0 - 1 in the AdcConvCtr01 register) = 01 (analog input 2):
- Timestamp: "AdcConvTimestamp01" register = 0 μs

| Channel | Timestamp |
|---------|--------------------------------|
| 2 | 0 μs |
| 1 | -47 μs |
| 4 | -47-59 = -106 μs |
| 3 | -47-59-47 = -153 μs |

9.1.23.10.6 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time |
|--------------------|
| 200 μs |

9.1.23.10.7 Minimum I/O update time

The minimum I/O update time specifies how far the bus cycle can be reduced so that an I/O update is performed in each cycle.

| Minimum I/O update time |
|-------------------------|
| 200 μs |

9.1.24 X20(c)AP31xx

Data sheet version: 2.55

9.1.24.1 General information

Power monitoring

These modules measure active, reactive and apparent power individually for each of the 3 phases as well as all of them collectively. The power consumption of each phase is also recorded individually and in total. In addition, the modules provide the RMS values for voltage and current on the 3 phases. When measuring the current, the value of the current through the neutral conductor can also be detected and monitored. Measurement of the mains frequency and the phase angle of the 3 phases (current and voltage) complete the power measurement data.

Energy management

The integrated functions on the modules map the immediate power requirements of the machine in detail as well as record its total power consumption. For the user, all relevant data is prepared and made available in the process image.

The ability to measure currents and voltages up to the 31st harmonic enables higher precision recording of RMS values than is generally possible. This allows the modules to easily cope with irregular sine curves and makes them well-suited to renewable energy applications. In these types of applications, for example, being able to accurately measure the frequency at a resolution of 0.01 Hz between 45 and 65 Hz is a great advantage. In general, the modules are suitable for use with 1-phase, 2-phase or 3-phase networks.

Characteristics

- Calculates RMS values from currents and voltages
- Calculates active, reactive and apparent power
- Phasing detection
- Measures individual phases and calculates cumulative values
- Optional measurement of current through the neutral conductor
- Calculates frequency and harmonics with high precision
- NetTime timestamp: Moment when measured value groups are read

NetTime timestamp of readout moments

For many applications, not only the measured value is important, but also the exact moment when a group of measured values is read out. The module is equipped with a NetTime timestamp function for this that supplies a timestamp for the recorded position and trigger time with microsecond accuracy.

The timestamp function is based on synchronized timers. If a timestamp event occurs, the module immediately saves the current NetTime. After the respective data is transferred to the CPU, including this precise moment, the CPU can then evaluate the data using its own NetTime (or system time), if necessary.

9.1.24.2 Coated modules

Coated modules are X20 modules with a protective coating for the electronics component. This coating protects X20c modules from condensation and corrosive gases.

The modules' electronics are fully compatible with the corresponding X20 modules.

For simplification purposes, only images and module IDs of uncoated modules are used in this data sheet.

The coating has been certified according to the following standards:

- Condensation: BMW GS 95011-4, 2x 1 cycle
- Corrosive gas: EN 60068-2-60, method 4, exposure 21 days

9.1.24.5 LED status indicators

For a description of the various operating modes, see "Diagnostic LEDs" on page 3787.

| Figure | LED | Color | Status | Description |
|---|-----------------------------|--------------|--|--|
|  | Operating state | | | |
| | r | Green | Off | No power to module |
| | | | Single flash | UNLINK mode |
| | | | Double flash | BOOT mode (during firmware update) ¹⁾ |
| | | | Blinking quickly | SYNC mode |
| | | | Blinking slowly | PREOPERATIONAL mode |
| | | | On | RUN mode |
| | Module status | | | |
| | e | Red | Off | No power to module or everything OK |
| | | | On | Error or reset status |
| | Analog input voltage | | | |
| | U1 - U3 | Green/Yellow | Off | Display disabled or $U_{Eff} < \text{threshold value}$ "Failure" |
| | | | Blinking | Phase sequence is correct and $U_{Eff} < \text{threshold value}$ "Warning" |
| | | Green | On | Phase sequence is correct and $U_{Eff} > \text{threshold value}$ "Warning" |
| | | | Blinking | Phase sequence is incorrect and $U_{Eff} < \text{threshold value}$ "Warning" |
| | | | On | Phase sequence is incorrect and $U_{Eff} > \text{threshold value}$ "Warning" |
| | Yellow | Blinking | Phase sequence is incorrect and $U_{Eff} < \text{threshold value}$ "Warning" | |
| | | On | Phase sequence is incorrect and $U_{Eff} > \text{threshold value}$ "Warning" | |
| | Analog input current | | | |
| | I1 - I3 | Green/Yellow | Off | Display disabled or $I_{Eff} < \text{threshold value}$ "Display" |
| On | | | Active power positive | |
| Yellow | | On | Active power negative | |
| Analog input neutral current | | | | |
| IN | | Off | Neutral current < Threshold value | |
| | Green | On | Neutral current > Threshold value "Failure", within the tolerance of the calculated total current | |
| | Red | On | Neutral current > Threshold value "Failure", outside the tolerance of the calculated total current | |

1) Depending on the configuration, a firmware update can take up to several minutes.

9.1.24.6 Pinout

X20AP31x1

X20AP31x2

Danger!

Risk of electric shock!

The terminal block is only permitted to conduct voltage when it is connected. It is not permitted to be disconnected or connected while voltage is applied or have voltage applied to it while it is removed under any circumstances.

This module is not permitted to be the last module connected on the X2X Link network. At least one subsequent X20ZF dummy module must provide protection against contact.

Shielding

Shielded cables must be used for the current channels of module X20AP3171 in order to maintain the specified accuracy. Cabling can either take place using one cable per channel or a multiple twisted pair cable for multiple channels.

Information:

Shielded cables must be grounded on both sides.

9.1.24.6.1 Connecting current transformers

In order to be able to properly calculate values, it is important for the current transformer phases to be connected correctly (i.e. direction of the current flow).

- Output on the transformer (S1) to the respective ILxa input on the module.
- Input on the transformer (S2) to the respective ILxb output on the module.

9.1.24.7 Safety guidelines

General

Information:

If the maximum voltage value of 655 V is displayed, it is necessary to check whether the input measurement range has been exceeded.

Caution!

The insulation for all current inputs must be double or reinforced.

X20AP31x2

X20AP31x2 modules with current transformers that are groundable meet the requirement from the median voltage guideline that states that a current transformer connection must always be grounded in systems that exceed a certain system voltage.

Caution!

Only a connection labeled "ILxb" is permitted to be grounded.

Caution!

The use of modules with current transformers that groundable is only permitted in systems with grounded median voltage. Operating these modules without connected grounding is not permitted.

Information:

Because these modules do not feature a neutral conductor connection, the ground potential on the current transformer connections forms the central reference point. (See ["Input circuit diagram" on page 673.](#))

Danger!

In the event of a fault (e.g. a break in insulation), further insulating measures have to be taken in addition to the basic insulation between voltage and current inputs on the module.

To avoid electric shocks, the wiring to the module must have adequate insulation. The dielectric strength of the cable insulation **MUST** be designed for the level of phase-to-phase nominal voltage.

9.1.24.8 Current transformers

Since the current inputs are not floating, a current transformer is required for each current channel used. The current transformer is a transducer that delivers a secondary signal proportional to the primary current. This secondary signal is measured by the module. The maximum directly configurable primary current is 65 A. Values greater than 65 A can also be measured by implementing a conversion in the software application (see explanation and example provided below).

The maximum secondary signal depends on the module:

| Module | Secondary current/voltage |
|-----------|-----------------------------|
| X20AP3111 | 20 mA |
| X20AP3121 | 1 A |
| X20AP3122 | 1 A |
| X20AP3131 | 5 A |
| X20AP3132 | 5 A |
| X20AP3161 | 333 mV |
| X20AP3171 | Configurable, maximum 52 mV |

The rated transformation ratio is calculated using the following formula:

| | |
|--|--|
| X20AP3111 - X20AP3121 - X20AP3131 - X20AP3122 - X20AP3132 | Rated transformation ratio $K_n = \frac{\text{Primary nominal current}}{\text{Secondary nominal current}}$ |
| X20AP3161 | No transformation; the maximum primary current corresponds to the 333 mV. |
| X20AP3171 | Direct input of $\mu\text{V/A}$ |

A smaller transformation ratio should be defined for measuring higher primary currents. The values calculated by the module must be converted in the application according to the real rated transformation ratio that must be defined.

Examples

Information:

The same factor must be used for all power ratings and energy values when making the conversion.

All AP modules except for AP3171

Currents of up to 100 A flow on the primary side. A current transformer with a rated transformation ratio of 100 to 1 A or a measurement range of 100 A is used. A rated transformation ratio of 50 to 1 A or a measurement range of 50 A is defined in the module to match the current transformer. If the primary current calculated by the module is 40 A, then the actual value will be calculated as follows:

$$\text{Actual primary current} = 40 \text{ A} * 100 / 50 = 80 \text{ A}$$

$$\text{Actual resolution} = 1 \text{ mA} * 100 / 50 = 2 \text{ mA}$$

X20AP3171

Because the primary current can be up to 300 A, a Rogowski coil with a primary current range of up to 500 A is used. This exhibits a transformation ratio of 500 $\mu\text{V/A}$. Suitable for this, a transformation ratio of 5000 $\mu\text{V/A}$ is set in the module.

The module returns a value of 8155 mA.

$$\text{Actual primary current} = 5000 \mu\text{V/A} / 500 \mu\text{V/A} * 8.155 \text{ A} = 81.55 \text{ A}$$

$$\text{Actual resolution} = 1 \text{ mA} * 5000 \mu\text{V/A} / 500 \mu\text{V/A} = 10 \text{ mA}$$

Caution!

To avoid damage to the module, ensure that the current inputs are floating. A current transformer must therefore be connected to each current input used.

Any other devices connected to this secondary circuit must be galvanically isolated.

X20AP31x1:

The current inputs on the module are not galvanically isolated, so the secondary circuit between the transformer and the module is not permitted to be grounded. Grounding or making other conductive connections between the transformers distorts the measurement and results in current values that are too low!

X20AP31x2:

Because the "ILxb" connections on the current inputs are all on the same electric potential, all the transformers on the "Lxb" side groundable for these modules.

9.1.24.9 Voltage transformer

Voltage transformers are not provided in the configuration by default (e.g. by setting the transformation ratio).

However, voltage transformers can be used if higher voltages need to be measured than are specified under nominal voltages in the technical data.

In addition, as with current value correction, the rated transformation between primary and secondary current must be calculated and applied (see "[Current transformers](#)" on page 671)

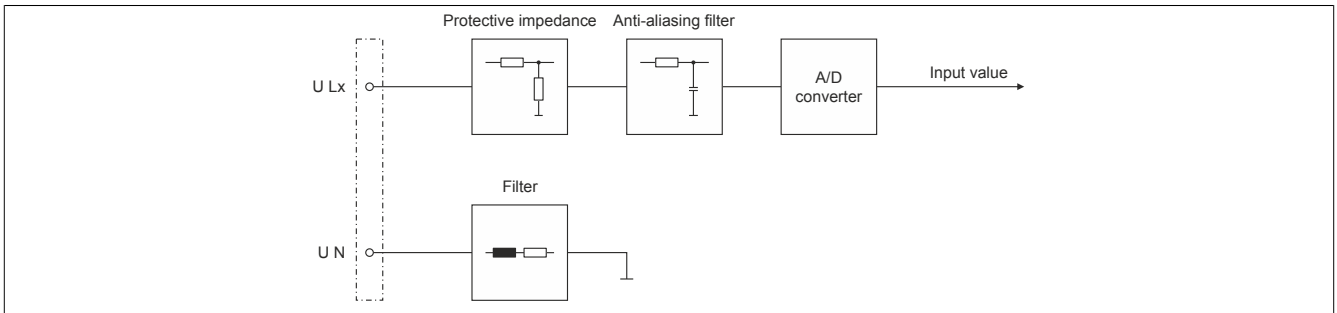

Information:

The same factor must be used for all voltage values, power ratings and energy values when making the transformation.

9.1.24.11 Typical connection examples for different network configurations

General information

There are many different network configurations around the world. This section will present a few typical connection examples.

Notice!

The X20AP31x2 modules may not be used with network configurations B, D and F due to a lack of grounding.

Connection example 1 - Network A

This example involves a 3-element, 3-phase, 4-line star measurement with grounded neutral conductor and optional fault current detection.

Connection example 2 - Network B

This example involves a 3-element, 3-phase, 3-line star measurement.

Connection example 3 - Network C

This example involves a 3-element, 3-phase, 3-line star measurement with grounded neutral conductor and optional fault current detection.

Connection example 4 - Network D

This example involves a 3-element, 3-phase, 4-line star measurement with optional fault current detection.

Connection example 5 - Network E

This example involves a 2-element, 2-phase, 3-line star measurement with grounded neutral conductor.

Connection example 6 - Network F

This example involves a 3-element, 3-phase, 3-line delta measurement.

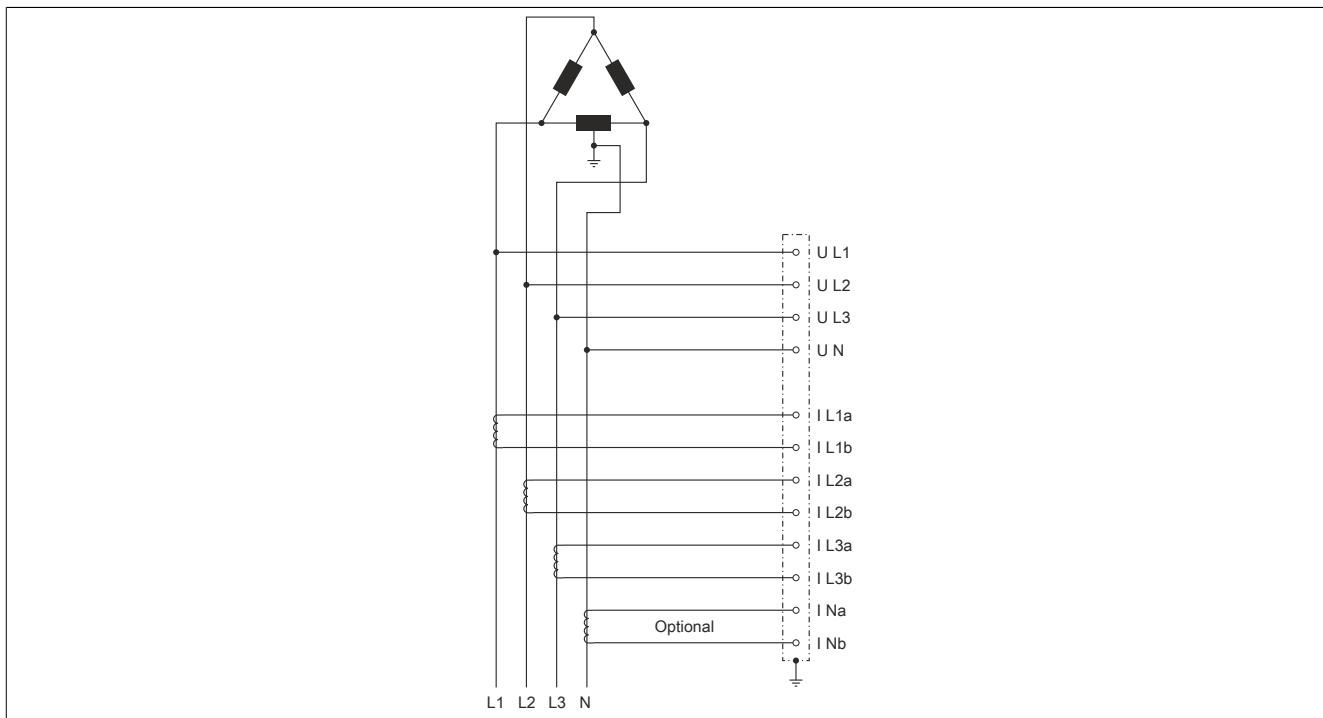

Connection example 7 - Network G

This example involves a 3-element, 3-phase, 4-line, delta measurement with grounded star point.

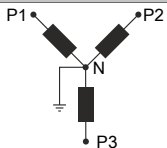

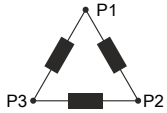

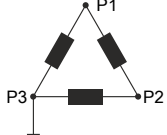

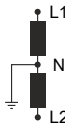

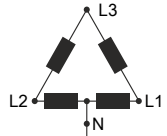

Information:

Exceeding the maximum voltage value specified in the data sheet is not permitted!

9.1.24.12 Permitted line-to-line nominal voltages (rated voltages)

The following table provides an overview of the maximum permitted line-to-line nominal voltage (rated voltage) depending on the used mains type and module.

| Network configuration | Network type | Modules | Permissible rated voltage | |
|-----------------------|---|---|---------------------------|-------|
| 1 | 3 phases 4 lines Grounded neutral conductor |  | All AP modules | 480 V |
| 2 | 3 phases 3 lines Not grounded |  | X20AP31x1 | 480 V |
| | | X20AP31x2 | Not permitted | |
| 3 | 3 phases 4 lines Grounded phase |  | X20AP31x1 | 480 V |
| | | X20AP21x2 | Not permitted | |
| 4 | 1 phase 2 lines Not grounded |  | X20AP31x1 | 480 V |
| | | X20AP31x2 | Not permitted | |
| 5 | 1 phase divided 3 lines Grounded neutral conductor |  | All AP modules | 480 V |
| 6 | 3 phases 4 lines Divided phase and grounded neutral conductor |  | All AP modules | 240 V |

9.1.24.13 Derating

X20AP(c)3121, X20AP3131:

At high temperatures, the averaged measurement current is not permitted to exceed the percentage values of the diagram.

100% corresponds to 3x the nominal current of a channel. Averaging the measurement current is done in a time period of 10 minutes.

The derating listed below must be applied for the current:

9.1.24.14 UL certificate information

To install the module(s) according to the UL standard, the following rules must be observed.

Information:

- Use copper conductors only. Minimum temperature rating of the cable to be connected to the field wiring terminals: 76°C, xxx - xxx AWG.
- All models are intended to be used in a final safety enclosure that must conform with requirements for protection against the spread of fire and have adequate rigidity per UL 61010-1 and UL 61010-2-201.
- Repairs can only be made by B&R.

Information:

- For use with listed energy-monitoring current transformers only.
- The current transformers are not permitted to be installed in equipment where they exceed 75 percent of the wiring space of any cross-sectional area within the equipment
- Restrict installation of current transformer in an area where it would block ventilation openings.
- Restrict installation of current transformer in an area of breaker arc venting.
- Not suitable for Class 2 wiring methods.
- Not intended for connection to Class 2 equipment.
- Secure current transformer and route conductors so that they do not directly contact live terminals or bus.
- For use with listed energy-monitoring current transformers.
- Associated leads of the current transformers must be maintained within the same overall enclosure.
- Unless the current transformers and its leads have been evaluated for REINFORCED INSULATION, a statement to segregate or insulate the leads from different circuits must be provided.
- The current transformers are intended for installation within the same enclosure as the equipment. These are not permitted to be installed within switchgear and panel boards.

Danger!

- To reduce the risk of electric shock, always open or disconnect circuit from the power distribution system (or service) of the building before installing or servicing current-sensing transformers.

9.1.24.15 Register description

9.1.24.15.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section "General data points" on page 3790.

9.1.24.15.2 Function model 0 - Standard

| Register | Name | Data type | Read | | Write | |

1) The offset specifies the position of the register within the CAN object.

9.1.24.15.3.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see ["Using I/O modules on the bus controller" on page 3789](#).

9.1.24.15.3.2 CAN I/O bus controller

The module occupies 3 analog logical slots with CAN I/O.

9.1.24.15.4 General information

The modules are used for power monitoring and for a machine's energy management. Examples of where this would be used:

- Multi-phase energy measurement for class 0.5S or class 1 for
 - 3-phase, 4-line applications with neutral conductor (with/without grounding)
 - 3-phase, 3-line applications (with/without grounding)
 - 2-phase networks with grounded phase B connection
- Single-phase measurement by disabling inputs that are not needed
- Mains analysis according to harmonic content
- Signal trace by 8 kHz recording of the 3 voltage channels and 4 current channels with FIFO

9.1.24.15.4.1 Measured value preparation

The modules provide the following possibilities for measured value preparation:

- Temperature coefficient of internal reference of 6 ppm/°C
- Energy registers for active, reactive and apparent energy, separated for forward and backward, fundamental waves and harmonics
- Threshold register for status signal generation and activation of power and energy measurement
- Determining the THD harmonic component
- Discrete Fourier Transformation (DFT) up to 31st harmonic component per phase for voltage and current
- Status signals for voltage dip, loss of voltage, phase sequence, energy flow, neutral current monitor, harmonic component monitor

9.1.24.15.4.2 Additional information

| Information | Description |
|-----------------------------|--|
| Measurement range limiting | Due to the majority of registers consisting of 16-bit values (exception: energy registers, which are interpolated to 32-bit by the firmware), the measurement ranges are subject to limitations, e.g. voltage 650.00 Vrms and current 65.000 Arms (after accounting for the transfer factor of the current transformer). |
| Extended measurement ranges | Extended measurement ranges can be achieved with the software application by upscaling the measured values. |
| Frozen values | Sample time register: If the group of measured values is read from the power meter, it is assigned a NetTime . Using this NetTime, a freezing of the values can be determined. |
| Environment variables | The values for duty cycle, boot counter, and minimum / maximum transformer temperature are recorded. |

9.1.24.15.4.3 Measurement function

The values measured for RMS, power, active power factor, phase angle and frequency are mean values over 16 full waves, the update rate is ~3 Hz.

The following represents the measurement time over 16 full waves at the corresponding frequency:

50 Hz → 320 ms

60 Hz → 267 ms

Energy measurement

The power measurement (energy measurement) is based on the integration of the measured values with a sampling rate of 1 MHz.

The gathered energy values are provided according to the set unit (1 Ws, 10 Ws, etc.) in the energy registers.

Automatic reading of the energy meter from the transformer must be enabled because valid values are only available after the transformer has been configured. It is possible to clear the energy registers or to configure them with a block of the register written in the software application.

Information:

When 1 Wh and 1 kWh are set, the energy pulses on the register "StatusInput" on page 697 may not be used.

Power measurement

The phase power ratings are calculated by the module and stored in the corresponding registers.

The total power ratings are equal to the sum of the phase power ratings. To prevent the number range from being exceeded, the value in the registers is equal to a fourth of the actual power. This value must be multiplied by 4 by the application.

The vector-based total apparent power (complex total apparent power) is calculated according to IEEE1459.

Power factor

The phase power factor is calculated by dividing the phase active power by the phase apparent power.

The total power factor is calculated by dividing the total active power by the total apparent power.

Neutral current

The neutral current can be measured or calculated. Both values are available.

The user can configure which one to use for displaying the status.

Phase angle

The phase angle is calculated based on the zero-crossing detection.

Frequency

Frequency measurement is based on Phase A. If A fails, then Phase C is used. If both A and C fail, then Phase B is used.

Temperature

The Chip-Junction temperature is measured approximately every 100 ms using the sensor integrated in the transformer.

THD+N - Sum of interference power of the harmonic (THD) + interference power of the noise (N)

The THD+N measurement is used to monitor the percentage of harmonics in the network.

If this percentage falls below 10%, then an accuracy of 0.01% can no longer be guaranteed.

This is calculated as follows: $(\text{SQR}(\text{RMS value}_{\text{Total}}^2 - \text{RMS value}_{\text{FundamentalWave}}^2)) / \text{RMS value}_{\text{FundamentalWave}}$

Fourier analysis

The harmonic component from the 2nd to the 31st harmonic is calculated for voltage and current and the THD (Total Harmonic Distortion) of each phase.

The DFT period (DFT = discrete Fourier Transformation) is 0.5 s. This corresponds to a resolution of 2 Hz. The input samples are recorded at a sampling rate of 8 kHz and can be optionally multiplied with a "Hann window" before being evaluated. This is initiated when requested by the application.

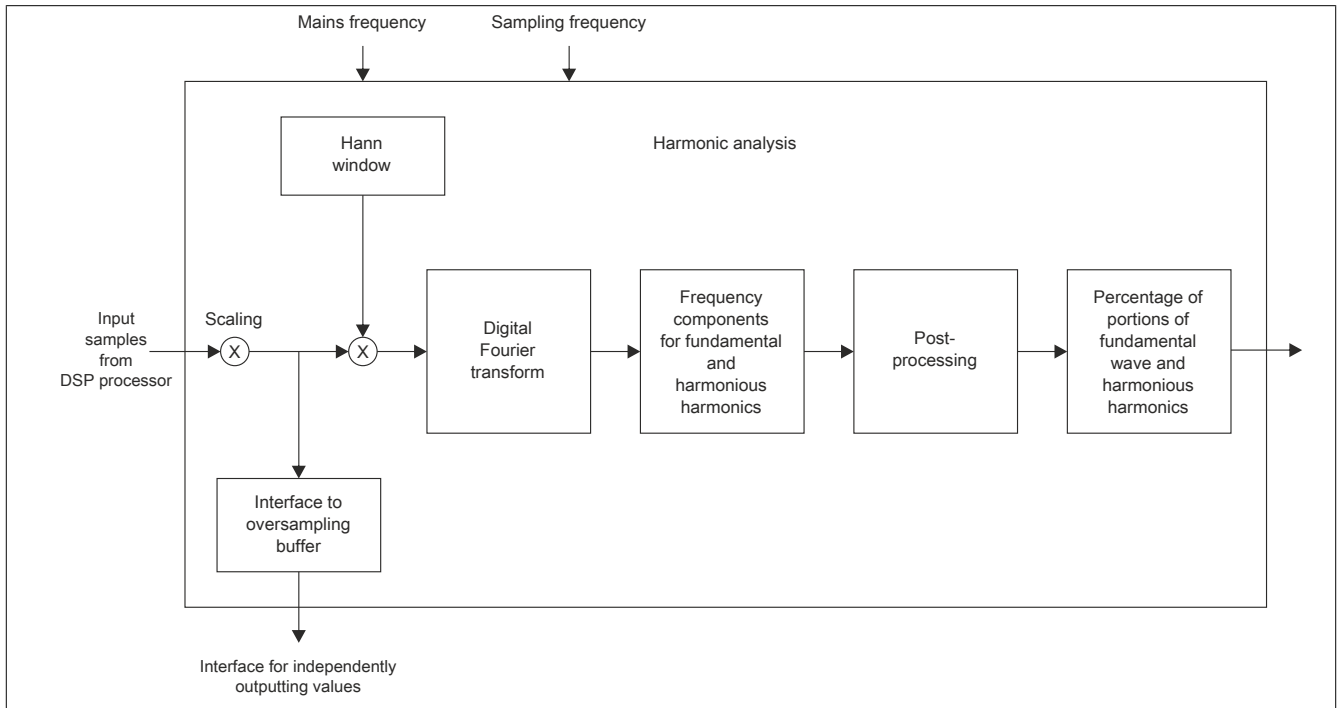

Figure 80: Diagram of Fourier analysis

9.1.24.15.4.4 Event generation

Zero-crossing detection

Zero-crossing detection can be configured for each phase for current or voltage and edge and forms the basis for frequency and angle measurements and subsequently also for active and reactive power calculations.

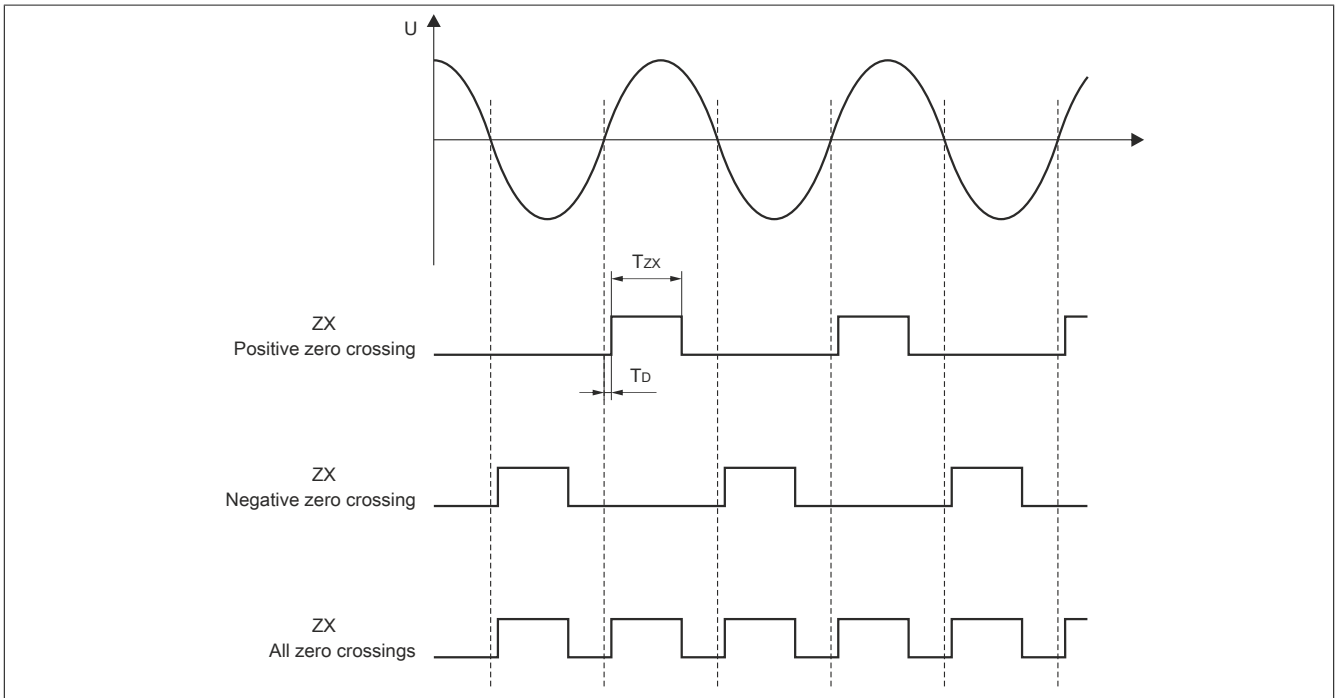

Figure 81: Timing diagram of zero-crossing detection per phase

| Symbol | Description | Minimum | Typical | Maximum | Unit |
|----------|-----------------------|---------|---------|---------|------|
| T_{ZX} | Length of high signal | | 5 | | ms |
| T_D | Delay time | | 0.2 | 0.5 | ms |

Voltage dip or power failure detection

| Event | Description |
|---------------|---|
| Voltage dip | The threshold for the voltage dip is typically set to 78% of the standard voltage (approx. 170 Vrms). The status flag is set if more than 3 8 kHz samples are below the threshold within 2 consecutive 11 ms windows. |
| Power failure | The threshold for the voltage dip is typically set to 10% of the standard voltage (approx. 22 Vrms). The status flag is set if more than three 8 kHz samples are below the threshold within 2 consecutive 11 ms windows. If a power failure is detected, zero crossing detection for voltage and current is disabled for this phase. |

Figure 82: Timing diagram for detection of a voltage dip or power failure

Neutral current monitoring

Neutral current monitoring of the measured and the calculated value is done with separate threshold value registers and status flags.

Phase sequence monitoring

3 phase and 2 phase applications are handled differently:

| Application | Description |
|-------------|--|
| 3 phases | Zero cross-overs of voltage and current must follow the sequence Phase A before Phase B before Phase C |
| 2 phases | Zero cross-overs of voltage and current must follow the sequence Phase A at least 180° before Phase C |

9.1.24.15.4.5 Configuration registers

The configuration and calibration registers are each composed of blocks and employ a checksum feature to highlight undesired changes. In order to apply this register to the transformer, the respective transfer register must be changed after the data is transferred to the module (incrementing, bit toggling, etc.). The start value of the transfer register is 0 after startup.

9.1.24.15.4.6 Oversampling

The input values are measured with a configurable sampling cycle time and saved in the internal physical data buffer with **timestamp**. This data area can now be read out by means of configurable data length in cyclic data transfer.

The recording and transfer system of logical channels is identical to that of the physical channels. The functions of the logical channels are also executed in the configured sampling cycle time and saved in the logical data buffer with timestamp. From here, the values can also be read out via configurable cyclic data points.

With fast cycle times, however, it can happen that the set sampling cycle time is not sufficient for the sum of all physical and logical functions. If the physical sampling should remain unaffected, logical processing can be slowed down via a prescaler setting.

Information:

Due to the free configurability of the sampling cycle time on the module, there is no synchronicity to the X2X Link network, regardless of configuration as standard inputs or with the oversampling function.

If synchronicity is desired or required, then the configured sampling cycle time must be a multiple of the X2X Link cycle time!

9.1.24.15.5 Interface for transferring process variable mapping

Due to the amount of potential cyclic input data and the limitation to 30 byte cyclic X2X data, the extended Flat-stream Interface (DPS = Data Point Stream) has been defined as the mechanism for transferring the process variables. DPS is based on the Flat Streaming Interface for serial interface modules. The Flat Streaming Interface was expanded to include the block number as the first byte of the user data frame and implements the termination of a frame (data image of the channel) with a zero segment.

The data blocks are re-transferred if a read request is triggered after a transfer has been completed. A block number can be sent via the DPS to set a different block or transfer the entire image (default: block number 0).

It should be possible to adapt the DPS interface to the available buffer size. However, the higher-level fieldbus must be taken into account when doing so (e.g. CAN 8 byte object, InputMTU size 7). The block number is added to the front of the actual payload data as a means to differentiate the blocks.

```
#define ADC_BLK_ALL          0    // struct ADC_REG
#define ADC_BLK_STATUS      1    // long NetTimeReg + struct ADC_REG_STATUS
#define ADC_BLK_RMS         2    // struct ADC_REG_RMS
#define ADC_BLK_POWER       3    // struct ADC_REG_POWER
#define ADC_BLK_THD_ANGLE   4    // struct THD_ANGLE
#define ADC_BLK_ENERGY      5    // long NetTimeEnergy + struct ADC_REG_ENERGY
#define ADC_BLK_DFT         6    // long NetTimeDft + struct ADC_REG_DFT
#define ADC_BLK_CFGACT      7    // struct ADC_REG_CFGACT
#define ADC_BLK_ENVREG      8    // struct ENV_STATUS
```

Information:

- **Consistency of the data is only provided for the individual variables because the data is transferred from the A/D converter asynchronously to the conversion.**
- **Make sure that the byte sequence of the register is in accordance with the Little Endian model (Intel format).**

The **NetTime** timestamps are always updated after the blocks have been generated when a new alternating buffer is provided.

9.1.24.15.5.1 Data block structures

ADC_REG

```
typedef struct ADC_REG      ADC_REG;
struct ADC_REG

9.1.24.15.6 Status register

9.1.24.15.6.1 Status signals and responses

Name:

StatusInput

The signals are recorded in 200 µs intervals. The energy pulse values in this register are not valid when 1 kWh and 1 Wh are set.

| Data type | Value |
|-----------|--------------------|
| UINT | See bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|---------|---|-------|---|
| 0 | Energy pulse total active energy | 0 | Energy increase too low |
| | | 1 | Energy threshold reached |
| 1 | Energy pulse total apparent energy Default: Arithmetic or vector sum (see register "MeteringMode" on page 724, bit 6) | 0 | Energy increase too low |
| | | 1 | Energy threshold reached |
| 2 | Energy pulse total active energy, fundamental wave | 0 | Energy increase too low |
| | | 1 | Energy threshold reached |
| 3 | Energy pulse total active energy, harmonics | 0 | Energy increase too low |
| | | 1 | Energy threshold reached |
| 4 | ZX1 zero cross signal (ZCS) – Phase A | 0 | Zero crossing not detected |
| | | 1 | Default: Pulse at rising edge of the zero cross signal of the voltage input, can be reconfigured via register "ZXConfig" on page 721 |
| 5 | ZX2 zero cross signal (ZCS) – Phase B | 0 | Zero crossing not detected |
| | | 1 | Default: Pulse at rising edge of the zero cross signal of the voltage input, can be reconfigured via register "ZXConfig" on page 721 |
| 6 | ZX3 zero cross signal (ZCS) – Phase C | 0 | Zero crossing not detected |
| | | 1 | Default: Pulse at rising edge of the zero cross signal of the voltage input, can be reconfigured via register "ZXConfig" on page 721 |
| 7 | Reserved | 0 | |
| 8 | DFT response sent | x | If the state in the register "ControlOutput" on page 698 corresponds with the response, then the action is complete |
| 9 | Energy value update response sent | 0 | No update |
| | | 1 | Update complete |
| 10 | Energy value response deleted | x | If the state in the register "ControlOutput" on page 698 corresponds with the response, then the action is complete |
| 11 | Energy value response set | x | If the state in the register "ControlOutput" on page 698 corresponds with the response, then the action is complete |
| 12 - 15 | Reserved | 0 | |

Energy measurement

The length of the energy pulses can vary according to the resulting output rate.

9.1.24.15.6.2 Control signals

Name:

ControlOutput

Control signals are evaluated in a $\sim 5 \text{ ms}$ interval.

| Data type | Value |
|-----------|--------------------|
| UINT | See bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|--------|----------------------------------|-------|---------------------------|
| 0 | DFT analysis | 0 | Don't start |
| | | 1 | Start ¹⁾ |
| 1 | Automatically read energy values | 0 | Do not automatically read |
| | | 1 | Automatically read |
| 2 | Clear energy values | 0 | Don't delete |
| | | 1 | Clear ¹⁾ |
| 3 | Set energy values | 0 | Don't start |
| | | 1 | Start ¹⁾ |
| 4 - 15 | Reserved | 0 | |

1) If the state in the register "ControlOutput" on page 698 corresponds with the response, then the action is complete.

9.1.24.15.6.3 Read timestamp for I/O register (+0x0022 = 16-bit)

Name:

SampleTime01_32bit

NetTime timestamp for the readout time of the status, effective value and power registers.

For more information about NetTime and timestamps, see "NetTime Technology" on page 3035.

| Data type | Value | Information |
|-----------|---------------------------------|------------------------------------|
| DINT | -2,147,483,647 to 2,147,483,647 | NetTime timestamp in μs |

9.1.24.15.6.4 A/D converter system status 1

Name:

SysStatus1

The register is read by the converter in a ~5 ms interval.

| Data type | Value |
|-----------|--------------------|
| UINT | See bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|-------|---|-------|--|
| 0 - 1 | Reserved | 0 | |
| 2 | SumStatusPhaseLoss Voltage of one or more phases < failure threshold in the register " PhaseLoseTh " on page 722 | 0 | Voltage within permitted range |

| | | 1 | Voltage less than the failure threshold |
| 3 | Reserved | 0 | |
| 4 | WarningPhaseC Voltage lower than warning threshold in the register " SagTh " on page 722 | 0 | Voltage within permitted range |
| | | 1 | Voltage less than the failure threshold |
| 5 | WarningPhaseB Voltage < warning threshold in the register " SagTh " on page 722 | 0 | Voltage within permitted range |
| | | 1 | Voltage less than the failure threshold |
| 6 | WarningPhaseA Voltage < warning threshold in the register " SagTh " on page 722 | 0 | Voltage within permitted range |
| | | 1 | Voltage less than the failure threshold |
| 7 - 15 | Reserved | 0 | |

9.1.24.15.6.8 Selection A/D converter system status 1

Name:

SystemStatusSel01

The most important bits of the "[SysStatus1](#)" on page 699 register are stored in this register.

| Data type | Value |
|-----------|--------------------|
| USINT | See bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|-------|---|-------|--|
| 0 - 1 | Reserved | 0 | |
| 2 | SumStatusPhaseLoss Voltage of one or more phases < failure threshold in the register " PhaseLoseTh " on page 722 | 0 | Voltage within permitted range |
| | | 1 | Voltage lower than the failure threshold |
| 3 | SumStatusPhaseWarning Voltage of one or more phases < warning threshold in the register " SagTh " on page 722 | 0 | Voltage within permitted range |
| | | 1 | Voltage lower than the warning threshold |
| 4 - 5 | Reserved | 0 | |
| 6 | ErrOrderPhasecurrent Error in the order of phase currents | 0 | No error |
| | | 1 | Errors |
| 7 | ErrOrderPhaseVoltage Error in the order of phase voltages | 0 | No error |
| | | 1 | Errors |

9.1.24.15.6.9 Selection A/D converter system status 2

Name:

SystemStatusSel02

The most important bits of the "SysStatus2" on page 700 register are stored in this register.

| Data type | Value |
|-----------|--------------------|
| USINT | See bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|-------|---|-------|--|
| 0 - 1 | Reserved | 0 | |
| 2 | SumStatusWarningTHDCurrent THDIx value of one or more phases > warning threshold in register "THDNITh" on page 722 | 0 | THDIx value within permitted range |
| | | 1 | THDIx value higher than warning threshold |
| 3 | SumStatusWarningTHDVoltage THDUx value of one or more phases > warning threshold in register "THDNUTh" on page 722 | 0 | THDUx value within permitted range |
| | | 1 | THDUx value higher than warning threshold |
| 4 - 5 | Reserved | 0 | |
| 6 | ErrIrmsNCalc The calculated value of the neutral line > warning threshold in the register "INWarnTh0" on page 722 | 0 | Calculated value within permitted range |
| | | 1 | Calculated value higher than warning threshold |
| 7 | ErrIrmsNMeas Measured value of the neutral line > warning threshold in the register "INWarnTh1" on page 722 | 0 | Measured value within permitted range |
| | | 1 | Measured value higher than warning threshold |

9.1.24.15.6.10 Phase status

Name:

PhaseStatus

This register corresponds to the "SysStatus4" on page 701 register. It contains the status of the 3 phases A, B and C.

| Data type | Value |
|-----------|--------------------|
| UINT | See bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|--------|---|-------|--------------------------------------|
| 0 | LossPhaseC Voltage < failure threshold in the register "PhaseLoseTh" on page 722 | 0 | Voltage within permitted range |
| | | 1 | Voltage lower than failure threshold |
| 1 | LossPhaseB Voltage < failure threshold in the register "PhaseLoseTh" on page 722 | 0 | Voltage within permitted range |
| | | 1 | Voltage lower than failure threshold |
| 2 | LossPhaseA Voltage < failure threshold in the register "PhaseLoseTh" on page 722 | 0 | Voltage within permitted range |
| | | 1 | Voltage lower than failure threshold |
| 3 | Reserved | 0 | |
| 4 | WarningPhaseC Voltage < warning threshold in the register "SagTh" on page 722 | 0 | Voltage within permitted range |
| | | 1 | Voltage lower than failure threshold |
| 5 | WarningPhaseB Voltage < warning threshold in the register "SagTh" on page 722 | 0 | Voltage within permitted range |
| | | 1 | Voltage lower than failure threshold |
| 6 | WarningPhaseA Voltage < warning threshold in the register "SagTh" on page 722 | 0 | Voltage within permitted range |
| | | 1 | Voltage lower than failure threshold |
| 7 - 15 | Reserved | 0 | |

9.1.24.15.7 Analog RMS value registers**9.1.24.15.7.1 Current RMS value neutral line measured**

Name:

IrmsN

Measured value of the neutral current between the P and N connections on the current terminal, multiplied with the transfer factor of the transformer.

| Data type | Value | Information |
|-----------|------------|---------------------------|
| UINT | 0 to 65535 | Measured value 0.001 Arms |

9.1.24.15.7.2 Voltage RMS value phase A/B/C

Name:

UrmsA

UrmsB

UrmsC

Measured value for N-terminal or virtual zero point.

| Data type | Value | Information |
|-----------|------------|--------------------------|
| UINT | 0 to 65535 | Measured value 0.01 Vrms |

9.1.24.15.7.3 Current RMS value neutral line calculated

Name:

IrmsNcalc

Calculated value of neutral current derived from the other 3 phases.

| Data type | Value | Information |
|-----------|------------|---------------------------|
| UINT | 0 to 65535 | Measured value 0.001 Arms |

9.1.24.15.7.4 Current RMS value phase A/B/C

Name:

IrmsA

IrmsB

IrmsC

Measured value of the phase current between the P and N connections on the current terminal, multiplied with the transfer factor of the transformer.

| Data type | Value | Information |
|-----------|------------|---------------------------|
| UINT | 0 to 65535 | Measured value 0.001 Arms |

9.1.24.15.8 Analog total harmonic distortion (THD) and angle registers**9.1.24.15.8.1 THD and N value voltage phase A/B/C**

Name:
THDNUA
THDNUB
THDNUC

$$\text{Harmonic ratio} = (\text{SQR}(\text{RMS value}_{\text{total}}^2 - \text{RMS value}_{\text{fundamental}}^2)) / \text{RMS value}_{\text{fundamental}}$$

| Data type | Value | Information |
|-----------|------------|------------------|
| UINT | 0 to 10000 | Resolution 0.01% |

9.1.24.15.8.2 THD and N value of current phase A/B/C

Name:
THDNIA
THDNIB
THDNIC

$$\text{Harmonics ratio} = (\text{SQR}(\text{RMS value}_{\text{total}}^2 - \text{RMS value}_{\text{fundamental}}^2)) / \text{RMS value}_{\text{fundamental}}$$

| Data type | Values | Information |
|-----------|------------|------------------|
| UINT | 0 to 10000 | Resolution 0.01% |

9.1.24.15.8.3 Fundamental frequency measured

Name:
Freq

Measured fundamental frequency of phases A, B and C.

| Data type | Value | Information |
|-----------|------------|--------------------|
| UINT | 0 to 10000 | Resolution 0.01 Hz |

9.1.24.15.8.4 Phase angle of power on phase A/B/C

Name:
PAngleA
PAngleB
PAngleC

Middle phase angle (power angle) of the current to the voltage based on the zero-crossing detection.

| Data type | Value | Information |
|-----------|---------------|-----------------|
| INT | -1800 to 1800 | Resolution 0.1° |

9.1.24.15.8.5 Temperature of the converter

Name:
Temperature

This register contains the internal temperature of the transformer component. The temperature is recorded in a 100 ms interval.

| Data type | Value | Information |
|-----------|-------------|----------------|
| INT | -200 to 200 | Resolution 1°C |

9.1.24.15.8.6 Phase angle of voltage on phase A/B/C

Name:
UAngleA
UAngleB
UAngleC

The value for phase A is always 0. On the other phases, the angle corresponds with the offset to A. This is based on the zero-crossing detection.

| Data type | Value | Information |
|-----------|---------------|-----------------|
| INT | -1800 to 1800 | Resolution 0.1° |

9.1.24.15.9 Analog power registers

9.1.24.15.9.1 Vector sum of the total apparent power LSW

Name:

SVmeanTLSB

The value in the register equals a fourth of the actual power.

This value must be multiplied by 4 by the application. Calculation formula for actual power:

$$\text{Actual vector sum of the total apparent power LSW} = \text{register value} * 4 \text{ (complex sum)}$$

| Data type | Value | Information |
|-----------|-----------------|---|
| INT | -32767 to 32767 | Resolution of units/LSB equals 4/65536 VA |

9.1.24.15.9.2 Vector sum of the total apparent power MSW

Name:

SVmeanT

The value in the register equals a fourth of the actual power. The calculation is made in accordance with IEEE 1459.

This value must be multiplied by 4 by the application. Calculation formula for actual power:

$$\text{Actual vector sum of the total apparent power MSW} = \text{register value} * 4 \text{ (complex sum)}$$

| Data type | Value | Information |
|-----------|------------|-----------------|
| INT | 0 to 32767 | Resolution 4 VA |

9.1.24.15.9.3 Total active power

Name:

PmeanT

The value in the register equals a fourth of the actual power. The calculation can be performed in either absolute or arithmetic mode (see register "[MeteringMode](#)" on page 724 <Bit 3>). Each phase can be separately enabled for the power calculation (see register "[MeteringMode](#)" on page 724 <Bits 0, 1 and 2>).

This value must be multiplied by 4 by the application. Calculation formula for actual power:

$$\text{Actual total active power} = \text{Register value} * 4$$

| Data type | Value | Information |
|-----------|-----------------|----------------|
| INT | -32767 to 32767 | Resolution 4 W |

9.1.24.15.9.4 Active power on phase A/B/C

Name:

PmeanA

PmeanB

PmeanC

Active power on the phase. Each phase can be separately enabled for the power calculation (see register "[MeteringMode](#)" on page 724 <Bits 0, 1 and 2>).

| Data type | Value | Information |
|-----------|-----------------|----------------|
| INT | -32767 to 32767 | Resolution 1 W |

9.1.24.15.9.5 Total reactive power

Name:

QmeanT

The value in the register equals a fourth of the actual power. The calculation can be performed in either absolute or arithmetic mode (see register "[MeteringMode](#)" on page 724 <Bit 4>). Each phase can be separately enabled for the power calculation (see register "[MeteringMode](#)" on page 724 <Bits 0, 1 and 2>).

This value must be multiplied by 4 by the application. Calculation formula for actual power:

$$\text{Actual total reactive power} = \text{Register value} * 4$$

| Data type | Value | Information |
|-----------|-----------------|------------------|
| INT | -32767 to 32767 | Resolution 4 var |

9.1.24.15.9.6 Reactive power on phase A/B/C

Name:

QmeanA

QmeanB

QmeanC

Reactive power on the phase. Each phase can be separately enabled for the power calculation (see register "[MeteringMode](#)" on page 724 <Bits 0, 1 and 2>).

| Data type | Value | Information |
|-----------|-----------------|------------------|
| INT | -32767 to 32767 | Resolution 1 var |

9.1.24.15.9.7 Total apparent power

Name:

SmeanT

The value in the register equals a fourth of the actual power. The power is calculated in arithmetic mode. Each phase can be separately enabled for the power calculation (see register "[MeteringMode](#)" on page 724 <Bits 0, 1 and 2>).

This value must be multiplied by 4 by the application. Calculation formula for actual power:

$$\text{Actual total apparent power} = \text{Register value} * 4$$

| Data type | Value | Information |
|-----------|------------|-----------------|
| INT | 0 to 32767 | Resolution 4 VA |

9.1.24.15.9.8 Apparent power on phase A/B/C

Name:

SmeanA

SmeanB

SmeanC

Apparent power on the phase. Each phase can be separately enabled for the power calculation (see register "[MeteringMode](#)" on page 724 <Bits 0, 1 and 2>).

| Data type | Value | Information |
|-----------|------------|-----------------|
| INT | 0 to 32767 | Resolution 1 VA |

9.1.24.15.9.9 Total power factor

Name:

PFmeanT

| Data type | Value | Information |
|-----------|---------------|------------------|
| INT | -1000 to 1000 | Resolution 0.001 |

9.1.24.15.9.10 Power factor on phase A/B/C

Name:

PFmeanA

PFmeanB

PFmeanC

| Data type | Value | Information |
|-----------|---------------|------------------|
| INT | -1000 to 1000 | Resolution 0.001 |

9.1.24.15.9.11 Total active power of fundamental wave

Name:

PmeanTF

The value in the register equals a fourth of the actual power.

This value must be multiplied by 4 by the application. Calculation formula for actual power:

$$\text{Actual total active power of fundamental wave} = \text{Register value} * 4$$

| Data type | Value | Information |
|-----------|-----------------|----------------|
| INT | -32767 to 32767 | Resolution 4 W |

9.1.24.15.9.12 Fundamental wave active power on phase A/B/C

Name:

PmeanAF

PmeanBF

PmeanCF

Active power of fundamental wave on the phase.

| Data type | Value | Information |
|-----------|-----------------|----------------|
| INT | -32767 to 32767 | Resolution 1 W |

9.1.24.15.9.13 Total active power of harmonics

Name:

PmeanTH

The value in the register equals a fourth of the actual power.

This value must be multiplied by 4 by the application. Calculation formula for actual power:

$$\text{Actual total active power of harmonics} = \text{Register value} * 4$$

| Data type | Value | Information |
|-----------|-----------------|----------------|
| INT | -32767 to 32767 | Resolution 4 W |

9.1.24.15.9.14 Harmonics active power on phase A/B/C

Name:

PmeanAH

PmeanBH

PmeanCH

Active power of harmonics on the phase.

| Data type | Value | Information |
|-----------|-----------------|----------------|
| INT | -32767 to 32767 | Resolution 1 W |

9.1.24.15.10 Analog energy registers**9.1.24.15.10.1 Read timestamp for energy register (+0x0022 = 16-bit)**

Name:

SampleTime02_32bit

NetTime timestamp for the readout time of the energy registers.

For more information about NetTime and timestamps, see ["NetTime Technology" on page 3035](#).

| Data type | Value | Information |
|-----------|---------------------------------|------------------------------|
| DINT | -2,147,483,647 to 2,147,483,647 | NetTime timestamp in μ s |

9.1.24.15.10.2 Forward total reactive energy

Name:

APenergyT

Total active energy in forward direction.

| Data type | Value | Information |
|-----------|-----------------|--|
| UDINT | 0 to 4294967295 | Resolution corresponding to setting in register "Power line constants" on page 723 . |

Notes:

- The register is updated automatically after being enabled, see register ["ControlOutput" on page 698 <bit 1>](#)
- The register is deleted upon request, see register ["ControlOutput" on page 698 <bit 2>](#)
- The register is set upon request, see register ["ControlOutput" on page 698 <bit 3>](#)
- For information about energy unit; see register ["Power line constants" on page 723](#)

9.1.24.15.10.3 Forward active energy on phase A/B/C

Name:

APenergyA

APenergyB

APenergyC

Active energy in forward direction of the phase.

| Data type | Value | Information |
|-----------|-----------------|--|
| UDINT | 0 to 4294967295 | Resolution corresponding to setting in register "Power line constants" on page 723 . |

Notes:

- The register is updated automatically after being enabled, see register ["ControlOutput" on page 698 <bit 1>](#)
- The register is deleted upon request, see register ["ControlOutput" on page 698 <bit 2>](#)
- The register is set upon request, see register ["ControlOutput" on page 698 <bit 3>](#)
- For information about energy unit; see register ["Power line constants" on page 723](#)

9.1.24.15.10.4 Reverse total active energy

Name:

ANenergyT

Total active energy in reverse direction.

| Data type | Value | Information |
|-----------|-----------------|--|
| UDINT | 0 to 4294967295 | Resolution corresponding to setting in register "Power line constants" on page 723 . |

Notes:

- The register is updated automatically after being enabled, see register ["ControlOutput" on page 698 <bit 1>](#)
- The register is deleted upon request, see register ["ControlOutput" on page 698 <bit 2>](#)
- The register is set upon request, see register ["ControlOutput" on page 698 <bit 3>](#)
- For information about energy unit; see register ["Power line constants" on page 723](#)

9.1.24.15.10.5 Reverse active energy on phase A/B/C

Name:

ANenergyA

ANenergyB

ANenergyC

Active energy in reverse direction of the phase.

| Data type | Value | Information |
|-----------|-----------------|---|
| UDINT | 0 to 4294967295 | Resolution corresponding to setting in register "Power line constants" on page 723. |

Notes:

- The register is updated automatically after being enabled, see register "ControlOutput" on page 698 <bit 1>
- The register is deleted upon request, see register "ControlOutput" on page 698 <bit 2>
- The register is set upon request, see register "ControlOutput" on page 698 <bit 3>
- For information about energy unit; see register "Power line constants" on page 723

9.1.24.15.10.6 Forward total reactive energy

Name:

RPenergyT

Total reactive energy in forward direction.

| Data type | Value | Information |
|-----------|-----------------|---|
| UDINT | 0 to 4294967295 | Resolution corresponding to setting in register "Power line constants" on page 723. |

Notes:

- The register is updated automatically after being enabled, see register "ControlOutput" on page 698 <bit 1>
- The register is deleted upon request, see register "ControlOutput" on page 698 <bit 2>
- The register is set upon request, see register "ControlOutput" on page 698 <bit 3>
- For information about energy unit; see register "Power line constants" on page 723

9.1.24.15.10.7 Forward reactive energy on phase A/B/C

Name:

RPenergyA

RPenergyB

RPenergyC

Reactive energy in forward direction of the phase.

| Data type | Value | Information |
|-----------|-----------------|---|
| UDINT | 0 to 4294967295 | Resolution corresponding to setting in register "Power line constants" on page 723. |

Notes:

- The register is updated automatically after being enabled, see register "ControlOutput" on page 698 <bit 1>
- The register is deleted upon request, see register "ControlOutput" on page 698 <bit 2>
- The register is set upon request, see register "ControlOutput" on page 698 <bit 3>
- For information about energy unit; see register "Power line constants" on page 723

9.1.24.15.10.8 Reverse total reactive energy

Name:

RNenergyT

Total reactive energy in reverse direction.

| Data type | Value | Information |
|-----------|-----------------|---|
| UDINT | 0 to 4294967295 | Resolution corresponding to setting in register "Power line constants" on page 723. |

Notes:

- The register is updated automatically after being enabled, see register "ControlOutput" on page 698 <bit 1>
- The register is deleted upon request, see register "ControlOutput" on page 698 <bit 2>
- The register is set upon request, see register "ControlOutput" on page 698 <bit 3>
- For information about energy unit; see register "Power line constants" on page 723

9.1.24.15.10.9 Reverse reactive energy of the phase A/B/C

Name:

RNenergyA

RNenergyB

RNenergyC

Reactive energy in reverse direction of the phase.

| Data type | Value | Information |
|-----------|-----------------|---|
| UDINT | 0 to 4294967295 | Resolution corresponding to setting in register "Power line constants" on page 723. |

Notes:

- The register is updated automatically after being enabled, see register "ControlOutput" on page 698 <bit 1>
- The register is deleted upon request, see register "ControlOutput" on page 698 <bit 2>
- The register is set upon request, see register "ControlOutput" on page 698 <bit 3>
- For information about energy unit; see register "Power line constants" on page 723

9.1.24.15.10.10 Arithmetic total apparent energy

Name:

SAenergyT

| Data type | Value | Information |
|-----------|-----------------|---|
| UDINT | 0 to 4294967295 | Resolution corresponding to setting in register "Power line constants" on page 723. |

Notes:

- The register is updated automatically after being enabled, see register "ControlOutput" on page 698 <bit 1>
- The register is deleted upon request, see register "ControlOutput" on page 698 <bit 2>
- The register is set upon request, see register "ControlOutput" on page 698 <bit 3>
- For information about energy unit; see register "Power line constants" on page 723

9.1.24.15.10.11 Apparent energy on phase A/B/C

Name:

SenenergyA

SenenergyB

SenenergyC

| Data type | Value | Information |
|-----------|-----------------|---|
| UDINT | 0 to 4294967295 | Resolution corresponding to setting in register "Power line constants" on page 723. |

Notes:

- The register is updated automatically after being enabled, see register "ControlOutput" on page 698 <bit 1>
- The register is deleted upon request, see register "ControlOutput" on page 698 <bit 2>
- The register is set upon request, see register "ControlOutput" on page 698 <bit 3>
- For information about energy unit; see register "Power line constants" on page 723

9.1.24.15.10.12 Vectorized total apparent energy

Name:
SVenergyT

| Data type | Value | Information |
|-----------|-----------------|---|
| UDINT | 0 to 4294967295 | Resolution corresponding to setting in register "Power line constants" on page 723. |

Notes:

- The register is updated automatically after being enabled, see register "ControlOutput" on page 698 <bit 1>
- The register is deleted upon request, see register "ControlOutput" on page 698 <bit 2>
- The register is set upon request, see register "ControlOutput" on page 698 <bit 3>
- For information about energy unit; see register "Power line constants" on page 723

9.1.24.15.10.13 Forward fundamental wave total active energy

Name:
APenergyTF

Fundamental wave of total active energy in forward direction.

| Data type | Value | Information |
|-----------|-----------------|---|
| UDINT | 0 to 4294967295 | Resolution corresponding to setting in register "Power line constants" on page 723. |

Notes:

- The register is updated automatically after being enabled, see register "ControlOutput" on page 698 <bit 1>
- The register is deleted upon request, see register "ControlOutput" on page 698 <bit 2>
- The register is set upon request, see register "ControlOutput" on page 698 <bit 3>
- For information about energy unit; see register "Power line constants" on page 723

9.1.24.15.10.14 Forward fundamental wave active energy on phase A/B/C

Name:
APenergyAF
APenergyBF
APenergyCF

Fundamental wave of active energy in forward direction of the phase.

| Data type | Value | Information |
|-----------|-----------------|---|
| UDINT | 0 to 4294967295 | Resolution corresponding to setting in register "Power line constants" on page 723. |

Notes:

- The register is updated automatically after being enabled, see register "ControlOutput" on page 698 <bit 1>
- The register is deleted upon request, see register "ControlOutput" on page 698 <bit 2>
- The register is set upon request, see register "ControlOutput" on page 698 <bit 3>
- For information about energy unit; see register "Power line constants" on page 723

9.1.24.15.10.15 Reverse fundamental wave total active energy

Name:
ANenergyTF

Fundamental wave of total active energy in reverse direction.

| Data type | Value | Information |
|-----------|-----------------|---|
| UDINT | 0 to 4294967295 | Resolution corresponding to setting in register "Power line constants" on page 723. |

Notes:

- The register is updated automatically after being enabled, see register "ControlOutput" on page 698 <bit 1>
- The register is deleted upon request, see register "ControlOutput" on page 698 <bit 2>
- The register is set upon request, see register "ControlOutput" on page 698 <bit 3>
- For information about energy unit; see register "Power line constants" on page 723

9.1.24.15.10.16 Reverse fundamental wave active energy on phase A/B/C

Name:

ANenergyAF

ANenergyBF

ANenergyCF

Fundamental wave of active energy in reverse direction of the phase.

| Data type | Value | Information |
|-----------|-----------------|---|
| UDINT | 0 to 4294967295 | Resolution corresponding to setting in register "Power line constants" on page 723. |

Notes:

- The register is updated automatically after being enabled, see register "ControlOutput" on page 698 <bit 1>
- The register is deleted upon request, see register "ControlOutput" on page 698 <bit 2>
- The register is set upon request, see register "ControlOutput" on page 698 <bit 3>
- For information about energy unit; see register "Power line constants" on page 723

9.1.24.15.10.17 Forward harmonics total active energy

Name:

APenergyTH

Harmonics of total active energy in forward direction.

| Data type | Value | Information |
|-----------|-----------------|---|
| UDINT | 0 to 4294967295 | Resolution corresponding to setting in register "Power line constants" on page 723. |

Notes:

- The register is updated automatically after being enabled, see register "ControlOutput" on page 698 <bit 1>
- The register is deleted upon request, see register "ControlOutput" on page 698 <bit 2>
- The register is set upon request, see register "ControlOutput" on page 698 <bit 3>
- For information about energy unit; see register "Power line constants" on page 723

9.1.24.15.10.18 Forward harmonics active energy on phase A/B/C

Name:

APenergyAH

APenergyBH

APenergyCH

Harmonics of active energy in forward direction of the phase.

| Data type | Value | Information |
|-----------|-----------------|---|
| UDINT | 0 to 4294967295 | Resolution corresponding to setting in register "Power line constants" on page 723. |

Notes:

- The register is updated automatically after being enabled, see register "ControlOutput" on page 698 <bit 1>
- The register is deleted upon request, see register "ControlOutput" on page 698 <bit 2>
- The register is set upon request, see register "ControlOutput" on page 698 <bit 3>
- For information about energy unit; see register "Power line constants" on page 723

9.1.24.15.10.19 Reverse harmonics total active energy

Name:

ANenergyTH

Harmonics of total active energy in forward direction.

| Data type | Value | Information |
|-----------|-----------------|---|
| UDINT | 0 to 4294967295 | Resolution corresponding to setting in register "Power line constants" on page 723. |

Notes:

- The register is updated automatically after being enabled, see register "ControlOutput" on page 698 <bit 1>
- The register is deleted upon request, see register "ControlOutput" on page 698 <bit 2>
- The register is set upon request, see register "ControlOutput" on page 698 <bit 3>
- For information about energy unit; see register "Power line constants" on page 723

9.1.24.15.10.20 Reverse harmonics active energy on phase A/B/C

Name:

ANenergyAH

ANenergyBH

ANenergyCH

Harmonics of active energy in reverse direction of the phase.

| Data type | Value | Information |
|-----------|-----------------|---|
| UDINT | 0 to 4294967295 | Resolution corresponding to setting in register "Power line constants" on page 723. |

Notes:

- The register is updated automatically after being enabled, see register "ControlOutput" on page 698 <bit 1>
- The register is deleted upon request, see register "ControlOutput" on page 698 <bit 2>
- The register is set upon request, see register "ControlOutput" on page 698 <bit 3>
- For information about energy unit; see register "Power line constants" on page 723

9.1.24.15.10.21 Total active energy combined

Name:

AenergyT

Total active energy in forward and backward direction.

Internal calculation formula for the total active energy:

$$AenergyT = (DINT)(APenergyT - ANenergyT)$$

Calculation overflows are ignored

| Data type | Value | Information |
|-----------|---------------------------------|---|
| DINT | -2,147,483,647 to 2,147,483,647 | Resolution corresponding to setting in register "Power line constants" on page 723. |

Notes:

- The register is updated automatically after being enabled, see register "ControlOutput" on page 698 <bit 1>
- The register is deleted upon request, see register "ControlOutput" on page 698 <bit 2>
- The register is set upon request, see register "ControlOutput" on page 698 <bit 3>
- For information about energy unit; see register "Power line constants" on page 723

9.1.24.15.10.22 Total reactive energy combined

Name:

REnergyT

Total reactive energy in forward and backward direction.

Internal calculation formula for the total reactive energy:

| Data type | Value | Information |
|-----------|---------------------------------|---|
| DINT | -2,147,483,647 to 2,147,483,647 | Resolution corresponding to setting in register "Power line constants" on page 723. |

Notes:

- The register is updated automatically after being enabled, see register "ControlOutput" on page 698 <bit 1>
- The register is deleted upon request, see register "ControlOutput" on page 698 <bit 2>
- The register is set upon request, see register "ControlOutput" on page 698 <bit 3>
- For information about energy unit; see register "Power line constants" on page 723

9.1.24.15.11 Analog discrete Fourier transformation register (DFT)**9.1.24.15.11.1 Read timestamp for DFT register (+0x0022 = 16-bit)**

Name:

SampleTime03_32bit

NetTime timestamp for the readout time of the DFT registers.

| Data type | Value | Information |
|-----------|---------------------------------|------------------------------|
| DINT | -2,147,483,647 to 2,147,483,647 | NetTime timestamp in μ s |

9.1.24.15.11.2 Harmonic distortion register (HD) current I and voltage V for phases A/B/C

Name:

DftAI0 to DftAI30

DftAV0 to DftAV30

DftBI0 to DftBI30

DftBV0 to DftBV30

DftCI0 to DftCI30

DftCV0 to DftCV30

Ratio of 2nd to 32nd order harmonic wave components.

Conversion from % = register value / 163.84

| Data type | Value | Information |
|-----------|------------|------------------------------|
| UINT | 0 to 32767 | Ratio of frequency component |

9.1.24.15.11.3 THD register current I and voltage V for phases A/B/C

Name:

DftAI31

DftAV31

DftBI31

DftBV31

DftCI31

DftCV31

Ratio of total harmonic distortion.

Conversion from % = register value / 163.84

| Data type | Value | Information |
|-----------|------------|--|
| UINT | 0 to 32767 | Total harmonic distortion on phase A current |

9.1.24.15.11.4 Fundamental wave current on phase A/B/C

Name:

DftAI_Fund

DftBI_Fund

DftCI_Fund

Calculation of the fundamental wave current

| Data type | Values | Information |
|-----------|------------|--------------------------------|
| UINT | 0 to 32767 | Fundamental wave current in mA |

The fundamental wave current is calculated according to the following formula:

Standard calculation

"Fundamental wave current"_{Current} = "Register value" * 3.2656^{-3} * {"Ratio"} over {"Ratio"_"Default"}}

$$\text{Fundamental wave current}_{\text{Current}} = \text{Register value} * 3.2656^{-3} * \frac{\text{Ratio}}{\text{Ratio}_{\text{Default}}}$$

Inverted calculation

"Fundamental wave current"_{Current} = "Register value" * 3.2656^{-3} * {"Ratio"_"Default"} over {"Ratio"}}

$$\text{Fundamental wave current}_{\text{Current}} = \text{Register value} * 3.2656^{-3} * \frac{\text{Ratio}_{\text{Default}}}{\text{Ratio}}$$

Legend

Register value The value of this register

Ratio Configured rated value (see ["Current transformer rating phase A/B/C/N" on page 719](#)).Ratio_{Default} The default rated value depends on the AP module being used:

| Module | Value |
|------------|------------------------------|
| X20AP3111 | 25000 |
| X20AP3121 | 500 |
| X20AP3131 | 100 |
| X20AP3161 | 500 |
| X20AP3171 | Default: 5000 Inverted: 1 |
| All others | 1 |

9.1.24.15.11.5 Fundamental wave voltage on phase A/B/C

Name:

DftAV_Fund

DftBV_Fund

DftCV_Fund

Calculation of the fundamental wave voltage

| Data type | Values | Information |
|-----------|------------|------------------------------------|
| UINT | 0 to 32767 | Fundamental value voltage in volts |

The fundamental wave voltage is calculated according to the following formula:

$$\text{Fundamental wave current}_{\text{Voltage}} = \text{Register value} * 3.2656^{-2}$$

9.1.24.15.12 Environment variables**9.1.24.15.12.1 Operating time**

Name:

ulUpTime

Total operating time of the module.

| Data type | Value | Information |
|-----------|--------------------|---------------------------|
| UDINT | 0 to 4,294,967,295 | Operating time in seconds |

9.1.24.15.12.2 Switch-on and reset counter

Name:

ulUpCount

Switch-on and reset counter of the module.

| Data type | Value | Information |
|-----------|--------------------|-----------------------------|
| UDINT | 0 to 4,294,967,295 | Switch-on and reset counter |

9.1.24.15.12.3 Minimum operating temperature

Name:

ssMinTemp

Lowest measured module temperature since the last time it was started.

| Data type | Value | Information |
|-----------|-------------|----------------|
| INT | -200 to 200 | Resolution 1°C |

9.1.24.15.12.4 Maximum operating temperature

Name:

ssMaxTemp

Highest measured module temperature since the last time it was started.

| Data type | Value | Information |
|-----------|-------------|----------------|
| INT | -200 to 200 | Resolution 1°C |

9.1.24.15.13 Module configuration

9.1.24.15.13.1 Mode register

Name:
ChanControl

| Data type | Value | Bus controller default setting |
|-----------|--------------------|--------------------------------|
| UINT | See bit structure. | 15 |

Bit structure:

| Bit | Name | Value | Information |
|--------|--|---------|---|
| 0 | Channel status LED for phase A | 0 | Off |
| | | 1 | On (bus controller default setting) |
| 1 | Channel status LED for phase B | 0 | Off |
| | | 1 | On (bus controller default setting) |
| 2 | Channel status LED for phase C | 0 | Off |
| | | 1 | On (bus controller default setting) |
| 3 | Reserved | 0 | |
| 4 | Neutral current monitor and status LED | 0 | Off (bus controller default setting) |
| | | 1 | On |
| 5 | Neutral current status derived from the calculated or measured value | 0 | Derived from the calculated value (bus controller default setting) |
| | | 1 | Derived from the measured value |
| 6 | Conversion of energy register to Wh and kWh ²⁾ | 0 | Disabled (1 Ws, 10 Ws, 100 Ws, 1 kWh) (bus controller default setting) |
| | | 1 | Enabled (1 Wh and 1 kWh) |
| 7 | Display current values despite power failure ³⁾ | 0 | Off ³⁾ (bus controller default setting) |
| | | 1 | On |
| 8 - 15 | Oversampling with prescaler | 0 | Disabled (bus controller default setting) |
| | | 1 - 255 | Enabled Sample cycle time as a multiple of 125 µs; only in the "Oversampling" function model |

- 1) When 1 Wh and 1 kWh are set, the energy pulses on the register "Status signals and responses" on page 697 may not be used.
- 2) When a power failure occurs, all current values are held at 0 by default.
- 3) According to the power failure status of the individual phases, the following values are held at 0 by default.
 - Mains frequency, phase angle, power factor
 - Effective voltage and current values
 - Active, reactive and apparent power values

9.1.24.15.13.2 Analog minimum current for active current channel LEDs

Name:
IDispTh

The indicator threshold defines the RMS value of the current at which the status LED for the phase current is illuminated. The default values vary from module to module and should be adjusted to the maximum primary current.

Suggestion: 1% of maximum value

| Data type | Value | Information | |
|-----------|------------|---|----------------------------|
| UINT | 1 to 65000 | RMS indicator threshold in mA. Bus controller default setting: | |
| | | Module | Indicator threshold |
| | | X20AP3111 | 200 mA |
| | | X20AP3121/22 | 500 mA |
| | | X20AP3131/32 | 500 mA |
| | | X20AP3161 | 500 mA |
| | | X20AP3171 | 500 mA |

9.1.24.15.13.3 Current transformer rating phase A/B/C/N

Name:

I_RatioA

I_RatioB

I_RatioC

I_RatioN

The following current transformer measurements are applied in these registers. The permissible values are module-dependent (0.1 resolution).

- **X20AP3111, 3121/22 and 3131/32:** The measured current is multiplied by the current transformation ratio.
- **X20AP3161:** The maximum primary current of the transformer is configured.
- **X20AP3171:** The current transformation ratio of the Rogowski coil is entered. This is the voltage in μV that the coil provides at 10 A primary current (0.1 $\mu\text{V/A}$).

| Data type | Value | Information | |
|-----------|---|---|---|
| UINT | x | Current transformer measurement. Bus controller default setting: | |
| | | Module | |
| | | Rating | |
| | | X20AP3111 | Transformation ratio: 10 to 32500. Bus controller default setting: 25000 |
| | | X20AP3121/22 | Transformation ratio: 10 to 650. Bus controller default setting: 500 |
| | | X20AP3131/32 | Transformation ratio: 10 to 130. Bus controller default setting: 100 |
| | | X20AP3161 | Measurement range: 50 to 650. Bus controller default setting: 500 |
| X20AP3171 | Current transformation ratio (I_Ratio / 5000): 2550 to 8000. Bus controller default setting: 10000 | | |

Information:

The maximum resulting current must not exceed the value of 65000 mA.

9.1.24.15.14 Update requests

9.1.24.15.14.1 User configuration

The following procedure has to be complied with to apply the new values in a configuration change.

- 1) Writing update register
 - CfgUpdate = 0xFFFF
 - Cs0Update = 0xFFFF
- 2) Writing the desired configuration register
- 3) Writing update register
 - CfgUpdate = 0x1
 - Cs0Update = 0x1

9.1.24.15.14.2 Update request status configuration register

Name:

CfgUpdate

The registers in section "[A/D converter status configuration](#)" on page 721 are only applied after changing this register. Writing with 0xFFFF only resets this register without applying the values.

| Data type | Value | Information |
|-----------|------------|--|
| UINT | 0 to 65535 | Update request. Bus controller default setting: 65535 |

9.1.24.15.14.3 Update request A/D converter Cs0, Cs1 and Cs3 register

Name:

Cs0Update

Cs1Update

Cs3Update

The register of the respective section is only applied after changing the corresponding Cs_xUpdate register. These are:

- Cs0Update: 3 registers in section "[A/D converter measurement configuration checksum 0](#)" on page 723
- Cs1Update: 3 registers in "[A/D converter power calibration checksum 1](#)" on page 728
- Cs3Update: 14 registers in section "[A/D converter RMS value synchronization checksum 3](#)" on page 726

Writing with 0xFFFF only resets this register without applying the value.

| Data type | Value | Information |
|-----------|------------|--|
| UINT | 0 to 65535 | Update request. Bus controller default setting: 65535 |

9.1.24.15.14.4 Reading update request A/D converter Cs1 and Cs3 register

Name:

Cs1UpdateFB

Cs3UpdateFB

The A/D converter configuration registers in the sections "[A/D converter status configuration](#)" on page 721 and "[A/D converter measurement configuration checksum 0](#)" on page 723 are only transferred to the feedback buffer after transfer to the A/D converter is complete.

| Data type | Value | Information |
|-----------|------------|-------------|
| UINT | 0 to 65535 | |

9.1.24.15.15 A/D converter status configuration

Changes in the registers in this section are only applied after an update request in register "CfgUpdate" on page 719.

9.1.24.15.15.1 A/D converter hardware signal pinout

Name:
ZXConfig

| Data type | Value | Bus controller default setting |
|-----------|--------------------|--------------------------------|
| UINT | See bit structure. | 0x4400 |

Bit structure:

| Bit | Name | Value | Information |
|---------|---|-------|---|
| 0 | Zero cross signals | 0 | Enabled (bus controller default setting) |
| | | 1 | Disabled |
| 1 - 2 | ZX20Con Trigger zero crossing | 00 | Positive zero crossing (bus controller default setting) |
| | | 01 | Negative zero crossing |
| | | 10 | Both zero cross-overs |
| | | 11 | No zero crossing |
| 3 - 4 | ZX1Con Trigger zero crossing | 00 | Positive zero crossing (bus controller default setting) |
| | | 01 | Negative zero crossing |
| | | 10 | Both zero cross-overs |
| | | 11 | No zero crossing |
| 5 - 6 | ZX2Con Trigger zero crossing | 00 | Positive zero crossing (bus controller default setting) |
| | | 01 | Negative zero crossing |
| | | 10 | Both zero cross-overs |
| | | 11 | No zero crossing |
| 7 - 9 | ZX0Src Signal source for ZX0 hardware signal | 000 | Voltage A (bus controller default setting) |
| | | 001 | Voltage B |
| | | 010 | Voltage C |
| | | 011 | Fix 0 |
| | | 100 | Current A |
| | | 101 | Current B |
| | | 110 | Current C |
| | | 111 | Fix 0 |
| 10 - 12 | ZX1Src Signal source for ZX1 hardware signal | 000 | Voltage A |
| | | 001 | Voltage B (bus controller default setting) |
| | | 010 | Voltage C |
| | | 011 | Fix 0 |
| | | 100 | Current A |
| | | 101 | Current B |
| | | 110 | Current C |
| | | 111 | Fix 0 |
| 13 - 15 | ZX2Src Signal source for ZX2 hardware signal | 000 | Voltage A |
| | | 001 | Voltage B |
| | | 010 | Voltage C (bus controller default setting) |
| | | 011 | Fix 0 |
| | | 100 | Current A |
| | | 101 | Current B |
| | | 110 | Current C |
| | | 111 | Fix 0 |

9.1.24.15.15.2 Voltage warning threshold

Name:

SagTh

This register defines an RMS voltage value for monitoring the voltage warning signals.

| Data type | Value | Information |
|-----------|---------------|---|
| UINT | 5000 to 50000 | Resolution 0.01 V. Bus controller default setting: 12368 |

9.1.24.15.15.3 Power failure threshold

Name:

PhaseLoseTh

This register defines an RMS voltage value for monitoring the power failure signals.

| Data type | Value | Information |
|-----------|--------------|--|
| UINT | 1000 to 6000 | Resolution 0.01 V. Bus controller default setting: 2420 |

9.1.24.15.15.4 Warning threshold for the calculated neutral current

Name:

INWarnTh0

Current value for monitoring the calculated neutral line current.

| Data type | Value | Information |
|-----------|------------|---|
| UINT | 0 to 65000 | Resolution 0.001 A. Bus controller default setting: 50 |

9.1.24.15.15.5 Warning threshold for the measured neutral current.

Name:

INWarnTh1

Current value for monitoring the measured neutral line current.

| Data type | Value | Information |
|-----------|------------|---|
| UINT | 0 to 65000 | Resolution 0.001 A. Bus controller default setting: 50 |

9.1.24.15.15.6 Warning threshold for exceeding voltage THD

Name:

THDNUTh

Percentage value defining warning threshold for THD ratio.

| Data type | Value | Information |
|-----------|------------|---|
| UINT | 0 to 10000 | Resolution 0.01%. Bus controller default setting: 1000 |

9.1.24.15.15.7 Warning threshold for exceeding current THD

Name:

THDNITh

Percentage value defining warning threshold for THD ratio.

| Data type | Value | Information |
|-----------|------------|---|
| UINT | 0 to 10000 | Resolution 0.01%. Bus controller default setting: 1000 |

9.1.24.15.16 A/D converter measurement configuration checksum 0

Changes in the registers in this section are only applied after an update request in register "Cs0Update" on page 720.

9.1.24.15.16.1 Power line constants

Name:

PLconstH

PLconstL

Base value for power line constant.

10 increments in the energy register result in 1 energy pulse. Base value 0x4A81 7C80 = 1,250,000,000 corresponds to 360 energy pulses per kWh or 0.1 energy pulses per kWh. In the energy registers, this results in 1 kWh per position.

The two registers can be set to the following values. Other values are not allowed

| Data type | PLConstH | PLConstL | 1 increment in the energy register corresponds to: |
|-----------|----------|----------|--|
| UINT | 0x0013 | 0x12D0 | 1 Ws ¹⁾ |
| | 0x00BE | 0xBC20 | 10 Ws ¹⁾ |
| | 0x0773 | 0x5940 | 100 Ws ¹⁾ |
| | 0x4A81 | 0x7C80 | 1 kWh ¹⁾ (bus controller default setting) |
| | 0x0010 | 0x0034 | 1 Wh ²⁾ |
| | 0x417B | 0xCE6C | 1 kWh ²⁾ |

1) Register "ChanControl" on page 718, bit 6 = 0

2) Register "ChanControl" on page 718, bit 6 = 1

Information:

When 1 Wh and 1 kWh are set, the energy pulses on the register "StatusInput" on page 697 may not be used.

9.1.24.15.16.2 Analog A/D converter measurement setting 1

Name:

MeteringMode

| Data type | Value | Bus controller default setting |
|-----------|--------------------|--------------------------------|
| UINT | See bit structure. | 135 |

Bit structure:

| Bit | Name | Value | Information |
|---------|--|-------|--|
| 0 | Enables phase C for adding the power and energy values together | 0 | Not released |
| | | 1 | Enabled (bus controller default setting) |
| 1 | Enables phase B for adding the power and energy values together | 0 | Not released |
| | | 1 | Enabled (bus controller default setting) |
| 2 | Enables phase A for adding the power and energy values together | 0 | Not released |
| | | 1 | Enabled (bus controller default setting) |
| 3 | Calculation method for adding active power and active energy | 0 | Arithmetic sum (bus controller default setting) |
| | | 1 | Absolute sum |
| 4 | Calculation method for adding reactive power and reactive energy | 0 | Arithmetic sum (bus controller default setting) |
| | | 1 | Absolute sum |
| 5 | Reserved | 0 | |
| 6 | Selects apparent energy for Energypulse2-Source | 0 | Arithmetic sum (bus controller default setting) |
| | | 1 | Vector sum |
| 7 | Energypulse2-Source | 0 | Apparent energy |
| | | 1 | Reactive energy (bus controller default setting) |
| 8 | Measuring configuration | 0 | 3P4W (bus controller default setting) |
| | | 1 | 3P3W |
| 9 | Resolution of energy register | 0 | Must be 0! |
| 10 | Integrator for DIDT current transformer | 0 | Off (bus controller default setting) |
| | | 1 | On |
| 11 | High-pass filter | 0 | On (bus controller default setting) |
| | | 1 | Off |
| 12 | Basis frequency | 0 | 50 Hz (bus controller default setting) |
| | | 1 | 60 Hz |
| 13 | Phase assignment | 0 | I1 to phase A and I3 to phase C (bus controller default setting) |
| | | 1 | I1 to Phase C and I3 to Phase A |
| 14 - 15 | Reserved | 0 | |

Comments regarding measurement configurations:

| Measuring configuration | Note |
|-------------------------|--|
| 3P4W | Monitors the phasing of voltages and currents: Phase A before phase B before phase C |
| 3P3W | Measuring configuration: Phase A and phase C, N connection bridges to phase B or open |
| | Measurement: e.g. the 2 phases A and C and the 2 corresponding currents are measured, phase B disabled |
| | Monitors the phasing of voltages and currents: Phase difference between A and C >180° |

9.1.24.15.17 User calibration of current and voltage values

Use the following procedure to properly calculate gain and offset:

- Read out the predefined values:
See ["A/D converter RMS value synchronization – read"](#) on page 725.
- Calculate and set new values:
See ["A/D converter RMS value synchronization checksum 3"](#) on page 726.
- Update predefined values by setting the register ["Cs3Update"](#) on page 720. The predefined values have been updated when the value in the register ["Cs3UpdateFB"](#) on page 720 is equal to the value of <Cs3Update>.

9.1.24.15.18 A/D converter RMS value synchronization – read**9.1.24.15.18.1 General information**

The values in the registers specified in this section must be read at the beginning of the calibration. This is the only way to ensure that the gain and offset will be calculated correctly.

The values contained in the registers correspond to the value_{old} in the calculation formulas for gain and offset (see ["A/D converter RMS value synchronization checksum 3"](#) on page 726).

9.1.24.15.18.2 Voltage RMS value gain phase A/B/C

Name:

UGainA_R

UGainB_R

UGainC_R

| Data type | Value |
|-----------|------------|
| UINT | 0 to 65535 |

9.1.24.15.18.3 Current RMS value gain phase A/B/C/N

Name:

IGainA_R

IGainB_R

IGainC_R

IGainN_R

| Data type | Value |
|-----------|------------|
| UINT | 0 to 65535 |

9.1.24.15.18.4 Voltage RMS value offset phase A/B/C

Name:

UoffsetA_R

UoffsetB_R

UoffsetC_R

| Data type | Value |
|-----------|-----------------|
| INT | -32767 to 32767 |

9.1.24.15.18.5 Current RMS value offset phase A/B/C/N

Name:

loffsetA_R

loffsetB_R

loffsetC_R

loffsetN_R

| Data type | Value |
|-----------|-----------------|
| INT | -32767 to 32767 |

9.1.24.15.19 A/D converter RMS value synchronization checksum 3

Changes in the registers in this section are only applied after an update request in register "Cs3Update" on page 720.

9.1.24.15.19.1 Voltage RMS value gain phase A/B/C

Name:

UGainA_W

UGainB_W

UGainC_W

The resulting gain is calculated using the following formula:

$$\text{Value}_{\text{new}} = \text{Value}_{\text{old}} * \text{correction factor, determined when } U = U_n$$

| Data type | Value | Information |
|-----------|------------|---|
| UINT | 0 to 65535 | Voltage RMS value gain, phase-based. Bus controller default setting: 26400 |

9.1.24.15.19.2 Current RMS value gain phase A/B/C/N

Name:

IGainA_W

IGainB_W

IGainC_W

IGainN_W

The resulting gain is calculated using the following formula:

$$\text{Value}_{\text{new}} = \text{Value}_{\text{old}} * \text{correction factor, determined when } I = I_n$$

| Data type | Value | Information |
|-----------|------------|--|
| UINT | 0 to 65535 | Current RMS value gain, phase-based. Bus controller default setting: X20AP3111, X20AP312x: 31248 X20AP313x: 38704 X20AP3161: 23339 X20AP3171: 16653 |

9.1.24.15.19.3 Voltage RMS value offset phase A/B/C

Name:

UoffsetA_W

UoffsetB_W

UoffsetC_W

Corresponds to the negated value of the corresponding RMS value register when U = 0.

| Data type | Value | Information |
|-----------|-----------------|---|
| INT | -32767 to 32767 | RMS value voltage offset, phase-based. Bus controller default setting: 0 |

9.1.24.15.19.4 Current RMS value offset phase A/B/C/N

Name:

IoffsetA_W

IoffsetB_W

IoffsetC_W

IoffsetN_W

Corresponds to the negated value of the corresponding RMS value register when I = 0.

| Data type | Value | Information |
|-----------|-----------------|---|
| INT | -32767 to 32767 | RMS value current offset, phase-based. Bus controller default setting: 0 |

9.1.24.15.20 User calibration of power values

Use the following procedure to properly calculate the power angle correction:

- 1) Calculate the values
- 2) Write the value 0xFFFF to register "Cs1Update" on page 720
- 3) Read register "Cs1UpdateFB" on page 720 until 0xFFFF is returned
- 4) Write the calculated values to the registers "PhiA_W, PhiB_W, PhiC_W" on page 728
- 5) Write the value 0x0001 to register Cs1Update
- 6) Read register Cs1UpdateFB until 0x0001 is returned

Information:

These registers are NOT nonvolatile, and the process needs to be repeated after every PowerOn and every rising edge of the ModuleOK bit.

9.1.24.15.20.1 A/D converter power angle correction phase A/B/C

Name:

PhiA_R

PhiB_R

PhiC_R

These registers can be used to read out the configured values at runtime, but are not nonvolatile and have the value 0 after the system is started.

| Data type | Values |
|-----------|------------------------|
| UINT | See the bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|---------|--|-------|---|
| 0 - 9 | Delay time for energy phase angle correction | x | The clock base is 2.048 MHz. Maximum 0.499 ms |
| 10 - 14 | Reserved | 0 | |
| 15 | Delay times | 0 | Effect on current channel |
| | | 1 | Effect on voltage channel |

9.1.24.15.20.2 A/D converter power calibration checksum 1

Name:
PhiA_W
PhiB_W
PhiC_W

These registers can be used to correct phase shifts at runtime. This can be necessary if the transformers used distort the phase shift.

Changes in these registers are only applied after an update request in register "Cs1Update" on page 720.

| Data type | Values | Bus controller default setting |
|-----------|------------------------|--------------------------------|
| UINT | See the bit structure. | 0 |

Bit structure:

| Bit | Name | Value | Information |
|---------|--|-----------|---|
| 0 - 9 | Delay time for energy phase angle correction | 0 to 1023 | See description for bits 0 to 9. Bus controller default setting: 0 |
| 10 - 14 | Reserved | 0 | |
| 15 | Delay times | 0 or 1 | See description for Bit 15 |

Description - Bits 0 to 9

The maximum correction 0x3FF = 1023 dec. corresponds to 0.49951 ms.

At 50 Hz mains this corresponds to a change of 8.99 degrees

At 60 Hz mains this corresponds to a change of 10.79 degrees

Schematic representation of inductive load: Voltage ahead of current

Schematic representation of capacitive load: Current ahead of voltage

Description - Bit 15

| | | |
|---|--|--|
| 0 | Delay affects current channel Effect with inductive load Effect with capacitive load | Reduced angle between I and U, and therefore an increased power factor Increased angle between U and I, and therefore an reduced power factor |
| 1 | Delay affects voltage channel Effect with inductive load Effect with capacitive load | Reduced angle between U and I, and therefore an increased power factor Increased angle between I and U, and therefore an reduced power factor |

9.1.24.15.21 Force analog energy registers

Name:

The registers are described under "[Analog energy registers](#)" on page 708. A corresponding comparison attached:

| Force registers | Read registers |
|---|----------------|
| Frc_APenergyT Frc_APenergyTF Frc_APenergyTH | "APenergyT" |
| Frc_APenergyA Frc_APenergyAF Frc_APenergyAH | "APenergyA" |
| Frc_APenergyB Frc_APenergyBF Frc_APenergyBH | "APenergyB" |
| Frc_APenergyC Frc_APenergyCF Frc_APenergyCH | "APenergyC" |
| Frc_ANenergyT Frc_ANenergyTF Frc_ANenergyTH | "ANenergyT" |
| Frc_ANenergyA Frc_ANenergyAF Frc_ANenergyAH | "ANenergyA" |
| Frc_ANenergyB Frc_ANenergyBF Frc_ANenergyBH | "ANenergyB" |
| Frc_ANenergyC Frc_ANenergyCF Frc_ANenergyCH | "ANenergyC" |
| Frc_RPenergyT | "RPenergyT" |
| Frc_RPenergyA | "RPenergyA" |
| Frc_RPenergyB | "RPenergyB" |
| Frc_RPenergyC | "RPenergyC" |
| Frc_RNenergyT | "RNenergyT" |
| Frc_RNenergyA | "RNenergyA" |
| Frc_RNenergyB | "RNenergyB" |
| Frc_RNenergyC | "RNenergyC" |
| Frc_SAenergyT | "SAenergyT" |
| Frc_SenergyA | "SenergyA" |
| Frc_SenergyB | "SenergyB" |
| Frc_SenergyC | "SenergyC" |
| Frc_SVenergyT | "SVenergyT" |

These registers can be used to set the energy counter to a specific value after a module has been replaced.

| Data type | Value | Information |
|-----------|-----------------|-----------------------------------|
| UDINT | 0 to 4294967295 | Bus controller default setting: 0 |

9.1.24.15.21.1 Force forward total active energy

Name:

FrcAPenergyT

The registers are described under "[Analog energy registers](#)" on page 708.

These registers can be used to set the energy counter to a specific value after a module has been replaced. The register is updated to the current values when triggered by register "[ControlOutput](#)" on page 698, bit 3.

| Data type | Value |
|-----------|-----------------|
| UDINT | 0 to 4294967295 |

9.1.24.15.22 Oversampling buffer

9.1.24.15.22.1 General information

A sample line contains the instantaneous values of currents (4 channels) and voltages (3 channels) as well as a sequential number and the **NetTime** at the time of transfer from the converter. These values are measured in a grid of 125 μ s * Prescaler.

The user must then normalize the values to the respective physical values:

$$\text{Voltage: } V_{\text{rms}} = (\text{INT32})V_{\text{s}} * 4 / \text{Sqrt}(2)$$

$$\text{Current: } I_{\text{rms}} = (\text{INT32})I_{\text{s}} * 4 / \text{Sqrt}(2)$$

9.1.24.15.22.2 Sample - Neutral current

Name:

lactN_Sample1 to lactN_Sample16

Current value of the neutral current

The value of these registers must be converted by the application: See ["General information" on page 730](#).

| Data type | Value | Information |
|-----------|-----------------|--------------------|
| INT | -32767 to 32767 | Resolution 0.001 A |

9.1.24.15.22.3 Sample - Current on phase A

Name:

lactA_Sample1 to lactA_Sample16

Present current value on phase A.

The value of these registers must be converted by the application: See ["General information" on page 730](#).

| Data type | Value | Information |
|-----------|-----------------|--------------------|
| INT | -32767 to 32767 | Resolution 0.001 A |

9.1.24.15.22.4 Sample - Voltage on phase A

Name:

UactA_Sample1 to UactA_Sample16

Present voltage value on phase A.

The value of these registers must be converted by the application: See ["General information" on page 730](#).

| Data type | Value | Information |
|-----------|-----------------|-------------------|
| INT | -32767 to 32767 | Resolution 0.01 V |

9.1.24.15.22.5 Sample - Current on phase B

Name:

lactB_Sample1 to lactB_Sample16

Present current value on phase B.

The value of these registers must be converted by the application: See ["General information" on page 730](#).

| Data type | Value | Information |
|-----------|-----------------|--------------------|
| INT | -32767 to 32767 | Resolution 0.001 A |

9.1.24.15.22.6 Sample - Current on phase B

Name:

UactB_Sample1 to UactB_Sample16

Present voltage value on phase B.

The value of these registers must be converted by the application: See ["General information" on page 730](#).

| Data type | Value | Information |
|-----------|-----------------|-------------------|
| INT | -32767 to 32767 | Resolution 0.01 V |

9.1.24.15.22.7 Sample - Current on phase C

Name:

lactC_Sample1 to lactC_Sample16

Present current value on phase C.

The value of these registers must be converted by the application: See ["General information"](#) on page 730.

| Data type | Value | Information |
|-----------|-----------------|--------------------|
| INT | -32767 to 32767 | Resolution 0.001 A |

9.1.24.15.22.8 Sample - Voltage on phase C

Name:

UactC_Sample1 to UactC_Sample16

Present voltage value on phase C.

The value of these registers must be converted by the application: See ["General information"](#) on page 730.

| Data type | Value | Information |
|-----------|-----------------|-------------------|
| INT | -32767 to 32767 | Resolution 0.01 V |

9.1.24.15.22.9 Sample number

Name:

SampleCount1 to Samplecount16

Sample line number, ascending, cyclic.

Number of new sample lines since last readout.

| Data type | Value |
|-----------|-----------------|
| SINT | -127 to 127 |
| INT | -32767 to 32767 |

9.1.24.15.22.10 Sample time

Name:

Timestamp

NetTime timestamp of sample line 1.

The older sample lines must be recalculated with 125 µs each.

For more information about NetTime and timestamps, see ["NetTime Technology"](#) on page 3035.

| Data type | Value |
|-----------|---------------------------------|
| INT | -32767 to 32767 |
| DINT | -2,147,483,647 to 2,147,483,647 |

9.1.24.15.23 Environment variables**9.1.24.15.23.1 Operating time in seconds**

Name:
OnTime

The operating time since startup is saved in seconds in this register.

| Data type | Value |
|-----------|-----------------|
| UDINT | 0 to 4294967295 |

9.1.24.15.23.2 Startup counter

Name:
UpCounter

The number of restarts since startup is saved in this register.

| Data type | Value |
|-----------|-----------------|
| UDINT | 0 to 4294967295 |

9.1.24.15.23.3 Minimum operating temperature

Name:
MinTemp

The lowest transformer temperature [°C] since startup is saved in this register.

| Data type | Value | Information |
|-----------|-------------|----------------|
| INT | -200 to 200 | Resolution 1°C |

9.1.24.15.23.4 Maximum operating temperature

Name:
MaxTemp

The highest transformer temperature [°C] since startup is saved in this register.

| Data type | Value | Information |
|-----------|-------------|----------------|
| INT | -200 to 200 | Resolution 1°C |

9.1.24.15.24 Flatstream communication

For a description of Flatstream communication, see ["Flatstream communication" on page 3802](#)

9.1.24.15.25 Flatstream communication with function blocks

As an additional option for Flatstream communication, communication with the module can be easily carried out with the "AsFitGen" library.

The library function blocks handle all incoming tasks with Flatstream mode, such as forwarding, sequencing, generation and evaluation of control bytes.

9.1.24.15.26 NetTime Technology

For a description of NetTime Technology, see ["NetTime Technology" on page 3035](#).

9.1.24.15.27 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time | |
|--------------------|-------------|
| | 200 μ s |

9.1.24.15.28 Minimum I/O update time

The minimum I/O update time specifies how far the bus cycle can be reduced so that an I/O update is performed in each cycle.

| Minimum I/O update time | |
|---|--------------|
| Voltage and current sampling rate for calculation of RMS value, power and energy | 1 MHz |
| Derived values: RMS value, power, energy, power factor, phase angle, frequency (mean values over 16 full waves) | Approx. 3 Hz |
| FFT on request (sample rate: 8 kHz) | 2 Hz |

9.2 Analog output modules

Analog output modules convert PLC internal numerical values into voltages or currents. The numerical values which are to be converted must be in 16-bit 2s complement. The conversion takes place independently of the resolution of the output module used.

Every channel on an analog output module has a status LED.

9.2.1 Summary

| Model number | Short description | Page |
|--------------|---|------|
| X20AO2437 | X20 analog output module, 2 outputs, 4 to 20 mA / 0 to 20 mA or 0 to 24 mA, 16-bit converter resolution, single channel electrically isolated | 735 |
| X20AO2438 | X20 analog output module, 2 outputs, 4 to 20 mA / 0 to 20 mA or 0 to 24 mA, 16-bit converter resolution, single-channel isolation, supports the HART protocol, NetTime function | 748 |
| X20AO2622 | X20 analog output module, 2 outputs, 10 V or 0 to 20 mA / 4 to 20 mA, 13-bit converter resolution | 773 |
| X20AO2632 | X20 analog output module, 2 outputs, ± 10 V or 0 to 20 mA, 16-bit converter resolution, NetTime function | 780 |
| X20AO2632-1 | X20 analog output module, 2 outputs, ± 11 V or 0 to 22 mA, 16-bit converter resolution, NetTime function | 788 |
| X20AO4622 | X20 analog output module, 4 outputs, ± 10 V or 0 to 20 mA / 4 to 20 mA, 13-bit converter resolution | 796 |

9.2.2 X20(c)AO2437

Data sheet version: 1.33

9.2.2.1 General information

The module is equipped with 2 current outputs with 16-bit digital converter resolution. The 2 channels are electrically isolated from each other. The user can select between the 3 output ranges 4 to 20 mA, 0 to 20 mA and 0 to 24 mA.

- 2 analog current outputs
- Electrically isolated analog channels
- 16-bit digital converter resolution

9.2.2.2 Coated modules

Coated modules are X20 modules with a protective coating for the electronics component. This coating protects X20c modules from condensation and corrosive gases.

The modules' electronics are fully compatible with the corresponding X20 modules.

For simplification purposes, only images and module IDs of uncoated modules are used in this data sheet.

The coating has been certified according to the following standards:

- Condensation: BMW GS 95011-4, 2x 1 cycle
- Corrosive gas: EN 60068-2-60, method 4, exposure 21 days

9.2.2.2.1 Starting temperature

The starting temperature describes the minimum permissible ambient temperature when the power is switched off at the time the coated module is switched on. This is permitted to be as low as -40°C . During operation, the conditions as specified in the technical data continue to apply.

Information:

It is important to absolutely ensure that there is no forced cooling by air currents in a closed control cabinet, for example using a fan or ventilation slots.

9.2.2.5 LED status indicators

For a description of the various operating modes, see "[Diagnostic LEDs](#)" on page 3787.

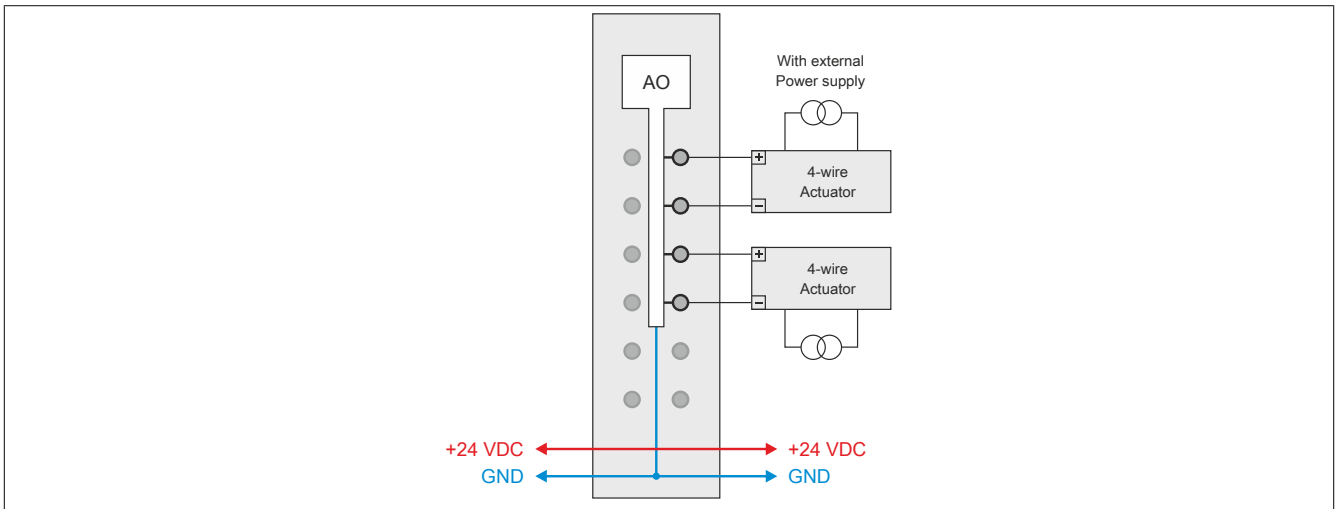

| Figure | LED | Color | Status | Description |
|---|-------------------------|--------------|---|--|
|  | Operating status | | | |
| | r | Green | Off | No power to module |
| | | | Single flash | UNLINK mode |
| | | | Double flash | BOOT mode (during firmware update) ¹⁾ |
| | | | Blinking quickly | SYNC mode |
| | | | Blinking slowly | PREOPERATIONAL mode |
| | | | On | RUN mode |
| | | | Flickering (approx. 10 Hz) | Module is in OSP mode |
| | Module status | | | |
| | e | Red | Off | No power to module or everything OK |
| | | | Single flash | A conversion error has occurred. When an error occurs, the LED of the faulty analog output channel begins to double flash and this status is output. |
| | | | On | Error or reset status |
| | Analog output | | | |
| | 1 - 2 | Orange | Off | Indicates one of the following cases: <ul style="list-style-type: none"> • No power to module • Channel disabled |
| | | | Single flash | Open line |
| | | Double flash | A conversion error has occurred. A single flash is output on the red "e" module status LED. | |
| | | On | Digital/analog converter running, value OK | |

- 1) Depending on the configuration, a firmware update can take up to several minutes.

9.2.2.6 Pinout

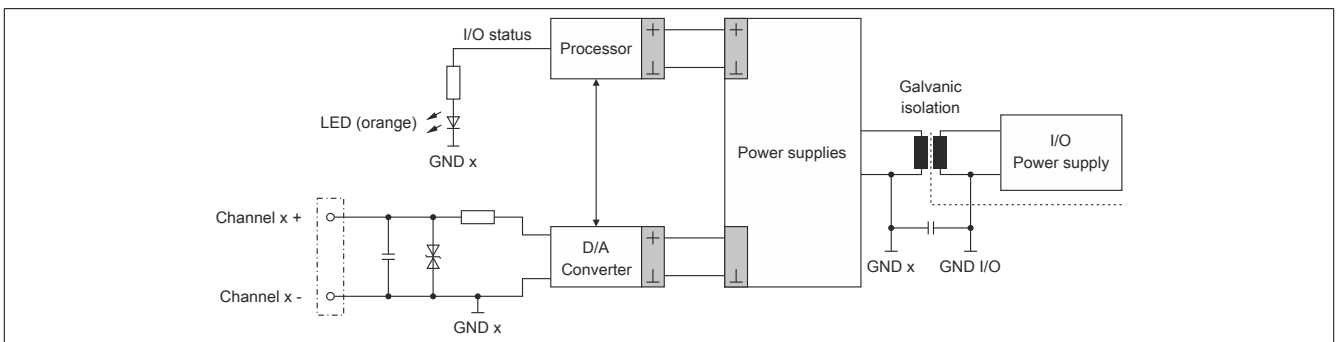

9.2.2.7 Connection example

9.2.2.8 OSP hardware requirements

In order to use OSP mode sensibly, it should be ensured that the power supply of the output module and CPU are independent of each other when the application is set up.

9.2.2.9 Output circuit diagram

9.2.2.10 Derating

To ensure proper operation, the derating values listed below must be adhered to:

Horizontal installation

Figure 83: Derating the load with horizontal mounting

Vertical installation

Figure 84: Derating the load with vertical mounting

9.2.2.11 Register description

9.2.2.11.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section "[General data points](#)" on page 3790.

9.2.2.11.2 Function model 0 - Standard

| Register | Name | Data type | Read | | Write | |
|--------------------------------------|---|-----------|--------|------------|--------|------------|

9.2.2.11.4 Function model 254 - Bus controller

| Register | Offset ¹⁾ | Name | Data type | Read | | Write | |
|--------------------------------------|----------------------|---|-----------|--------|------------|--------|------------|
| | | | | Cyclic | Non-cyclic | Cyclic | Non-cyclic |
| Analog signal - Configuration | | | | | | | |
| 386 394 | - | AnalogMode01 AnalogMode02 | UINT | | | | • |
| 390 398 | - | DACSlewwrate01 DACSlewwrate02 | UINT | | | | • |
| Analog signal - Communication | | | | | | | |
| 0 2 | 0 2 | AnalogOutput01 AnalogOutput02 | (U)INT | | | • | |
| 30 31 | - | AnalogStatus01 AnalogStatus02 | USINT | | • | | |
| | | OpenLineAnalogOutput01 or OpenLineAnalogOutput02 | Bit 2 | | | | |
| | | ConversionErrorAnalogOutput01 or ConversionErrorAnalogOutput02 | Bit 3 | | | | |
| | | IoSuppErrorAnalogOutput01 or IoSuppErrorAnalogOutput02 | Bit 7 | | | | |

1) The offset specifies the position of the register within the CAN object.

9.2.2.11.4.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see ["Using I/O modules on the bus controller" on page 3789](#).

9.2.2.11.4.2 CAN I/O bus controller

The module occupies 1 analog logical slot on CAN I/O.

9.2.2.11.5 Analog signal - Configuration

The module has 2 electrically isolated channels. All registers have a dual design. Channels can be configured and operated independently of one another.

Specific features

- Electrical isolation by channel
- Configurable output ramp DAC slew rate (Default: 210 ms full scale)

9.2.2.11.5.1 AnalogMode

Name:

AnalogMode01 to AnalogMode02

These registers are used to predefine the operating parameters that the module will be using for the respective channel. Each channel must be activated and configured separately.

Information:

When you select the operating mode "Scaling 0 to 20 mA (Resolution 0 to 65535)", then the corresponding "AnalogOutput" registers are interpreted internally as UINT instead of INT.

The entire program must be rebuilt for the data type change to take effect. The data type cannot be changed during runtime (e.g. using a library).

| Data type | Values | Bus controller default setting |
|-----------|------------------------|--------------------------------|
| UINT | See the bit structure. | 33 |

Bit structure:

| Bit | Name | Value | Information |
|--------|---|-------|--|
| 0 | Channel | 0 | Disabled |
| | | 1 | Enabled (bus controller default setting) |
| 1 | Check - D/A converter configuration/status | 0 | Enabled (bus controller default setting) |
| | | 1 | Disabled |
| 2 - 3 | Reserved | - | |
| 4 | Scaling 0 to 20 mA (Resolution 0 to 32767) | 0 | Disabled |
| | | 1 | Enabled |
| 5 | Scaling 4 to 20 mA (Resolution 0 to 32767) | 0 | Disabled |
| | | 1 | Enabled (bus controller default setting) |
| 6 | Scaling 0 to 24 mA (Resolution 0 to 24000) | 0 | Disabled |
| | | 1 | Enabled |
| 7 | Scaling 0 to 20 mA (Resolution 0 to 65535) | 0 | Disabled |
| | | 1 | Enabled |
| 8 - 15 | Reserved | - | |

9.2.2.11.5.2 DACSlewrates

Name:

DACSlewrates01 to DACSlewrates02

These registers limit the rate at which the analog signal is modified. This makes it possible to define a sort of upper limit frequency.

The following formula applies: $f(\text{Analog}) = f(\text{Output rate}) * \text{Permitted change} / \text{max. } \Delta(\text{standardized output value})$

| Data type | Values | Bus controller default setting |
|-----------|------------------------|--------------------------------|
| UINT | See the bit structure. | 514 |

Bit structure:

| Bit | Name | Value | Information |
|---------|---------------------------------------|-------|--|
| 0 - 2 | Permitted change per rate | 000 | 1-bit |
| | | 001 | 2-bit |
| | | 010 | 4-bit (bus controller default setting) |
| | | 011 | 8-bit |
| | | 100 | 16-bit |
| | | 101 | 32-bit |
| | | 110 | 64-bit |
| | | 111 | 128-bit |
| 3 - 7 | Reserved | - | |
| 8 - 11 | Output rate | 0000 | 257730 Hz |
| | | 0001 | 198410 Hz |
| | | 0010 | 152440 Hz (bus controller default setting) |
| | | 0011 | 131580 Hz |
| | | 0100 | 115740 Hz |
| | | 0101 | 69440 Hz |
| | | 0110 | 37590 Hz |
| | | 0111 | 25770 Hz |
| | | 1000 | 20160 Hz |
| | | 1001 | 16030 Hz |
| | | 1010 | 10290 Hz |
| | | 1011 | 8280 Hz |
| | | 1100 | 6900 Hz |
| | | 1101 | 5530 Hz |
| | | 1110 | 4240 Hz |
| | | 1111 | 3300 Hz |
| 12 - 14 | Reserved | - | |
| 15 | Slewrates enable (ramp functionality) | 0 | Disabled (undefined jump behavior) |
| | | 1 | Enabled (defined transitions) |

9.2.2.11.6 Analog signal - Communication

In order to output the desired current signal (default: 4 to 20 mA), the module must be provided with the normalized output value (default: 0 to 32767).

9.2.2.11.6.1 AnalogOutput

Name:

AnalogOutput01 to AnalogOutput02

These registers provide the normalized output values. Depending on the scaling selected (see register "[Analog-Mode](#)" on page 742), the range of values and the data type can be adapted to the requirements of the application. Once a permissible value is transferred, the module outputs the corresponding current.

Information:

The value "0" disables the channel status LED.

| Data type | Value |
|----------------|------------|
| INT | 0 to 32767 |
| Optional: UINT | 0 to 65535 |

9.2.2.11.6.2 AnalogStatus

Name:

AnalogStatus01 to AnalogStatus02

The status register gives the user feedback about whether the respective channel is functioning properly.

| Data type | Value |
|-----------|-------------------|
| USINT | See bit structure |

Bit structure:

| Bit | Name | Value | Information |
|-------|-----------------------------------|-------|---------------------------------|
| 0 - 1 | Reserved | - | |
| 2 | OpenLineAnalogOutput01, 02 | 0 | Line OK |
| | | 1 | Open line |
| 3 | ConversionErrorAnalogOutput01, 02 | 0 | Conversion temperature OK |
| | | 1 | Conversion temperature too high |
| 4 - 6 | Reserved | - | |
| 7 | IoSuppErrorAnalogOutput01, 02 | 0 | Module supply OK |
| | | 1 | Module supply error |

9.2.2.11.7 Function model "OSP"

In function model "OSP" (Operator Set Predefined), the user defines an analog value or digital pattern. This OSP value is output as soon as the communication between the module and master is aborted.

Functionality

The user has the choice between 2 OSP modes:

- Retain last valid value
- Replace with static value

In the first case, the module retains the last value recognized as a valid output status.

When selecting mode "Replace with static value", a plausible output value must be entered in the associated value register. When an OSP event occurs, this value is output instead of the value currently requested by the task.

9.2.2.11.7.1 Activating the OSP output in the module

Name:

OSPValid

This data point offers the possibility to start module output and request OSP operation during running operation.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|-------|----------|-------|--|
| 0 | OSPValid | 0 | Request OSP operation (after initial start or module in Standby) |
| | | 1 | Request normal operation |
| 1 - 7 | Reserved | 0 | |

There is one OSPValid bit on the module, which is managed by the user task. It must be set when the enabled channels are started. As long as the OSPValid bit remains set in the module, the module behaves the same as the "Standard" function model.

If an OSP event occurs (e.g. communication between the module and master CPU interrupted) then the OSPValid bit will be reset on the module. The module enters OSP mode and the output occurs in the "OSPMode" on page 746 register according to the configuration.

The following applies:

The OSP replacement value remains even after the communication channel has recovered. OSP mode is only exited when a set OSPValid bit is transferred.

When the master CPU is restarted, the OSPValid bit is re-initialized on the master CPU. It must once more be set by the application and transferred via the bus.

When temporary communication errors occur between the module and master CPU (e.g. due to EMC), a few bus cycles will pass without refreshing the cyclic registers. The OSPValid bit is reset internally in the module - the bit in the CPU however remains set. Upon the next successful transfer, the OSPValid bit in the module is set again and the module returns to normal operation.

The ModulOK bit can be evaluated if the task in the master CPU needs to know which output mode the module is currently in.

Warning!

If the OSPValid bit is reset to "0" on the module, then the output state no longer depends on the relevant task in the master CPU. However, an output still occurs depending on the configuration of the OSP replacement value.

9.2.2.11.7.2 Setting the OSP mode

Name:

CfgOSPMODE01 to CfgOSPMODE02

This register essentially controls a channel's behavior when OSP is being used.

| Data type | Value | Description |
|-----------|-------|---------------------------|
| USINT | 0 | Replace with static value |
| | 1 | Retain last valid value |

9.2.2.11.7.3 Define the OSP analog output value

Name:

CfgOSPValue01 to CfgOSPValue02

This register contains the analog output value, which is output in "Replace with static value" mode during OSP operation.

| Data type | Value |
|-------------------------------|-------------------------------|
| Corresponds to AnalogOutput0x | Corresponds to AnalogOutput0x |

Warning!

"OSPValue" is only applied by the module if bit "OSPValid" has been set in the module.

9.2.2.11.8 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time |
|--------------------|
| 200 μ s |

9.2.2.11.9 Minimum I/O update time

The minimum I/O update time specifies how far the bus cycle can be reduced so that an I/O update is performed in each cycle.

| Minimum I/O update time |
|-------------------------|
| 200 μ s |

9.2.3 X20(c)AO2438

Data sheet version: 1.43

9.2.3.1 General information

The module is equipped with 2 current outputs with 16-bit digital converter resolution. It supports the HART communication standard for data transfer, parameter configuration and diagnostics.

The 2 channels are electrically isolated from each other. The user can select between the 3 output ranges 4 to 20 mA, 0 to 20 mA and 0 to 24 mA.

- 2 analog current outputs
- HART protocol integration
- Support for HART variables
- Electrically isolated analog channels
- 16-bit digital converter resolution
- OSP mode
- NetTime timestamp: HART image

NetTime timestamp of the HART image

For many applications, not only the HART values are important, but also the exact time of reception. For this purpose, the module has a NetTime timestamp function that provides the reception time with a timestamp with microsecond accuracy.

The timestamp function is based on synchronized timers. If a timestamp event occurs, the module immediately saves the current NetTime. After the respective data is transferred to the CPU, including this precise moment, the CPU can then evaluate the data using its own NetTime (or system time), if necessary.

OSP mode

In function model "OSP" (Operator Set Predefined), the user defines an analog value. This OSP value is always output as soon as the communication between the module and master is interrupted. Alternatively, the last valid output value can also be obtained.

This ensures that the module does not fall into an undefined state in the event of communication failure.

9.2.3.2 Coated modules

Coated modules are X20 modules with a protective coating for the electronics component. This coating protects X20c modules from condensation and corrosive gases.

The modules' electronics are fully compatible with the corresponding X20 modules.

For simplification purposes, only images and module IDs of uncoated modules are used in this data sheet.

The coating has been certified according to the following standards:

- Condensation: BMW GS 95011-4, 2x 1 cycle
- Corrosive gas: EN 60068-2-60, method 4, exposure 21 days

9.2.3.3 Order data

| Model number | Short description | Figure |
|--------------|---|--------|
| | Analog outputs | |
| X20AO2438 | X20 analog output module, 2 outputs, 4 to 20 mA / 0 to 20 mA or 0 to 24 mA, 16-bit converter resolution, single-channel isolation, supports the HART protocol, NetTime function | |
| X20cAO2438 | X20 analog output module, coated, 2 outputs, 4 to 20 mA / 0 to 20 mA or 0 to 24 mA, 16-bit converter resolution, single-channel isolation, supports the HART protocol, NetTime function | |
| | Required accessories | |
| | Bus modules | |
| X20BM11 | X20 bus module, 24 VDC keyed, internal I/O supply continuous | |
| X20BM15 | X20 bus module, with node number switch, 24 VDC keyed, internal I/O supply continuous | |
| X20cBM11 | X20 bus module, coated, 24 VDC keyed, internal I/O supply continuous | |
| | Terminal blocks | |
| X20TB12 | X20 terminal block, 12-pin, 24 VDC keyed | |

Table 93: X20AO2438, X20cAO2438 - Technical data

- 1) Based on the current output value.
- 2) Based on the respective output range
- 3) Load change from 1 Ω → 600 Ω, resistive
- 4) Based on the entire output range.

9.2.3.5 LED status indicators

For a description of the various operating modes, see "[Diagnostic LEDs](#)" on page 3787.

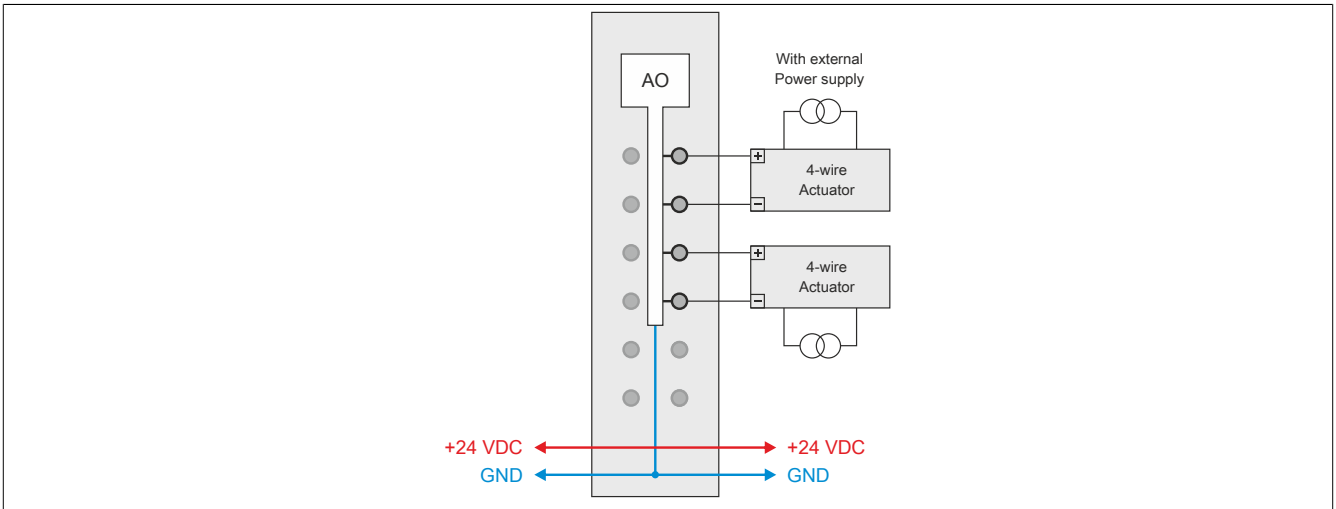

| Figure | LED | Color | Status | Description |
|---|-------------------------|--------|----------------------------|---|
|  | Operating status | | | |
| | r | Green | Off | No power to module |
| | | | Single flash | UNLINK mode |
| | | | Double flash | BOOT mode (during firmware update) ¹⁾ |
| | | | Blinking quickly | SYNC mode |
| | | | Blinking slowly | PREOPERATIONAL mode |
| | | | On | RUN mode |
| | | | Flickering (approx. 10 Hz) | Module is in OSP mode |
| | Module status | | | |
| | e | Red | Off | No power to module or everything OK |
| | | | Single flash | A conversion error has occurred. When an error occurs, the LED of the faulty analog output channel begins to double flash and this status is output. |
| | | | On | Error or reset status |
| | Analog output | | | |
| | 1 - 2 | Orange | Off | Indicates one of the following cases: <ul style="list-style-type: none"> No power to module Channel disabled |
| | | | Single flash | Open line |
| | | | Double flash | A conversion error has occurred. A single flash is output on the red "e" module status LED. |
| | | | On | Digital/analog converter running, value OK |
| | HART link | | | |
| | L | Green | Off | Indicates one of the following cases: <ul style="list-style-type: none"> No power to module HART disabled for the respective channel |
| | | | Flickering | Carrier signal active (DCD or RTS) |
| | HART error | | | |
| | e | Red | Off | Indicates one of the following cases: <ul style="list-style-type: none"> Communication taking place without errors No power to module HART disabled for the respective channel |
| | | | On | Communication error |

1) Depending on the configuration, a firmware update can take up to several minutes.

9.2.3.6 Pinout

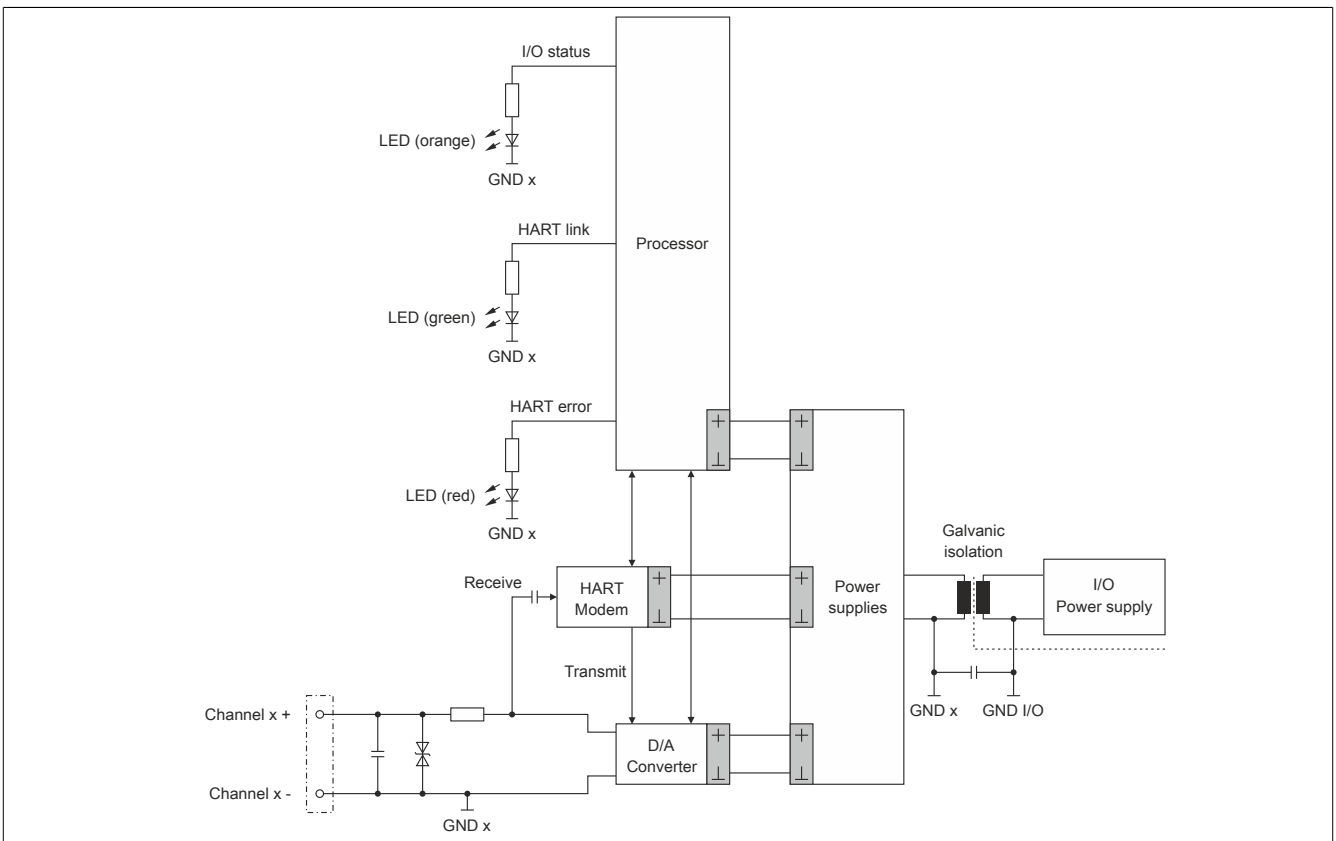

9.2.3.7 Connection example

9.2.3.8 OSP hardware requirements

In order to use OSP mode sensibly, it should be ensured that the power supply of the output module and CPU are independent of each other when the application is set up.

9.2.3.9 Output circuit diagram

9.2.3.10 Operation

9.2.3.10.1 Derating

To ensure proper operation, the derating values listed below must be adhered to:

Horizontal installation

Figure 85: Derating the load with horizontal mounting

Vertical installation

Figure 86: Derating the load with vertical mounting

9.2.3.10.2 HART communication standard

This module supports the HART communication standard for data transfer, parameter configuration and diagnostics. The HART standard is used for the current range 4 to 20 mA. Be aware that the load is not permitted to fall below 230 Ω .

Figure 87: Specified HART operational range

Both current ranges 0 to 20 mA and 0 to 24 mA are supported by this module. HART communication can also be used in these ranges as well. It is important to make sure, however, that the output current lies within the specified HART operational range.

9.2.3.11 Register description

9.2.3.11.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section "General data points" on page 3790.

9.2.3.11.2 Function model 0 - Standard

1) The offset specifies the position of the register within the CAN object.

9.2.3.11.4.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see ["Using I/O modules on the bus controller" on page 3789](#).

9.2.3.11.4.2 CAN I/O bus controller

The module occupies 2 analog logical slots on CAN I/O.

9.2.3.11.5 Analog signal - Configuration

The module has 2 independent electrically isolated channels with integrated HART modems. Both channels can be used to output an analog signal and handle HART communication. 2 registers need to be configured for one analog signal. The 2 channels operate independently, so 2 registers must be configured per channel to be used.

The current outputs (default: 4 to 20 mA) can be used as conventional analog signals. The integrated HART modems retrieve digital information from the memory on the HART slave using the same physical lines that modulate the HART signals.

Each channel can use one of the following connection variants:

- Point-to-point (connection of one HART node on the channel):
 - Evaluation of the analog signal
 - and
 - Recording of up to 4 HART values
- Multidrop (connection of up to 15 HART nodes on the channel):
 - Recording of one HART value per connected node

Specific features

- Electrical isolation by channel
- Up to 4 or 15 HART input variables per channel
- Configurable output rate (DAC slew rate) to transfer HART and analog signal without interference (default: 210 ms full scale)
- Selectable error strategy (static replacement value or retention of the last permitted value)
- Cyclic "HART status" polling (HART command 0), the status information received is made available for channel diagnostics
- Compatible with an additional secondary master in the HART network (module acts as the primary master)
- "HART communication error bit" (shows loss of HART connection if a connection had already been established successfully)
- Optional: BURST mode for one node per channel
- Optional: Cyclic polling of "HART variables" (HART command 3 or 9)
- Optional: FlatStream functionality (module acts as bridge for HART packets)

9.2.3.11.5.1 AnalogMode

Name:

AnalogMode01 to AnalogMode02

These registers are used to predefine the operating parameters that the module will be using for the respective channel. Each channel must be activated and configured separately.

Information:

When you select the operating mode "Scaling 0 to 20 mA (Resolution 0 to 65535)", then the corresponding "AnalogOutput" registers are interpreted internally as UINT instead of INT.

The entire program must be rebuilt for the data type change to take effect. The data type cannot be changed during runtime (e.g. using a library).

| Data type | Values | Bus controller default setting |
|-----------|------------------------|--------------------------------|
| UINT | See the bit structure. | 33 |

Bit structure:

| Bit | Name | Value | Information |
|--------|---|-------|--|
| 0 | Channel | 0 | Disabled |
| | | 1 | Enabled (bus controller default setting) |
| 1 | Check - D/A converter configuration/status | 0 | Enabled (bus controller default setting) |
| | | 1 | Disabled |
| 2 - 3 | Reserved | - | |
| 4 | Scaling 0 to 20 mA (Resolution 0 to 32767) | 0 | Disabled |
| | | 1 | Enabled |
| 5 | Scaling 4 to 20 mA (Resolution 0 to 32767) | 0 | Disabled |
| | | 1 | Enabled (bus controller default setting) |
| 6 | Scaling 0 to 24 mA (Resolution 0 to 24000) | 0 | Disabled |
| | | 1 | Enabled |
| 7 | Scaling 0 to 20 mA (Resolution 0 to 65535) | 0 | Disabled |
| | | 1 | Enabled |
| 8 - 15 | Reserved | - | |

Information:

The "AnalogMode" registers provide the option of avoiding the cyclic check of the D/A converter configuration. To manage communication reliably, this option should only be used if no HART communication is taking place on the channel.

9.2.3.11.5.2 DACSlewwrate

Name:

DACSlewwrate01 to DACSlewwrate02

These registers limit the rate at which the analog signal is modified. This makes it possible to define a sort of upper limit frequency.

The following formula applies: $f(\text{Analog}) = f(\text{Output rate}) * \text{Permitted change} / \text{max. } \Delta(\text{standardized output value})$

To ensure communication takes place without errors, it's important that the frequency range of the digital HART signal is not influenced by the analog output. HART communication takes place in the frequency range 950 to 2500 Hz.

Example (default): $f(\text{Analog}) = 152440 \text{ Hz} * 4 / (32767 - 0)$

Conclusion: $f(\text{Analog}) = \sim 20 \text{ Hz} \ll 950 \text{ Hz} = f(\text{HART})$

| Data type | Values | Bus controller default setting |
|-----------|------------------------|--------------------------------|
| UINT | See the bit structure. | 514 |

Bit structure:

| Bit | Name | Value | Information |
|---------|---------------------------------------|-------|--|
| 0 - 2 | Permitted change per rate | 000 | 1-bit |
| | | 001 | 2-bit |
| | | 010 | 4-bit (bus controller default setting) |
| | | 011 | 8-bit |
| | | 100 | 16-bit |
| | | 101 | 32-bit |
| | | 110 | 64-bit |
| | | 111 | 128-bit |
| 3 - 7 | Reserved | - | |
| 8 - 11 | Output rate | 0000 | 257730 Hz |
| | | 0001 | 198410 Hz |
| | | 0010 | 152440 Hz (bus controller default setting) |
| | | 0011 | 131580 Hz |
| | | 0100 | 115740 Hz |
| | | 0101 | 69440 Hz |
| | | 0110 | 37590 Hz |
| | | 0111 | 25770 Hz |
| | | 1000 | 20160 Hz |
| | | 1001 | 16030 Hz |
| | | 1010 | 10290 Hz |
| | | 1011 | 8280 Hz |
| | | 1100 | 6900 Hz |
| | | 1101 | 5530 Hz |
| | | 1110 | 4240 Hz |
| | | 1111 | 3300 Hz |
| 12 - 14 | Reserved | - | |
| 15 | Slewwrate enable (ramp functionality) | 0 | Disabled (undefined jump behavior) |
| | | 1 | Enabled (defined transitions) |

9.2.3.11.6 Analog signal - Communication

In order to output the desired current signal (default: 4 to 20 mA), the module must be provided with the normalized output value (default: 0 to 32767). In this way, the X20AO2438 can be used as a conventional output module. The integrated HART modem physically uses the same line. Using higher frequency signals, the module can communicate with the HART slave and retrieve additional information.

9.2.3.11.6.1 AnalogOutput

Name:

AnalogOutput01 to AnalogOutput02

These registers provide the standardized output values. Depending on the scaling selected (see register "[Analog-Mode](#)" on page 760), the value range and the data type can be adapted to the requirements of the application. Once a permitted value is determined, the module outputs the respective current.

Information:

The value "0" disables the channel status LED.

| Data type | Value |
|----------------|------------|
| INT | 0 to 32767 |
| Optional: UINT | 0 to 65535 |

9.2.3.11.6.2 AnalogStatus

Name:

AnalogStatus01 to AnalogStatus02

The status register gives the user feedback about whether the respective channel is functioning properly.

| Data type | Value |
|-----------|-------------------|
| USINT | See bit structure |

Bit structure:

| Bit | Name | Value | Information |
|-------|-----------------------------------|-------|---------------------------------|
| 0 - 1 | Reserved | - | |
| 2 | OpenLineAnalogOutput01, 02 | 0 | Line OK |
| | | 1 | Open line |
| 3 | ConversionErrorAnalogOutput01, 02 | 0 | Conversion temperature OK |
| | | 1 | Conversion temperature too high |
| 4 - 6 | Reserved | - | |
| 7 | IoSuppErrorAnalogOutput01, 02 | 0 | Module supply OK |
| | | 1 | Module supply error |

9.2.3.11.7 HART

HART (Highway Addressable Remote Transducer) is a protocol for communicating with intelligent field devices. It was developed in order to more efficiently use the infrastructure for transferring analog signals. The digital HART notifications are modulated to the analog signal using Frequency Shift Keying (FSK). HART can thus use the same physical line as the analog signal without influencing the original function.

HART slaves are able to determine different process data independently and prepare HART concordantly. This protocol supports polling of the value of a process variable as well as its unit and status. Field devices usually supply their information after the master requests it. In newer revisions, it is also possible to transfer configuration data.

There are 2 different types of HART networks. In a *point-to-point* network, only one slave is connected to a HART master. Here, the analog signal and the HART signal can be transferred over the same line. Managing several slaves with HART requires what is known as a *multidrop* network. Here, each HART slave is assigned and identified by a unique address. Classic analog signals cannot be clearly traced in bus systems. As a result, the HART protocol does not support analog information transfers in multidrop networks up to and including HART Revision 5.

Information:

Split range operation with HART AO modules

Beginning with HART revision 6, bus stations that use an analog signal according to the split range method are written to separately. The HART protocol supports multidrop addressing as well as the use of analog signals for these applications.

The module was designed based on HART-Revision 5. Only single-channel FSK scheme is available for transmitting the signals.

Since all HART frames are generated and evaluated in the application when using the FlatStream interface, information that isn't specified until later revisions can also be read.

9.2.3.11.7.1 HART - Configuration

HART modules are analog modules equipped with a HART modem. For each channel, a separate HART network can be managed by the module, which acts as a primary master. Once configured successfully, the HART information is stored in the module where it can then be used by the PLC.

The number of HART slaves must be specified in the configuration.

If only one slave is connected to the HART channel, then it is part of a point-to-point network. The module can then prepare up to 4 process variables from the connected slave.

Multidrop mode allows up to 15 HART slaves to be connected. The primary process variable from each slave is then retrieved.

HartNodeCnt

Name:

HartCodeCnt_1 to HartCodeCnt_2

These registers tell the module how many HART slaves are connected to a channel.

Information:

If a slave is not connected to one of the HART channels, the value "0" should be defined in this register. This shortens the I/O update time and avoids superfluous error messages.

| Data type | Value | Information |
|-----------|---------|--|
| USINT | 0 | HART communication disabled for this channel |
| | 1 | Point-to-point Standard HART communication (bus controller default setting) |
| | 2 to 15 | Multidrop Number of HART slave nodes |

HartBurstNode

Name:

HartBurstNode_1 to HartBurstNode_2

In addition to the type of network, the user can also choose from 2 different types of communication behavior. Conventional HART communication relies on polling. The module queries the data from the HART slave individually and receives the corresponding information from the slave as a response. If a HART node should be queried in short time intervals, the user can configure burst mode for a node on each channel. In this case, the slave transmits the information from this node cyclically without a new request by the master.

The node numbers (short address) whose information should be queried using burst mode are entered by channel in the "HartBurstNode" registers. Burst mode is enabled using register "HartMode" on page 764.

| Data type | Value | Information |
|-----------|---------|--|
| USINT | 0 to 15 | Point-to-point. Bus controller default setting: 0 |

HartMode

Name:

HartMode_1 to HartMode_2

The user can use these registers to configure the communication behavior of each of the HART channels. Generally, the HART nodes are polled individually. This register can still be used to start or stop burst mode when needed. In burst mode, a node transmits its information cyclically instead of continuously. As a result, the HART standard allows the simultaneous usage of both burst mode and polling.

Information:

Register "HartBurstNode" on page 764 must be configured correctly for burst queries.

| Data type | Values | Bus controller default setting |
|-----------|--------------------|--------------------------------|
| UINT | See bit structure. | 0 |

Bit structure:

| Bit | Name | Value | Information |
|-------|------------------------|-------|--|
| 0 | Slave polling mode | 0 | Polling mode enabled (bus controller default setting) |
| | | 1 | Polling mode disabled |
| 1 | Start slave burst mode | 0 | No response to burst (bus controller default setting) |
| | | 1 | Enables burst mode in the "HartBurstNode" on page 764 node |
| 2 | Stop slave burst mode | 0 | No response to burst (bus controller default setting) |
| | | 1 | Disables burst mode, if enabled |
| 3 - 7 | Reserved | - | |

9.2.3.11.7.2 HART - Communication

After the configuration is completed, the information is retrieved automatically and transferred to the module registers. A separate register is implemented in the module for each piece of information. HART modules are designed to query up to 15 pieces of information per channel. The module reads in the data, stores it in temporary memory and prepares it for retrieval. When the X2X master accesses the module registers, it is irrelevant whether the HART data originates from a point-to-point or multidrop network.

Overview of internal module mapping

| | <i>Point-to-point network (1 HART slave)</i> | <i>Multidrop network (2 to 15 HART slaves)</i> |
|--------------|--|--|
| (Pv)Input_01 | Primary piece of information from HART node 1 | Primary piece of information from HART node 1 |
| (Pv)Input_02 | Secondary piece of information from HART node 1 | Primary piece of information from HART node 2 |
| ... | ... | ... |
| (Pv)Input_04 | Quaternary piece of information from HART node 1 | Primary piece of information from HART node 4 |
| (Pv)Input_05 | Reserved | Primary piece of information from HART node 5 |
| ... | ... | ... |
| (Pv)Input_15 | Reserved | Primary piece of information from HART node 15 |

The HART specifications stipulates that information from a HART node be split into various pieces. The value of a process variable is stored to the respective "PvInput" on page 765 register and has a size of 4 bytes (REAL) per the HART specification. Due to the length limitation of 30 bytes on the X2X Link network, there are limitations to the number of possible cyclic variables. It is recommended to transfer a maximum of 2 "PvInput" on page 765 registers cyclically to the X2X master. All other information should be read in a different way. To access HART information, the user can choose between the following methods:

- **Acyclic:** If library AsIOAcc is used, information is queried acyclically only when it is needed, i.e. communication can be adapted to the program sequence of the X2X master. In this way, all of the necessary module registers on the X2X Link network can be queried despite the length limitation. This type of information exchange is not real-time capable.
- **Cyclic:** Data points configured for cyclic transfer are read once per bus cycle. This procedure allows real-time capable information exchange between the module and X2X master. The length limitation may prevent all data from being queried within one cycle, however.
- **Multiplexed:** A runtime driver can be used to transfer the HART data points in the I/O mapping. In this case, the HART process data points are transferred in an alternating pattern using time-division multiplexing. Communication remains real-time capable. Multiple bus cycles are needed to update all data points, however.

Information:

"Multiplexed" data transfer is used only for HART data points.

Information from the analog inputs/outputs is always transferred cyclically (see above).

- **Flatstream:** HART modules are equipped with a Flatstream interface. When using Flatstream communication, the module is used as a bridge between the X2X master and HART slave, i.e. the X2X master communicates directly with the HART slave (see "Flatstream communication" on page 3802). Flatstream communication is also not real-time capable. It allows unrestricted access to the HART slave. The user must have sufficient knowledge of the HART protocol command set as well as the capabilities of the corresponding HART slave.

PvInput

Name:

PvInput_01 to PvInput_15

PvInput_01_01 to PvInput_01_15

PvInput_02_01 to PvInput_02_15

These registers return the current value of the process variable that has been read.

Information:

These registers are of data type REAL, which means that the available bytes on the X2X Link are filled more quickly when operated cyclically. If information from several slave nodes is needed, it must be retrieved acyclically or using Flatstream .

| Data type | Value | Information |
|-----------|-------------|---------------------------------------|
| REAL | IEEE754 SPF | 32-bit data type with valid value |
| | 0x7FA00000 | Not a number (NaN) with invalid value |

PvUnit

Name:

PvUnit_01 to PvUnit_15

PvUnit_01_01 to PvUnit_01_15

PvUnit_02_01 to PvUnit_02_15

These registers return a HART-specific code that specifies the unit for the measured value. The coding for this is established in the HART specification.

| Data type | Value |
|-----------|---|
| USINT | See description of the HART slave See HART specification |

PvSampleTime

Name:

PvSampleTime01 to PvSampleTime02

PvSampleTime01_01 to PvSampleTime01_15

PvSampleTime02_01 to PvSampleTime02_15

These registers return the timestamp for when the module reads the current channel mapping. The values are provided as signed 2-byte or 4-byte values.

For more information about NetTime and timestamps, see "[NetTime Technology](#)" on page 3035.

| Data type | Values | Information |
|-----------|---------------------------|---|
| INT | -32,768 to 32767 | NetTime timestamp of the current input value in μs |
| DINT | -2147483648 to 2147483647 | NetTime timestamp of the current input value in μs |

This refers to the point in time when the HART master receives the slave's response. This is a way to check whether new HART information has been read since the last X2X cycle.

Information:

The cycle times of a HART network are relatively long so that it is not possible to reliably determine when the measured value is retrieved with just this information.

PvNodeComStatus

Name:

PvNodeComStatus01 to PvNodeComStatus02

PvNodeComStatus01_01 to PvNodeComStatus01_15

PvNodeComStatus02_01 to PvNodeComStatus02_15

These registers provide information about whether a read value is valid. Per the HART specification, this type of status register consists of 2 parts. The "response code" is stored in the high byte; the "field device status" is stored in the low byte. This makes it possible to check the current state of a read process variable.

These registers can be checked before further processing information in temporary storage. If the current value is 0x0000, an error was not detected during the HART transfer and the information from the checked node can be used. If a different value is present, the situation in the HART network should be checked. This can be done using an extension register, for example.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|--------|---|-------|---|
| 0 | Quality - Node information 2 to n | 0 | Digital measured value okay |
| | | 1 | Measured value outside the permitted range |
| 1 | Quality - Node information 1 | 0 | Digital measured value okay |
| | | 1 | Measured value outside the permitted range |
| 2 | Limit violation | 0 | Parameter okay |
| | | 1 | Invalid measured value(s) or encoder supply value |
| 3 | Static analog signal | 0 | Normal value change/fluctuation |
| | | 1 | Constant analog value of Node 1 slave |
| 4 | Additional status information (only supported by a few slaves) | 0 | Not available |
| | | 1 | Available (only using Flatstream command #48) |
| 5 | Restart | 0 | Normal operation |
| | | 1 | Field device restarts |
| 6 | Device ID | 0 | Unchanged |
| | | 1 | Changed |
| 7 | Device error | 0 | Measured value okay |
| | | 1 | Questionable measured value information |
| 8 - 14 | Response code, if relevant | x | See HART-specific response code |
| 15 | Error - Communication | 0 | Error-free communication (response code irrelevant) |
| | | 1 | Faulty communication (response code relevant) |

HART-specific response code (excerpt):

| | |
|------------------------------------|---|
| 0x82 ... Receive buffer overflow | If a HART communication error occurs, the response code is written. Bit 15 is always set. |
| 0x88 ... Checksum incorrect | |
| 0x90 ... Faulty protocol structure | |
| 0xA0 ... Overrun | |
| 0xC0 ... Parity not allowed | |
| 0xFF ... Timeout | |

Retrieving information that has been read

After the node data has been transferred to the module registers, the information can be retrieved from the module. A separate register in the module is implemented for each piece of information.

PvCountHartRequest

Name:

PvCountHartRequest01 to PvCountHartRequest02

These registers are increased once the module is ready to transmit a message to the corresponding channel.

| Data type | Values |
|-----------|--------------------|
| UDINT | 0 to 4,294,967,295 |

PvCountHartTimeout

Name:

PvCountHartTimeout01 to PvCountHartTimeout02

These registers are increased if the slave exceeds the maximum permitted time before responding to the module's request.

| Data type | Values |
|-----------|--------------------|
| UDINT | 0 to 4,294,967,295 |

PvCountHartRxError

Name:

PvCountHartRxError01 to PvCountHartRxError02

These registers are increased if communication errors occur on Layer 1 of the OSI model (e.g. transmission error as per parity bit).

| Data type | Values |
|-----------|--------------------|
| UDINT | 0 to 4,294,967,295 |

PvCountHartFrameError

Name:

PvCountHartFrameError01 to PvCountHartFrameError02

These registers are increased if communication errors occur on Layer 2 of the OSI model (e.g. faulty telegram structure).

| Data type | Values |
|-----------|--------------------|
| UDINT | 0 to 4,294,967,295 |

PvNodeFound

Name:

PvNodeFound01 to PvNodeFound02

These registers provide information about which nodes were detected on which channel (slave identified successfully).

| Data type | Values |
|-----------|------------------------|
| UINT | See the bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|-----|--|-------|-----------------------|
| 0 | Node 0 (default mode) Node 1 (multidrop mode) | 0 | Not detected as valid |
| | | 1 | Detected as valid |
| 1 | Node 2 (multidrop mode) | 0 | Not detected as valid |
| | | 1 | Detected as valid |
| ... | | ... | |
| 13 | Node 14 (multidrop mode) | 0 | Not detected as valid |
| | | 1 | Detected as valid |
| 14 | Node 15 (multidrop mode) | 0 | Not detected as valid |
| | | 1 | Detected as valid |
| 15 | Reserved | - | |

PvNodeError

Name:

PvNodeError01 to PvNodeError02

These registers contain the HART communications error bits. These bits are set if the connection to a node was established successfully but the node at some point no longer responds as it should (e.g. the HART slave exceeds the configured timeout / number of retries).

| Data type | Values |
|-----------|------------------------|
| UINT | See the bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|-----|--|-------|------------------------------|
| 0 | Node 0 (default mode) Node 1 (multidrop mode) | 0 | Detected as having no errors |
| | | 1 | Detected as having errors |
| 1 | Node 2 (multidrop mode) | 0 | Detected as having no errors |
| | | 1 | Detected as having errors |
| ... | | ... | |
| 13 | Node 14 (multidrop mode) | 0 | Detected as having no errors |
| | | 1 | Detected as having errors |
| 14 | Node 15 (multidrop mode) | 0 | Detected as having no errors |
| | | 1 | Detected as having errors |
| 15 | Reserved | - | |

9.2.3.11.7.3 Extended configuration

The additional configuration registers are specified values when the module is started. In most systems, the user does not need to make any adjustments here. Register values should only be changed if HART network communication is not taking place satisfactorily.

HartNodeDisable

Name:

HartNodeDisable_1 to HartNodeDisable_2

These registers are intended for things like maintenance. They make it possible to cut off configured HART nodes to suppress error messages for a certain period of time. During normal operation, the configured nodes must be switched active to guarantee that the procedure runs smoothly.

| Data type | Values | Bus controller default setting |
|-----------|--------------------|--------------------------------|
| UINT | See bit structure. | 0x3FFF |

Bit structure:

| Bit | Name | Value | Information |
|-----|--------------------------|-------|---|
| 0 | Node 0 (default mode) | 0 | Enabled (bus controller default setting) |
| | Node 1 (multidrop mode) | 1 | Disabled |
| 1 | Node 2 (multidrop mode) | 0 | Enabled |
| | | 1 | Disabled (bus controller default setting) |
| ... | | ... | |
| 13 | Node 14 (multidrop mode) | 0 | Enabled |
| | | 1 | Disabled (bus controller default setting) |
| 14 | Node 15 (multidrop mode) | 0 | Enabled |
| | | 1 | Disabled (bus controller default setting) |
| 15 | Reserved | - | |

HartProtTimeOut

Name:

HartProtTimeOut_1 to HartProtTimeOut_2

These registers specify the time span within which the slave must respond for the response to be valid.

| Data type | Values [ms] | Information |
|-----------|-------------|--|
| UINT | 0 to 65535 | Bus controller default setting: 256 [ms] |

HartProtRetry

Name:

HartProtRetry_1 to HartProtRetry_2

These registers determine how many times the master retries a request if it receives an invalid response or no response at all.

| Data type | Value | Information |
|-----------|------------|--|
| UINT | 0 to 65535 | Bus controller default setting: 3 attempts |

HartPreamble

Name:

HartPreamble_1 to HartPreamble_2

The length of the preamble can be set in these registers. The preamble is used to synchronize the receiver to the transmitter. The longer the declared preamble, the less chance that a communication error will occur. Nevertheless, a useful signal is not transmitted during synchronization so the preamble should be kept as short as possible.

| Data type | Value | Information |
|-----------|---------|------------------------------------|
| UINT | 5 to 20 | Bus controller default setting: 20 |

9.2.3.11.8 Flatstream communication

For a description of Flatstream communication, see ["Flatstream communication" on page 3802](#)

9.2.3.11.9 HART with Flatstream

When using Flatstream communication, the module acts as a bridge between the X2X master and an intelligent field device connected to the module. Flatstream mode can be used for either point-to-point connections as well as for multidrop systems. Specific algorithms such as timeout and checksum monitoring are usually managed automatically. During normal operation, the user does not have access to these details.

HART is considered a master-slave network where half-duplex communication takes place asynchronously. Various features have been included to ensure that signals are transmitted without errors.

For example, the user can increase the length of the preamble, thus making the transmission more secure. However, this also has an effect on the percentage of payload data and overhead.

Additional information about HART can be found at www.HARTcomm.org.

How it works

The module has 2 independent channels. When using Flatstream, the channel number must therefore be specified. The general structure of a Flatstream frame is extended as follows.

| Input/Output sequence | Tx/Rx bytes | | |
|-----------------------|-----------------------------|----------------|---|
| (unchanged) | Control byte (unchanged) | Channel number | HART frame (without preamble and checksum) |

| HART frame with Flatstream | | | | | |
|----------------------------|------|-----|------|-------|--------|
| Startup | ADDR | CMD | BCNT | (STS) | (DATA) |

| | |
|---------|--|
| Startup | Start identification |
| ADDR | Address within the HART network |
| CMD | HART command |
| BCNT | Byte counters (number of remaining bytes) |
| *STS | Status of the last command received. Information about the working mode of the HART Slave and communication errors (if supported, return data from the HART Slave) |
| *DATA | Data (if necessary for the command) |

Examples of HART commands

| Command | Function |
|---------|--|
| 0x00 | Read slave ID |
| 0x03 | Read current value and up to 4 variables |
| 0x09 | Read up to 4 variables including status |
| 0x21 | Read variables |

9.2.3.11.10 Function model "OSP"

In function model "OSP" (Operator Set Predefined), the user defines an analog value or digital pattern. This OSP value is output as soon as the communication between the module and master is aborted.

Functionality

The user has the choice between 2 OSP modes:

- Retain last valid value
- Replace with static value

In the first case, the module retains the last value recognized as a valid output status.

When selecting mode "Replace with static value", a plausible output value must be entered in the associated value register. When an OSP event occurs, this value is output instead of the value currently requested by the task.

9.2.3.11.10.1 Activating the OSP output in the module

Name:

OSPValid

This data point offers the possibility to start module output and request OSP operation during running operation.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|-------|----------|-------|--|
| 0 | OSPValid | 0 | Request OSP operation (after initial start or module in Standby) |
| | | 1 | Request normal operation |
| 1 - 7 | Reserved | 0 | |

There is one OSPValid bit on the module, which is managed by the user task. It must be set when the enabled channels are started. As long as the OSPValid bit remains set in the module, the module behaves the same as the "Standard" function model.

If an OSP event occurs (e.g. communication between the module and master CPU interrupted) then the OSPValid bit will be reset on the module. The module enters OSP mode and the output occurs in the "OSPMoDe" on page 771 register according to the configuration.

The following applies:

The OSP replacement value remains even after the communication channel has recovered. OSP mode is only exited when a set OSPValid bit is transferred.

When the master CPU is restarted, the OSPValid bit is re-initialized on the master CPU. It must once more be set by the application and transferred via the bus.

When temporary communication errors occur between the module and master CPU (e.g. due to EMC), a few bus cycles will pass without refreshing the cyclic registers. The OSPValid bit is reset internally in the module - the bit in the CPU however remains set. Upon the next successful transfer, the OSPValid bit in the module is set again and the module returns to normal operation.

The ModulOK bit can be evaluated if the task in the master CPU needs to know which output mode the module is currently in.

Warning!

If the OSPValid bit is reset to "0" on the module, then the output state no longer depends on the relevant task in the master CPU. However, an output still occurs depending on the configuration of the OSP replacement value.

9.2.3.11.10.2 Setting the OSP mode

Name:

CfgOSPMoDe01 to CfgOSPMoDe02

This register essentially controls a channel's behavior when OSP is being used.

| Data type | Value | Description |
|-----------|-------|---------------------------|
| USINT | 0 | Replace with static value |
| | 1 | Retain last valid value |

9.2.3.11.10.3 Define the OSP analog output value

Name:

CfgOSPValue01 to CfgOSPValue02

This register contains the analog output value, which is output in "Replace with static value" mode during OSP operation.

| Data type | Value |
|-------------------------------|-------------------------------|
| Corresponds to AnalogOutput0x | Corresponds to AnalogOutput0x |

Warning!

"OSPValue" is only applied by the module if bit "OSPValid" has been set in the module.

9.2.3.11.11 NetTime Technology

For a description of NetTime Technology, see ["NetTime Technology" on page 3035](#).

9.2.3.11.12 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time |
|--------------------|
| 200 µs |

9.2.3.11.13 Minimum I/O update time

The minimum I/O update time specifies how far the bus cycle can be reduced so that an I/O update is performed in each cycle.

| Minimum I/O update time | |
|-------------------------|------|
| Analog outputs | 1 ms |

| Minimum I/O update time Hart Communication | |
|--|-----------------------------|
| Point-to-point | 500 ms |
| Multidrop | 500 ms * number of stations |

9.2.4 X20AO2622

Data sheet version: 3.12

9.2.4.1 General information

The module is equipped with 2 outputs with 13-bit (including sign) digital converter resolution. It is possible to select between the current and voltage signal using different terminals.

This module is designed for X20 6-pin terminal blocks. If needed (e.g. for logistical reasons), the 12-pin terminal block can also be used.

- 2 analog outputs
- Either current or voltage signal possible
- 13-bit digital converter resolution

9.2.4.2 Order data

| | 1 - 2 | Orange | Off | Value = 0 |
| | | | On | Value ≠ 0 |

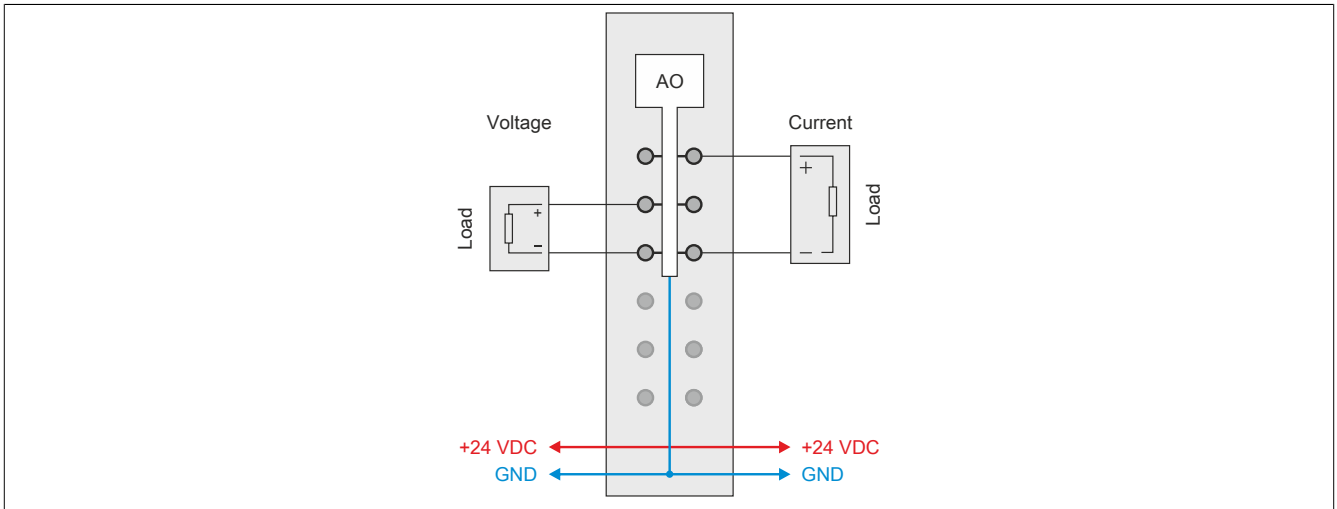

- 1) Depending on the configuration, a firmware update can take up to several minutes.

9.2.4.5 Pinout

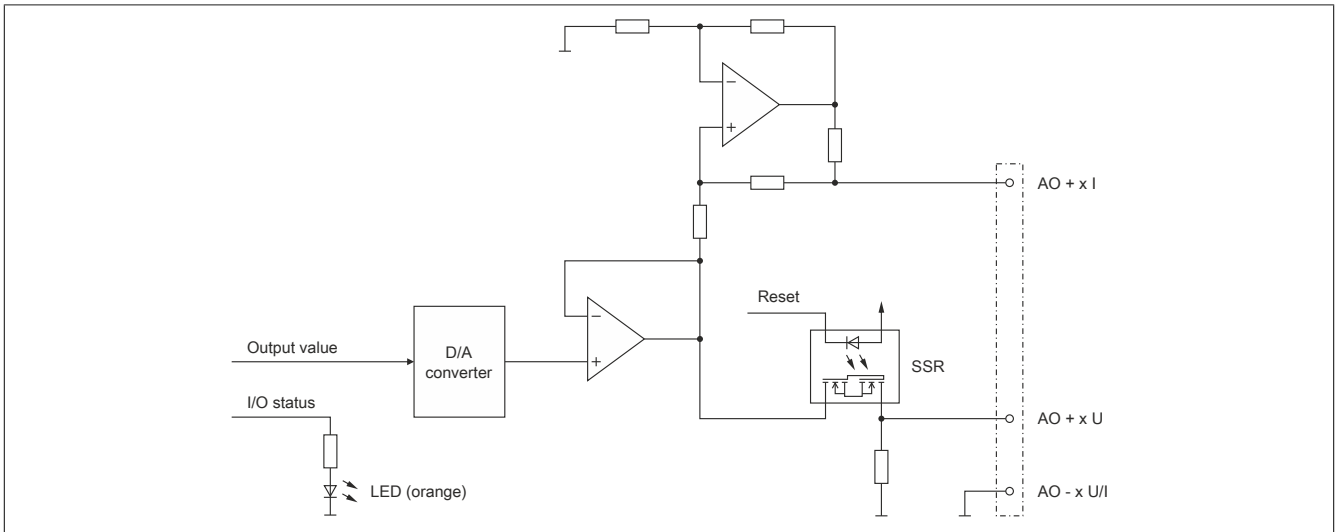

The individual channels can be configured for either current or voltage signals. The type of signal is also determined by the terminals used.

9.2.4.6 Connection example

9.2.4.7 Output circuit diagram

9.2.4.8 Register description

9.2.4.8.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section "[General data points](#)" on page 3790.

9.2.4.8.2 Function model 0 - Standard and function model 1 - I/O with fast reaction

| Register | Name | Data type | Read | | Write | |
|----------------------|--------------------------------|-----------|--------|------------|--------|------------|
| | | | Cyclic | Non-cyclic | Cyclic | Non-cyclic |
| Configuration | | | | | | |
| 18 | ConfigOutput01 | USINT | | | | • |
| Communication | | | | | | |
| 0 | AnalogOutput01 | INT | | | • | |
| 2 | AnalogOutput02 | INT | | | • | |

9.2.4.8.3 Function model 254 - Bus controller

| Register | Offset ¹⁾ | Name | Data type | Read | | Write | |
|----------------------|----------------------|---|-----------|--------|------------|--------|------------|
| | | | | Cyclic | Non-cyclic | Cyclic | Non-cyclic |
| Configuration | | | | | | | |
| 18 | - | ConfigOutput01 (channel type) | USINT | | | | • |
| Communication | | | | | | | |
| 0 | 0 | AnalogOutput01 | INT | | | • | |
| 2 | 2 | AnalogOutput02 | INT | | | • | |

1) The offset specifies the position of the register within the CAN object.

9.2.4.8.3.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see "[Using I/O modules on the bus controller](#)" on page 3789.

9.2.4.8.3.2 CAN I/O bus controller

The module occupies 1 analog logical slot on CAN I/O.

9.2.4.8.4 Function model comparison

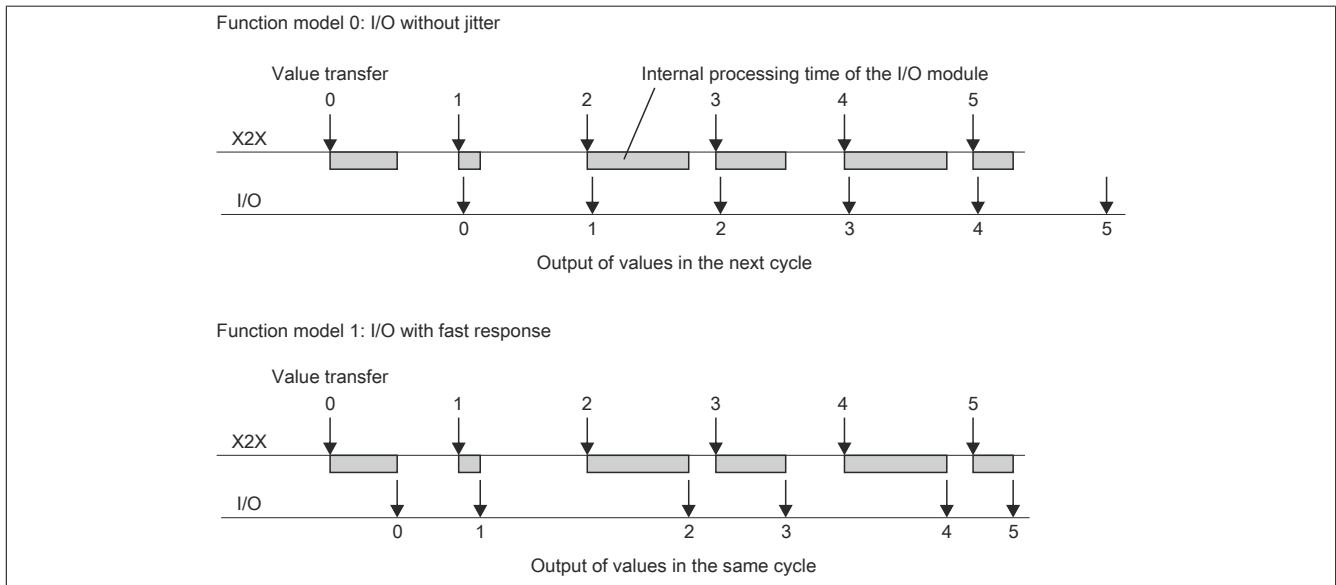

Function model 0: I/O without jitter (standard)

Corrected values are output in the next cycle if the minimum cycle is $\geq 300 \mu\text{s}$ in order to reduce jitter to a minimum.

Function model 1: I/O with fast reaction

Corrected values are output in the same cycle if the minimum cycle is $\geq 300 \mu\text{s}$ (optimized reactions).

Comparison of the two function models

9.2.4.8.5 Analog outputs

The individual channels can be configured for either current or voltage signals. The type of signal is also determined by the terminals used.

9.2.4.8.5.1 Output values of the analog outputs

Name:

AnalogOutput01 to AnalogOutput02

These registers provide the standardized output values. Once a permitted value is received the module outputs the respective current or voltage.

| Data type | Value | Information |
|-----------|-----------------|---|
| INT | -32768 to 32767 | Voltage signal -10 to 10 VDC |
| | 0 to 32767 | Current signal 0 to 20 mA |
| | 0 to 32767 | Current signal 4 to 20 mA ¹⁾ |

1) From upgrade version 1.0.2.0 or hardware revision "I0"

9.2.4.8.5.2 Setting the channel type

Name:

ConfigOutput01

This register can be used to set the channel type of the outputs.

Each channel is capable of handling either current or voltage signals. The type of signal is determined by the terminal connections used. Since current and voltage require different adjustment values, it is also necessary to configure the desired type of output signal. The following output signals can be set:

- ± 10 V voltage signal (default)
- 0 to 20 mA current signal
- 4 to 20 mA current signal

| Data type | Values | Bus controller default setting |
|-----------|------------------------|--------------------------------|
| USINT | See the bit structure. | 0 |

Bit structure:

| Bit | Name | Value | Information |
|-------|--------------------------------------|-------|--|
| 0 | Channel 1 | 0 | Voltage signal (bus controller default setting) |
| | | 1 | Current signal, measurement range corresponding to bit 4 |
| 1 | Channel 2 | 0 | Voltage signal |
| | | 1 | Current signal, measurement range corresponding to bit 5 |
| 2 - 3 | Reserved | 0 | |
| 4 | Channel 1: Current measurement range | 0 | 0 to 20 mA current signal |
| | | 1 | 4 to 20 mA current signal |
| 5 | Channel 2: Current measurement range | 0 | 0 to 20 mA current signal |
| | | 1 | 4 to 20 mA current signal |
| 6 - 7 | Reserved | 0 | |

9.2.4.8.6 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time |
|--------------------|
| 250 μ s |

9.2.4.8.7 Minimum I/O update time

The minimum I/O update time specifies how far the bus cycle can be reduced so that an I/O update is performed in each cycle.

| Minimum I/O update time |
|-------------------------|
| 300 μ s |

9.2.5 X20AO2632

Data sheet version: 3.20

9.2.5.1 General information

The module is equipped with 2 outputs with 16-bit (including sign) digital converter resolution. It is possible to select between the current and voltage signal using different terminals.

This module is designed for X20 6-pin terminal blocks. If needed (e.g. for logistical reasons), the 12-pin terminal block can also be used.

- 2 analog outputs
- Either current or voltage signal possible
- 16-bit digital converter resolution
- NetTime timestamp: Switch-off time

NetTime timestamp for output

For many applications, not only the output value is important, but also the exact switching time. The module is equipped with a NetTime timestamp function for this that can define a switching time to the nearest microsecond.

The timestamp function is based on synchronized timers. The CPU can predefine output events and provide them with a timestamp. After transferring the respective data, including the exact time, the module executes the predefined action at the exactly defined time.

9.2.5.2 Order data

| Model number | Short description | Figure |
|--------------|---|--|
| X20AO2632 | Analog outputs X20 analog output module, 2 outputs, ± 10 V or 0 to 20 mA, 16-bit converter resolution, NetTime function |  |

9.2.5.8.3 Function model 254 - Bus controller

| Register | Offset ¹⁾ | Name | Data type | Read | | Write | |
|--------------------------------------|----------------------|---|-----------|--------|------------|--------|------------|
| | | | | Cyclic | Non-cyclic | Cyclic | Non-cyclic |
| Analog output - Configuration | | | | | | | |
| 0 | - | ConfigOutput01 (channel type) | UINT | | | | • |
| Analog output - Communication | | | | | | | |
| 2 | 0 | AnalogOutput01 | INT | | | • | |
| 4 | 2 | AnalogOutput02 | | | | | |

1) The offset specifies the position of the register within the CAN object.

9.2.5.8.3.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see ["Using I/O modules on the bus controller" on page 3789](#).

9.2.5.8.3.2 CAN I/O bus controller

The module occupies 1 analog logical slot on CAN I/O.

9.2.5.8.4 General information

The module provides 2 analog outputs. Each channel can output a voltage range of ± 10 V or a current range of 0 to 20 mA.

The module also has a time-based watchdog monitor. The user can activate this feature channel-by-channel as needed.

9.2.5.8.5 Analog output - Configuration

Each channel is configured independently. The user can also define an optional time-based monitor. To make this possible, 2 watchdog timers were implemented, which can be assigned to the outputs.

9.2.5.8.5.1 Setting the channel type

Name:

ConfigOutput01

This register can be used to set the channel type of the outputs.

Each channel is capable of handling either current or voltage signals. The type of signal is determined by the terminal connections used. Since current and voltage require different adjustment values, it is also necessary to configure the desired type of output signal. The following output signals can be set:

- ± 10 V voltage signal
- 0 to 20 mA current signal

| Data type | Values | Bus controller default setting |
|-----------|------------------------|--------------------------------|
| UINT | See the bit structure. | 0 |

Bit structure:

| Bit | Description | Value | Information |
|---------|-------------|-------|---|
| 0 - 7 | Reserved | 0 | |
| 8 | Channel 1 | 0 | Voltage signal (bus controller default setting) |
| | | 1 | Current signal |
| 9 | Channel 2 | 0 | Voltage signal (bus controller default setting) |
| | | 1 | Current signal |
| 10 - 15 | Reserved | 0 | |

9.2.5.8.5.2 Configuring the time-based watchdog monitor

Name:

Cfo_Channel01TimeMode to Cfo_Channel02TimeMode

This register is used to activate or configure the time-based watchdog monitor for the analog output channels.

Possibilities per channel:

- Validation timer data type: General choice 16 or 32 bit
- Validation window: The maximum value can be further limited within the data type.
- Timer allocation: A separate timer is available for each channel. However, all channels can be configured with the same validation timer, whereby the same settings must be made for the data type and window in the TimeMode registers.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|--------|----------------------|-------|---|
| 0 - 4 | Max. validation time | 00000 | Disabled |
| | | 00001 | 2 μ s |
| | | 00010 | 4 μ s |
| | | 00011 | 8 μ s |
| | | ... | ... |
| | | 11111 | 2,147,483,648 μ s (~35 min) |
| 5 - 7 | Reserved | 0 | |
| 8 | Timer allocation | 0 | ValidationTimer01 (default for channel 1) |
| | | 1 | ValidationTimer02 (default for channel 2) |
| 9 - 14 | Reserved | 0 | |
| 15 | Time format | 0 | 16-bit |
| | | 1 | 32-bit |

9.2.5.8.6 Analog output - Communication

In standard mode, the module's outputs are enabled. Based on the configuration and AnalogOutput value, they output the corresponding current or voltage.

If the application requires time-controlled monitoring of the outputs, a validation timer can be assigned to each channel. The validation timer register assigns a validity period to the current output value. If validation is enabled, the module compares the validation time and the [NetTime](#) of the X2X Link. If the transmitted validity period is exceeded, the module switches off the channel and resets the output. State "Safety shutdown" is only exited again when a new valid validation time has been transmitted. If enabled, the module reports back which state it is currently in via the error state bit of the channel.

If the value of the validation timer is incremented in each task cycle, the valid validation time will be calculated as follows:

| | |
|---|--|
| NetTime of the X2X Link master (to which the module is connected) | |
| + | Timespan for transferring data from the X2X Link master to the CPU (higher-level system) |
| + | Cycle time of task class (including tolerance) |
| + | Timespan for transferring the data from the CPU to the module |
| + | Timespan allowed by the application (e.g. for tolerating failure of an X2X Link cycle) |
| = | Valid validation time |

The AnalogOutputEnableByte is enabled during time-based monitoring. If the timer expires prematurely, the corresponding bit in the AnalogOutputOkayByte is reset and the output drops out. This provides an easy way to achieve a defined state.

9.2.5.8.6.1 Output values of the analog outputs

Name:

AnalogOutput01 to AnalogOutput02

These registers provide the standardized output values. Once a permitted value is received, the module outputs the respective current or voltage.

Information:

The value "0" disables the channel status LED.

| Data type | Value | |
|-----------|-----------------|---------|
| INT | -32767 to 32767 | Voltage |
| | 0 to 32767 | Current |

9.2.5.8.6.2 SDC counter register

Name:

SDCLifeCount

The 8-bit counter register is needed for the SDC software package. It is incremented with the system clock to allow the SDC to check the validity of the data frame.

| Data type | Values |
|-----------|-------------|
| SINT | -128 to 127 |

9.2.5.8.6.3 Transfer of the timestamp

Name:

ValidationTimer01 to ValidationTimer02

When an output is being monitored, these registers must provide the timestamp which, when reached, will cause the output to shut down automatically. The values must be provided as signed 2-byte or 4-byte values.

For more information about NetTime and timestamps, see ["NetTime Technology"](#) on page 3035.

| Data type | Values [µs] | |
|-----------|---------------------------------|---|
| INT | -32768 to 32767 | NetTime timestamp of the current output value |
| DINT | -2,147,483,648 to 2,147,483,647 | NetTime timestamp of the current output value |

9.2.5.8.6.4 Enabling/disabling the output channels

Name:

AnalogOutput01Enable to AnalogOutput02Enable

AnalogOutput01EnableReadback to AnalogOutput02EnableReadback

The "OutputEnable" byte is only needed for the channels with activated time-based monitoring. The individual bits are used to enable/disable the respective channels. To receive reliable feedback about the current state of the module, the byte was also implemented so that it can be read cyclically.

| Data type | Value |
|-----------|-------------------|
| USINT | See bit structure |

Bit structure:

| Bit | Name | Value | Information |
|-------|------------------------------|-------|--------------------|
| 0 | AnalogOutput01Enable | 0 | Output deactivated |
| | AnalogOutput01EnableReadback | 1 | Output activated |
| 1 | AnalogOutput02Enable | 0 | Output deactivated |
| | AnalogOutput02EnableReadback | 1 | Output activated |
| 2 - 7 | Reserved | 0 | |

9.2.5.8.6.5 Checking the output values

Name:

AnalogOutput01OK to AnalogOutput02OK

These registers are only needed for channels with activated time-based monitoring. The individual bits report whether the respective channel is actually generating the required voltage or current.

| Data type | Value |
|-----------|-------------------|
| USINT | See bit structure |

Bit structure:

| Bit | Name | Value | Information |
|-------|------------------|-------|-------------------------------|
| 0 | AnalogOutput01OK | 0 | Electrical signal deactivated |
| | | 1 | Electrical signal activated |
| 1 | AnalogOutput02OK | 0 | Electrical signal deactivated |
| | | 1 | Electrical signal activated |
| 2 - 7 | Reserved | 0 | |

9.2.5.8.7 NetTime Technology

For a description of NetTime Technology, see ["NetTime Technology" on page 3035](#).

9.2.5.8.8 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time |
|--------------------|
| 200 μ s |

9.2.5.8.9 Minimum I/O update time

The minimum I/O update time specifies how far the bus cycle can be reduced so that an I/O update is performed in each cycle.

| Minimum I/O update time |
|-------------------------|
| 200 μ s |

9.2.6 X20AO2632-1

Data sheet version: 1.30

9.2.6.1 General information

The module is equipped with 2 outputs with 16-bit (including sign) digital converter resolution. It is possible to select between the current and voltage signal using different terminals.

This module is designed for X20 6-pin terminal blocks. If needed (e.g. for logistical reasons), the 12-pin terminal block can also be used.

- 2 analog outputs
- Either current or voltage signal possible
- Extended signal range
- 16-bit digital converter resolution
- NetTime timestamp: Switch-off time

NetTime timestamp for output

For many applications, not only the output value is important, but also the exact switching time. The module is equipped with a NetTime timestamp function for this that can define a switching time to the nearest microsecond.

The timestamp function is based on synchronized timers. The CPU can predefine output events and provide them with a timestamp. After transferring the respective data, including the exact time, the module executes the predefined action at the exactly defined time.

9.2.6.2 Order data

| Model number | Short description | Figure |
|--------------|--|---|
| | Analog outputs |  |

9.2.6.8 Register description

9.2.6.8.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section ["General data points" on page 3790](#).

9.2.6.8.2 Function model 0 - Standard

| Register | Name | Data type | Read | | Write | |
|--------------------------------------|--|-----------|--------|------------|--------|------------|
| | | | Cyclic | Non-cyclic | Cyclic | Non-cyclic |
| Analog output - Configuration | | | | | | |

| | AnalogOutput01OK | Bit 0 | | | | |
| | AnalogOutput02OK | Bit 1 | | | | |

9.2.6.8.3 Function model 254 - Bus controller

| Register | Offset ¹⁾ | Name | Data type | Read | | Write | |
|--------------------------------------|----------------------|---|-----------|--------|------------|--------|------------|
| | | | | Cyclic | Non-cyclic | Cyclic | Non-cyclic |
| Analog output - Configuration | | | | | | | |
| 0 | - | ConfigOutput01 (channel type) | UINT | | | | • |
| Analog output - Communication | | | | | | | |
| 2 | 0 | AnalogOutput01 | INT | | | • | |
| 4 | 2 | AnalogOutput02 | | | | | |

1) The offset specifies the position of the register within the CAN object.

9.2.6.8.3.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see ["Using I/O modules on the bus controller" on page 3789](#).

9.2.6.8.3.2 CAN I/O bus controller

The module occupies 1 analog logical slot on CAN I/O.

9.2.6.8.4 General information

The module provides 2 analog outputs. Each channel can output a voltage range of ± 11 V or a current range of 0 to 22 mA.

The module also has a time-based watchdog monitor. The user can activate this feature channel-by-channel as needed.

9.2.6.8.5 Analog output - Configuration

Each channel is configured independently. The user can also define an optional time-based monitor. To make this possible, 2 watchdog timers were implemented, which can be assigned to the outputs.

9.2.6.8.5.1 Setting the channel type

Name:

ConfigOutput01

This register can be used to set the channel type of the outputs.

Each channel is capable of handling either current or voltage signals. The type of signal is determined by the terminal connections used. Since current and voltage require different adjustment values, it is also necessary to configure the desired type of output signal. The following output signals can be set:

- ± 11 V voltage signal
- 0 to 22 mA current signal

| Data type | Values | Bus controller default setting |
|-----------|------------------------|--------------------------------|
| UINT | See the bit structure. | 0 |

Bit structure:

| Bit | Description | Value | Information |
|---------|-------------|-------|---|
| 0 - 7 | Reserved | 0 | |
| 8 | Channel 1 | 0 | Voltage signal (bus controller default setting) |
| | | 1 | Current signal |
| 9 | Channel 2 | 0 | Voltage signal (bus controller default setting) |
| | | 1 | Current signal |
| 10 - 15 | Reserved | 0 | |

9.2.6.8.5.2 Configuring the time-based watchdog monitor

Name:

Cfo_Channel01TimeMode to Cfo_Channel02TimeMode

This register is used to activate or configure the time-based watchdog monitor for the analog output channels.

Possibilities per channel:

- Validation timer data type: General choice 16 or 32 bit
- Validation window: The maximum value can be further limited within the data type.
- Timer allocation: A separate timer is available for each channel. However, all channels can be configured with the same validation timer, whereby the same settings must be made for the data type and window in the TimeMode registers.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|--------|----------------------|-------|---|
| 0 - 4 | Max. validation time | 00000 | Disabled |
| | | 00001 | 2 μ s |
| | | 00010 | 4 μ s |
| | | 00011 | 8 μ s |
| | | ... | ... |
| | | 11111 | 2,147,483,648 μ s (~35 min) |
| 5 - 7 | Reserved | 0 | |
| 8 | Timer allocation | 0 | ValidationTimer01 (default for channel 1) |
| | | 1 | ValidationTimer02 (default for channel 2) |
| 9 - 14 | Reserved | 0 | |
| 15 | Time format | 0 | 16-bit |
| | | 1 | 32-bit |

9.2.6.8.6 Analog output - Communication

In standard mode, the module's outputs are enabled. Based on the configuration and AnalogOutput value, they output the corresponding current or voltage.

If the application requires time-controlled monitoring of the outputs, a validation timer can be assigned to each channel. The validation timer register assigns a validity period to the current output value. If validation is enabled, the module compares the validation time and the [NetTime](#) of the X2X Link. If the transmitted validity period is exceeded, the module switches off the channel and resets the output. State "Safety shutdown" is only exited again when a new valid validation time has been transmitted. If enabled, the module reports back which state it is currently in via the error state bit of the channel.

If the value of the validation timer is incremented in each task cycle, the valid validation time will be calculated as follows:

| | |
|---|--|
| NetTime of the X2X Link master (to which the module is connected) | |
| + | Timespan for transferring data from the X2X Link master to the CPU (higher-level system) |
| + | Cycle time of task class (including tolerance) |
| + | Timespan for transferring the data from the CPU to the module |
| + | Timespan allowed by the application (e.g. for tolerating failure of an X2X Link cycle) |
| = | Valid validation time |

The AnalogOutputEnableByte is enabled during time-based monitoring. If the timer expires prematurely, the corresponding bit in the AnalogOutputOkayByte is reset and the output drops out. This provides an easy way to achieve a defined state.

9.2.6.8.6.1 Output values of the analog outputs

Name:

AnalogOutput01 to AnalogOutput02

These registers provide the standardized output values. Once a permitted value is received, the module outputs the respective current or voltage.

Information:

The value "0" disables the channel status LED.

| Data type | Value | |
|-----------|-----------------|---------|
| INT | -32767 to 32767 | Voltage |
| | 0 to 32767 | Current |

9.2.6.8.6.2 SDC counter register

Name:

SDCLifeCount

The 8-bit counter register is needed for the SDC software package. It is incremented with the system clock to allow the SDC to check the validity of the data frame.

| Data type | Values |
|-----------|-------------|
| SINT | -128 to 127 |

9.2.6.8.6.3 Transfer of the timestamp

Name:

ValidationTimer01 to ValidationTimer02

When an output is being monitored, these registers must provide the timestamp which, when reached, will cause the output to shut down automatically. The values must be provided as signed 2-byte or 4-byte values.

For more information about NetTime and timestamps, see ["NetTime Technology" on page 3035](#).

| Data type | Values [µs] | |
|-----------|---------------------------------|---|
| INT | -32768 to 32767 | NetTime timestamp of the current output value |
| DINT | -2,147,483,648 to 2,147,483,647 | NetTime timestamp of the current output value |

9.2.6.8.6.4 Enabling/disabling the output channels

Name:

AnalogOutput01Enable to AnalogOutput02Enable

AnalogOutput01EnableReadback to AnalogOutput02EnableReadback

The "OutputEnable" byte is only needed for the channels with activated time-based monitoring. The individual bits are used to enable/disable the respective channels. To receive reliable feedback about the current state of the module, the byte was also implemented so that it can be read cyclically.

| Data type | Value |
|-----------|-------------------|
| USINT | See bit structure |

Bit structure:

| Bit | Name | Value | Information |
|-------|------------------------------|-------|--------------------|
| 0 | AnalogOutput01Enable | 0 | Output deactivated |
| | AnalogOutput01EnableReadback | 1 | Output activated |
| 1 | AnalogOutput02Enable | 0 | Output deactivated |
| | AnalogOutput02EnableReadback | 1 | Output activated |
| 2 - 7 | Reserved | 0 | |

9.2.6.8.6.5 Checking the output values

Name:

AnalogOutput01OK to AnalogOutput02OK

These registers are only needed for channels with activated time-based monitoring. The individual bits report whether the respective channel is actually generating the required voltage or current.

| Data type | Value |
|-----------|-------------------|
| USINT | See bit structure |

Bit structure:

| Bit | Name | Value | Information |
|-------|------------------|-------|-------------------------------|
| 0 | AnalogOutput01OK | 0 | Electrical signal deactivated |
| | | 1 | Electrical signal activated |
| 1 | AnalogOutput02OK | 0 | Electrical signal deactivated |
| | | 1 | Electrical signal activated |
| 2 - 7 | Reserved | 0 | |

9.2.6.8.7 NetTime Technology

For a description of NetTime Technology, see "[NetTime Technology](#)" on page 3035.

9.2.6.8.8 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time |
|--------------------|
| 200 μ s |

9.2.6.8.9 Minimum I/O update time

The minimum I/O update time specifies how far the bus cycle can be reduced so that an I/O update is performed in each cycle.

| Minimum I/O update time |
|-------------------------|
| 200 μ s |

9.2.7 X20(c)AO4622

Data sheet version: 3.24

9.2.7.1 General information

The module is equipped with 4 outputs with 13-bit (including sign) digital converter resolution. It is possible to select between the current and voltage signal using different terminals.

- 4 analog outputs
- Either current or voltage signal possible
- 13-bit digital converter resolution

9.2.7.2 Coated modules

Coated modules are X20 modules with a protective coating for the electronics component. This coating protects X20c modules from condensation and corrosive gases.

The modules' electronics are fully compatible with the corresponding X20 modules.

For simplification purposes, only images and module IDs of uncoated modules are used in this data sheet.

The coating has been certified according to the following standards:

- Condensation: BMW GS 95011-4, 2x 1 cycle
- Corrosive gas: EN 60068-2-60, method 4, exposure 21 days

9.2.7.2.1 Starting temperature

The starting temperature describes the minimum permissible ambient temperature when the power is switched off at the time the coated module is switched on. This is permitted to be as low as -40°C . During operation, the conditions as specified in the technical data continue to apply.

Information:

It is important to absolutely ensure that there is no forced cooling by air currents in a closed control cabinet, for example using a fan or ventilation slots.

9.2.7.3 Order data

| | 1 - 4 | Orange | Off | Value = 0 |
| | | | On | Value ≠ 0 |

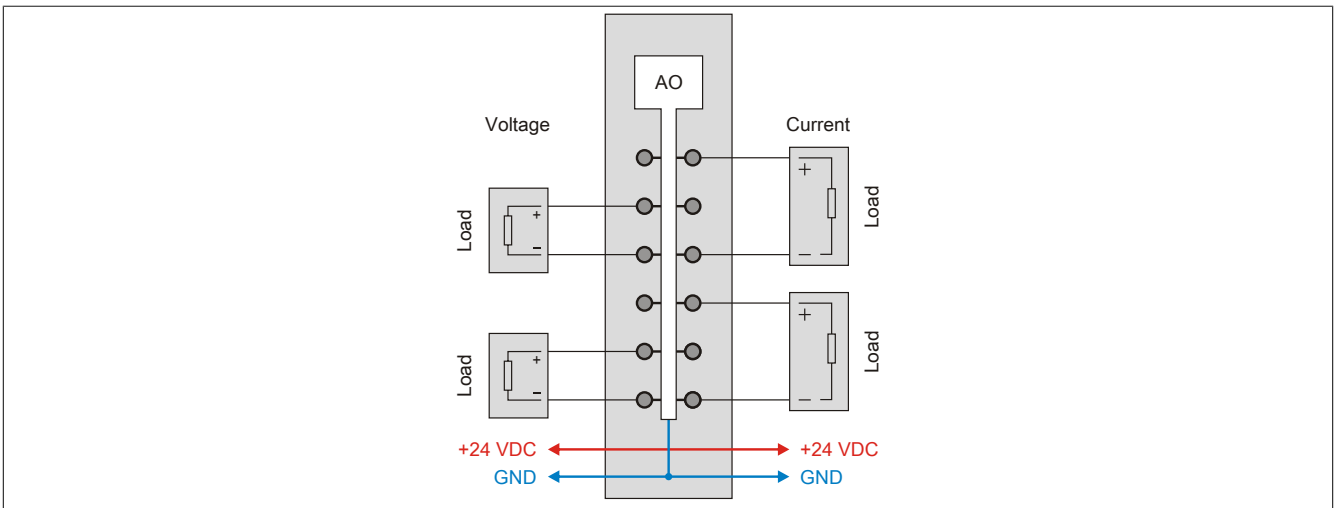

- 1) Depending on the configuration, a firmware update can take up to several minutes.

9.2.7.6 Pinout

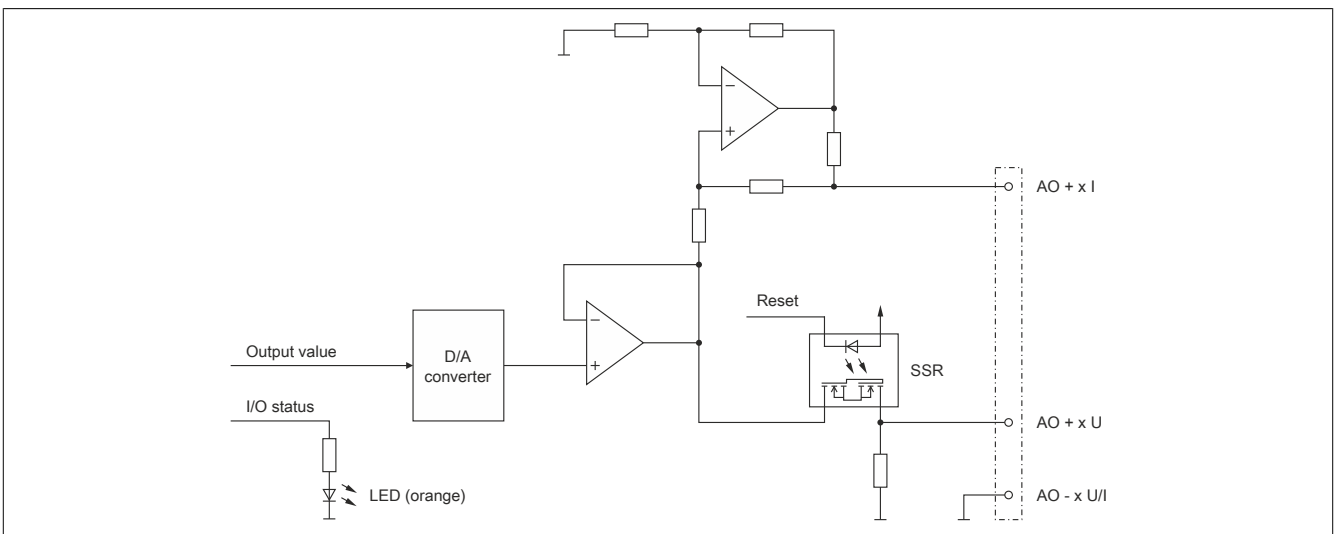

The individual channels can be configured for either current or voltage signals. The type of signal is also determined by the terminals used.

9.2.7.7 Connection example

9.2.7.8 Output circuit diagram

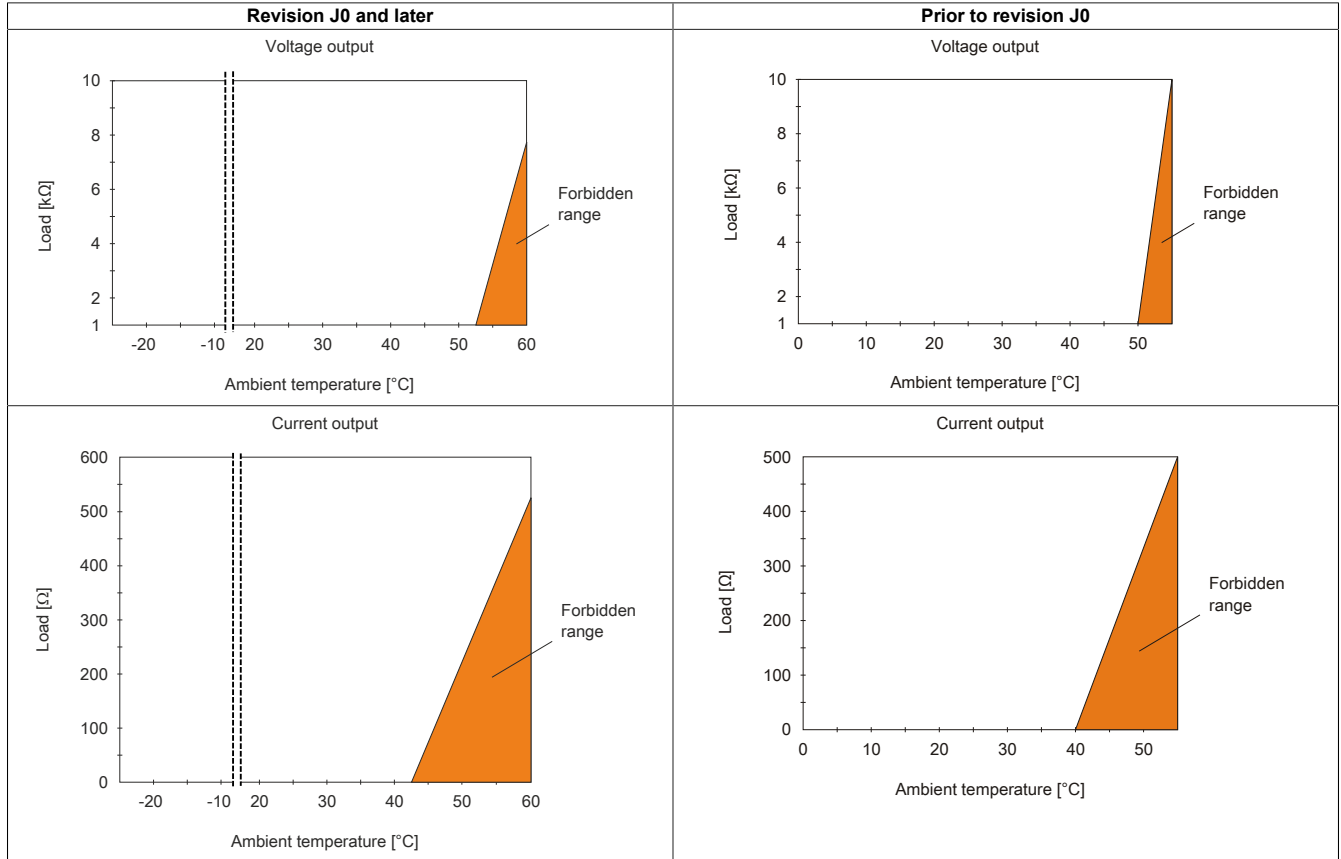

9.2.7.9 Derating

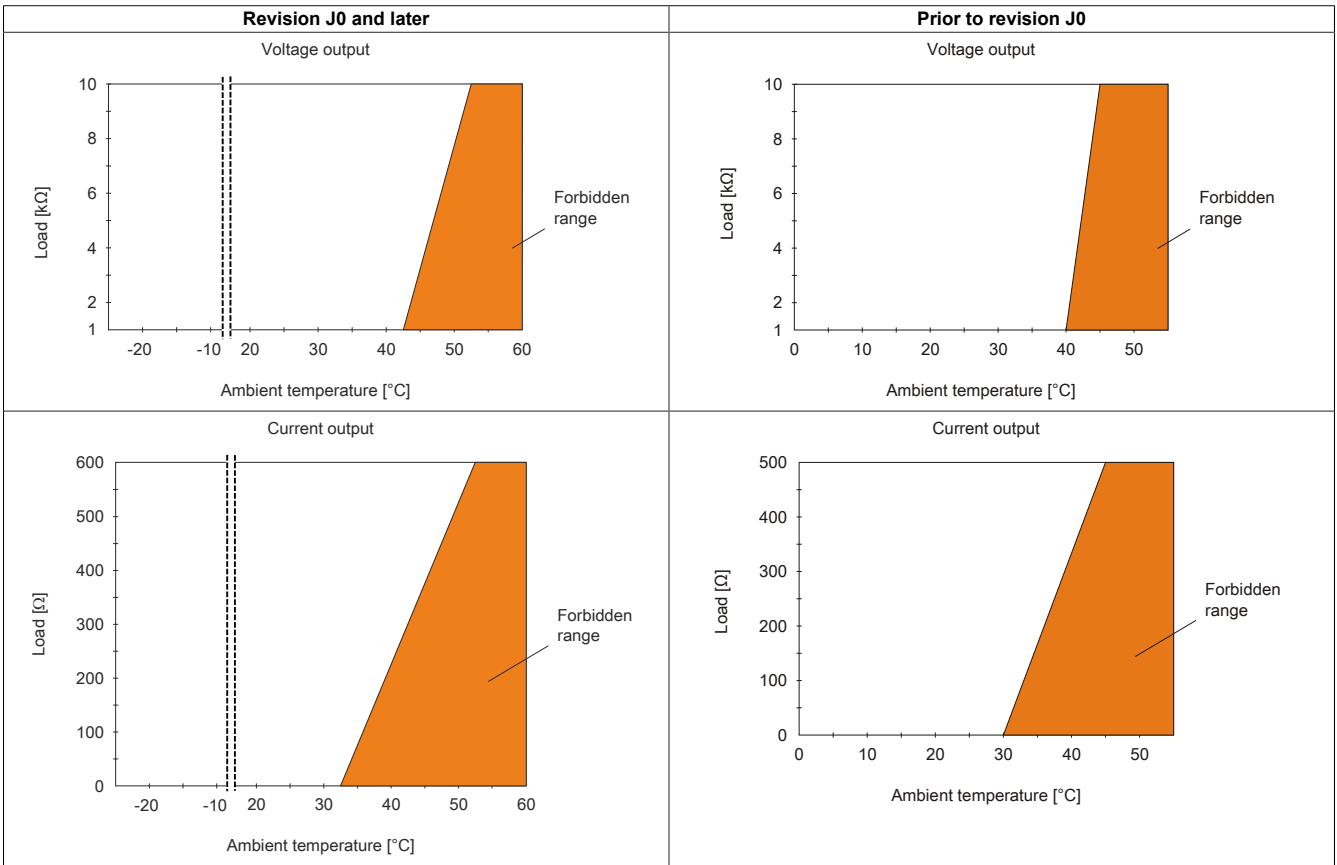

To ensure proper operation, the following points must be taken into account:

- The derating values listed below must be taken into account.
- In mixed operation with one current output, the mean value of both derating curves must be applied.
- In mixed operation with 2 or 3 current outputs, the derating of the current outputs must be applied.

Horizontal mounting orientation

Vertical mounting orientation

9.2.7.10 Register description

9.2.7.10.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section "[General data points](#)" on page 3790.

9.2.7.10.2 Function model 0 - Standard and function model 1 - I/O with fast response

| Register | Name | Data type | Read | | Write | |
|--------------------------------------|---|-----------|--------|---------|--------|---------|
| | | | Cyclic | Acyclic | Cyclic | Acyclic |
| Analog signal - Configuration | | | | | | |
| 18 | ConfigOutput01 (channel type) | USINT | | | | • |
| Analog signal - Communication | | | | | | |
| 0 | AnalogOutput01 | INT | | | • | |
| 2 | AnalogOutput02 | INT | | | • | |
| 4 | AnalogOutput03 | INT | | | • | |
| 6 | AnalogOutput04 | INT | | | • | |

9.2.7.10.3 Function model 254 - Bus controller

| Register | Offset ¹⁾ | Name | Data type | Read | | Write | |
|--------------------------------------|----------------------|---|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| Analog signal - Configuration | | | | | | | |
| 18 | - | ConfigOutput01 (channel type) | USINT | | | | • |
| Analog signal - Communication | | | | | | | |
| 0 | 0 | AnalogOutput01 | INT | | | • | |
| 2 | 2 | AnalogOutput02 | INT | | | • | |
| 4 | 4 | AnalogOutput03 | INT | | | • | |
| 6 | 6 | AnalogOutput04 | INT | | | • | |

1) The offset specifies the position of the register within the CAN object.

9.2.7.10.3.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see "[Using I/O modules on the bus controller](#)" on page 3789.

9.2.7.10.3.2 CAN I/O bus controller

The module occupies 1 analog logical slot on CAN I/O.

9.2.7.10.4 Function model comparison

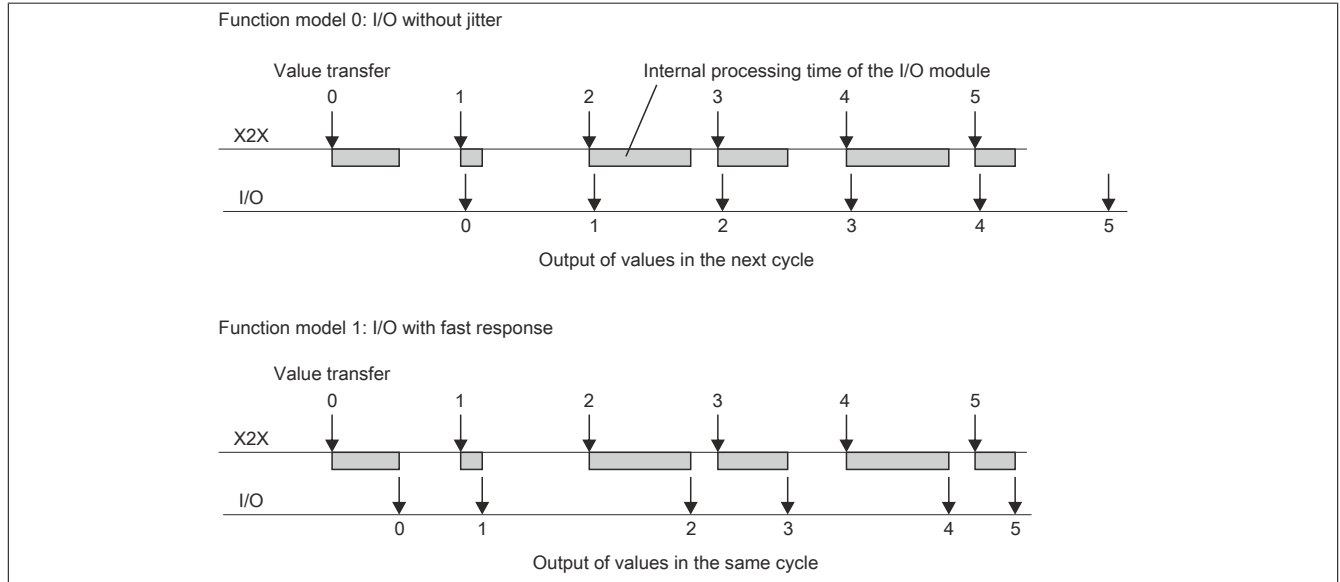

Function model 0: I/O without jitter (standard)

With a minimum cycle of $\geq 400 \mu\text{s}$, the corrected values are output in the next cycle. This reduces jitter to a minimum.

Function model 1: I/O with fast response

With a minimum cycle of $\geq 400 \mu\text{s}$, the corrected values are output in the same cycle (optimized response).

The two function models compared

9.2.7.10.5 Analog outputs

The individual channels can be configured for either current or voltage signals. The type of signal is also determined by the terminals used.

9.2.7.10.5.1 Output values of the analog output

Name:

AnalogOutput01 to AnalogOutput04

The normalized output values are specified via these registers. After a permissible value is transferred, the module outputs the corresponding current or voltage.

| Data type | Values | Information |
|-----------|-----------------|---|
| INT | -32768 to 32767 | Voltage signal -10 to 10 VDC |
| | 0 to 32767 | Current signal 0 to 20 mA |
| | 0 to 32767 | Current signal 4 to 20 mA ¹⁾ |

1) Starting with upgrade version 1.0.2.0 and hardware revision "I0"

9.2.7.10.5.2 Setting the channel type

Name:

ConfigOutput01

The channel type of the outputs can be defined in this register.

The individual channels are designed for current and voltage signals. The differentiation is made by different terminal connections; because of different adjustment values for current and voltage, the output signal must also be selected. The following output signals can be set:

- ± 10 V voltage signal
- 0 to 20 mA current signal
- 4 to 20 mA current signal

| Data type | Values | Bus controller default setting |
|-----------|------------------------|--------------------------------|
| USINT | See the bit structure. | 0 |

Bit structure:

| Bit | Description | Value | Information |
|-----|--------------------------------------|-------|--|
| 0 | Channel 1 | 0 | Voltage signal (bus controller default setting) |
| | | 1 | Current signal, measurement range corresponding to bit 4 |
| ... | | ... | |
| 3 | Channel 4 | 0 | Voltage signal |
| | | 1 | Current signal, measurement range corresponding to bit 7 |
| 4 | Channel 1: Current measurement range | 0 | 0 to 20 mA current signal |
| | | 1 | 4 to 20 mA current signal |
| ... | | ... | |
| 7 | Channel 4: Current measurement range | 0 | 0 to 20 mA current signal |
| | | 1 | 4 to 20 mA current signal |

9.2.7.10.6 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time |
|--------------------|
| 250 μ s |

9.2.7.10.7 Minimum I/O update time

The minimum I/O update time specifies how far the bus cycle can be reduced so that an I/O update is performed in each cycle.

| Minimum I/O update time |
|-------------------------|
| 400 μ s |

9.2.8 X20(c)AO4632

Data sheet version: 3.22

9.2.8.1 General information

The module is equipped with 4 outputs with 16-bit (including sign) digital converter resolution. It is possible to select between the current and voltage signal using different terminals.

- 4 analog outputs
- Either current or voltage signal possible
- 16-bit digital converter resolution

9.2.8.2 Coated modules

Coated modules are X20 modules with a protective coating for the electronics component. This coating protects X20c modules from condensation and corrosive gases.

The modules' electronics are fully compatible with the corresponding X20 modules.

For simplification purposes, only images and module IDs of uncoated modules are used in this data sheet.

The coating has been certified according to the following standards:

- Condensation: BMW GS 95011-4, 2x 1 cycle
- Corrosive gas: EN 60068-2-60, method 4, exposure 21 days

9.2.8.2.1 -40°C starting temperature

The starting temperature describes the minimum permissible ambient temperature when the power is switched off at the time the coated module is switched on. This is permitted to be as low as -40°C. During operation, the conditions as specified in the technical data continue to apply.

Information:

It is important to absolutely ensure that there is no forced cooling by air currents in a closed control cabinet, for example using a fan or ventilation slots.

Vertical mounting orientation

9.2.8.10 Register description

9.2.8.10.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section ["General data points" on page 3790](#).

9.2.8.10.2 Function model 0 - Standard

| Register | Name | Data type | Read | | Write | |
|--------------------------------------|--|-----------|--------|------------|--------|------------|
| | | | Cyclic | Non-cyclic | Cyclic | Non-cyclic |
| Analog signal - Configuration | | | | | | |
| 0 | ConfigOutput01 (channel type) | UINT | | | | • |
| Analog signal - Communication | | | | | | |
| Index * 2 | AnalogOutput0N (Index N = 1 to 4) | INT | | | • | |
| 10 + Index * 4 | AnalogOutputDelayed0N (Index N = 0 to 3) | INT | | | • | |
| 12 | OutputDelayConfig00 | UINT | | | • | |
| 18 | OutputDelayConfig01 | UINT | | | • | |
| 14 | AnalogOutputLatchTime00 | UINT | • | | | |
| 22 | AnalogOutputLatchTime01 | UINT | • | | | |
| 20 | Error | UINT | • | | | |

9.2.8.10.3 Function model 254 - Bus controller

| Register | Offset ¹⁾ | Name | Data type | Read | | Write | |
|--------------------------------------|----------------------|---|-----------|--------|------------|--------|------------|
| | | | | Cyclic | Non-cyclic | Cyclic | Non-cyclic |
| Analog signal - Configuration | | | | | | | |
| 0 | - | ConfigOutput01 (channel type) | UINT | | | | • |
| Analog signal - Communication | | | | | | | |
| 10 + Index * 4 | Index * 2 - 2 | AnalogOutput0N (Index N = 1 to 4) | INT | | | • | |

1) The offset specifies the position of the register within the CAN object.

9.2.8.10.3.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see ["Using I/O modules on the bus controller" on page 3789](#).

9.2.8.10.3.2 CAN I/O bus controller

The module occupies 1 analog logical slot on CAN I/O.

9.2.8.10.4 Analog output - Configuration

9.2.8.10.4.1 Setting the channel type

Name:

ConfigOutput01

This register can be used to set the channel type of the outputs.

Each channel is capable of handling either current or voltage signals. The type of signal is determined by the terminal connections used. Since current and voltage require different adjustment values, it is also necessary to configure the desired type of output signal. The following output signals can be set:

- ± 10 V voltage signal
- 0 to 20 mA current signal

| Data type | Values | Bus controller default setting |
|-----------|------------------------|--------------------------------|
| UINT | See the bit structure. | 0 |

Bit structure:

| Bit | Description | Value | Information |
|---------|-------------|-------|---|
| 0 - 7 | Reserved | 0 | |
| 8 | Channel 1 | 0 | Voltage signal (bus controller default setting) |
| | | 1 | Current signal |
| ... | | ... | |
| 11 | Channel 4 | 0 | Voltage signal (bus controller default setting) |
| | | 1 | Current signal |
| 12 - 15 | Reserved | 0 | |

9.2.8.10.5 Analog output - Configuration

9.2.8.10.5.1 Output values of the analog outputs

Name:

AnalogOutput01 to AnalogOutput04

These registers provide the standardized output values. Once a permitted value is received, the module outputs the respective current or voltage.

Information:

The value "0" disables the channel status LED.

| Data type | Value | |
|-----------|-----------------|---------|
| INT | -32767 to 32767 | Voltage |
| | 0 to 32767 | Current |

9.2.8.10.5.2 Value for delayed output

Name:

AnalogOutputDelayed00 to AnalogOutputDelayed03

These registers contain the values with which the analog outputs are overwritten after the delay configured with "OutputDelayConfig0x" on page 812 has expired.

| Data type | Value | Output Signal |
|-----------|-----------------|----------------------------------|
| INT | -32768 to 32767 | Voltage signal -10 VDC to 10 VDC |
| | 0 to 32767 | Current signal 0 mA to 20 mA |

9.2.8.10.5.3 Configuration of the output delay

Name:

OutputDelayConfig00 to OutputDelayConfig01

2 configurations independent from each other can be created using these registers.

The delay time after which "AnalogOutputDelay0x" on page 811 should overwrite the channel can be configured using bits 0 to 13. Using bits 14 and 15, the channel is determined for which the configuration is valid.

Each channel can only be overwritten once. No additional channel can be overwritten while the respective time is running.

| Data type | Values |
|-----------|------------------------|
| UINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|---------|-------------------------------------|-------|------------------|
| 0 - 13 | Delay time for the selected channel | x | Time in μ s |
| 14 - 15 | Channel | 00 | Analog output 01 |
| | | 01 | Analog output 02 |
| | | 10 | Analog output 03 |
| | | 11 | Analog output 04 |

9.2.8.10.5.4 Delay time for the output value

Name:

AnalogOutputLatchTime00 to AnalogOutputLatchTime01

These registers can be used to read when the respective overwrite value was actually written on the output.

| Data type | Value |
|-----------|-------------------|
| UINT | Actual delay time |

9.2.8.10.5.5 Error register for counter

Name:

Error

There are some limitations because 2 timers are used. This register is available to the user for reporting these potential errors.

The error bits are deleted as soon as a valid state is reset.

| Data type | Values |
|-----------|------------------------|
| UINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|--------|------------------|-------|--|
| 0 | Analog output 01 | 0 | OK |
| | | 1 | Has already been overwritten |
| ... | ... | ... | ... |
| 3 | Analog output 04 | 0 | OK |
| | | 1 | Has already been overwritten |
| 4 | Timer 01 | 0 | OK |
| | | 1 | Already in use |
| 5 | Timer 02 | 0 | OK |
| | | 1 | Already in use |
| 6 | Timer 01 and 02 | 0 | OK |
| | | 1 | Both timers refer to the same channel number |
| 7 - 15 | Reserved | - | |

9.2.8.10.6 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time |
|--------------------|
| 200 μ s |

9.2.8.10.7 Minimum I/O update time

The minimum I/O update time specifies how far the bus cycle can be reduced so that an I/O update is performed in each cycle.

| Minimum I/O update time |
|-------------------------|
| 200 μ s |

9.2.9 X20(c)AO4632-1

Data sheet version: 1.41

9.2.9.1 General information

The module is equipped with 4 outputs with 16-bit (including sign) digital converter resolution. It is possible to select between the current and voltage signal using different terminals.

- 4 analog outputs
- Either current or voltage signal possible
- Extended signal range
- 16-bit digital converter resolution
- NetTime timestamp: Switch-off time

NetTime timestamp for output

For many applications, not only the output value is important, but also the exact switching time. The module is equipped with a NetTime timestamp function for this that can define a switching time to the nearest microsecond.

The timestamp function is based on synchronized timers. The CPU can predefine output events and provide them with a timestamp. After transferring the respective data, including the exact time, the module executes the predefined action at the exactly defined time.

9.2.9.2 Coated modules

Coated modules are X20 modules with a protective coating for the electronics component. This coating protects X20c modules from condensation and corrosive gases.

The modules' electronics are fully compatible with the corresponding X20 modules.

For simplification purposes, only images and module IDs of uncoated modules are used in this data sheet.

The coating has been certified according to the following standards:

- Condensation: BMW GS 95011-4, 2x 1 cycle
- Corrosive gas: EN 60068-2-60, method 4, exposure 21 days

9.2.9.2.1 -40°C starting temperature

The starting temperature describes the minimum permissible ambient temperature when the power is switched off at the time the coated module is switched on. This is permitted to be as low as -40°C. During operation, the conditions as specified in the technical data continue to apply.

Information:

It is important to absolutely ensure that there is no forced cooling by air currents in a closed control cabinet, for example using a fan or ventilation slots.

9.2.9.3 Order data

9.2.9.5 LED status indicators

For a description of the various operating modes, see "Diagnostic LEDs" on page 3787.

| Figure | LED | Color | Status | Description |
|---|-------|--------|--------------|--|
|  | r | Green | Off | No power to module |
| | | | Single flash | RESET mode |
| | | | Double flash | BOOT mode (during firmware update) ¹⁾ |
| | | | Blinking | PREOPERATIONAL mode |
| | | | On | RUN mode |
| | e | Red | Off | No power to module or everything OK |
| | | | On | Error or reset status |
| | 1 - 4 | Orange | Off | Value = 0 |
| | | | On | Value \neq 0 |

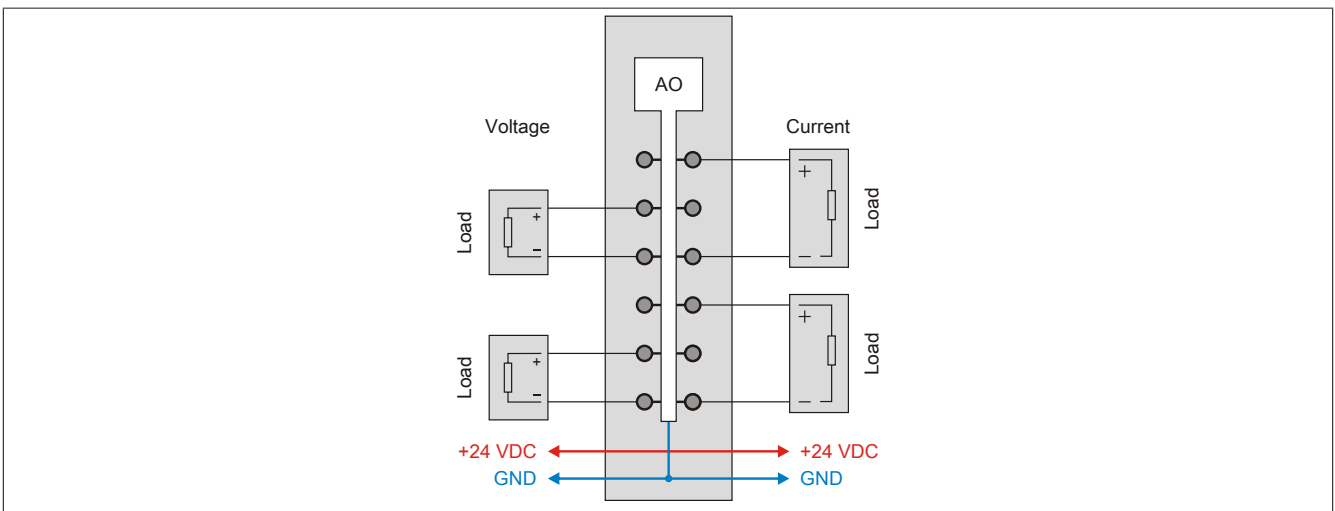

- 1) Depending on the configuration, a firmware update can take up to several minutes.

9.2.9.6 Pinout

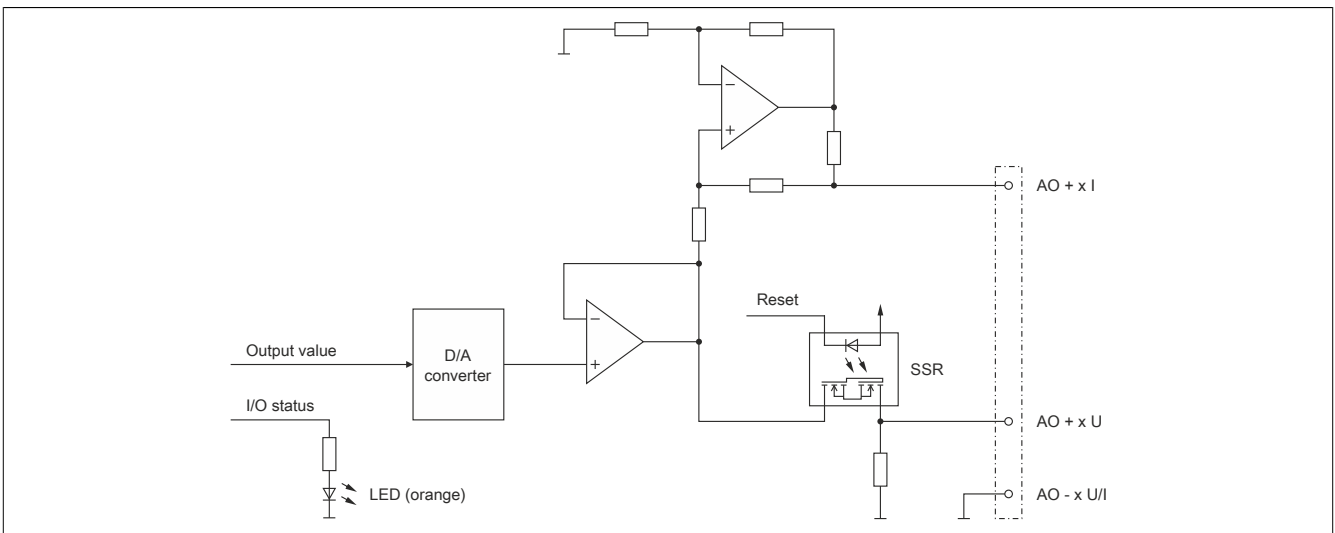

The individual channels can be configured for either current or voltage signals. The type of signal is also determined by the terminals used.

9.2.9.7 Connection example

9.2.9.8 Output circuit diagram

9.2.9.9 Derating

To ensure proper operation, the following items must be taken into consideration:

- The following derating listings must be taken into consideration
- For mixed operation with one current output, the average of both derating curves should be used
- For mixed operation with 2 or 3 current outputs, the derating for the current outputs should be used

9.2.9.10 Register description

9.2.9.10.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section ["General data points" on page 3790](#).

9.2.9.10.2 Function model 0 - Standard

| Register | Name | Data type | Read | | Write | |
|--------------------------------------|--|-----------|--------|------------|--------|------------|
| | | | Cyclic | Non-cyclic | Cyclic | Non-cyclic |
| Analog output - Configuration | | | | | | |
| 0 | ConfigOutput01 (channel type) | UINT | | | | • |
| 590 + Index*4 | Cfo_Channel0NTimeMode (Index N = 1 to 4) | UINT | | | | • |
| Analog output - Communication | | | | | | |
| Index * 2 | AnalogOutput0N (Index N = 1 to 4) | INT | | | • | |
| 457 | SDCLifeCount | SINT | • | | | |
| 794 + Index*8 | ValidationTimer0N (Index N = 1 to 4) | INT | | | • | |
| 796 + Index*8 | ValidationTimer0N (Index N = 1 to 4) | DINT | | | • | |
| 833 | Enabling/disabling the output channels | USINT | • | | • | |
| | AnalogOutput01Enable, ~Readback | Bit 0 | | | | |
| | ... | ... | | | | |
| | AnalogOutput04Enable, ~Readback | Bit 3 | | | | |
| 835 | Checking the output values | USINT | • | | | |
| | AnalogOutput01OK | Bit 0 | | | | |
| | ... | ... | | | | |
| | AnalogOutput04OK | Bit 3 | | | | |

9.2.9.10.3 Function model 254 - Bus controller

| Register | Offset ¹⁾ | Name | Data type | Read | | Write | |
|--------------------------------------|----------------------|-----------------------------------|-----------|--------|------------|--------|------------|
| | | | | Cyclic | Non-cyclic | Cyclic | Non-cyclic |
| Analog output - Configuration | | | | | | | |
| 0 | - | ConfigOutput01 (channel type) | UINT | | | | • |
| Analog output - Communication | | | | | | | |
| 10 + Index * 4 | Index * 2 - 2 | AnalogOutput0N (Index N = 1 to 4) | INT | | | • | |

1) The offset specifies the position of the register within the CAN object.

9.2.9.10.3.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see ["Using I/O modules on the bus controller" on page 3789](#).

9.2.9.10.3.2 CAN I/O bus controller

The module occupies 1 analog logical slot on CAN I/O.

9.2.9.10.4 General information

The module provides 4 analog outputs. Each channel can output a voltage range of ± 11 V or a current range of 0 to 22 mA.

The module also has a time-based watchdog monitor. The user can activate this feature on a channel-by-channel basis as needed.

9.2.9.10.5 Analog output - Configuration

Each channel is configured independently. The user can also define an optional time-based monitor. To make this possible, 4 watchdog timers were implemented, which can be assigned to the outputs.

9.2.9.10.5.1 Setting the channel type

Name:

ConfigOutput01

This register can be used to set the channel type of the outputs.

Each channel is capable of handling either current or voltage signals. The type of signal is determined by the terminal connections used. Since current and voltage require different adjustment values, it is also necessary to configure the desired type of output signal. The following output signals can be set:

- ± 11 V voltage signal
- 0 to 22 mA current signal

| Data type | Values | Bus controller default setting |
|-----------|------------------------|--------------------------------|
| UINT | See the bit structure. | 0 |

Bit structure:

| Bit | Description | Value | Information |
|---------|-------------|-------|---|
| 0 - 7 | Reserved | 0 | |
| 8 | Channel 1 | 0 | Voltage signal (bus controller default setting) |
| | | 1 | Current signal |
| ... | | ... | |
| 11 | Channel 4 | 0 | Voltage signal (bus controller default setting) |
| | | 1 | Current signal |
| 12 - 15 | Reserved | 0 | |

9.2.9.10.5.2 Configuring the time-based watchdog monitor

Name:

Cfo_Channel01TimeMode to Cfo_Channel04TimeMode

This register is used to activate or configure the time-based watchdog monitor for the analog output channels.

Possibilities per channel:

- Validation timer data type: General choice 16 or 32 bit
- Validation window: The maximum value can be further limited within the data type.
- Timer allocation: A separate timer is available for each channel. However, all channels can be configured with the same validation timer, whereby the same settings must be made for the data type and window in the TimeMode registers.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|---------|----------------------|-------|---|
| 0 - 4 | Max. validation time | 00000 | Disabled |
| | | 00001 | 2 μ s |
| | | 00010 | 4 μ s |
| | | 00011 | 8 μ s |
| | | ... | ... |
| | | 11111 | 2,147,483,648 μ s (~35 min) |
| 5 - 7 | Reserved | 0 | |
| 8 - 9 | Timer allocation | 00 | ValidationTimer01 (default for channel 1) |
| | | 01 | ValidationTimer02 (default for channel 2) |
| | | 10 | ValidationTimer03 (default for channel 3) |
| | | 11 | ValidationTimer04 (default for channel 4) |
| 10 - 14 | Reserved | 0 | |
| 15 | Time format | 0 | 16-bit |
| | | 1 | 32-bit |

9.2.9.10.6 Analog output - Communication

In standard mode, the module's outputs are enabled. Based on the configuration and AnalogOutput value, they output the corresponding current or voltage.

If the application requires time-controlled monitoring of the outputs, a validation timer can be assigned to each channel. The validation timer register assigns a validity period to the current output value. If validation is enabled, the module compares the validation time and the [NetTime](#) of the X2X Link. If the transmitted validity period is exceeded, the module switches off the channel and resets the output. State "Safety shutdown" is only exited again when a new valid validation time has been transmitted. If enabled, the module reports back which state it is currently in via the error state bit of the channel.

If the value of the validation timer is incremented in each task cycle, the valid validation time will be calculated as follows:

| | |
|---|--|
| NetTime of the X2X Link master (to which the module is connected) | |
| + | Timespan for transferring data from the X2X Link master to the CPU (higher-level system) |
| + | Cycle time of task class (including tolerance) |
| + | Timespan for transferring the data from the CPU to the module |
| + | Timespan allowed by the application (e.g. for tolerating failure of an X2X Link cycle) |
| = | Valid validation time |

The AnalogOutputEnableByte is enabled during time-based monitoring. If the timer expires prematurely, the corresponding bit in the AnalogOutputOkayByte is reset and the output drops out. This provides an easy way to achieve a defined state.

9.2.9.10.6.1 Output values of the analog outputs

Name:

AnalogOutput01 to AnalogOutput04

These registers provide the standardized output values. Once a permitted value is received, the module outputs the respective current or voltage.

Information:

The value "0" disables the channel status LED.

| Data type | Value | |
|-----------|-----------------|---------|
| INT | -32767 to 32767 | Voltage |
| | 0 to 32767 | Current |

9.2.9.10.6.2 SDC counter register

Name:

SDCLifeCount

The 8-bit counter register is needed for the SDC software package. It is incremented with the system clock to allow the SDC to check the validity of the data frame.

| Data type | Values |
|-----------|-------------|
| SINT | -128 to 127 |

9.2.9.10.6.3 Transfer of the timestamp

Name:

ValidationTimer01 to ValidationTimer04

When an output is being monitored, these registers must provide the timestamp which, when reached, will cause the output to shut down automatically. The values must be provided as signed 2-byte or 4-byte values.

For more information about NetTime and timestamps, see ["NetTime Technology"](#) on page 3035.

| Data type | Values [µs] | |
|-----------|---------------------------------|---|
| INT | -32768 to 32767 | NetTime timestamp of the current output value |
| DINT | -2,147,483,648 to 2,147,483,647 | NetTime timestamp of the current output value |

9.2.9.10.6.4 Enabling/disabling the output channels

Name:

AnalogOutput01Enable to AnalogOutput04Enable

AnalogOutput01EnableReadback to AnalogOutput04EnableReadback

The "OutputEnable" byte is only needed for the channels with activated time-based monitoring. The individual bits are used to enable/disable the respective channels. To receive reliable feedback about the current state of the module, the byte was also implemented so that it can be read cyclically.

| Data type | Value |
|-----------|-------------------|
| USINT | See bit structure |

Bit structure:

| Bit | Name | Value | Information |
|-------|------------------------------|-------|--------------------|
| 0 | AnalogOutput01Enable | 0 | Output deactivated |
| | AnalogOutput01EnableReadback | 1 | Output activated |
| ... | | ... | |
| 3 | AnalogOutput04Enable | 0 | Output deactivated |
| | AnalogOutput04EnableReadback | 1 | Output activated |
| 4 - 7 | Reserved | 0 | |

9.2.9.10.6.5 Checking the output values

Name:

AnalogOutput01OK to AnalogOutput04OK

These registers are only needed for channels with activated time-based monitoring. The individual bits report whether the respective channel is actually generating the required voltage or current.

| Data type | Value |
|-----------|-------------------|
| USINT | See bit structure |

Bit structure:

| Bit | Name | Value | Information |
|-------|------------------|-------|-------------------------------|
| 0 | AnalogOutput01OK | 0 | Electrical signal deactivated |
| | | 1 | Electrical signal activated |
| ... | | ... | |
| 3 | AnalogOutput04OK | 0 | Electrical signal deactivated |
| | | 1 | Electrical signal activated |
| 4 - 7 | Reserved | 0 | |

9.2.9.10.7 NetTime Technology

For a description of NetTime Technology, see ["NetTime Technology" on page 3035](#).

9.2.9.10.8 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time |
|--------------------|
| 200 μ s |

9.2.9.10.9 Minimum I/O update time

The minimum I/O update time specifies how far the bus cycle can be reduced so that an I/O update is performed in each cycle.

| Minimum I/O update time |
|-------------------------|
| 200 μ s |

9.2.10 X20AO4635

Data sheet version: 3.11

9.2.10.1 General information

The module is equipped with 4 outputs with 16-bit (including sign) digital converter resolution. It is possible to select between the current and voltage signal using different terminals.

- 4 analog outputs
- Either current or voltage signal possible
- 16-bit digital converter resolution
- Low temperature drift

9.2.10.2 Order data

| Model number | Short description | Figure |

9.2.10.4 LED status indicators

For a description of the various operating modes, see "Diagnostic LEDs" on page 3787.

| Figure | LED | Color | Status | Description |
|--|-------|--------|--------------|--|
|  | r | Green | Off | No power to module |
| | | | Single flash | RESET mode |
| | | | Double flash | BOOT mode (during firmware update) ¹⁾ |
| | | | Blinking | PREOPERATIONAL mode |
| | e | Red | On | RUN mode |
| | | | Off | No power to module or everything OK |
| | 1 - 4 | Orange | On | Error or reset status |
| | | | Off | Value = 0 |
| | | | On | Value ≠ 0 |

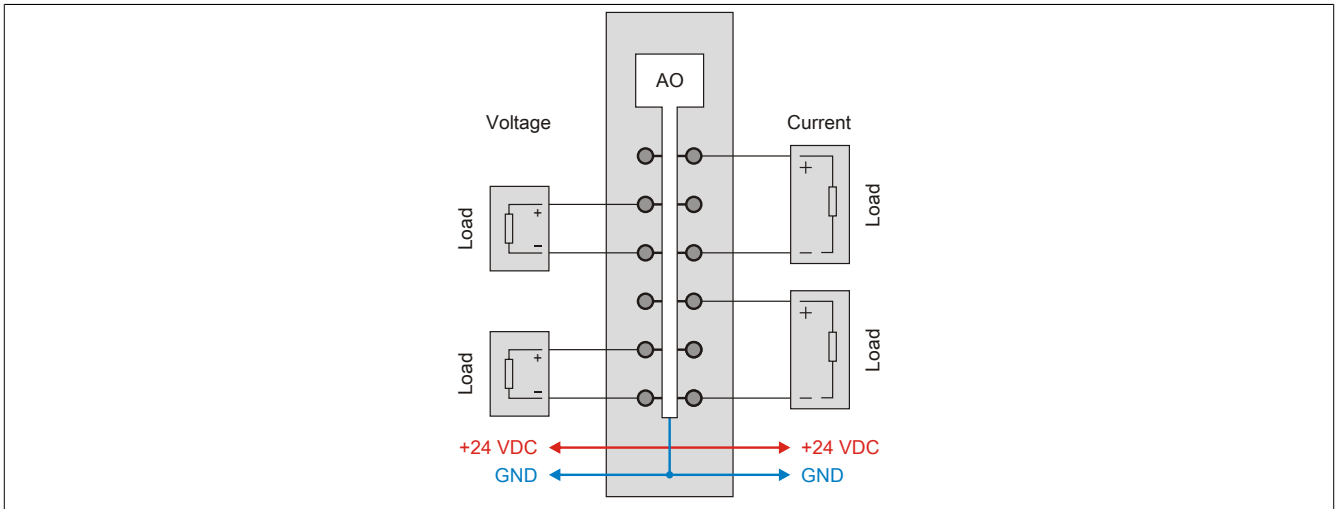

- 1) Depending on the configuration, a firmware update can take up to several minutes.

9.2.10.5 Pinout

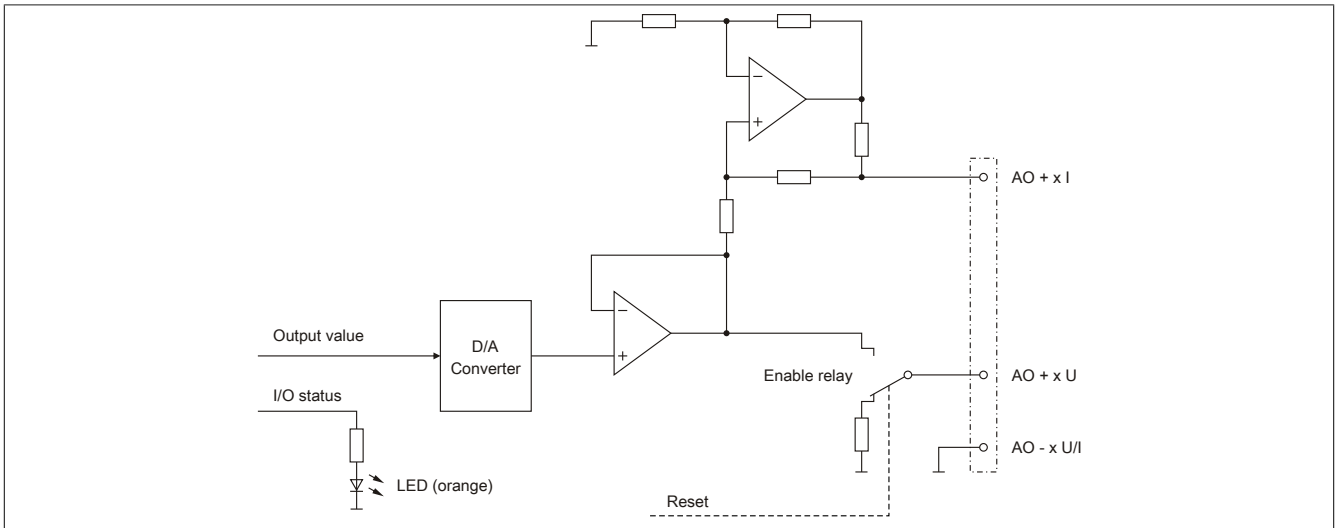

The individual channels can be configured for either current or voltage signals. The type of signal is also determined by the terminals used.

9.2.10.6 Connection example

9.2.10.7 Output circuit diagram

9.2.10.8 Module operation

To ensure proper operation, the following items must be taken into consideration:

- The following derating listings must be taken into consideration
- For mixed operation with one current output, the average of both derating curves should be used
- For mixed operation with 2 or 3 current outputs, the derating for the current outputs should be used

Horizontal installation

Figure 92: Derating the load with a voltage output and horizontal mounting

Vertical installation

Figure 93: Derating the load with a voltage output and vertical mounting

9.2.10.9 Register description

9.2.10.9.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section ["General data points" on page 3790](#).

9.2.10.9.2 Function model 0 - Standard

| Register | Name | Data type | Read | | Write | |
|----------------------|---|-----------|--------|------------|--------|------------|
| | | | Cyclic | Non-cyclic | Cyclic | Non-cyclic |
| Configuration | | | | | | |
| 0 | ConfigOutput01 (channel type) | UINT | | | | • |
| Communication | | | | | | |
| 2 | AnalogOutput01 | INT | | | • | |
| 4 | AnalogOutput02 | INT | | | • | |
| 6 | AnalogOutput03 | INT | | | • | |
| 8 | AnalogOutput04 | INT | | | • | |

9.2.10.9.3 Function model 254 - Bus controller

| Register | Offset ¹⁾ | Name | Data type | Read | | Write | |
|----------------------|----------------------|---|-----------|--------|------------|--------|------------|
| | | | | Cyclic | Non-cyclic | Cyclic | Non-cyclic |
| Configuration | | | | | | | |
| 0 | - | ConfigOutput01 (channel type) | UINT | | | | • |
| Communication | | | | | | | |
| 2 | 0 | AnalogOutput01 | INT | | | • | |
| 4 | 2 | AnalogOutput02 | INT | | | • | |
| 6 | 4 | AnalogOutput03 | INT | | | • | |
| 8 | 6 | AnalogOutput04 | INT | | | • | |

1) The offset specifies the position of the register within the CAN object.

9.2.10.9.3.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see ["Using I/O modules on the bus controller" on page 3789](#).

9.2.10.9.3.2 CAN I/O bus controller

The module occupies 1 analog logical slot on CAN I/O.

9.2.10.9.4 Analog outputs

The individual channels can be configured for either current or voltage signals. The type of signal is also determined by the terminals used.

9.2.10.9.4.1 Output values of the analog outputs

Name:

AnalogOutput01 to AnalogOutput04

These registers provide the standardized output values. Once a permitted value is received, the module outputs the respective current or voltage.

Information:

The value "0" disables the channel status LED.

| Data type | Value | |
|-----------|-----------------|---------|
| INT | -32767 to 32767 | Voltage |
| | 0 to 32767 | Current |

9.2.10.9.4.2 Setting the channel type

Name:

ConfigOutput01

This register can be used to set the channel type of the outputs.

Each channel is capable of handling either current or voltage signals. The type of signal is determined by the terminal connections used. Since current and voltage require different adjustment values, it is also necessary to configure the desired type of output signal. The following output signals can be set:

- ± 10 V voltage signal
- 0 to 20 mA current signal

| Data type | Values | Bus controller default setting |
|-----------|------------------------|--------------------------------|
| UINT | See the bit structure. | 0 |

Bit structure:

| Bit | Description | Value | Information |
|---------|-------------|-------|---|
| 0 - 7 | Reserved | 0 | |
| 8 | Channel 1 | 0 | Voltage signal (bus controller default setting) |
| | | 1 | Current signal |
| ... | | ... | |
| 11 | Channel 4 | 0 | Voltage signal (bus controller default setting) |
| | | 1 | Current signal |
| 12 - 15 | Reserved | 0 | |

9.2.10.9.5 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time |
|--------------------|
| 200 μ s |

9.2.10.9.6 Minimum I/O update time

The minimum I/O update time specifies how far the bus cycle can be reduced so that an I/O update is performed in each cycle.

| Minimum I/O update time |
|-------------------------|
| 200 μ s |

9.3 Bus controllers

Bus controllers consist of a base module, power supply module for providing power to the entire system and the fieldbus interface. This makes the bus controller an extremely flexible fieldbus interface.

Unlike a CPU with an integrated fieldbus connection, the bus controller does not need to be programmed in order to transfer or receive I/O data on the fieldbus. It works simply by configuring it on the fieldbus master.

Compact design

The supply for the bus controller, X2X Link network and I/O modules is part of the bus controller. No additional power supply modules are required.

9.3.1 Summary

| Model number | Short description | Page |
|--------------|---|------|
| X20BC0043-10 | X20 bus controller, 1 CANopen interface, order 1x terminal block TB2105 separately! Order bus base, power supply module and terminal block separately! | 834 |
| X20BC0053 | X20 bus controller, 1 DeviceNet interface, order 1x TB2105 terminal block separately Order bus base, power supply module and terminal separately | 841 |
| X20BC0063 | X20 bus controller, 1 PROFIBUS DP interface, 9-pin DSUB connection, order bus base, power supply module and terminal block separately | 847 |
| X20BC0073 | X20 bus controller, 1 CAN I/O interface, order 1x TB2105 terminal block separately Order bus base, power supply module and terminal separately | 851 |
| X20BC0083 | X20 bus controller, 1 POWERLINK interface, integrated 2-port hub, 2x RJ45, order bus base, power supply module and terminal block separately! | 859 |
| X20BC0087 | X20 bus controller, 1 Modbus TCP or Modbus UDP interface, integrated 2-port switch, 2x RJ45, order bus base, power supply module and terminal block separately. | 864 |
| X20BC0087-10 | X20 bus controller, 1 Modbus TCP or Modbus UDP interface, producer mode feature (via UDP), integrated switch, 2x RJ45, order bus base, power supply module and terminal block separately. | 870 |
| X20BC0088 | X20 bus controller, 1 EtherNet/IP interface, integrated switch, web interface, 2x RJ45, order bus base, power supply module and terminal block separately! | 877 |
| X20BC008U | X20 bus controller, 1 OPC UA Ethernet interface, integrated 2-port switch, 2x RJ45, order bus base, power supply module and terminal block separately. | 882 |
| X20BC00E3 | X20 bus controller, 1 PROFINET IO interface, integrated 2-port switch, 2x RJ45, order bus base, power supply module and terminal block separately! | 904 |
| X20BC00G3 | X20 bus controller, 1 EtherCAT interface, 2x RJ45, order bus base, power supply module and terminal block separately. | 910 |
| X20BC0143-10 | X20 bus controller, 1 CANopen interface, 9-pin DSUB, order 1x connector 7AC911.9 separately. Order bus base, power supply module and terminal block separately. | 914 |
| X20cBC0083 | X20 bus controller, coated, 1 POWERLINK interface, integrated 2-port hub, 2x RJ45, order bus base, power supply module and terminal block separately! | 859 |
| X20cBC0087 | X20 bus controller, coated, Modbus/TCP or Modbus/UDP interface, integrated 2-port switch, 2x RJ45, order bus base, power supply module and terminal block separately | 864 |
| X20cBC0088 | X20 bus controller, coated, 1 EtherNet/IP interface, integrated switch, web interface, 2x RJ45, order bus base, power supply module and terminal block separately! | 877 |
| X20cBC00E3 | X20 bus controller, coated, 1 PROFINET IO interface, integrated 2-port switch, 2x RJ45, order bus base, power supply module and terminal block separately! | 904 |

9.3.2 X20BC0043-10

Data sheet version: 1.16

9.3.2.1 General information

CAN (Controller Area Network) systems are widespread in the field of automation technology. CAN topology is based on a line structure and uses twisted wire pairs for data transfer. CANopen is a higher-layer protocol based on CAN. As a standardized protocol, it provides a high degree of flexibility for implementing a wide range of configurations.

The bus controller makes it possible to connect up to 253 X2X Link I/O modules to CANopen. A transition between IP20 and IP67 protection outside of the control cabinet is possible by aligning X20, X67 or XV modules one after the other as needed at distances up to 100m. All CANopen transmission types such as synchronous, event and polling modes are supported together with PDO linking, life/node guarding, emergency objects, and much more.

- Fieldbus: CANopen
- Auto-configuration of I/O modules
- I/O configuration via the fieldbus
- Constant response times even with large amounts of data (max. 32 Rx and 32 Tx PDOs)
- Configurable I/O cycle (0.5 to 4 ms)
- Possible to configure the transfer rate or have it detected automatically
- Heartbeat consumer and producer
- Emergency producer
- 2x SDO server, NMT slave
- Simple bootup (autostart)
- Terminal access via the serial interface on the X20PS9400
- Integrated terminating resistor

Information:

Only the standard function model (see the respective module description) is supported when the bus controller is used together with multi-function modules it has automatically configured itself.

Automation Studio V4.3 or later can be used to easily create configuration files (e.g. DCF files). All other function models are also supported by transferring configuration data to the bus controller (e.g. via the master environment with an SDO download).

Automation Studio can be downloaded at no cost from the B&R website (www.br-automation.com). The evaluation license is permitted to be used to create complete configurations for fieldbus bus controllers at no cost.

9.3.2.2 Order data

| Model number | Short description | Figure |
|--------------|--|---|
| | Bus controllers |  |
| X20BC0043-10 | X20 bus controller, 1 CANopen interface, order 1x terminal block TB2105 separately! Order bus base, power supply module and terminal block separately! | |
| | Required accessories | |
| | System modules for bus controllers | |
| X20BB80 | X20 bus base, for X20 base module (BC, HB, etc.) and X20 power supply module, X20 end plates (left and right) X20AC0SL1/ X20AC0SR1 included | |
| X20PS9400 | X20 power supply module, for bus controller and internal I/O power supply, X2X Link power supply | |
| X20PS9402 | X20 power supply module, for bus controller and internal I/O power supply, X2X Link power supply, supply not electrically isolated | |
| | Terminal blocks | |
| 0TB2105.9010 | Accessory terminal block, 5-pin, screw clamps 2.5 mm ² | |
| 0TB2105.9110 | Accessory terminal block, 5-pin, push-in terminal block 2.5 mm ² | |
| X20TB12 | X20 terminal block, 12-pin, 24 VDC keyed | |

| Mechanical properties | | |
| Note | Order 1x terminal block TB2105 separately. Order 1x terminal block X20TB12 separately. Order 1x power supply module X20PS9400 X20PS9402 separately. Order 1x bus base X20BB80 separately. | |
| Pitch ²⁾ | 37.5 ^{+0.2} mm | |

Table 109: X20BC0043-10 - Technical data

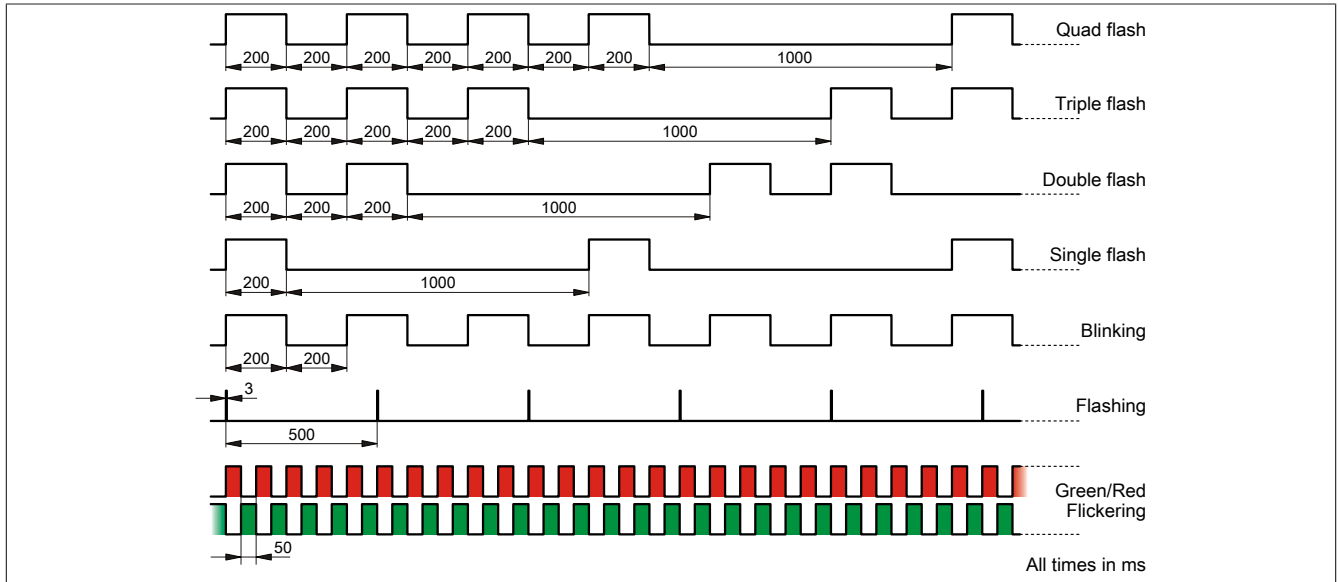

- 1) The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring.
- 2) Spacing is based on the width of bus base X20BB80. In addition, power supply module X20PS9400 or X20PS9402 is always required for the bus controller.

9.3.2.4 LED status indicators

| Figure | LED | Color | Status | Description |
|--|------------------|-----------|--|--|
|  | MS ¹⁾ | Green | Off | No power supply |
| | | | Flashing | 5-second time window for deleting all configuration settings |
| | | | On | Boot procedure OK, I/O modules OK |
| | | Red | Double flash | Successfully erased flash memory |
| | | | Triple flash | Successfully saved transfer rate |
| | | | Quad flash | Successfully saved configuration |
| | On ²⁾ | | I/O modules: Error message or incorrect configuration | |
| | RUN | Green | Off | No power supply |
| | | | Single flash | STOP mode |
| | | | Triple flash | Firmware download in progress |
| | | | Blinking | Mode PREOPERATIONAL |
| | | | On | Mode OPERATIONAL |
| | ERR | Red | Off | No power supply or everything OK |
| | | | Single flash | CAN warning limit reached |
| | | | Double flash | Node guarding / Heartbeat error |
| | | | Blinking | Invalid node number or configuration |
| | | | On | Bus error: Bus off |
| | RUN/ERR | Green/Red | Flickering | Transfer rate detection in progress |
| | TxD | Yellow | Off | No data is being transmitted from the bus controller via the CANopen fieldbus. |
| | | | On | The bus controller is transmitting data via the CANopen fieldbus. |
| TERM | Yellow | Off | The terminating resistor integrated in the bus controller is switched off. | |
| | | On | The terminating resistor integrated in the bus controller is switched on. | |

- 1) LED "MS" is a green/red dual LED. Several red blinking signals are displayed immediately after the device is switched on. These are startup messages, however, and not errors.
- 2) The red "MS" LED can be cleared by writing to object 0x3001-Sub 0xA.

LED status indicators - Blink times

9.3.2.5 Operating and connection elements

9.3.2.6 CAN bus interface

The interface is a 5-pin multipoint connector. Terminal block 0TB2105 must be ordered separately.

| Interface | Pinout | | |
|--|----------|------------------|------------|
| | Terminal | Function | |
| <p>5-pin male multipoint connector</p> | 1 | CAN _L | CAN ground |
| | 2 | CAN _L | CAN low |
| | 3 | SHLD | Shield |
| | 4 | CAN _H | CAN high |
| | 5 | NC | |

9.3.2.7 Terminating resistor

A terminating resistor is already integrated on the bus controller. It can be turned on and off with a switch on the bottom of the housing. An active terminating resistor is indicated by the "TERM" LED.

9.3.2.8 Node number and transfer rate

Node numbers and transfer rates are configured using the two bus controller number switches.

The transfer rate can be specified in two ways:

- Automatic detection by bus controller (see ["Automatic transfer rate detection" on page 838](#))
- Fixed definition by user (see ["Setting the transfer rate" on page 838](#))

| Switch position | Node number | Transfer rate |
|-----------------|--|--|
| 0x00 | Not allowed | - |
| 0x01 - 0x7F | 1 - 127 | Automatically set by the bus controller (default) or fixed setting by the user |
| 0x80 - 0x88 | - | Sets a fixed transfer rate |
| 0x89 | - | Sets automatic transfer rate detection |
| 0x8A - 0x8F | Not allowed | - |
| 0x90 | Clearing the parameters See "Clearing parameters" on page 840 | - |
| 0x91 | Not allowed | - |
| 0x92 | Save configuration ¹⁾ See "Save automatic configuration" on page 839 | - |
| 0x93 - 0xFF | Not allowed | - |

1) This function is available starting with Hardware version E0 or Firmware version V0001.0107.

9.3.2.9 Automatic transfer rate detection

After startup, the bus controller goes into "Listen only" mode. This means the bus controller behaves passively on the bus and only listens.

The bus controller attempts to receive valid objects. If receive errors occur, the controller switches to the next transfer rate in the lookup table.

If no objects are received, all transfer rates are tested cyclically. This procedure is repeated until valid objects are received.

Lookup table

The bus controller tests the transfer rate according to this table. Beginning with the starting transfer rate (1000 kbit/s), the controller switches to the next lower transfer rate. At the end of the table, the bus controller restarts the search from the beginning.

| Transfer rate |
|---------------|
| 1000 kbit/s |
| 800 kbit/s |
| 500 kbit/s |
| 250 kbit/s |
| 125 kbit/s |
| 100 kbit/s |
| 50 kbit/s |
| 20 kbit/s |
| 10 kbit/s |

9.3.2.10 Setting the transfer rate

The bus controller will detect the transfer rate automatically by default. Switch positions 0x80 to 0x88 can be used to set a fixed transfer rate, or 0x89 can be used to enable automatic transfer rate detection.

| Switch position | Transfer rate |
|-----------------|-----------------------------------|
| 0x80 | 1000 kbit/s |
| 0x81 | 800 kbit/s |
| 0x82 | 500 kbit/s |
| 0x83 | 250 kbit/s |
| 0x84 | 125 kbit/s |
| 0x85 | 100 kbit/s |
| 0x86 | 50 kbit/s |
| 0x87 | 20 kbit/s |
| 0x88 | 10 kbit/s |
| 0x89 | Automatic transfer rate detection |

Programming the transfer rate

1. Switch off the power supply to the bus controller.
2. Define the transfer rate by selecting the switch position (0x80 to 0x89).
3. Switch on the power supply to the bus controller.
4. Wait until LED "MS" blinks with a red triple flash (transfer rate is now programmed).
5. Switch off the power supply to the bus controller.
6. Set the desired node number (0x01 - 0x7F).
7. Switch on the power supply to the bus controller.
8. The bus controller now boots with the set node number and the programmed transfer rate.

9.3.2.11 Save automatic configuration

The node number position 0x92 can be used to save automatically generated configurations. This makes it possible to work with a standardized configuration without having to adapt the application to changes associated with service work or different development stages for example.

1. Turn off the power supply to the bus controller.
2. Set the node number to 0x90.
3. Turn on the power supply to the bus controller.
4. Wait until the "MS" LED flashes green.
5. The node number switch must be set to 0x00 and then back to 0x90 within this time window of 5 seconds (rotate the top switch).
6. Wait until the "MS" LED blinks with a red double-flash (parameters have been cleared).
7. Turn off the power supply to the bus controller.
8. Set the node number to 0x92.
9. Turn on the power supply to the bus controller.
10. Wait until the "MS" LED flashes green.
11. The node number switch must be set to 0x02 and then back to 0x092 within this time window of 5 seconds (rotate the top switch).
12. Wait until the "MS" LED blinks with a red quad-flash (parameters have been saved).
13. Turn off the power supply to the bus controller.
14. Set the desired node number (0x01 - 0x7F).
15. Turn on the power supply to the bus controller.
16. The bus controller boots with the set node number and automatic transfer rate detection.

Information:

A mapping tool for decoding the saved PDO mapping is available in the Download section of the B&R website (www.br-automation.com).

Information:

This function is available starting with Hardware version E0 or Firmware version V0001.0107.

9.3.2.12 Clearing parameters

Various parameters can be stored in the bus controller's flash memory:

- Communication parameters
- Vendor-specific parameters
- Application parameters (device profile)
- Programmed transfer rate

Clearing the parameters using switch position 0x90 returns the bus controller to its factory settings.

Clearing the parameters listed above

1. Turn off the power supply to the bus controller.
2. Set the node number to 0x90.
3. Turn on the power supply to the bus controller.
4. Wait until the "MS" LED flashes green. The node number switch must be set to 0x00 and then back to 0x090 within this time window of 5 seconds (rotate the top switch).
5. Wait until the "MS" LED blinks with a red double-flash (parameters have been cleared).
6. Turn off the power supply to the bus controller.
7. Set the desired node number (0x01 - 0x7F).
8. Turn on the power supply to the bus controller.
9. The bus controller boots with the set node number and automatic transfer rate detection.

9.3.2.13 Additional documentation and import files (EDS)

Additional documentation about bus controller functions as well as the necessary import files for the master engineering tool are available for download from the Downloads section of the B&R website (www.br-automation.com).

9.3.3 X20BC0053

Data sheet version: 2.36

9.3.3.1 General information

DeviceNet was developed by Allen-Bradley as a CAN bus based automation network. It is based on a producer/consumer protocol. From the user's point of view, all data is handled completely separately from the features of the CAN bus (e.g. longer data packets are fragmented automatically by DeviceNet). I/O messages with defined characteristics are used for access.

This bus controller makes it possible to connect X2X Link I/O nodes to DeviceNet. It has automatic transfer rate detection, auto scan, automatic mapping and automatic configuration of the I/O modules. Explicit messaging, change of state, cyclic, polled and bit strobe are supported as transfer modes.

In addition to the standard communication objects, there are vendor-specific objects to represent the modular X20 System in the best manner possible. X20 and other modules based on X2X Link can be connected to the bus controller.

The entire configuration of this type of modular system is supported by the DeviceNet standard. Allen Bradley developed the modular I/O configuration to simplify the necessary configuration steps. The DeviceNet bus controllers from B&R also support this type of configuration.

- Fieldbus: DeviceNet
- I/O configuration via the fieldbus
- Support of both linear and modular (Allen Bradley) configuration systems
- Auto scan, automatic I/O mapping of the I/Os
- Automatic I/O configuration
- Integrated terminating resistor

Information:

Only the standard function model (see the respective module description) is supported when the bus controller is used together with multi-function modules it has automatically configured itself.

9.3.3.2 Order data

| Model number | Short description | Figure |
|--------------|--|---|
| | Bus controllers |  |
| X20BC0053 | X20 bus controller, 1 DeviceNet interface, order 1x TB2105 terminal block separately Order bus base, power supply module and terminal separately | |

| Note | Order 1x TB2105 terminal block separately Order 1x X20TB12 terminal block separately Order 1x X20PS9400 or X20PS9402 power supply module separately Order 1x X20BB80 bus base separately |
| Spacing ²⁾ | 37.5 ^{+0.2} mm |

Table 111: X20BC0053 - Technical data

- 1) The minimum cycle time defines how far the bus cycle can be reduced without communication errors occurring.
- 2) Spacing is based on the width of the X20BB80 bus base. In addition, an X20PS9400 or X20PS9402 supply module is always required for the bus controller.

9.3.3.4 LED status indicators

| Figure | LED | Color | Status | Description |
|---|-------------------|-----------|----------|---|
|  | MOD ¹⁾ | Green | Off | Bus sense error: If the "NET" LED is also "off", there is no 24 V DeviceNet voltage. No transfer rate: If the PS9400's "RUN" LED is active (PREOPERATIONAL or RUN mode), the automatic transfer rate detection is still running or no transfer rate could be detected. |
| | | | On | RUN mode: The 24 V DeviceNet voltage is OK and the module is operating under normal conditions. |
| | | | Blinking | Standby mode: Configuration is missing, incomplete, or incorrect. |
| | | Red | Blinking | Recoverable Fault mode: |
| | | Green/red | Blinking | Module is performing a self test. |
| | NET ¹⁾ | Green | Off | No power, offline: <ul style="list-style-type: none"> • Bus sense error: If the "MOD" LED is also off, there is no 24 V DeviceNet voltage. • No transfer rate: If the PS9400's "RUN" LED is active (PREOPERATIONAL or RUN mode), the automatic transfer rate detection is still running or no transfer rate could be detected. • Module has not yet completed a duplicate MAC-ID test. |
| | | | Blinking | Online, not connected: <ul style="list-style-type: none"> • The module has carried out the duplicate MAC-ID test and is online. • There is no established connection to a master/scanner. |
| | | | On | Everything is OK: A connection to the master/scanner (explicit or I/O) is set up. |
| | | Red | Blinking | Connection timeout: The time for an I/O connection has expired. |
| | | | On | Critical connection error - fieldbus communication no longer possible: <ul style="list-style-type: none"> • Duplicate MAC ID error • Bus off • Receive/transmit overrun |
| | | TxD | Yellow | Off |
| | On | | | The bus controller is transmitting data via the DeviceNet fieldbus |
| | TERM | Yellow | Off | The terminating resistor integrated in the bus controller is turned off |
| | | | On | The terminating resistor integrated in the bus controller is turned on |

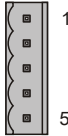

1) The "MOD" and "NET" LEDs are green/red dual LEDs.

9.3.3.5 Operating and connection elements

9.3.3.6 DeviceNet interface

The interface is a 5-pin multipoint connector. Terminal block 0TB2105 must be ordered separately.

| Interface | Pinout | | |
|--|----------|-----------------------|------------------------------|
| | Terminal | DeviceNet | |
|  5-pin male multipoint connector | 1 | CAN _⊥ (V-) | CAN ground |
| | 2 | CAN _L | CAN low |
| | 3 | SHLD | Shield |
| | 4 | CAN _H | CAN high |
| | 5 | V+ | Supply voltage ¹⁾ |

1) The 24 VDC in the DeviceNet network must be fed in externally in order to guarantee correct operation and data exchange. 24 VDC is not made available by the device.

9.3.3.7 Terminating resistor

A terminating resistor is already integrated on the bus controller. It can be turned on and off with a switch on the bottom of the housing. An active terminating resistor is indicated by the "TERM" LED.

9.3.3.8 Node number

The MAC ID is configured using the two address switches on the bus controller.

The configurable range lies between 0 and 63. This value range is required in the DeviceNet specifications for a DeviceNet device.

| Switch position | MAC ID |
|-----------------|---|
| 00 - 63 | 0 to 63 |
| 64 | The MAC ID can be configured by setting the address switch using the master/scanner software. |
| 65 - 89 | Not permitted |
| 90 | See "Clearing parameters" on page 845 |
| 91 - 94 | Not permitted |
| 95 | See "Automatic configuration" on page 846 |
| 96 - 99 | Not permitted |

Number position in switch position "P"

9.3.3.9 Automatic transfer rate detection

After booting, the bus controller goes into "Listen only" mode. This means the bus controller behaves passively on the bus and only listens.

The bus controller attempts to receive valid objects. If receive errors occur, the controller switches to the next transfer rate in the lookup table.

If no objects are received, all transfer rates are tested cyclically. This procedure is repeated until valid objects are received, indicating that the correct transfer rate has been determined. Only transfer rates permitted by the DeviceNet specification are tested.

Lookup table

The controller tests the transfer rate according to this table. Beginning with the starting transfer rate (500 kbit/s), the controller switches to the next lower transfer rate. At the end of the table, the bus controller restarts the search from the beginning.

| Transfer rate |
|---------------|
| 500 kbit/s |
| 250 kbit/s |
| 125 kbit/s |

Information:

While automatic transfer rate recognition is running, both DeviceNet LEDs are switched off (because there is no LED status definition in the DeviceNet specifications for this status).

To ensure that the module has been supplied and booted, this manufacturer specific status definition requires the X20PS9400 RUN LED to be active.

9.3.3.10 Clearing parameters

Various parameters can be stored in the bus controller's flash memory. Deleting these parameters using switch position 90 returns the bus controller to its factory settings.

Deleting the parameters

1. Turn off the power supply to the bus controller.
2. Set the node number to 90
3. Turn on the power supply to the bus controller.
4. Wait until the "MOD" LED flashes green for 5 s (3 ms on / 500 ms off). The node number switch "x10" must be set to 0 and then back to 9 within this time window.
5. Wait until the "MOD" LED blinks with a red double-flash (parameters have been cleared).
6. Turn off the power supply to the bus controller.
7. Set the desired node number (00 to 63).
8. Turn on the power supply to the bus controller.
9. The bus controller boots with the set node number and automatic transfer rate detection.

9.3.3.11 Automatic configuration of the I/O modules

The automatic configuration of the connected I/O modules by the bus controller is supported starting with Rev. D0 (firmware \geq V1.23) of the bus controller.

To prevent the configuration data from being accidentally overwritten on the bus controller, the procedure described below must be followed when creating the configuration data. When doing this, it is important that all required I/O modules are also started when booting the bus controller (i.e. supplied with power). This is especially important when using potential groups (E-stop switches).

The automatic configuration sets the following attributes of class 0x65 on the individual I/O modules:

- Module type (0x01)
- Input length (0x03)
- Output length (0x05)

Additional parameters are not set. That means that the connected modules are configured with their standard settings and standard I/O lengths. This can be changed by editing the parameters in the respective master engineering tool.

Automatic configuration

1. Turn off the power supply to the bus controller.
2. Set node number switch to 95 (this is done by turning switch "x10" to position 9 and switch "x1" to 5).
3. Turn on the power supply to the bus controller.
4. Wait until the "MOD" LED starts blinking green (3 ms on / 500 ms off). This phase of green blinking lasts 5 s. The node number "x10" switch must be set to 0 within this time frame and then set back to 9.
5. Wait until the "MOD" LED blinks (4 red flashes). The old configuration data is now deleted completely and overwritten with the new values from the connected I/O modules.
6. Turn off the power supply to the bus controller.
7. Set the desired node number (00 to 63).
8. Turn on the power supply to the bus controller.
9. The bus controller boots using the set node number, automatic transfer rate recognition and standard settings from the connected I/O modules.

9.3.3.12 Additional documentation and import files (EDS)

Additional documentation about bus controller functions as well as the necessary import files for the master engineering tool are available for download from the Downloads section of the B&R website (www.br-automation.com).

9.3.4 X20BC0063

Data sheet version: 2.24

9.3.4.1 General information

PROFIBUS DP is based on the physics of the RS485 interface. Data transfer is controlled using a hybrid bus access procedure: Active stations receive communication rights via a token passing procedure and can then access all stations on the network according to the master-slave principle. The maximum time of circulation for a token can be configured, which results in a defined cycle time.

Access represents various services for the user for both cyclic and for acyclic data transfer.

This bus controller makes it possible to connect X2X Link I/O nodes to PROFIBUS DP. It supports PROFIBUS DP with all of its options and other additional properties. In addition to the device, module and channel diagnostics provided in the PROFIBUS standard, it is also possible, for example, to switch to the slot diagnostics option in S7 format.

X20 or other modules based on X2X Link can be connected to the bus controller. The configuration of the modular system is optimally supported by PROFIBUS DP.

- Fieldbus: PROFIBUS DP
- I/O configuration via the fieldbus
- Extensive device, module, and channel diagnosis according to PROFIBUS DP standard
- Communication with X2X Link I/O nodes even works when some nodes are missing or without power

Information:

Only the standard function model (see the respective module description) is supported when the bus controller is used together with multi-function modules it has automatically configured itself.

9.3.4.2 Order data

| | 4 | CNTR-P | Transmit enable |
| | 5 | DGND | Power supply |
| | 6 | VP | Power supply |
| | 7 | Reserved | |
| | 8 | RxD/TxD-N | Data ²⁾ |
| | 9 | CNTR-N | Transmit enable\ |
| CNTR ... Direction switch for external repeaters | | | |

- 1) Cable color: Red
2) Cable color: Green

9.3.4.8 PROFIBUS DP node number switches

The PROFIBUS DP node number is configured using both number switches of the bus controller.

| Switch position | Node number |
|-----------------|-------------|
| 0x00 | Not allowed |
| 0x01 - 0x7D | 1 to 125 |
| 0x7E - 0xFF | Not allowed |

9.3.4.9 Automatic transfer rate detection

After booting or after a communication timeout, the bus controller goes into the status "Baud Search". This means the bus controller behaves passively on the bus.

The bus controller always begins the search for the configured transfer rate with the highest transfer rate. If a complete error-free telegram is not received during monitoring time, then the search is continued using the next lowest transfer rate.

| Transfer rate |
|---------------|
| 12 Mbit/s |
| 6 Mbit/s |
| 3 Mbit/s |
| 1.5 Mbit/s |
| 500 kbit/s |
| 187.5 kbit/s |
| 93.75 kbit/s |
| 45.45 kbit/s |
| 19.2 kbit/s |
| 9.6 kbit/s |

9.3.4.10 Additional documentation and import files (EDS)

Additional documentation about bus controller functions as well as the necessary import files for the master engineering tool are available for download from the Downloads section of the B&R website (www.br-automation.com).

9.3.5 X20BC0073

Data sheet version: 2.41

9.3.5.1 General information

The bus controller makes it possible to connect X2X Link I/O nodes to CAN I/O. CAN I/O is a transfer protocol based on standard CAN bus that is fully integrated in the B&R system.

Up to 44 logical I/O modules can be connected to the bus controller. Up to 16 of these can be analog modules including power supply module.

- Fieldbus: CAN bus
- Automatic firmware update via the fieldbus
- Integrated I/O access in B&R Automation Studio
- Integrated terminating resistor

Information:

The bus controller is unable to detect modules after a gap in the X2X Link station numbers. This can be caused by:

- X20 modules not being connected
- Modules with integrated node number switch, such as the X20BM05

Information:

Only the standard function model (see the respective module description) is supported when the bus controller is used together with multi-function modules it has automatically configured itself.

9.3.5.2 Order data

| Model number | Short description | Figure |

| Note | Order 1x TB2105 terminal block separately Order 1x X20TB12 terminal block separately Order 1x X20PS9400 or X20PS9402 power supply module separately Order 1x X20BB80 bus base separately |
| Pitch ²⁾ | 37.5 ^{+0.2} mm |

Table 115: X20BC0073 - Technical data

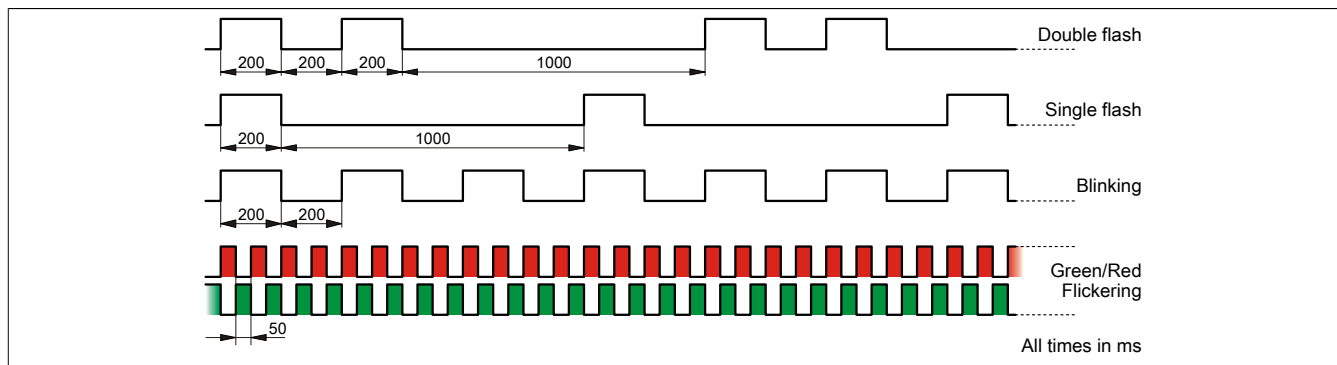

- 1) CAN I/O data points are processed in Automation Runtime in a separate cycle set to 10 ms (CAN I/O cycle).
- 2) Spacing is based on the width of the X20BB80 bus base. In addition, an X20PS9400 or X20PS9402 supply module is always required for the bus controller.

9.3.5.4 LED status indicators

| Figure | LED | Color | Status | Description |
|---|----------------------|-----------------------------------|--|--|
|  | STATUS ¹⁾ | Green | Off | No power supply |
| | | | Blinking | PREOPERATIONAL mode |
| | | | On | RUN mode |
| | | Red | On | CAN connection reports BusOff status |
| | | Green/red | Flickering | Transfer rate detection in progress |
| | | Green blinking / red single flash | | PREOPERATIONAL mode; CAN connection reports: Warning limit reached |
| | | Steady green / single red flash | | RUN mode; CAN connection reports: Warning limit reached |
| | TxD | Yellow | Off | The bus controller is not transmitting any data via the CAN I/O fieldbus |
| | | | On | The bus controller is transmitting data via the CAN I/O fieldbus |
| | TERM | Yellow | Off | The terminating resistor integrated in the bus controller is turned off |
| On | | | The terminating resistor integrated in the bus controller is turned on | |

1) The "STATUS" LED is a green/red dual LED.

LED status indicators - Blink times

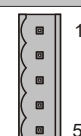

9.3.5.5 Operating and connection elements

9.3.5.6 CAN bus interface

The interface is a 5-pin multipoint connector. Terminal block 0TB2105 must be ordered separately.

| Interface | Pinout | | |
|--|----------|------------------|------------|
| | Terminal | Function | |
|  5-pin male multipoint connector | 1 | CAN _L | CAN ground |
| | 2 | CAN _L | CAN low |
| | 3 | SHLD | Shield |
| | 4 | CAN _H | CAN high |
| | 5 | NC | |

9.3.5.7 Terminating resistor

A terminating resistor is already integrated on the bus controller. It can be turned on and off with a switch on the bottom of the housing. An active terminating resistor is indicated by the "TERM" LED.

9.3.5.8 Node number and transfer rate

The node number and transfer rate are configured using the two number switches on the bus controller. The switch positions 0x00 to 0x40 and 0x60 enable automatic transfer rate detection (see ["Automatic transfer rate detection" on page 855](#)). The rest of the switch positions have a fixed transfer rate (see table).

| Switch position | Node number | Transfer rate |
|--------------------|-------------|---------------|
| 0x00 ¹⁾ | From EEPROM | From EEPROM |
| 0x01 - 0x3F | 1 - 63 | Automatic |
| 0x40 ¹⁾ | From EEPROM | From EEPROM |
| 0x41 - 0x5F | 1 - 31 | 1000 kbit/s |
| 0x60 ¹⁾ | From EEPROM | From EEPROM |
| 0x61 - 0x7F | 1 - 31 | 800 kbit/s |
| 0x80 | Reserved | - |
| 0x81 - 0x9F | 1 - 31 | 500 kbit/s |
| 0xA0 | Reserved | - |
| 0xA1 - 0xBF | 1 - 31 | 250 kbit/s |
| 0xC0 | Reserved | - |
| 0xC1 - 0xDF | 1 - 31 | 125 kbit/s |
| 0xE0 | Reserved | - |
| 0xE1 - 0xFE | 1 - 31 | 20 kbit/s |
| 0xFF | Reserved | - |

1) When one of these numbers is configured, the bus controller uses the operating parameters from the internal EEPROM. The EEPROM is programmed using library CANIO.

9.3.5.9 Automatic transfer rate detection

After startup, the bus controller goes into "Listen only" mode. This means the bus controller behaves passively on the bus and only listens.

The bus controller attempts to receive valid objects. If receive errors occur, the controller switches to the next transfer rate in the lookup table.

If no objects are received, all transfer rates are tested cyclically. This procedure is repeated until valid objects are received.

Starting transfer rate

The bus controller begins the search with this transfer rate. The starting transfer rate can be defined in two different ways:

- Read from EEPROM
- The last detected transfer rate is used after a software reset (command code 20).

Lookup table

The controller tests the transfer rate according to this table. Beginning with the starting transfer rate, the controller switches to the next lower transfer rate. At the end of the table, the bus controller restarts the search from the beginning.

| Transfer rate |
|---------------|
| 1000 kbit/s |
| 500 kbit/s |
| 250 kbit/s |
| 125 kbit/s |
| 50 kbit/s |
| 20 kbit/s |
| 10 kbit/s |

9.3.5.10 SG4

The module comes with preinstalled firmware. The firmware is also part of the Automation Runtime operating system for the PLC. With different versions, the Automation Runtime firmware is loaded onto the module.

The latest firmware is made available automatically when updating Automation Runtime.

9.3.5.11 Logical I/O modules

Up to 44 I/O modules can be connected to the bus controller. A maximum of 28 digital and 16 analog modules including power supply module are possible. This value refers not to the physical but the logical I/O module slots.

Information:

Physical I/O modules can take up more than one digital or analog slot.

The following table lists all X20 modules capable of using CAN I/O and how many logical digital and analog slots are needed.

| Module | Digital module slots | Analog module slots |
|------------------------|----------------------|---------------------|
| X20AI1744, X20AI1744-3 | 0 | 1 |

9.3.6 X20(c)BC0083

Data sheet version: 2.38

9.3.6.1 General information

The bus controller makes it possible to connect X2X Link I/O nodes to POWERLINK. It is also possible to operate the X2X Link cycle synchronously 1:1 or synchronous to POWERLINK using a prescaler.

POWERLINK is a standard protocol for Fast Ethernet with hard real-time characteristics. The POWERLINK Standardization Group (EPSSG) ensures openness and continuous advancement. www.ethernet-powerlink.org

- POWERLINK
- I/O configuration and Firmware update via the fieldbus
- Integrated hub for efficient cabling

9.3.6.2 Coated modules

Coated modules are X20 modules with a protective coating for the electronics component. This coating protects X20c modules from condensation and corrosive gases.

The modules' electronics are fully compatible with the corresponding X20 modules.

For simplification purposes, only images and module IDs of uncoated modules are used in this data sheet.

The coating has been certified according to the following standards:

- Condensation: BMW GS 95011-4, 2x 1 cycle
- Corrosive gas: EN 60068-2-60, method 4, exposure 21 days

9.3.6.2.1 Starting temperature

The starting temperature describes the minimum permissible ambient temperature when the power is switched off at the time the coated module is switched on. This is permitted to be as low as -40°C . During operation, the conditions as specified in the technical data continue to apply.

Information:

It is important to absolutely ensure that there is no forced cooling by air currents in a closed control cabinet, for example using a fan or ventilation slots.

9.3.6.3 Order data

| Model number | Short description | Figure |
|--------------|---|---|
| | Bus controllers |  |
| X20BC0083 | X20 bus controller, 1 POWERLINK interface, integrated 2-port hub, 2x RJ45, order bus base, power supply module and terminal block separately! | |

Table 117: X20BC0083, X20cBC0083 - Technical data

- 1) See Automation Help under "Communication / POWERLINK / General information / Hardware - CN" for more information.
- 2) The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring.
- 3) Spacing is based on the width of bus base X20BB80. In addition, power supply module X20PS9400 or X20PS9402 is always required for the bus controller.

9.3.6.5 Operating and connection elements

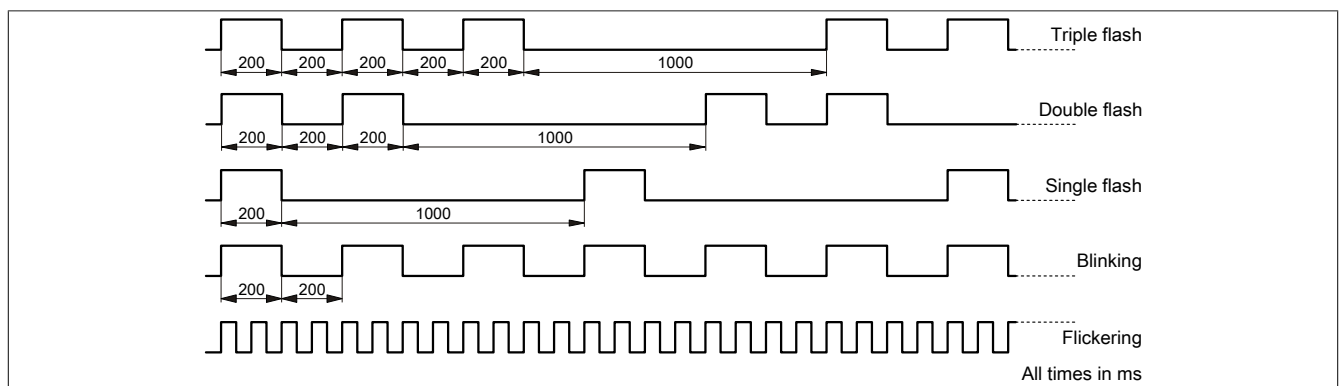

9.3.6.5.1 LED status indicators

| Figure | LED | Color | Status | Description |
|---|-------------------|---------|--------------|---|
|  | S/E ¹⁾ | Green | Off | No power supply or mode NOT_ACTIVE. The controlled node (CN) is either not supplied with power, or it is in state NOT_ACTIVE. The CN waits in this state for about 5 seconds after a restart. Communication is not possible with the CN. If no POWERLINK communication is detected during these 5 seconds, the CN enters state BASIC_ETHERNET (flickering). If POWERLINK communication is detected before this time expires, however, the CN immediately enters state PRE_OPERATIONAL_1. |
| | | | Flickering | Mode BASIC_ETHERNET. The CN has not detected any POWERLINK communication. In this state, it is possible to communicate directly with the CN (e.g. with UDP, IP, etc.) If communication POWERLINK is detected in this state, the CN switches to PRE_OPERATIONAL_1. |
| | | | Single flash | Mode PRE_OPERATIONAL_1. When operating on a POWERLINK V1 manager, the CN switches directly to PRE_OPERATIONAL_2. When operated on a POWERLINK V2 manager, the CN waits until an SoC frame is received and then switches to the PRE_OPERATIONAL_2 state. |
| | | | Double flash | Mode PRE_OPERATIONAL_2. The CN is normally configured by the manager in this state. It is then switched to state READY_TO_OPERATE by command (POWERLINK V2) or by setting the "data valid" flag in the output data (POWERLINK V1). |
| | | | Triple flash | Mode READY_TO_OPERATE. In network POWERLINK V1, the CN switches automatically to OPERATIONAL as soon as input data is present. In a POWERLINK V2 network, the manager switches to the OPERATIONAL state by issuing a command. |
| | | | On | Mode OPERATIONAL. The PDO mapping is active and cyclic data is evaluated. |
| | | | Blinking | Mode STOPPED. Output data is not being output, and no input data is being provided. It is only possible to switch to or leave this state after the manager has given the appropriate command. |
| | | | On | The controlled node (CN) is in an error state (failed Ethernet frames, increased number of collisions on the network, etc.). If an error occurs in the following states, then the green LED blinks over the red LED: |
| | | Red | On | <ul style="list-style-type: none"> PRE_OPERATIONAL_1 PRE_OPERATIONAL_2 READY_TO_OPERATE  <p>Note:</p> <ul style="list-style-type: none"> Several red blinking signals are displayed immediately after the device is switched on. This is not an error, however. The LED is lit red for CNs with configured physical node number 0 but that have not yet been assigned a node number via dynamic node allocation (DNA). |
| | | L/A IFx | Green | On |
| | | | Blinking | The link to the remote station is established, and Ethernet activity is taking place on the bus. |

1) The Status/Error LED "S/E" is a green/red dual LED.

LED status indicators - Blink times

9.3.6.5.2 POWERLINK node number

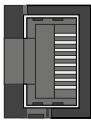

The node number for the POWERLINK node is set using the two number switches.

| Switch position | Description |
|-----------------|--|
| 0x00 | Only permitted when operating the POWERLINK node in DNA mode. |
| 0x01 - 0xEF | Node number of the POWERLINK node. Operation as a controlled node. |
| 0xF0 - 0xFF | Reserved, switch position not permitted. |

9.3.6.5.3 Ethernet interface

For information about wiring X20 modules with an Ethernet interface, see ["Cabling guidelines for X20 modules with an Ethernet cable" on page 58](#).

| Interface | Pinout | | |
|--|--------|-------------|----------------|
| | Pin | Ethernet | |
|  Shielded RJ45 | 1 | RXD | Receive data |
| | 2 | RXD\ | Receive data\ |
| | 3 | TXD | Transmit data |
| | 4 | Termination | |
| | 5 | Termination | |
| | 6 | TXD\ | Transmit data\ |
| | 7 | Termination | |
| | 8 | Termination | |

9.3.6.6 Dynamic node allocation (DNA)

Most POWERLINK bus controllers have the ability to dynamically assign node numbers. This has the following advantages:

- No setting of the node number switch
- Easier installation
- Reduced error sources

For information regarding configuration as well as an example, see Automation Help → Communication → POWERLINK → General information → Dynamic node allocation (DNA)

Information:

Interface IF1 must always be used as the input from the preceding node.

9.3.6.7 SG3

This module is not supported on SG3 target systems.

9.3.6.8 SG4

The module comes with preinstalled firmware. The firmware is also part of the Automation Runtime operating system for the PLC. With different versions, the Automation Runtime firmware is loaded onto the module.

The latest firmware is made available automatically when updating Automation Runtime.

9.3.7 X20(c)BC0087

Data sheet version: 2.36

9.3.7.1 General information

Established in 1979, the Modbus protocol has approved the use of Ethernet with both Modbus TCP and Modbus/UDP. Today, Modbus TCP is an open Internet draft standard introduced by Schneider Automation to the Internet Engineering Task Force (IETF), the organization responsible for Internet standardization. The Modbus services and object model have been preserved since the original version and left unchanged for use with the TCP/IP transmission medium.

Modbus/UDP differs from Modbus TCP in that it uses connectionless communication via UDP/IP. The advantages of faster and easier communication with UDP/IP also brings with it the disadvantage of requiring error detection and correction in the application layer.

This bus controller makes it possible to connect X2X Link I/O nodes to Modbus via Ethernet. The bus controller can be operated on B&R controllers through the use of Automation Studio or on third-party systems with Modbus TCP or -UDP master functionality.

- Fieldbus: Modbus/TCP, Modbus/UDP
- I/O configuration via the fieldbus
- DHCP-capable
- Bootp-capable
- Integrated double switch for efficient cabling
- Configurable I/O cycle (0.5 to 4 ms)
- Response time: <1 to 8 ms (depending on the load on the integrated switch)
- Validity check for command sequences before execution

Information:

Only the standard function model (see the respective module description) is supported when the bus controller is used together with multi-function modules it has automatically configured itself.

All other function models are supported when configured accordingly in Automation Studio V4.3 or later.

Automation Studio can be downloaded at no cost from the B&R website (www.br-automation.com). The evaluation license is permitted to be used to create complete configurations for fieldbus bus controllers at no cost.

9.3.7.2 Coated modules

Coated modules are X20 modules with a protective coating for the electronics component. This coating protects X20c modules from condensation and corrosive gases.

The modules' electronics are fully compatible with the corresponding X20 modules.

For simplification purposes, only images and module IDs of uncoated modules are used in this data sheet.

The coating has been certified according to the following standards:

- Condensation: BMW GS 95011-4, 2x 1 cycle
- Corrosive gas: EN 60068-2-60, method 4, exposure 21 days

9.3.7.2.1 Starting temperature

The starting temperature describes the minimum permissible ambient temperature when the power is switched off at the time the coated module is switched on. This is permitted to be as low as -40°C . During operation, the conditions as specified in the technical data continue to apply.

Information:

It is important to absolutely ensure that there is no forced cooling by air currents in a closed control cabinet, for example using a fan or ventilation slots.

9.3.7.3 Order data

| Model number | Short description | Figure |
|--------------|--|--------|
| | Bus controllers | |

Table 119: X20BC0087, X20cBC0087 - Technical data

- 1) The minimum cycle time defines how far the bus cycle can be reduced without communication errors occurring.
- 2) Spacing is based on the width of bus base X20BB80. In addition, power supply module X20PS9400 or X20PS9402 is always required for the bus controller.

9.3.7.5 Operating and connection elements

9.3.7.5.1 LED status indicators

| Figure | LED | Color | Status | Description |
|----------|-------------------|-------|--|--|
| | S/E ¹⁾ | Green | On | Indicates that there is at least one client connection |
| | | | 2 pulses | Indicates that there are no client connections |
| | | | 4 pulses | Indicates that the controller is waiting for an address from the DHCP server |
| | | | Blinking | Initialization of connected I/O modules |
| | | Red | 2 pulses | Watchdog timeout |
| | | | 3 pulses | Faulty I/O module configuration data |
| | | | 4 pulses | Indicates that the controller has detected an IP address being used twice |
| | | | 5 pulses | Indicates a missing, defective or incorrect I/O module |
| | | | 6 pulses | Error reading flash memory. Last write operation was incomplete or contained errors. ²⁾ |
| | L/A IFx | Green | On | Indicates a major unrecoverable fault |
| Blinking | | | Ethernet activity taking place on the RJ45 port (IF1, IF2) indicated by the respective LED | |
| On | | | Indicates an established connection (link), but no communication is taking place | |
| | | | Off | Indicates that no physical Ethernet connection exists |

- 1) The Status/Error LED "S/E" is a green/red dual LED. The LED blinks red several times immediately after startup. This is a boot message, however, and not an error.
- 2) Possible cause: The bus controller received a command to save, but was switched off before saving was complete. In this case, the bus controller continues to use the old configuration and indicates the failed write operation with a blink code.

9.3.7.5.2 Modbus/TCP network address switch

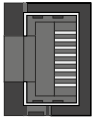

| Switch position | Description |
|-----------------|--|
| 0x00 | This switch position is the factory default setting. In this position, the address switches have no effect on system parameters. The bus controller parameters in flash memory are used (IP address or interface number). The bus controller is started with factory default values if valid flash data is not present. |
| 0x01 - 0x7F | The last position of the IP address saved in flash memory is changed to the address switch value. The IP address saved in flash memory is not changed. The interface number is read from flash memory. |
| 0x80 - 0xEF | Sets the bus controller to DHCP mode for this range. The DNS server is informed of the current hostname. A hostname is generated according to the setting of the address switch. Example The generated hostname is made up of 3 elements: "br" + "mb" + Address switch value (3 decimal places) This means, for example, that the following hostname is generated for address switch setting 0xD7 (dec. 215): "brmb215". |
| 0xF0 | Auto-store mode: The IP settings are obtained from the DHCP or BOOTP server. If the IP settings are different than the values stored in flash memory, then the current IP parameters are saved. This function is available in firmware version 1.39 and later. |
| 0xF1 - 0xFD | Reserved (same function as position 0xFF). |
| 0xFE | Initializes all bus controller parameters with default values during booting. No values are read from flash memory. The communication parameters correspond to the values assigned with switch setting 0xFF. |
| 0xFF | Initializes all communication parameters with default values. All other bus controller parameters are read from flash memory. Default parameters: <ul style="list-style-type: none"> • IP address: 192.168.100.1 • Subnet mask: 255.255.255.0 • Gateway: 192.168.100.254 • Primary NetBIOS name: "br" + MAC address • Secondary NetBIOS name: "br" + "mb" + address switch value (decimal) • Interface number: 502 • X2X Link configuration: 4 ms cycle time • X2X Link cable length: 0 m |

9.3.7.5.3 Ethernet interface

For information about wiring X20 modules with an Ethernet interface, see ["Cabling guidelines for X20 modules with an Ethernet cable"](#) on page 58.

| Interface | Pinout | | |
|--|--------|-------------|----------------|
| | Pin | Ethernet | |
|  Shielded RJ45 | 1 | RXD | Receive data |
| | 2 | RXD\ | Receive data\ |
| | 3 | TXD | Transmit data |
| | 4 | Termination | |
| | 5 | Termination | |
| | 6 | TXD\ | Transmit data\ |
| | 7 | Termination | |
| | 8 | Termination | |

9.3.7.6 Setting the IP address (default value)

Changes to the network address switches are only applied after a restart. If the bus controller is restarted with the address switch value 0xFF, it is initialized with the IP address 192.168.100.1. This address is also the factory default setting. The interface number is set to 502 (reserved for Modbus).

This IP address can be used to establish a connection to the bus controller. The internationally unique MAC address is listed on the housing side of the bus controller. The combination of "br" and the MAC address results in a unique name (primary NetBIOS name) that also makes it possible to access the bus controller.

Example of the primary NetBIOS name:

| | |
|-------------------------|-------------------|
| MAC address: | 00-60-65-00-49-02 |
| Resulting NetBIOS name: | br006065004902 |

This means that, without additional parameter changes, either the default IP address 192.168.100.1 or the NetBIOS name "br+MAC" can be used to communicate with the bus controller.

Since NetBIOS is being used, the bus controller can only be accessed via this name if there are no intermediary routers or gateways in the way.

9.3.7.7 Automatic IP assignment by a DHCP server

If a network address switch setting between 0x80 and 0xEF is configured, the bus controller will attempt to request an IP address from the DHCP server. The assigned IP address can be queried with command "ping" together with the hostname. The bus controller registers this hostname on the DHCP server, which should forward it to a DNS server.

Example The hostname (DNS name) is made up of 3 elements:
 "br" + "mb" + Address switch value (3 decimal places)
 This means, for example, that the following hostname is generated for address switch setting 0xD7 (dec. 215): "brmb215".

If DNS service is not available on the network, the bus controller's two NetBIOS names can also be used for access. The secondary NetBIOS name is identical to the hostname. If the address switches are set to 0x00, it is identical to the primary NetBIOS name. The bus controller can only be reached via its NetBIOS name if no other routers or gateways are in the way.

9.3.7.8 Changing the IP address with the network address switches

The address switches can be used to change the last byte in the IP address configured on the bus controller. The IP address saved in flash memory is not changed. If the address switches are set to 0x00, the bus controller applies the IP address last saved to flash memory. Switch positions between 0x01 and 0x7F cause the last position of the IP address (the lowest byte) to be overwritten by the value of the address switch. This provides the user a quick and easy way to address a large number of bus controllers. In short, an IP address between 192.168.100.1 and 192.168.100.127 can be selected for a bus controller using the address switches without requiring any additional software configuration.

9.3.7.9 Information about NetBIOS names

In addition to the hostname used to register on the DHCP server, the bus controller also has so-called NetBIOS names. These are used to access the bus controller from a PC using its name (as opposed to its IP address). This is only possible if no routers or gateways are in the way, however.

The primary NetBIOS name is always composed of the prefix "br" and the MAC address from the bus controller (see ["Automatic IP assignment by a DHCP server" on page 868](#)).

The secondary NetBIOS name corresponds to the primary NetBIOS name at address switch position 0x00. This is necessary because several bus controllers with address switch value 0x00 are permitted to be located in one network segment. In this case, the IP address from flash memory is used.

For all other address switch positions, the secondary NetBIOS name is generated from the network address switch value (as in DHCP mode): "br" + "mb" + Address switch value (3 decimal places).

A hostname defined explicitly by the user will be used for the secondary NetBIOS name regardless of the address switch value.

This makes it possible to access the bus controller with the NetBIOS name configured using the address switches. This is also possible if the controller was not configured for use with a DHCP server (address switch setting between 0x01 and 0x7F).

9.3.7.10 Saving an IP address to flash memory

The IP parameters in flash memory can be changed via the Modbus protocol, the ModbusTCP Toolbox or the Telnet interface. The ModbusTCP Toolbox can be downloaded from the B&R website.

The IP address, subnet and gateway are all defined in the address range 0x1003 to 0x100E. Each has a length of 4 words. The data is applied by writing constant 0xC1 to address 0x1140 ("Write single register" fc6, addr. 0x1140, data 0xC1). The new settings are applied after the bus controller is restarted.

9.3.8 X20BC0087-10

Data sheet version: 1.03

9.3.8.1 General information

Established in 1979, the Modbus protocol has approved the use of Ethernet with both Modbus TCP and Modbus/UDP. Today, Modbus TCP is an open Internet draft standard introduced by Schneider Automation to the Internet Engineering Task Force (IETF), the organization responsible for Internet standardization. The Modbus services and object model have been preserved since the original version and left unchanged for use with the TCP/IP transmission medium.

Modbus/UDP differs from Modbus TCP in that it uses connectionless communication via UDP/IP. The advantages of faster and easier communication with UDP/IP also brings with it the disadvantage of requiring error detection and correction in the application layer.

This bus controller makes it possible to connect X2X Link I/O nodes to Modbus via Ethernet. The bus controller can be operated on B&R controllers through the use of Automation Studio or on third-party systems with Modbus TCP or -UDP master functionality.

- Fieldbus: Modbus/TCP, Modbus/UDP
- I/O configuration via the fieldbus
- DHCP-capable
- Bootp-capable
- Integrated double switch for efficient cabling
- Configurable I/O cycle (0.5 to 4 ms)
- Response time: <1 - 8 ms (depending on the load on the integrated switch)
- Validity check for command sequences before execution
- Producer mode

Information:

Only the standard function model (see the respective module description) is supported when the bus controller is used together with multi-function modules it has automatically configured itself.

All other function models are supported when configured accordingly in Automation Studio V4.3 or later.

Automation Studio kann kostenlos von der B&R Webseite www.br-automation.com heruntergeladen werden. Die Evaluierungslizenz darf unentgeltlich zur Erstellung vollständiger Konfigurationen der Feldbus Bus Controller benützt werden.

9.3.8.7 Modbus/TCP network address switch

| Switch position | Description |
|-----------------|--|
| 0x00 | This switch position is the factory default setting. In this position, the address switches have no effect on system parameters. The bus controller parameters in flash memory are used (IP address or interface number). The bus controller is started with factory default values if valid flash data is not present. |
| 0x01 - 0x7F | The last position of the IP address saved in flash memory is changed to the address switch value. The IP address saved in flash memory is not changed. The interface number is read from flash memory. |
| 0x80 - 0xEF | Sets the bus controller to DHCP mode for this range. The DNS server is informed of the current hostname. A hostname is generated according to the setting of the address switch. Example The generated hostname is made up of 3 elements: "br" + "mb" + Address switch value (3 decimal places) This means, for example, that the following hostname is generated for address switch setting 0xD7 (dec. 215): "brmb215". |
| 0xF0 | Auto-store mode: The IP settings are obtained from the DHCP or BOOTP server. If the IP settings are different than the values stored in flash memory, then the current IP parameters are saved. This function is available in firmware version 1.39 and later. |
| 0xF1 - 0xFD | Reserved (same function as position 0xFF). |
| 0xFE | Initializes all bus controller parameters with default values during booting. No values are read from flash memory. The communication parameters correspond to the values assigned with switch setting 0xFF. |
| 0xFF | Initializes all communication parameters with default values. All other bus controller parameters are read from flash memory. Default parameters: <ul style="list-style-type: none"> • IP address: 192.168.100.1 • Subnet mask: 255.255.255.0 • Gateway: 192.168.100.254 • Primary NetBIOS name: "br" + MAC address • Secondary NetBIOS name: "br" + "mb" + address switch value (decimal) • Interface number: 502 • X2X Link configuration: 4 ms cycle time • X2X Link cable length: 0 m |

9.3.8.8 Setting the IP address (default value)

Changes to the network address switches are only applied after a restart. If the bus controller is restarted with the address switch value 0xFF, it is initialized with the IP address 192.168.100.1. This address is also the factory default setting. The interface number is set to 502 (reserved for Modbus).

This IP address can be used to establish a connection to the bus controller. The internationally unique MAC address is listed on the housing side of the bus controller. The combination of "br" and the MAC address results in a unique name (primary NetBIOS name) that also makes it possible to access the bus controller.

Example of the primary NetBIOS name:

MAC address: 00-60-65-00-49-02

Resulting NetBIOS name: br006065004902

This means that, without additional parameter changes, either the default IP address 192.168.100.1 or the NetBIOS name "br+MAC" can be used to communicate with the bus controller.

Since NetBIOS is being used, the bus controller can only be accessed via this name if there are no intermediary routers or gateways in the way.

9.3.8.9 Automatic IP assignment by a DHCP server

If a network address switch setting between 0x80 and 0xEF is configured, the bus controller will attempt to request an IP address from the DHCP server. The assigned IP address can be queried with command "ping" together with the hostname. The bus controller registers this hostname on the DHCP server, which should forward it to a DNS server.

Example The hostname (DNS name) is made up of 3 elements:
 "br" + "mb" + Address switch value (3 decimal places)
 This means, for example, that the following hostname is generated for address switch setting 0xD7 (dec. 215): "brmb215".

If DNS service is not available on the network, the bus controller's two NetBIOS names can also be used for access. The secondary NetBIOS name is identical to the hostname. If the address switches are set to 0x00, it is identical to the primary NetBIOS name. The bus controller can only be reached via its NetBIOS name if no other routers or gateways are in the way.

9.3.8.10 Changing the IP address with the network address switches

The address switches can be used to change the last byte in the IP address configured on the bus controller. The IP address saved in flash memory is not changed. If the address switches are set to 0x00, the bus controller applies the IP address last saved to flash memory. Switch positions between 0x01 and 0x7F cause the last position of the IP address (the lowest byte) to be overwritten by the value of the address switch. This provides the user a quick and easy way to address a large number of bus controllers. In short, an IP address between 192.168.100.1 and 192.168.100.127 can be selected for a bus controller using the address switches without requiring any additional software configuration.

9.3.8.11 Information about NetBIOS names

In addition to the hostname used to register on the DHCP server, the bus controller also has so-called NetBIOS names. These are used to access the bus controller from a PC using its name (as opposed to its IP address). This is only possible if no routers or gateways are in the way, however.

The primary NetBIOS name is always composed of the prefix "br" and the MAC address from the bus controller (see ["Automatic IP assignment by a DHCP server" on page 874](#)).

The secondary NetBIOS name corresponds to the primary NetBIOS name at address switch position 0x00. This is necessary because several bus controllers with address switch value 0x00 are permitted to be located in one network segment. In this case, the IP address from flash memory is used.

For all other address switch positions, the secondary NetBIOS name is generated from the network address switch value (as in DHCP mode): "br" + "mb" + Address switch value (3 decimal places).

A hostname defined explicitly by the user will be used for the secondary NetBIOS name regardless of the address switch value.

This makes it possible to access the bus controller with the NetBIOS name configured using the address switches. This is also possible if the controller was not configured for use with a DHCP server (address switch setting between 0x01 and 0x7F).

9.3.8.12 Saving an IP address to flash memory

The IP parameters in flash memory can be changed via the Modbus protocol, the ModbusTCP Toolbox or the Telnet interface. The ModbusTCP Toolbox can be downloaded from the B&R website.

The IP address, subnet and gateway are all defined in the address range 0x1003 to 0x100E. Each has a length of 4 words. The data is applied by writing constant 0xC1 to address 0x1140 ("Write single register" fc6, addr. 0x1140, data 0xC1). The new settings are applied after the bus controller is restarted.

9.3.9 X20(c)BC0088

Data sheet version: 2.36

9.3.9.1 General information

EtherNet/IP is an Ethernet-based fieldbus. EtherNet/IP was developed by Allen-Bradley (Rockwell Automation) and later transferred to the Open DeviceNet Vendor Association (ODVA) as an open standard. In 1998, a working group at ControlNet International developed a procedure for setting the published Common Industrial Protocol to Ethernet. EtherNet/IP was published in March 2000 as an open industrial automation standard based on this procedure.

This bus controller makes it possible to connect X2X Link I/O nodes to EtherNet/IP. The bus controller can be operated via interface module X20IF10D1-1 or by 3rd-party systems with EtherNet/IP scanner functionality.

- Fieldbus: EtherNet/IP
- Integrated 3-port switch for efficient cabling
- Auto-configuration of I/O modules
- Can be configured by the scanner (master) using configuration assembly
- Web interface
- DHCP-capable
- Configurable I/O cycle (0.5 to 4 ms)
- Minimum fieldbus cycle time (also requested packet interval or RPI): 1 ms

Information:

Only the standard function model (see the respective module description) is supported when the bus controller is used together with multi-function modules it has automatically configured itself.

Automation Studio V4.3 or later can be used to easily create configuration files (e.g. EDS files, binary files). All other function models are also supported by transferring configuration data to the bus controller (e.g. using the scanner via a "configuration assembly").

Automation Studio can be downloaded at no cost from the B&R website (www.br-automation.com). The evaluation license is permitted to be used to create complete configurations for fieldbus bus controllers at no cost.

9.3.9.2 Coated modules

Coated modules are X20 modules with a protective coating for the electronics component. This coating protects X20c modules from condensation and corrosive gases.

The modules' electronics are fully compatible with the corresponding X20 modules.

For simplification purposes, only images and module IDs of uncoated modules are used in this data sheet.

The coating has been certified according to the following standards:

- Condensation: BMW GS 95011-4, 2x 1 cycle
- Corrosive gas: EN 60068-2-60, method 4, exposure 21 days

9.3.9.2.1 Starting temperature

The starting temperature describes the minimum permissible ambient temperature when the power is switched off at the time the coated module is switched on. This is permitted to be as low as -40°C . During operation, the conditions as specified in the technical data continue to apply.

Information:

It is important to absolutely ensure that there is no forced cooling by air currents in a closed control cabinet, for example using a fan or ventilation slots.

Table 123: X20BC0088, X20cBC0088 - Technical data

- 1) The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring.
- 2) Pitch is based on the width of bus base X20BB80. In addition, power supply module X20PS9400 or X20PS9402 is always required for the bus controller.

9.3.9.5 Operating and connection elements

9.3.9.5.1 LED status indicators

| Figure | LED | Color | Status | Description |
|---------|--------------------------|----------|---|---|
| | Mod status ¹⁾ | Green | On | Indicates that there is at least one client connection |
| | | | Blinking | Bus controller not yet configured. |
| | | | Flickering | HTTP file upload (firmware or configuration file) |
| | | Red | On | Major unrecoverable fault. |
| | | | Blinking | Major recoverable fault. |
| | | | Green/Red | Blinking |
| | Net status ¹⁾ | Green | On | Indicates at least one established active scanner (master) connection |
| | | | Blinking | Indicates no established active scanner (master) connection |
| | | | Off | Indicates no IP address has been assigned |
| | | Rot | On | Indicates an IP address has been used more than once |
| | | | Blinking | Indicates a timeout on at least one connection |
| | | | Green/Red | Blinking |
| L/A IFx | Green | Blinking | Ethernet activity taking place on the RJ45 interface (IF1, IF2) indicated by the respective LED | |
| | | On | Indicates an established connection (link), but no communication is taking place | |
| | | Off | Indicates that no physical Ethernet connection exists | |

- 1) The "Mod status" and "Net status" LEDs are green/red dual LEDs.

9.3.9.5.2 EtherNet/IP address switching positions

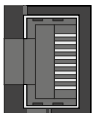

| Switch position | Description |
|-----------------|--|
| 0x00 | The IP address saved in flash memory is used. The adapter is started via DHCP if attribute 3 (configuration control) of the TCP/IP interface object was set to DHCP. |
| 0x01 to 0x7F | The last position of the IP address saved in flash memory is changed to the address switch value. The IP address saved in flash memory is not changed. All other adapter parameters are read from flash memory and used without being changed. |
| 0x80 to 0xEF | Sets the bus controller to DHCP mode for this range. The DNS server is informed of the current hostname. A hostname is generated according to how the network address switches are set. Example: The generated hostname is made up of three elements: "br" + "eip" + Address switch position (three decimal places) This means, for example, that the following hostname is generated for address switch position 0xD7 (dec. 215): "breip215". |
| 0xF0 to 0xFD | Reserved (same function as position 0xFF). |
| 0xFE | Initializes all bus controller parameters with default values during booting. No values are read from flash memory. The communication parameters correspond to the values assigned with switch setting 0xFF. |
| 0xFF | Initializes all communication parameters with default values. All other bus controller parameters are read from flash memory. Default parameters: <ul style="list-style-type: none"> • IP address: 192.168.100.1 • Subnet mask: 255.255.255.0 • Gateway: 192,168,100,254 • Primary NetBIOS name: "br" + MAC address • Secondary NetBIOS name: "br" + "eip" + address switch number (decimal) • X2X Link configuration: 1 ms cycle time • X2X Link cable length: 0 m |

9.3.9.5.3 Ethernet interface

For information about wiring X20 modules with an Ethernet interface, see ["Cabling guidelines for X20 modules with an Ethernet cable"](#) on page 58.

| Interface | Pinout | | |
|--|--------|-------------|----------------|
| | Pin | Ethernet | Pinout |
|  Shielded RJ45 | 1 | RXD | Receive data |
| | 2 | RXD\ | Receive data\ |
| | 3 | TXD | Transmit data |
| | 4 | Termination | |
| | 5 | Termination | |
| | 6 | TXD\ | Transmit data\ |
| | 7 | Termination | |
| | 8 | Termination | |

9.3.9.6 Setting the IP address (default value)

Changes to the network address switch are only applied after a restart (power cycle). If the bus controller is restarted with the address switch value 0xFF, it is initialized with IP address 192.168.100.1. This address is also the factory default setting.

This IP address can be used to establish a connection to the bus controller. The internationally unique MAC address is listed on the housing side of the bus controller. The combination of "br" and the MAC address results in a unique name (primary NetBIOS name) that also makes it possible to access the bus controller.

Example of the primary NetBIOS name:

| | |
|-------------------------|-------------------|
| MAC address: | 00-60-65-00-49-02 |
| Resulting NetBIOS name: | br006065004902 |

This means that, without additional parameter changes, either the default IP address 192.168.100.1 or the NetBIOS name "br+MAC" can be used to communicate with the controller.

Since NetBIOS is being used, the bus controller can only be accessed via this name if there are no intermediary routers or gateways in the way.

9.3.9.7 Automatic IP assignment by a DHCP server

If a address switch position between 0x80 and 0xEF is configured, the bus controller will attempt to request an IP address from the DHCP server. The assigned IP address can be queried with a "ping" command together with the hostname. The bus controller registers this hostname on the DHCP server, which should forward it to a DNS server.

Example: The hostname (DNS name) is made up of three elements:
 "br" + "eip" + Address switch value (three decimal places).
 This means, for example, that the following hostname is generated for address switch setting 0xD7 (dec. 215): "breip215".

If DNS service is not available on the network, the bus controller's two NetBIOS names can also be used for access. The secondary NetBIOS name is identical to the hostname; at address switch value 0x00, it is identical with the primary NetBIOS name. The bus controller can only be reached via its NetBIOS name if no other routers or gateways are in the way.

9.3.9.8 Changing the IP address with the network address switches

The address switches can be used to change the last byte in the IP address configured on the bus controller. The IP address saved in flash memory is not changed. If the address switches are set to 0x00, the bus controller applies the IP address last saved to flash memory. Switch positions between 0x01 and 0x7F cause the last position of the IP address (the lowest byte) to be overwritten by the value of the address switch. This provides the user a quick and easy way to address a large number of bus controllers. In short, an IP address between 192.168.100.1 and 192.168.100.127 can be selected for a bus controller using the address switches without requiring any additional software configuration.

9.3.9.9 Saving an IP address to flash memory

The IP parameters in the flash memory can be changed via the EtherNet/IP protocol or using the Telnet interface (see EtherNet/IP in the user's manual). If the IP address should be set via the TCP/IP object (class 0xF5), then the new address will only be saved to flash if instance attribute 3 (configuration control) of the TCP/IP object is set to 0 (see CIP specification).

9.3.10 X20BC008U

Data sheet version: 1.25

9.3.10.1 General information

This bus controller provides OPC UA server functions. This allows any OPC UA clients access to read or write data from I/O modules connected to the bus controller.

- Protocol: OPC UA
- I/O configuration via OPC UA
- 10 ms minimum cycle time
- Integrated switch for wiring multiple slaves
- 100 Mbit/s full-duplex mode
- Up to 1440 bytes of input data and up to 1440 bytes of output data possible
- Integrated web page for firmware updates
- OPC UA diagnostics and module diagnostics at runtime via OPC UA clients

9.3.10.2 Order data

| Spacing ²⁾ | 37.5 ^{+0.2} mm |

Table 125: X20BC008U - Technical data

- 1) The minimum cycle time defines how far the bus cycle can be reduced without communication errors occurring.
2) Spacing is based on the width of bus base X20BB80. In addition, power supply module X20PS9400 or X20PS9402 is always required for the bus controller.

9.3.10.4 LED status indicators

The following table lists the LED status indicators available on the bus controller. Exact blink times are specified in the timing diagram in the next section.

| Figure | LED | Color | Status | Description |
|---|------------------|------------------|---|--|
|  | MS ¹⁾ | Green | Off | X2X halted |
| | | | 3 pulses | Initializing X2X network |
| | | | On ²⁾ | Normal operation, X2X active |
| | | Red | 1 pulse | One or more modules missing since startup |
| | | | 2 pulses | I/O module missing that was already active |
| | | | 3 pulses | Mismatch of at least 1 I/O module with configuration |
| | | | 4 pulses | Watchdog timer expired |
| | | On | Corrupt configuration file in flash memory or hardware fault | |
| | | CS ¹⁾ | Green | Off |
| | 1 pulse | | | Waiting for DHCP server ³⁾ |
| | 2 pulses | | | Waiting for time synchronization ³⁾ |
| | Red | | On | At least 1 connection is active. |
| | | | 1 pulse | Waiting for DHCP server ³⁾ |
| | | | 2 pulses | Waiting for time synchronization ³⁾ |
| | | | 3 pulses | Error mode OutputKeepAlive is active. |
| | | | On | IP address conflict. Another network station used the same IP address. |
| | | | On | Indicates that no physical Ethernet connection exists |
| | L/A IFx | Green | Off | Indicates that no physical Ethernet connection exists |
| Blinking | | | Ethernet activity taking place on the RJ45 interface (IF1, IF2) indicated by the respective LED | |
| On | | | Indicates an established connection (link), but no communication is taking place | |

- 1) This LED is a green/red dual LED.
- 2) The red LED can be superimposed over the green LED, which results in a mixed color.
- 3) The waiting time is indicated by green pulses in the first 10 seconds of the search or synchronization; red pulses then follow.

LED status indicators - Blink times

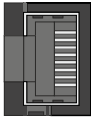

9.3.10.5 Operating and connection elements

9.3.10.6 Ethernet interface

For information about wiring X20 modules with an Ethernet interface, see "[Cabling guidelines for X20 modules with an Ethernet cable](#)" on page 58.

| Interface | Pinout | | |
|--|--------|-------------|----------------|
| | Pin | Ethernet | Pinout |
|  Shielded RJ45 | 1 | RXD | Receive data |
| | 2 | RXD\ | Receive data\ |
| | 3 | TXD | Transmit data |
| | 4 | Termination | |
| | 5 | Termination | |
| | 6 | TXD\ | Transmit data\ |
| | 7 | Termination | |
| | 8 | Termination | |

9.3.10.7 Address switch

The bus controller has 2 address switches. The bus controller can be set to different operating modes using certain, pre-defined switch positions.

| Switch position | Description |
|-----------------|--|
| 0x00 | All parameters are initialized from flash memory. The bus controller is started with its default values if valid flash data is not present. In this case the configuration is identical to switch position 0xFF. |
| 0x01 - 0x7F | Parameters are read from flash memory. The last position of the IP address saved in flash memory is changed to the address switch value, however. Example <ul style="list-style-type: none"> IP address stored in flash memory: 192.168.1.1 Switch position: 0x20 (decimal 32) Resulting IP address: 192.168.1.32 |
| 0x80 - 0xEF | In this range, the bus controller operates in DHCP mode. A hostname is generated according to the setting of the address switch. The generated hostname is composed of 3 elements: →"br" + "opc" + Address switch value (3 decimal positions) Example If the address switch value is 0xD7 (dec. 215), for example, then hostname "bropc215" will be generated. |
| 0xF0 | See " Restoring to factory settings " on page 886. |
| 0xF1 - 0xFE | Reserved, switch position not permitted |
| 0xFF | All parameters are set to their default values. Parameters in flash memory are not overwritten. The following default values are used: <ul style="list-style-type: none"> IP address: 192.168.1.1 Subnet mask: 255.255.255.0 Default gateway: 192.168.1.254 DNS server: 192.168.1.254 OPC UA server port: 4840 |

9.3.10.7.1 Restoring to factory settings

The following procedure is used to reset the bus controller to its default configuration.

- 1) Set the address switch to F0.
- 2) Switch on the power supply.
- 3) If LED "MS" is blinking red, it indicates that the deletion operation can be started.
- 4) To start the deletion procedure, set the address switch to 00 for 1 second and then set it back to F0.
- 5) If LED "MS" is solid red, it indicates that deletion is in progress; this lasts approximately 20 seconds. When deletion has completed, LED "MS" blinks red and green alternately.
- 6) Reset the address switch to the desired value and reboot the bus controller.

Information:

If the deletion procedure is interrupted due to a power failure, the operation must be restarted; otherwise, parts of the previous configuration may be retained.

9.3.10.8 Firmware update

Using the Ethernet interface and [configured IP address](#) of the bus controller, it is possible to connect to the integrated web page in a web browser. The update is started by selecting menu option "Firmware download".

The screenshot shows the web interface for the X20BC008U bus controller. The top navigation bar is orange with the text 'Perfection in Automation' and the website 'www.br-automation.com'. Below this, there is a breadcrumb trail: 'X20BC008U > Advanced > Firmware Download'. The main content area has a 'Firmware Download' section with a 'NOTE:' stating: 'After a firmware download, the buscontroller will still have full functionality. However, a reboot will be required to activate the new firmware and to resume webservice operation.' Below the note, there is a 'Firmware Version' input field containing '1.00'. There is a 'Choose File' button next to the text 'No file chosen'. At the bottom, there is a 'Start Download' button and a progress indicator showing '%'. The left sidebar contains navigation links for 'X20BC008U', 'Advanced', and 'Firmware Download'.

Notes about the firmware update

The current firmware version, as well as all previous versions, can be downloaded from the website. It is important to note that the firmware filename "60155_1.fw" stored in the ZIP file is identical for all firmware versions. It consists of the module ID (ModuleID=60155) and hardware variant (_1).

To better differentiate between firmware versions, the version number is included in the ZIP filename in version 1.18 and later.

Information:

The X20BC008U does not support automated firmware updates via hardware upgrade. The firmware update must be carried out manually by the user through downloading via the web server.

9.3.10.9 Supported OPC UA server facets

The bus controller supports the following server facets:

Core server facet

- Address space base
- Base info server capabilities
- Base info ValueAsText
- Discovery get endpoints
- Session general service behavior
- Session base
- Session minimum 5
- View basic
- View TranslateBrowsePath
- View RegisterNodes
- View minimum continuation point (the number of continuation points is unlimited)
- Attribute read
- Attribute write values

Data access

- Monitor basic
- Monitor value change
- Monitor items 1000
- Monitor QueueSize 100
- Subscription basic
- Subscription minimum 10

Generic features

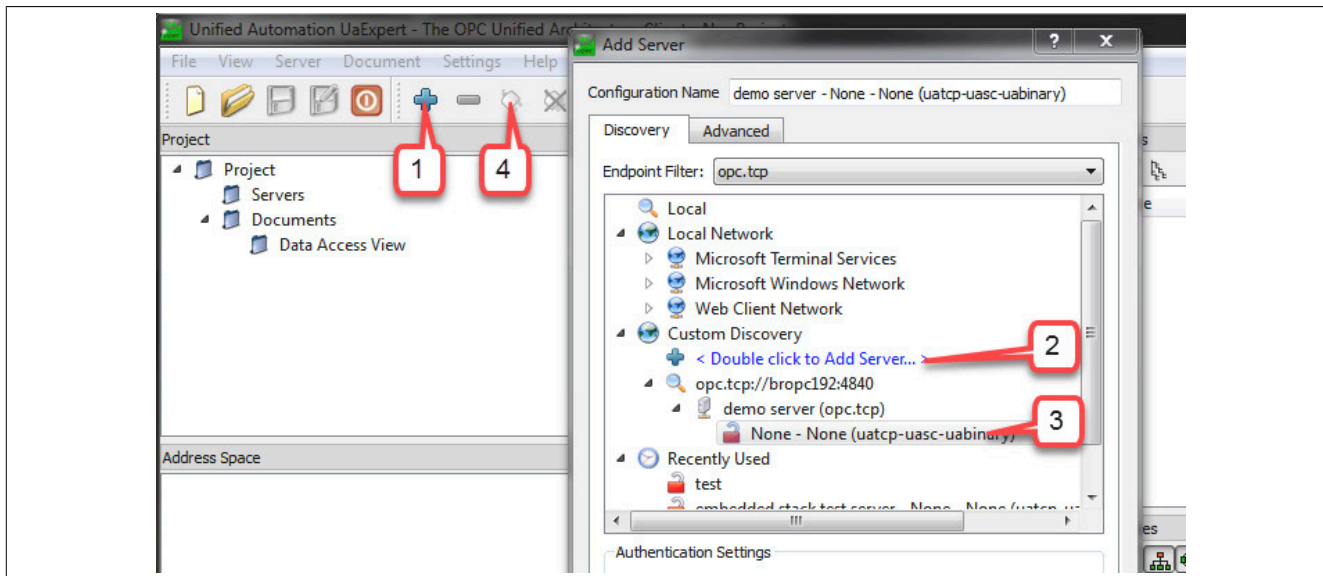

- Address space method
- Method call

Transport

- UA-TCP UA-SC UA-Binary

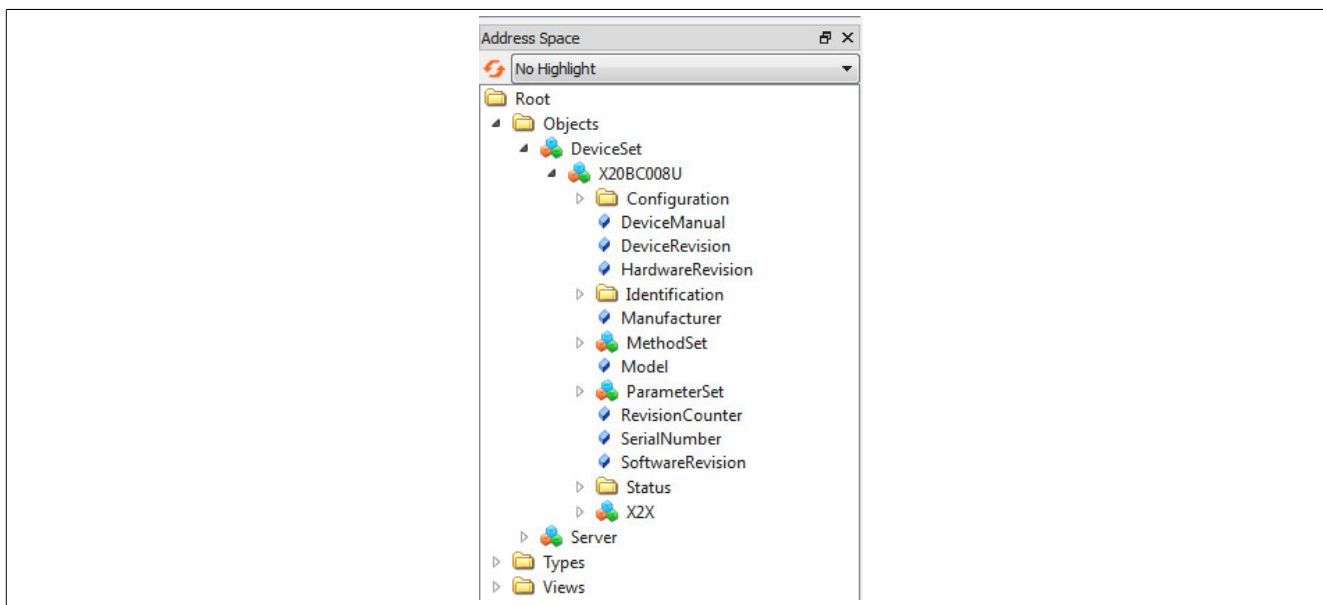

9.3.10.10 Connecting with UaExpert

This example shows how a bus controller can be connected to OPC UA client software UaExpert.

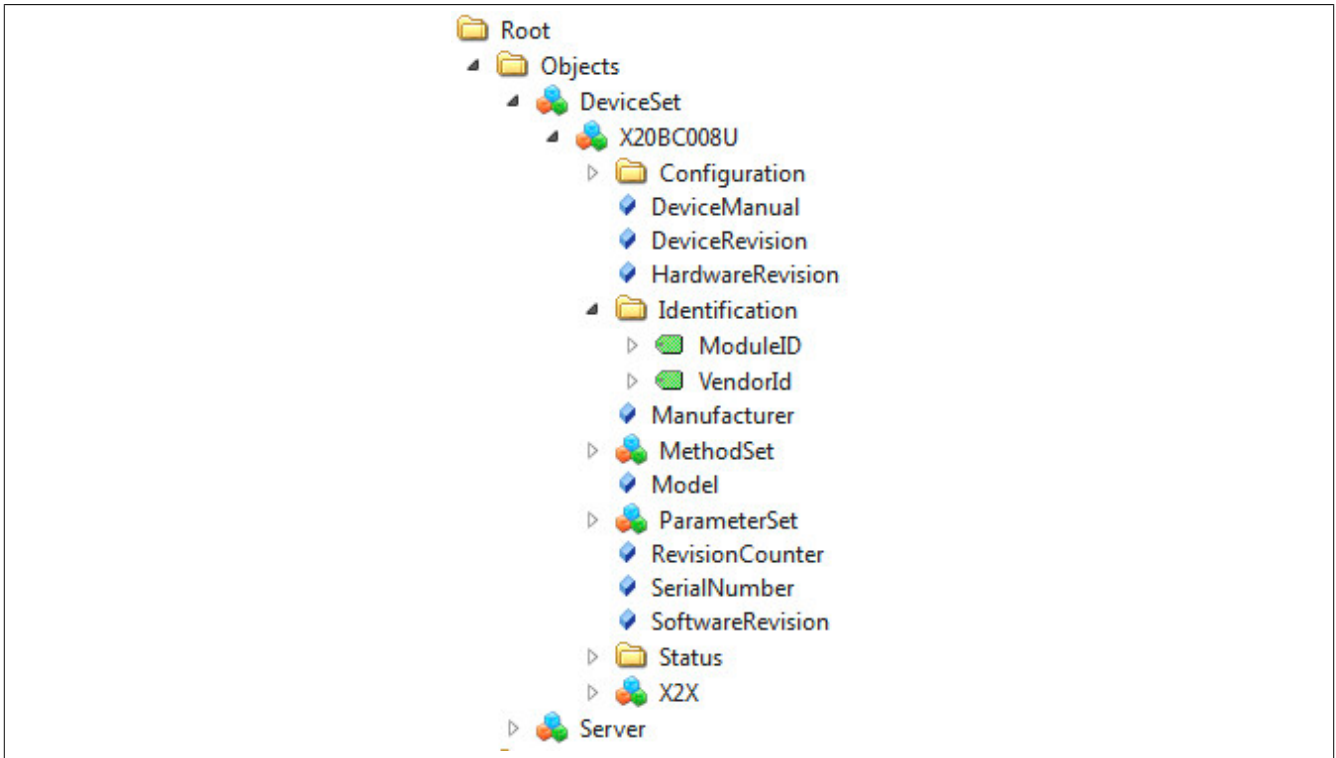

- 1) Click on "Add server" to add a server.
- 2) Double-click on "<Double-click to add server>" to enter the server's URL.
Example: "opc.tcp://bropc215:4840" or "opc.tcp://192.168.1.1:4840"
- 3) If the server can be reached over the network, double-click on "None - None (uatcp-uasc-uabinary)" to add it to the server list in the main window.
- 4) Click on "Connect server" to establish the connection.

As soon as the connection has been established, the structure of the "address space" provided by the bus controller will be shown in its own window. The bus controller is displayed under "DeviceSet" and contains all objects provided by the bus controller.

9.3.10.11 Bus controller information model

The bus controller uses the OPC UA information model to provide access to the configuration and data on the I/O modules and bus controller. This information model also enables OPC UA clients to access existing data.

Based on hierarchical references, all available nodes for the bus controller are defined as child nodes of head node `"/Root/Objects/DeviceSet/X20BC008U"`. These include nodes for configuration and access to I/O module process data.

9.3.10.11.1 Note regarding automated access

Nodes are actually accessed in the information model based on their specific node ID. For X20BC008U, this ID consists of a numerical 16-bit namespace index and 32-bit identifier.

When using a software library (e.g. AsOpcUac) to access nodes, the following points should be noted:

- First, the namespace strings should be translated into the namespace index. The necessary functions are provided by client libraries.
- Node IDs should be determined using service `"UA_TranslatePath"`.

Information:

Using hard-coded node IDs can cause problems since they may change if a new firmware version is installed.

9.3.10.11.2 Namespaces used

The following namespaces are used in the OPC UA bus controller:

| Namespace URI | Description |
|--|---|
| http://opcfoundation.org/UA/ | NamespaceIndex 0 ¹⁾ Types and objects specified by the OPC Foundation |
| urn:br-automation/BuR/UA/X20BC008U | B&R NamespaceIndex 1 ¹⁾ |
| http://br-automation.com/OpcUa/BC/io-system/ | B&R NamespaceIndex 2 ²⁾ Information model for the bus controller I/O system |

- 1) Standardized, NamespaceIndex cannot be changed.
- 2) This NamespaceIndex is not standardized and can therefore be changed. This means that the currently used index "2" could change in future firmware versions if necessary.
To avoid possible problems in applications, the namespace used should always be read with UA_GetNamespaceIndex() and added to the relative path name as a variable string (currently "2") before the directory or object name.

The namespaces used can also be read from the bus controller.

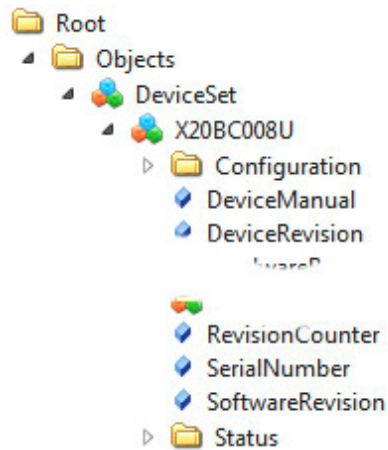

The screenshot displays the OPC UA Data Access View for the 'NamespaceArray' object. The left pane shows the Address Space tree with 'Server' and 'NamespaceArray' highlighted. The right pane shows the Data Access View for 'NamespaceArray' with a table of attributes and values. The 'Value' attribute is expanded to show an array of three namespace URIs: 'http://opcfoundation.org/UA/', 'urn:br-automation/BuR/UA/X20BC008U', and 'http://br-automation.com/OpcUa/BC/io-system/'.

| # | Server | Node Id | Display Name | Value | Datatype | urce Timestar |
|------------|-------------------|--|--------------|-------|----------|---------------|

| | [2] | http://br-automation.com/OpcUa/BC/io-system/ | | | | |
| | DataType | String | | | | |

9.3.10.11.3 Device information

The bus controller object and all I/O module objects have multiple direct child nodes that allow information about the relevant modules to be exported.

Bus controller

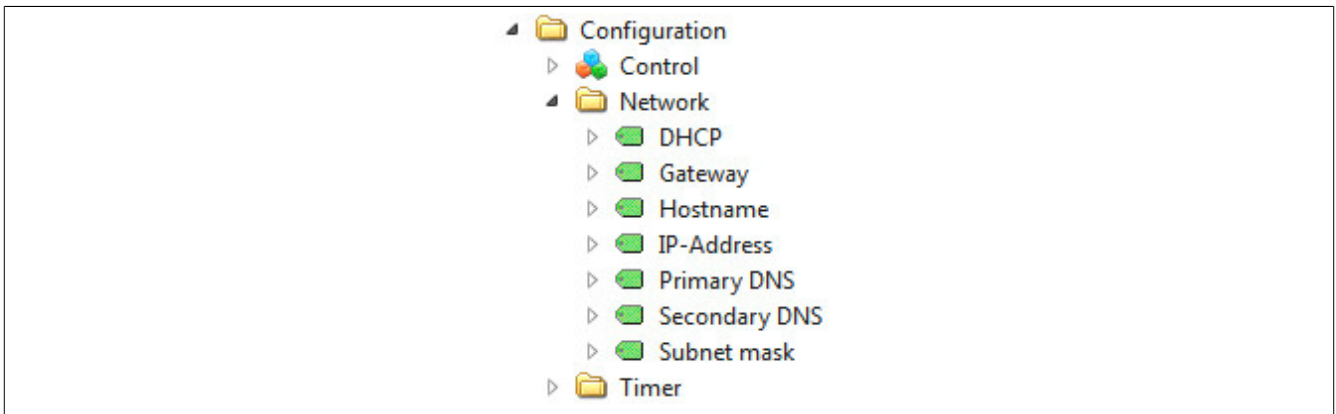

Example of an AI module

| Node name | Description |
|---------------------------|--|
| DeviceManual | URL providing further information about the module |
| DeviceRevision | Reserved |
| HardwareRevision | Current hardware revision |
| Manufacturer | Manufacturer of the module |
| Model | Module name |
| RevisionCounter | Reserved (always -1) |
| SerialNumber | Full serial number as a string |
| HardwareRevision | Current software revision |
| Identification → ModuleID | Numeric identification number for the module |
| Identification → VendorID | Numeric ID of the module manufacturer |

9.3.10.11.4 Network configuration

A valid network configuration is required in order for the bus controller to operate. The network configuration used is based on the address switch setting and the configuration stored in flash memory. For more information, see ["Address switch"](#) on page 885.

For new configuration data to be transferred, it must be saved in the control object by calling method [ApplyChanges](#) in the control object.

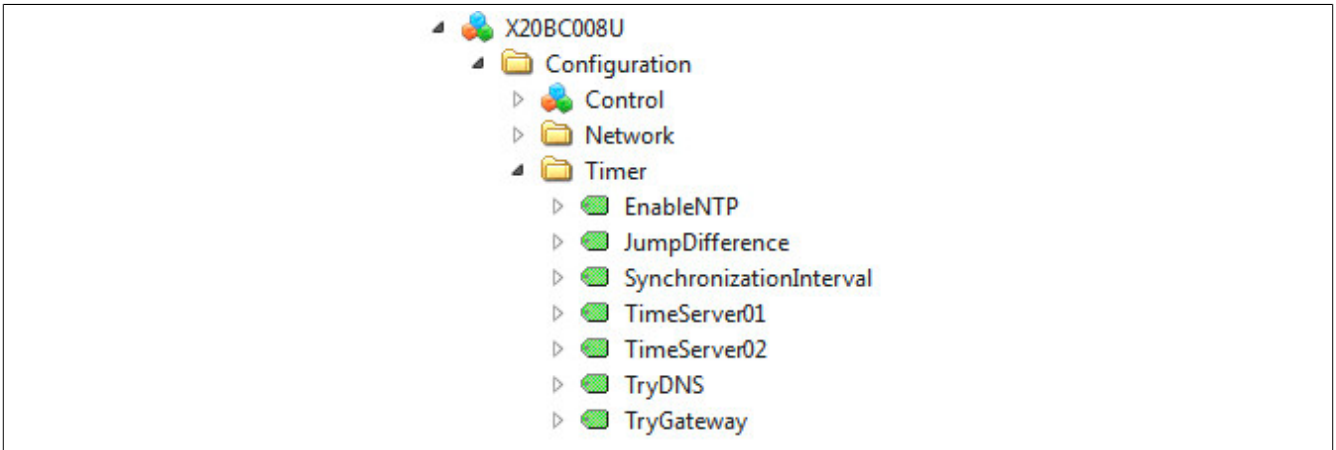

Information:

The network parameters will only be applied after the bus controller is restarted.

Position of the data in the information model: `"/ X20BC008U / Configuration / Network"`

| Node name | Description |
|-----------------------------|---|
| DHCP | Enables/Disables DHCP client functionality If the DHCP client is enabled, the gateway, IP address, subnet mask and DNS server parameters are obtained from the DHCP server. In this case, the configured values are not used. They can be read and modified, however. |
| Gateway | Configuration of the default gateway IP address |
| Hostname | Configuration of the hostname |
| IP address | Configuration of a static IP address |
| Primary DNS / Secondary DNS | Configuration of a primary or secondary DNS server |
| Subnet mask | Sets the subnet mask |

9.3.10.11.5 Time synchronization

OPC UA uses the UTC timestamp. It is possible to configure multiple NTP servers for use as time references.

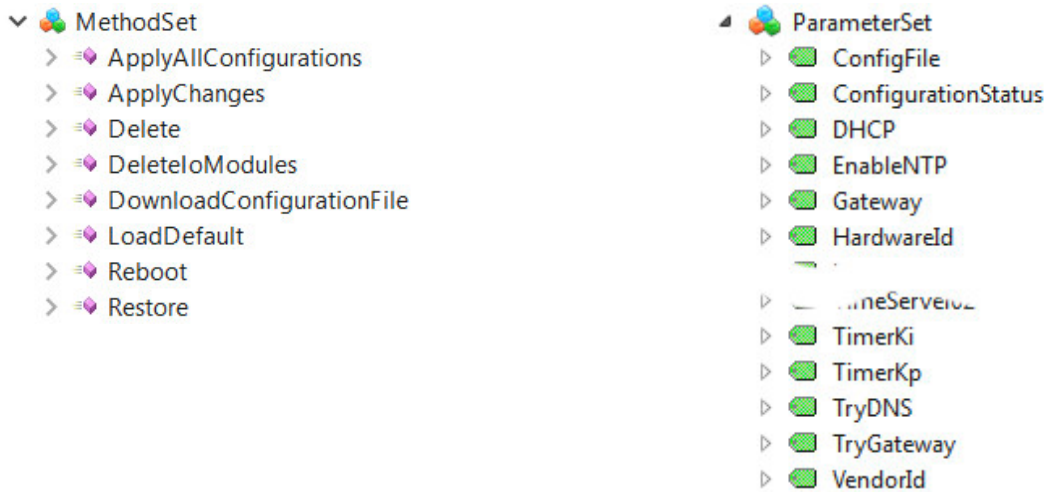

Information:

Both NTP and the OPC UA server transfer the UTC timestamp. If UTC time needs to be converted to a corresponding local time, the conversion must be carried out via the OPC UA client.

Position of the data in the information model: "../ X20BC008U / Configuration / Timer"

| Node name | Description |
|-----------------------------|---|
| EnableNTP | Enables/Disables time synchronization. |
| JumpDifference | Time difference from which a time jump occurs (in milliseconds). During normal operation, the internal timer synchronizes to the reference time of at least one time server. If a difference is detected that is greater than the value specified in this parameter, a time jump occurs. If the deviation is minimal, a time jump does not occur. Instead, the difference is corrected by adjusting the timer speed. |
| SynchronizationInterval | Interval at which the time is polled from the time server (in minutes). |
| TimerServer01/TimerServer02 | Hostnames or IP addresses of up to 2 time servers. If one of the servers is not available, the other will be used instead. |
| TryDNS | An attempt will be made to use the DNS server as the time server. This option can be useful if the network configuration is obtained via DHCP since network stations on which the DNS server is hosted will often host an NTP server as well. In this case, an NTP server does not need to be configured. |
| TryGateway | An attempt will be made to use the default gateway as the time server. This option can be useful if the network configuration is obtained via DHCP since the default gateway often hosts an NTP server as well. In this case, an NTP server does not need to be configured. |

9.3.10.11.6 MethodSet and ParameterSet

The bus controller object and the I/O module objects each contain objects "MethodSet" and "ParameterSet".

- "MethodSet" groups all methods for a given module into a flat list.
- "ParameterSet" groups all variable nodes into a flat list.

These sets should be used if variables and nodes are to be accessed automatically. The advantage of providing access via a set is that the location of the nodes is known from the start. It is then not necessary to take an additional structure into account. This allows the structure to be changed (e.g. due to new features, better clarity, etc.) without having to adapt automatic accesses.

Position of the data in the information model:

"./ X20BC008U / MethodSet"

"./ X20BC008U / ParameterSet"

9.3.10.11.6.1 Supported methods

Apply

There are 2 different methods for saving changed values.

- [ApplyChanges](#) - Save a single value
- [ApplyAllConfigurations](#) - Save all values

ApplyAllConfigurations

This method is in the [MethodSet](#) of the X20BC008U object. This means that all changed configurations can be applied at once. This replaces individual calls of method [ApplyChanges](#).

When method "ApplyAllConfigurations" is called, all changed configurations are initially saved. Then it is checked whether one of the configuration changes requires a restart of the bus controller. If so, this is indicated in the corresponding output argument for the method and the procedure is ended. The configuration is only applied after the bus controller has been restarted, e.g. by calling method [Reboot](#). If no restart of the bus controller is required, all I/O modules requiring a restart due to the configuration change are restarted automatically.

ApplyChanges

Changed values are only saved by calling method "ApplyChanges". The method has an output argument that indicates the [configuration status](#) at the end of the call.

If the new configuration leads to the creation of additional cyclic data on the X2X Link network, the new parameters will not be applied immediately. In this case, the bus controller must be restarted (see "[Reboot](#)" on [page 896](#)). This is indicated by configuration status "Reboot of bus controller required". The bus controller does not have to be restarted immediately, however. Further I/O modules can be configured first.

If the module has been reconfigured without increasing the size of the cyclic X2X frame, only the I/O module is restarted. This is indicated by configuration status "Module reboot triggered". After restarting the module, the changed configuration was applied. This is indicated by configuration status "Configuration OK".

As soon as method "ApplyChanges" has been called, the module is permanently assigned to a slot. From then on, the slot will only accept modules of the same type. If another module type is connected, this module does not boot up completely and remains in mode PREOPERATIONAL mode. Configuration status "Wrong ModuleId" is displayed.

Delete

When method "Delete" is called, the configuration file for the corresponding module is deleted. However, the currently active configuration is not modified.

Modules of any type can be connected in the slot used. After the bus controller has restarted, the module that is currently inserted is started with its default configuration.

DeleteloModules

This method deletes the configuration files of all configured X2X modules.

This method is only available with firmware versions $\geq V1.13$.

Information:

Each deletion of a configuration, i.e. both "[Delete](#)" and "[DeleteloModules](#)", requires a restart of the bus controller.

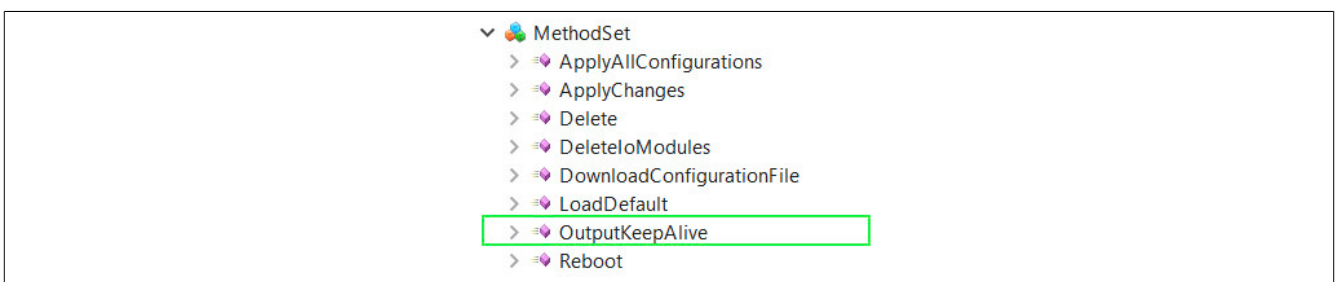

DownloadConfigurationFile

This method allows configuration data to be downloaded to the bus controller in XML format.

LoadDefault

This method loads the default configuration for the relevant module. All parameters are reset to their default setting. However, the configuration is only saved and transferred when method [Apply](#) is called.

OutputKeepAlive

This method defines the behavior of the digital outputs after connection loss. By default, the digital outputs maintain the current output states after connection loss. This means that outputs remain set if they were set.

This method is only available with firmware versions V1.18 or later.

RegisterRead

This method is located in the [method set](#) of the I/O module object. It allows I/O module registers to be read directly. As an input argument, this method requires the number corresponding to the register that is to be read. The read value is returned as an output argument.

Reboot

This method is in the [method set](#) of the X20BC008U object. It allows the bus controller to be restarted. If the method is called, all connected clients are disconnected and the bus controller and all I/O modules are restarted.

Starting with firmware version V1.13, it is possible to restart each connected X2X module individually by calling a method. This is normally not required since the bus controller automatically restarts the connected X2X modules if necessary. In addition, the NodeID of the reboot method has been modified.

- NodeID in firmware <V1.13: 120
- NodeID in firmware ≥V1.13: 240

RegisterWrite

This method is located in the [method set](#) of the I/O module object. It is used to write registers to the relevant I/O module directly. The register number and the value to be written are transferred as input arguments.

Restore

Calling this method restores the last saved configuration.

9.3.10.11.7 Status

Position of the data in the information model: `../X20BC008U/Status"`

9.3.10.11.7.1 ConfigFile

This node allows the current configuration to be exported in XML format. Only parameters that deviate from the default setting are saved in the configuration file.

9.3.10.11.7.2 ConfigurationStatus

This node indicates the current configuration state.

| Value | EnumString | Description |
|-------|---------------------------------------|--|
| 0 | Not configured | Not configured |
| 1 | No configuration available | A module for which no configuration has been saved is inserted in the slot. In this case, the module runs with its default configuration. |
| 2 | Configuration ready | A configuration exists for a module in this slot, but the module is not available. |
| 3 | Configuration OK | The module is configured correctly. |
| 4 | Configuration changed but not applied | The configuration was changed. The modified parameters have not yet been applied or saved, however. |
| 5 | Module reboot triggered | A restart has been triggered for the module. |
| 6 | Wrong ModuleId | The module in the slot does not correspond to the module configured for this slot. |
| 7 | Reboot of bus controller required | The configuration was saved but could not be applied straightaway. In this case, the saved configuration will be applied after the bus controller has restarted. |
| 8 | Error during configuration | An error occurred during configuration. |

9.3.10.11.7.3 ModuleOK

This node also exists in folder [Process data](#). It indicates whether the I/O module is functioning correctly.

9.3.10.11.7.4 NetworkStatus

The network status provides information about the operating state of the X2X Link stations, i.e. the bus modules of the respective I/O modules.

| Bit | Description |
|-------|---------------------------------|
| 0 | I/O bus supply, 1 = OK |
| 1 | Reserved |
| 2 | I/O bus, 1 = OK |
| 3 | DataValid, 0 = OK, 1 = Old data |
| 4 - 7 | Always 1 |

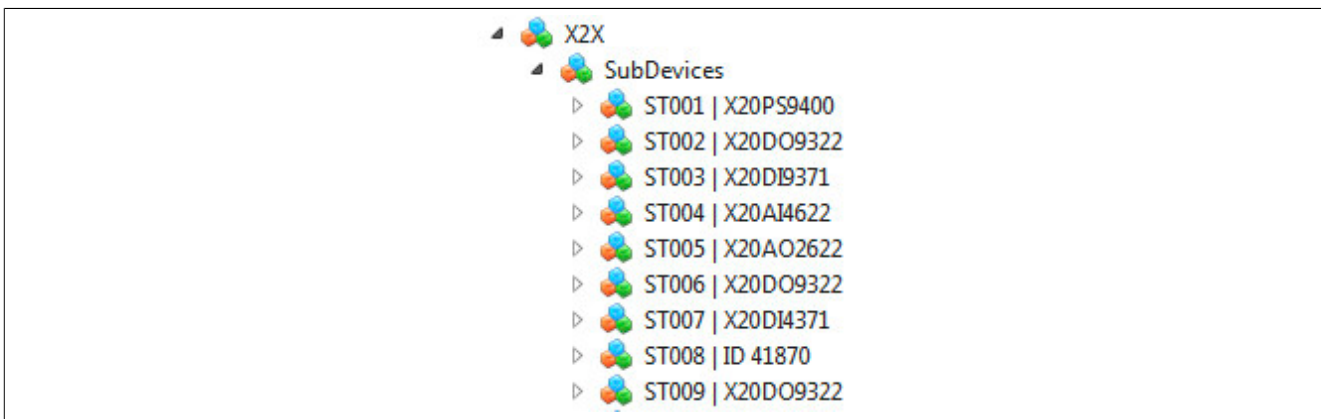

This results in the following values:

| Description | Value (decimal) | Value (hex) |
|---|-----------------|-------------|
| X2X Link station inactive (e.g. no X2X Link power supply) | 0 | 0x00 |
| Everything OK (I/O data valid) | 245 | 0xF5 |
| No communication with the electronics module (bits 7 to 3 invalid) | 249 | 0xF9 |
| I/O data invalid, communication between X2X ASIC and electronics module OK (ASIC carried out a valid "Sync in" transfer with the electronics module in the previous X2X Link cycle) | 253 | 0xFD |

Information:

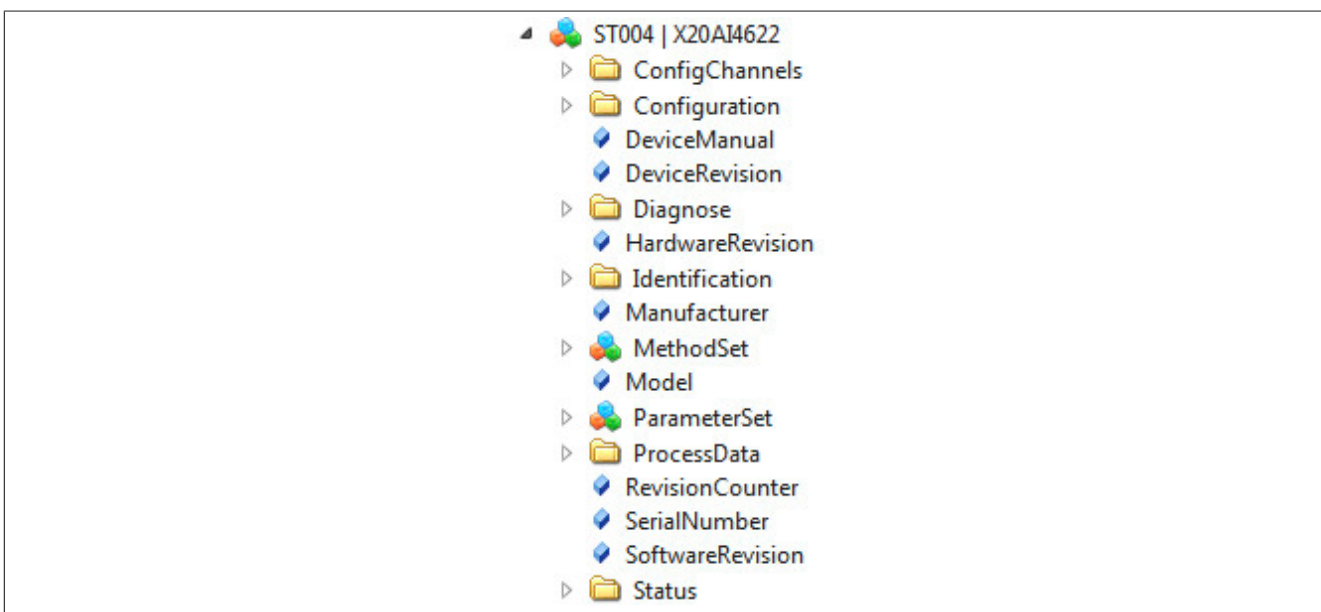

Any value unequal to 245 (0xF5) means that the I/O data of the corresponding module is invalid. This circumstance is usually taken into account or processed accordingly in the application.

9.3.10.11.8 X2X Link and I/O modules

All I/O modules detected on the X2X Link network are listed under "X20BC008U / X2X / SubDevices". All data, control and configuration nodes assigned to the respective module are located at a lower level.

Example of an AI module's nodes

Connected modules are automatically detected and started with their default configuration, provided that a corresponding configuration has not been saved. In order to fully map I/O module nodes, the bus controller contains a database with additional information for each module. The information model is updated accordingly, allowing the modules' full range of functions to be used. For a list of modules supported by the database, see "[Supported modules](#)" on page 899.

X2X modules not contained in the database can be used in function model 254. Since the bus controller does not know the product ID in this case, the modules are labeled "ID 'ModuleID>'" (see e.g. "ID 41870" in the image above). The configuration for these modules can only be modified using method "[RegisterWrite](#)" on page 896. The process data points are labeled "RegisterXX" in folder [Process data of the I/O modules](#). For the meaning of register numbers, see the relevant module documentation.

Information:

It is not possible to modify the process data image in this operating mode.

9.3.10.11.8.1 Supported modules

The following table shows all of the I/O modules that are stored in the bus controller's database. See "X2X Link and I/O modules" on page 898.

| Model number | Starting with firmware version | Description |
|--------------|--------------------------------|--|
| X20AI2222 | V1.13 | X20 analog input module, 2 inputs, ± 10 V, 13-bit converter resolution, configurable input filter |
| X20AI2322 | V1.13 | X20 analog input module, 2 inputs, 0 to 20 mA / 4 to 20 mA, 12-bit converter resolution, configurable input filter |
| X20AI2622 | V1.00 | X20 analog input module, 2 inputs, ± 10 V or 0 to 20 mA / 4 to 20 mA, 13-bit converter resolution, configurable input filter |
| X20AI4222 | V1.13 | X20 analog input module, 4 inputs, ± 10 V, 13-bit converter resolution, configurable input filter |
| X20AI4322 | V1.13 | X20 analog input module, 4 inputs, 0 to 20 mA / 4 to 20 mA, 12-bit converter resolution, configurable input filter |
| X20(c)AI4622 | V1.00 Coated module V1.18 | X20 analog input module, 4 inputs, ± 10 V or 0 to 20 mA / 4 to 20 mA, 13-bit converter resolution, configurable input filter |
| X20AI8221 | V1.13 | X20 analog input module, 8 inputs, ± 10 V, 13-bit converter resolution |
| X20AI8321 | V1.13 | X20 analog input module, 8 inputs, 0 to 20 mA, 12-bit converter resolution |
| X20AO2622 | V1.00 | X20 analog output module, 2 outputs, 10 V or 0 to 20 mA / 4 to 20 mA, 13 bit converter resolution |
| X20(c)AO4622 | V1.00 Coated module V1.18 | X20 analog output module, 4 outputs, 10 V or 0 to 20 mA / 4 to 20 mA, 13 bit converter resolution |
| X20AP3111 | V1.13 | X20 energy metering module, 3 analog inputs, 480 VAC, 50/60 Hz, 4 analog inputs, 20 mA AC, calculates effective, reactive and apparent power/energy, calculates RMS values, 240 V keyed, NetTime function |
| X20(c)AP3121 | V1.13 Coated module V1.18 | X20 energy metering module, 3 analog inputs, 480 VAC, 50/60 Hz, 4 analog inputs, 1 A AC, calculates effective, reactive and apparent power/energy, calculates RMS values, 240 V keyed, NetTime function |
| X20AP3122 | V1.13 | X20 energy metering module, 3 analog inputs, 480 VAC, 50/60 Hz, 4 analog inputs, 1 A AC, groundable, calculates effective, reactive and apparent power/energy, calculates RMS values, 240 V keyed, NetTime function |
| X20(c)AP3131 | V1.13 Coated module V1.18 | X20 energy metering module, 3 analog inputs, 480 VAC, 50/60 Hz, 4 analog inputs, 5 A AC, calculates effective, reactive and apparent power/energy, calculates RMS values, 240 V keyed, NetTime function |
| X20AP3132 | V1.13 | X20 energy metering module, 3 analog inputs, 480 VAC, 50/60 Hz, 4 analog inputs, 5 A AC, groundable, calculates effective, reactive and apparent power/energy, calculates RMS values, 240 V keyed, NetTime function |
| X20AP3161 | V1.13 | X20 energy metering module, 3 analog inputs, 480 VAC, 50/60 Hz, 4 analog inputs, 333 mV AC, calculates effective, reactive and apparent power/energy, calculates RMS values, 240 V keyed, NetTime function |
| X20AP3171 | V1.13 | X20 energy metering module, 3 analog inputs, 480 VAC, 50/60 Hz, 4 analog inputs, Rogowski adjustable (μ V/A), max. 52 mV, calculates effective, reactive and apparent power/energy, calculates RMS values, 240 V keyed, NetTime function |
| X20AT2222 | V1.00 | X20 temperature input module, 2 inputs for resistance measurement, PT100, PT1000, resolution 0.1°C, 3-wire connections |
| X20AT2402 | V1.00 | X20 temperature input module, 2 thermocouple inputs, Type J, K, N, S, B, R, resolution 0.1°C |
| X20(c)AT4222 | V1.00 | X20 temperature input module, 4 inputs for resistance measurement, PT100, PT1000, resolution 0.1°C, 3-wire connections |
| X20(c)AT6402 | V1.00 | X20 temperature input module, 6 thermocouple inputs, Type J, K, N, S, B, R, resolution 0.1°C |
| X20(c)BR9300 | V1.18 | X20 bus receiver, X2X Link, supply for X2X Link and internal I/O power supply |
| X20(c)BT9100 | V1.18 | X20 bus receiver, X2X Link, supply for X2X Link and internal I/O power supply |
| X20BT9400 | V1.18 | X20 bus transmitter, X2X Link, supply for internal I/O power supply, X2X Link supply for X67 modules, reverse polarity protection, short-circuit proof, overload-proof, parallel connection possible, redundancy operation possible |
| X20CM8281 | V1.20 | X20 Universelles Mischmodul, 4 digitale Eingänge, 24 VDC, Sink, 1-Leitertechnik, 2 digitale Ausgänge, 0,5 A, Source, 1-Leitertechnik, 1 analoger Eingang, ± 10 V oder 0 bis 20 mA / 4 bis 20 mA, 12 Bit Wandlerauflösung, 1 analoger Ausgang, ± 10 V / 0 bis 20 mA, 12 Bit Wandlerauflösung, 2 Zähler als Ereigniszähler oder zur Torzeitmessung |
| X20(c)CS1020 | V1.13 Coated module V1.18 | X20 interface module, 1 RS232 interface, max. 115.2 kbit/s |
| X20(c)CS1030 | V1.13 Coated module V1.18 | X20 interface module, 1 RS422/485 interface, max. 115.2 kbit/s |
| X20DI2371 | V1.00 | X20 digital input module, 2 inputs, 24 VDC, sink, configurable input filter, 3-wire connections |
| X20DI2372 | V1.00 | X20 digital input module, 2 inputs, 24 VDC, source, configurable input filter, 3-wire connections |
| X20DI2377 | V1.20 | X20 Digitales Eingangsmodule, 2 Eingänge, 24 VDC, Sink, Eingangsfilter parametrierbar, 2 Ereigniszähler 50 kHz, 3-Leitertechnik |
| X20(c)DI4371 | V1.00 | X20 digital input module, 4 inputs, 24 VDC, sink, configurable input filter, 3-wire connections |
| X20DI4372 | V1.00 | X20 digital input module, 4 inputs, 24 VDC, source, configurable input filter, 3-wire connections |
| X20(c)DI6371 | V1.00 | X20 digital input module, 6 inputs, 24 VDC, sink, configurable input filter, 2-wire connections |
| X20(c)DI6372 | V1.00 | X20 digital input module, 6 inputs, 24 VDC, source, configurable input filter, 2-wire connections |
| X20DI8371 | V1.00 | X20 digital input module, 8 inputs, 24 VDC, sink, configurable input filter, 1-wire connections |
| X20(c)DI9371 | V1.00 | X20 digital input module, 12 inputs, 24 VDC, sink, configurable input filter, 1-wire connections |
| X20(c)DI9372 | V1.00 | X20 digital input module, 12 inputs, 24 VDC, source, configurable input filter, 1-wire connections |
| X20DID371 | V1.00 | X20 digital input module, 8 inputs, 24 VDC, sink, configurable input filter, 2-wire connections |
| X20(c)DIF371 | V1.00 Coated Modul V1.18 | X20 digital input module, 16 inputs, 24 VDC, sink, configurable input filter, 1-wire connections |

9.3.10.11.8.2 Configuration of the I/O modules

I/O modules can be configured via the information model. The corresponding nodes are grouped in folder "Configuration", which exists for each module. The configuration parameters contained in this folder and the structure of these parameters are specific to each I/O module. For an explanation of parameters, see the respective module documentation. In addition to the configuration nodes, each configuration folder contains an object named "Control." The methods contained in this object are used to control the configuration process.

The current status of the configuration can be queried via node [ConfigurationStatus](#).

Example of a module configuration

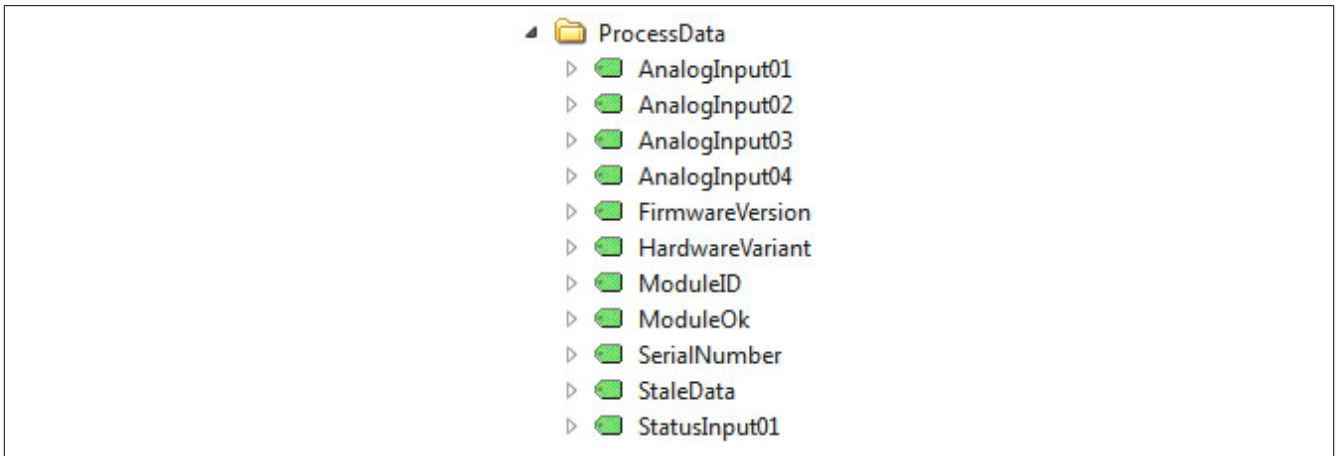

Information:

Modifying the configuration can lead to the addition or removal of configuration parameters. To detect this, the relevant higher-level node must be re-imported (browsed).

9.3.10.11.8.3 Process data of the I/O modules

The process data provided by an I/O module is grouped in folder "ProcessData". These nodes allow output process data to be written and input process data to be read. For the meaning of data points, see the relevant module documentation.

Example of an AI module's process data

Information:

If the configuration is modified, the available process data nodes may change. To detect this, the relevant higher-level node must be re-imported (browsed).

Until the relevant configuration changes are applied, it may not be possible to feed data to recently enabled nodes. This is indicated via a corresponding state.

9.3.10.11.8.4 ConfigChannels

This folder groups nodes containing a copy of the values that were written to the relevant configuration register in the module. These values can only be read and are provided for troubleshooting purposes. They are automatically calculated on initialization or on applying the configuration. For more information about the meaning of these values, see the relevant module documentation.

Example of an AI module's ConfigChannel nodes

9.3.11 X20(c)BC00E3

Data sheet version: 1.25

9.3.11.1 General information

PROFINET (Process Field Network) is an Industrial Ethernet protocol. It uses TCP/IP and is real-time capable.

PROFINET IO is specially designed for communication between a controller and decentralized field devices and describes the entire data exchange between controllers (masters) and devices (slaves) as well as configuration and diagnostics. It follows the producer-consumer model.

2 transfer variants are available:

- Real-time (RT) communication
- Isochronous real-time (IRT) communication

Within PROFINET IO, process data and alarms are always transferred in real time (RT). RT communication is the basis for data exchange with PROFINET IO. Clock-synchronous data exchange with PROFINET is defined in the isochronous real-time (IRT) concept. The difference to real-time communication lies essentially in the determinism, so that the start of a bus cycle is maintained with the highest precision.

X20 modules or other modules based on X2X Link can be connected to the bus controller. Modular system configurations are optimally supported by PROFINET. Using the device description file (GSDML format), it is very easy to handle project configuration in the respective engineering tool from the manufacturer of the master device.

- Fieldbus: PROFINET IO
- I/O configuration via the fieldbus
- Conformance Class B
- Minimum cycle time 1 ms
- Integrated switch for cabling multiple slaves
- 100 Mbit/s full duplex mode
- Up to 1440 bytes of input data and up to 1440 bytes of output data are possible
- Integrated website
- PROFINET diagnostics and module diagnostics during runtime from within the master environment
- Module and switch diagnostics during runtime using the website or SNMP

9.3.11.2 Coated modules

Coated modules are X20 modules with a protective coating for the electronics component. This coating protects X20c modules from condensation and corrosive gases.

The modules' electronics are fully compatible with the corresponding X20 modules.

For simplification purposes, only images and module IDs of uncoated modules are used in this data sheet.

The coating has been certified according to the following standards:

- Condensation: BMW GS 95011-4, 2x 1 cycle
- Corrosive gas: EN 60068-2-60, method 4, exposure 21 days

| Spacing ²⁾ | 37.5 ^{+0.2} mm | |

Table 127: X20BC00E3, X20cBC00E3 - Technical data

- 1) The minimum cycle time defines how far the bus cycle can be reduced without communication errors occurring.
2) Spacing is based on the width of the X20BB80 bus base. In addition, an X20PS9400 or X20PS9402 supply module is always required for the bus controller.

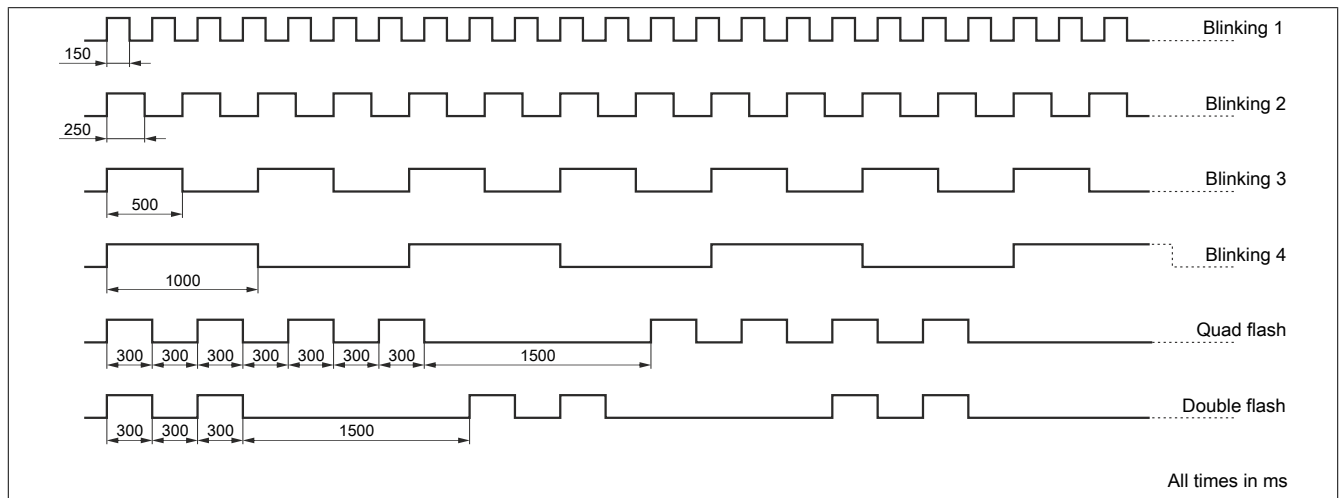

9.3.11.5 LED status indicators

The following table lists the LED status indicators available on the bus controller. Exact blink times are specified in the timing diagram in the next section.

| Figure | LED | Color | Status | Description | |
|---|---|------------------|--------------|---|--|
|  | MS ¹⁾ | Green | Off | The PROFINET master is in "Stop" mode. | |
| | | | Quad flash | The bus controller does not have a valid IP address (0.0.0.0). It will wait in this state until it is assigned an IP address from the PROFINET master or from an external source. This state can also occur if the bus controller is being operated in DHCP mode. | |
| | | | Double flash | An unacknowledged alarm is pending on the bus controller. | |
| | | | Blinking 1 | The bus controller is in the initialization phase. This boot phase is where all connected I/O modules are initialized. | |
| | | | Blinking 3 | The bus controller is configuring the connected I/O modules. The configuration is transferred to the bus controller via the PROFINET master. | |
| | | | On | A connection to a PROFINET master has been established. The master and slave are both in OPERATIONAL mode and data is being exchanged between them. This mode also indicates that the master itself is in RUN mode. | |
| | | | Red | Blinking 4 | The bus controller has detected an error. However, it can still be corrected in the master environment during runtime. |
| | | | | Blinking 1 | The bus controller has detected an error. This error cannot be corrected during runtime; a restart is required. |
| | | BF ¹⁾ | Green | Blinking 2 | Device identification ("blink" function in step 7 when searching for existing Ethernet stations). |
| | | | | On | A connection to a PROFINET master has been established. |
| | | | Red | On | Not connected to a PROFINET Master |
| | | | | L/A IFx | Green |
| Blinking | Ethernet activity taking place on the RJ45 interface (IF1, IF2) indicated by the respective LED | | | | |
| On | Indicates an established connection (link), but no communication is taking place | | | | |

1) The "MS" and "BF" LEDs are green/red dual LEDs.

LED status indicators - Blinking patterns

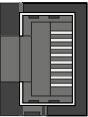

9.3.11.6 Operating and connection elements

9.3.11.7 Ethernet interface

For information about wiring X20 modules with an Ethernet interface, see "Cabling guidelines for X20 modules with an Ethernet cable" on page 58.

| Interface | Pinout | | |
|--|--------|-------------|----------------|
| | Pin | Ethernet | |
|  Shielded RJ45 | 1 | RXD | Receive data |
| | 2 | RXD\ | Receive data\ |
| | 3 | TXD | Transmit data |
| | 4 | Termination | |
| | 5 | Termination | |
| | 6 | TXD\ | Transmit data\ |
| | 7 | Termination | |
| | 8 | Termination | |

9.3.11.8 Node number switches

This bus controller is equipped with 2 node number switches. The bus controller can be set to various operating states with certain predefined switch positions. Various parameters (PROFINET device name, DHCP mode, etc.) can also be configured.

| Switch position | Description |
|-----------------|--|
| 0x00 | Initializes all parameters from flash memory: PROFINET-compliant initialization via the DCP protocol (factory setting) |
| 0x01 - 0xEF | These switch positions generate a valid PROFINET device name. This name is composed as follows: "brpnXXX". Number XXX corresponds to the decimal value of the node number switch position. The system automatically adds leading 0s. |
| 0xF0 | Erases flash memory (see "Erasing flash memory" on page 908) |
| 0xF1 - 0xFD | Reserved, switch position not permitted |
| 0xFE | IP address via DHCP server |
| 0xFF | Sets all parameters to default |

PROFINET-compliant factory setting - Node number switch position 0x00

| Parameter | Value |
|----------------------|-------------------------------|
| IP address | 0.0.0.0 |
| Subnet mask | 0.0.0.0 |
| Gateway | 0.0.0.0 |
| PROFINET device name | "" ... No name when delivered |

Default parameters - Node number switch position 0xFF

Parameters cannot be changed by the master in node switch position 0xFF.

| Parameter | Value |
|----------------------|-----------------|
| IP address | 192.168.100.1 |
| Subnet mask | 255.255.255.0 |
| Gateway | 192.168.100.254 |
| PROFINET device name | x20bc00e3 |

9.3.11.9 Erasing flash memory

Erasing flash memory using switch position 0xF0 returns the bus controller to its factory state.

Procedure

1. Turn off the power supply to the bus controller.
2. Set the node number to 0xF0.
3. Turn the power supply to the bus controller back on.
4. Wait until the "MS" LED flashes green for 5 s. The node number switch must be set to 0x00 and then back to 0xF0 within this time window of 5 seconds (rotate the top switch).
5. Wait until the "MS" LED blinks with a red double-flash (flash has been cleared).
6. Turn off the power supply to the bus controller.
7. Set the desired node number (0x00 - 0xEF)
8. Turn the power supply to the bus controller back on.
9. The bus controller boots with the configured node number.

9.3.11.10 Web interface

The integrated Web interface gives the user an overview of the bus controller's network parameters, the configured I/O modules and the switch configuration. The starting page includes information regarding specific bus controller settings such as IP address, host name and the PROFINET device name. In addition, the web page provides information about the current firmware version. Information concerning module diagnostics is incorporated into a tree structure. Expanding and collapsing the individual module nodes provides an overview of the configured I/O modules. In addition, various package counters are read from the integrated switch. This makes diagnosing errors on the network quick and easy.

Network parameters concerning the bus controller itself can be read, but they cannot be modified. The bus controller's IP configuration is handled during booting or by the PROFINET master when a connection is established.

Each page of the Web interface contains help information that describes the functions and parameters displayed on that page. The link to this information can be found in the upper right corner of the page in the form of a question mark.

A connection to the web interface is established by entering the **current IP address** or the unique **host name** in a Web browser. Some functions require authentication.

The host name is composed of a predefined text and a unique MAC address. For example, if the bus controller has the MAC address 00:60:65:11:22:33, this will result in the following host name: **br006065112233**.

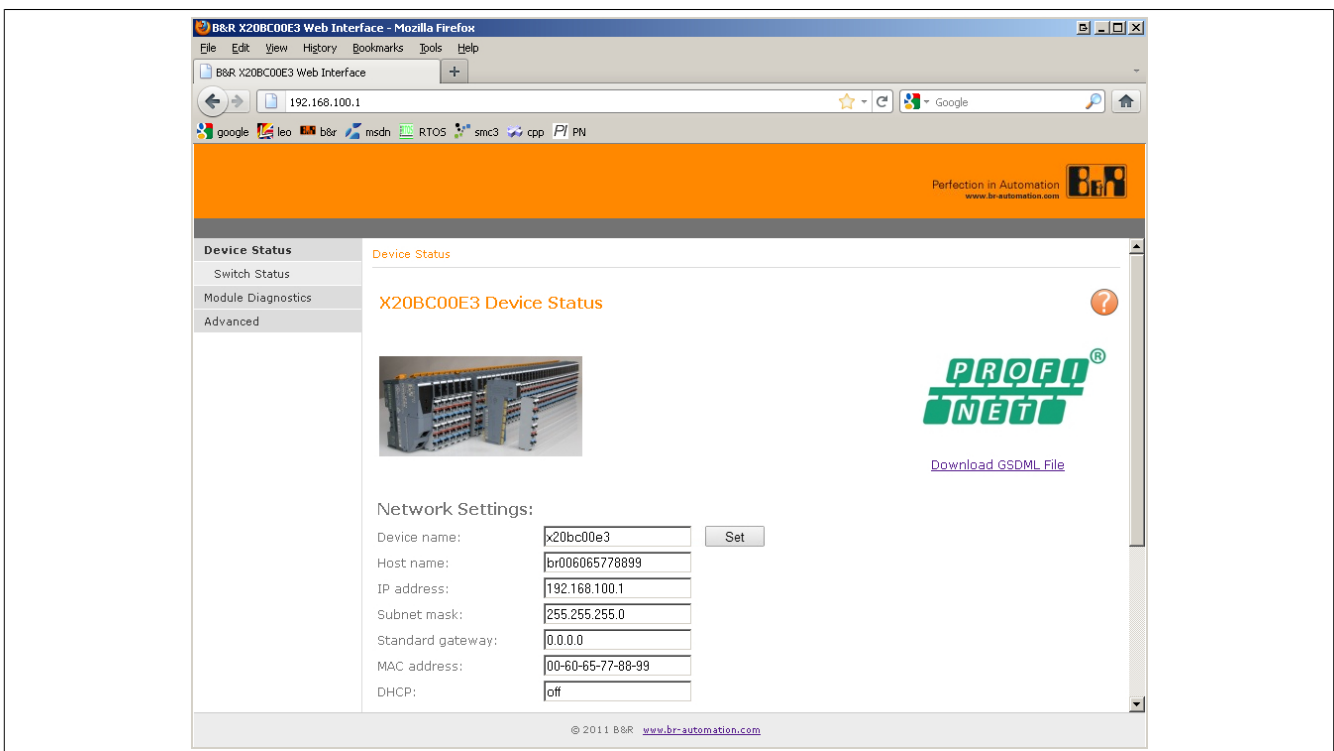

Default parameters for the web interface

| | |
|-------------|---------------|
| IP address: | 192.168.100.1 |
| Username: | admin |
| Password: | B&R |

Information:

Take note of the node number switch position.

Please note that authentication parameters are case-sensitive.

9.3.12 X20BC00G3

Data sheet version: 1.23

9.3.12.1 General information

EtherCAT is an Ethernet-based fieldbus developed by Beckhoff. This protocol is suitable for both hard and soft real-time requirements in automation technology. In addition to a ring structure, which becomes logically necessary because of the summation frame telegram used, the EtherCAT technology also physically supports topologies such as line, tree, star (limited) and combinations of these topologies. B&R's X20BC80G3 (expandable bus controller module) and X20HB88G0 (standalone junction base module) are available for implementing these topologies.

EtherCAT slave devices take the data designated for them from a telegram as it is passing through the device. Input data is also added to the telegram as it is passing through. The bus controller allows X2X Link I/O modules to be coupled to EtherCAT and operated on any EtherCAT master system. A transition between IP20 and IP67 protection outside of the control cabinet is possible by arranging X20, X67 or XV modules one after the other as needed at distances up to 100 m.

Master systems without FoE (File access over EtherCAT) support require an appropriate configuration tool to transfer the configuration (optional).

- Fieldbus: EtherCAT
- Auto-configuration of I/O modules
- I/O configuration and firmware update via the fieldbus (FoE)
- Full support of the modular slice concept via CoE (CANopen over EtherCAT)
- Configurable I/O cycle (0.2 to 4 ms)
- Synchronization between the fieldbus and X2X Link

Information:

Only the standard function model (see the respective module description) is supported when the bus controller is used together with multi-function modules it has automatically configured itself.

All other function models are supported when configured accordingly in Automation Studio V4.3 or later.

Automation Studio can be downloaded at no cost from the B&R website (www.br-automation.com). The evaluation license is permitted to be used to create complete configurations for fieldbus bus controllers at no cost.

| Note | Order 1x terminal block X20TB12 separately Order 1x power supply module X20PS9400 or X20PS9402 separately Order 1x bus base X20BB80 separately |
| Spacing ²⁾ | 37.5 ^{+0.2} mm |

Table 129: X20BC00G3 - Technical data

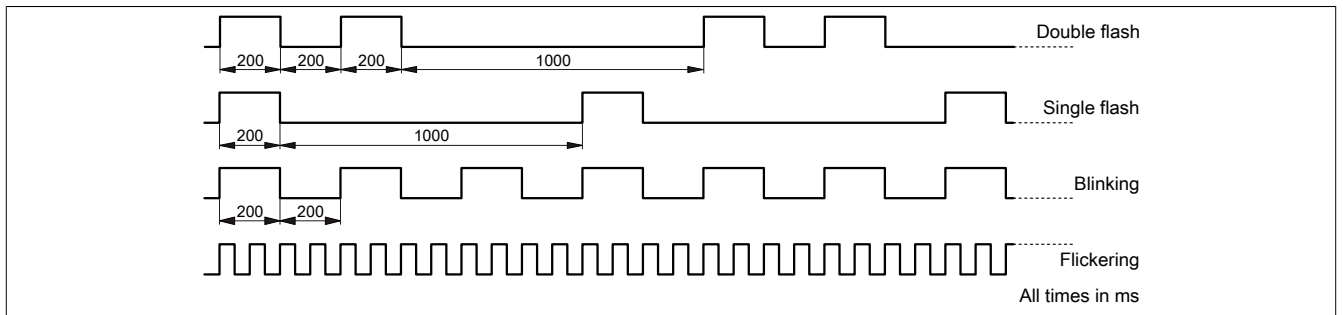

- 1) The minimum cycle time defines how far the bus cycle can be reduced without communication errors occurring.
- 2) Spacing is based on the width of bus base X20BB80. In addition, power supply module X20PS9400 or X20PS9402 is always required for the bus controller.

9.3.12.4 LED status indicators

| Figure | LED | Color | Status | Description |
|---|----------------------|-------|--------------|---|
|  | STATUS ¹⁾ | Green | On | The bus controller is in state OPERATIONAL. |
| | | | Blinking | State PREOPERATIONAL |
| | | | Single flash | State SAFE-OPERATIONAL |
| | | | Flickering | The bus controller has started and is not yet in state INIT, or it is in state BOOTSTRAP (e.g. during firmware download). |
| | | | Off | State INIT |
| | | Red | On | A critical communication or application error has occurred. |
| | | | Blinking | Invalid configuration data |
| | | | Single flash | The bus controller has an internal error and has changed the EtherCAT state on its own. |
| | | | Double flash | Watchdog timeout (process data watchdog or EtherCAT watchdog) |
| | | | Flickering | Error in startup procedure (state INIT achieved, but the error indicator bit in the AL status register is set) |
| | L/A IN L/A OUT | Green | Off | No error |
| | | | Blinking | The respective LED blinks when Ethernet activity is taking place (PORT OPEN) on the corresponding RJ45 interface (IN, OUT). |
| | | | On | A connection (link) is established, but no communication is taking place (PORT OPEN). |
| | | | Off | No physical Ethernet connection exists (PORT CLOSED). |

1) LED "STATUS" is a green/red dual LED used to indicate EtherCAT states ERROR and RUN.

LED status indicators - Blink times

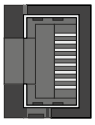

9.3.12.5 Operating and connection elements

9.3.12.6 RJ45 ports

For information about wiring X20 modules with an Ethernet interface, see "Cabling guidelines for X20 modules with an Ethernet cable" on page 58.

| Interface | Pinout | | |
|--|--------|-------------|----------------|
| | Pin | Ethernet | |
|  Shielded RJ45 | 1 | TXD | Transmit data |
| | 2 | TXD\ | Transmit data\ |
| | 3 | RXD | Receive data |
| | 4 | Termination | |
| | 5 | Termination | |
| | 6 | RXD\ | Receive data\ |
| | 7 | Termination | |
| | 8 | Termination | |

9.3.12.7 EtherCAT network address switches

A slave alias address can be set using the 2 network address switches on the bus controller. During the initialization phase (during startup), the bus controller writes the value of the address switches to ESC register 0x12 or 0x13. However, this value is only applied in the corresponding registers if the switch value is between 0x00 and 0xFA (decimal 250).

| Switch position | Description |
|-----------------|--|
| 0x00 to 0xFA | Writes the address switch value to the "Station alias" register. |
| 0xFB to 0xFE | Does not apply the address switch value. ESC alias registers are not changed. |
| 0xFF | Does not apply the address switch value. ESC alias registers are not changed. If the address switches are set to value 0xFF and the bus controller is restarted, then it will boot with the default values. All set parameters remain unchanged in flash memory. |

The master determines whether the alias address is used to address the slave by setting the corresponding bit (bit 24) in the ESC DL control register.

9.3.12.8 Deleting parameters

Various parameters can be stored in the bus controller's flash memory. Deleting these parameters using switch position F0 returns the bus controller to its factory settings.

Deleting the parameters

1. Switch off the power supply to the bus controller.
2. Set the node number to F0.
3. Switch on the power supply to the bus controller.
4. Wait until LED "STATUS" flashes green.
5. Set the node number switch to 0 and then back to F0.
6. Wait until LED "STATUS" blinks (parameters have been deleted).
7. Switch the power supply to the bus controller off and then back on.
8. The bus controller boots with its default settings.

9.3.13 X20BC0143-10

Data sheet version: 1.16

9.3.13.1 General information

CAN (Controller Area Network) systems are widespread in the field of automation technology. CAN topology is based on a line structure and uses twisted wire pairs for data transfer. CANopen is a higher-layer protocol based on CAN. As a standardized protocol, it provides a high degree of flexibility for implementing a wide range of configurations.

The bus controller makes it possible to connect up to 253 X2X Link I/O modules to CANopen. A transition between IP20 and IP67 protection outside of the control cabinet is possible by aligning X20, X67 or XV modules one after the other as needed at distances up to 100m. All CANopen transmission types such as synchronous, event and polling modes are supported together with PDO linking, life/node guarding, emergency objects, and much more.

- Fieldbus: CANopen
- Auto-configuration of I/O modules
- I/O configuration via the fieldbus
- Constant response times even with large amounts of data (max. 32 Rx and 32 Tx PDOs)
- Configurable I/O cycle (0.5 to 4 ms)
- Possible to configure the transfer rate or have it detected automatically
- Heartbeat consumer and producer
- Emergency producer
- 2x SDO server, NMT slave
- Simple bootstrap (autostart)
- Terminal access via the serial interface on the X20PS9400

Information:

Only the standard function model (see the respective module description) is supported when the bus controller is used together with multi-function modules it has automatically configured itself.

Automation Studio V4.3 or later can be used to easily create configuration files (e.g. DCF files). All other function models are also supported by transferring configuration data to the bus controller (e.g. via the master environment with an SDO download).

Automation Studio can be downloaded at no cost from the B&R website (www.br-automation.com). The evaluation license is permitted to be used to create complete configurations for fieldbus bus controllers at no cost.

9.3.13.2 Order data

| Model number | Short description | Figure |

| Mechanical properties | |
| Note | Order 1x terminal block X20TB12 separately. Order 1x power supply module X20PS9400 or X20PS9402 separately. Order 1x bus base X20BB80 separately. |
| Spacing ²⁾ | 37.5 ^{+0.2} mm |

Table 131: X20BC0143-10 - Technical data

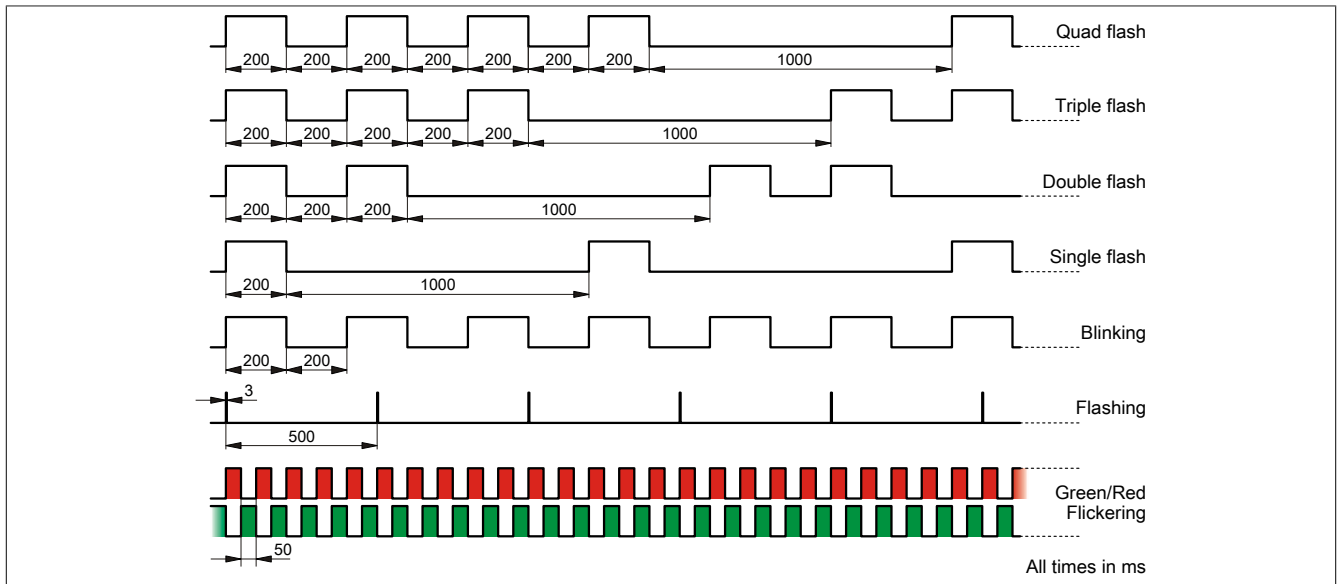

- 1) The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring.
2) Spacing is based on the width of bus base X20BB80. In addition, power supply module X20PS9400 or X20PS9402 is always required for the bus controller.

9.3.13.4 LED status indicators

| Figure | LED | Color | Status | Description |
|---|------------------|--------------------------------------|--|--|
|  | MS ¹⁾ | Green | Off | No power supply |
| | | | Flashing | 5 s window for deleting all configuration settings |
| | | | On | Boot procedure OK, I/O modules OK |
| | | Red | Double flash | Successfully erased flash memory |
| | | | Triple flash | Successfully saved transfer rate |
| | | | Quad flash | Successfully saved configuration |
| | RUN | Green | Off | No power supply |
| | | | Single flash | STOP mode |
| | | | Triple flash | Firmware download in progress |
| | | | Blinking | PREOPERATIONAL mode |
| | | | On | OPERATIONAL mode |
| | | | ERR | Red |
| | Single flash | CAN warning limit reached | | |
| | Double flash | Node guarding / heartbeat error | | |
| | Blinking | Invalid node number or configuration | | |
| | On | Bus errors: Bus off | | |
| RUN/ERR | Green/red | Flickering | Transfer rate detection in progress | |
| TxD | Yellow | Off | The bus controller is not transmitting any data via the CANopen fieldbus | |
| | | On | The bus controller is transmitting data via the CANopen fieldbus | |

1) The "MS" LED is a green/red dual LED. The LED blinks red several times immediately after startup. This is a boot message, however, and not an error.

LED status indicators - Blink times

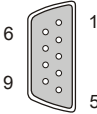

9.3.13.5 Operating and connection elements

9.3.13.6 CAN bus interface

The CAN bus interface is a 9-pin DSUB plug.

| Interface | Pin | CAN | |
|---|-----|----------|------------|
|  | 1 | Reserved | |
| | 2 | CAN_L | CAN low |
| | 3 | CAN_GND | CAN ground |
| | 4 | Reserved | |
| | 5 | Reserved | |
| | 6 | Reserved | |
| | 7 | CAN_H | CAN high |
| | 8 | Reserved | |
| | 9 | Reserved | |

9.3.13.7 Node number and transfer rate

Node numbers and transfer rates are configured using the two bus controller number switches.

The transfer rate can be specified in two ways:

- Automatic detection by bus controller (see ["Automatic transfer rate detection" on page 917](#))
- Fixed definition by user (see ["Setting the transfer rate" on page 918](#))

| Switch position | Node number | Transfer rate |
|-----------------|--|--|
| 0x00 | Not allowed | - |
| 0x01 - 0x7F | 1 - 127 | Automatically set by the bus controller (default) or fixed setting by the user |
| 0x80 - 0x88 | - | Sets a fixed transfer rate |
| 0x89 | - | Sets automatic transfer rate detection |
| 0x8A - 0x8F | Not allowed | - |
| 0x90 | Clearing the parameters See "Clearing parameters" on page 920 | - |
| 0x91 | Not allowed | - |
| 0x92 | Save configuration ¹⁾ See "Save automatic configuration" on page 919 | - |
| 0x93 - 0xFF | Not allowed | - |

1) This function is available starting with Hardware version E0 or Firmware version V0001.0107.

9.3.13.8 Automatic transfer rate detection

After startup, the bus controller goes into "Listen only" mode. This means the bus controller behaves passively on the bus and only listens.

The bus controller attempts to receive valid objects. If receive errors occur, the controller switches to the next transfer rate in the lookup table.

If no objects are received, all transfer rates are tested cyclically. This procedure is repeated until valid objects are received.

Lookup table

The bus controller tests the transfer rate according to this table. Beginning with the starting transfer rate (1000 kbit/s), the controller switches to the next lower transfer rate. At the end of the table, the bus controller restarts the search from the beginning.

| Transfer rate |
|---------------|
| 1000 kbit/s |
| 800 kbit/s |
| 500 kbit/s |
| 250 kbit/s |
| 125 kbit/s |
| 100 kbit/s |
| 50 kbit/s |
| 20 kbit/s |
| 10 kbit/s |

9.3.13.9 Setting the transfer rate

The bus controller will detect the transfer rate automatically by default. Switch positions 0x80 to 0x88 can be used to set a fixed transfer rate, or 0x89 can be used to enable automatic transfer rate detection.

| Switch position | Transfer rate |
|-----------------|-----------------------------------|
| 0x80 | 1000 kbit/s |
| 0x81 | 800 kbit/s |
| 0x82 | 500 kbit/s |
| 0x83 | 250 kbit/s |
| 0x84 | 125 kbit/s |
| 0x85 | 100 kbit/s |
| 0x86 | 50 kbit/s |
| 0x87 | 20 kbit/s |
| 0x88 | 10 kbit/s |
| 0x89 | Automatic transfer rate detection |

Programming the transfer rate

1. Switch off the power supply to the bus controller.
2. Define the transfer rate by selecting the switch position (0x80 to 0x89).
3. Switch on the power supply to the bus controller.
4. Wait until LED "MS" blinks with a red triple flash (transfer rate is now programmed).
5. Switch off the power supply to the bus controller.
6. Set the desired node number (0x01 - 0x7F).
7. Switch on the power supply to the bus controller.
8. The bus controller now boots with the set node number and the programmed transfer rate.

9.3.13.10 Save automatic configuration

The node number position 0x92 can be used to save automatically generated configurations. This makes it possible to work with a standardized configuration without having to adapt the application to changes associated with service work or different development stages for example.

1. Turn off the power supply to the bus controller.
2. Set the node number to 0x90.
3. Turn on the power supply to the bus controller.
4. Wait until the "MS" LED flashes green.
5. The node number switch must be set to 0x00 and then back to 0x90 within this time window of 5 seconds (rotate the top switch).
6. Wait until the "MS" LED blinks with a red double-flash (parameters have been cleared).
7. Turn off the power supply to the bus controller.
8. Set the node number to 0x92.
9. Turn on the power supply to the bus controller.
10. Wait until the "MS" LED flashes green.
11. The node number switch must be set to 0x02 and then back to 0x092 within this time window of 5 seconds (rotate the top switch).
12. Wait until the "MS" LED blinks with a red quad-flash (parameters have been saved).
13. Turn off the power supply to the bus controller.
14. Set the desired node number (0x01 - 0x7F).
15. Turn on the power supply to the bus controller.
16. The bus controller boots with the set node number and automatic transfer rate detection.

Information:

A mapping tool for decoding the saved PDO mapping is available in the Download section of the B&R website (www.br-automation.com).

Information:

This function is available starting with Hardware version E0 or Firmware version V0001.0107.

9.3.13.11 Clearing parameters

Various parameters can be stored in the bus controller's flash memory:

- Communication parameters
- Vendor-specific parameters
- Application parameters (device profile)
- Programmed transfer rate

Clearing the parameters using switch position 0x90 returns the bus controller to its factory settings.

Clearing the parameters listed above

1. Turn off the power supply to the bus controller.
2. Set the node number to 0x90.
3. Turn on the power supply to the bus controller.
4. Wait until the "MS" LED flashes green. The node number switch must be set to 0x00 and then back to 0x090 within this time window of 5 seconds (rotate the top switch).
5. Wait until the "MS" LED blinks with a red double-flash (parameters have been cleared).
6. Turn off the power supply to the bus controller.
7. Set the desired node number (0x01 - 0x7F).
8. Turn on the power supply to the bus controller.
9. The bus controller boots with the set node number and automatic transfer rate detection.

9.3.13.12 Additional documentation and import files (EDS)

Additional documentation about bus controller functions as well as the necessary import files for the master engineering tool are available for download from the Downloads section of the B&R website (www.br-automation.com).

9.4 Bus controllers system modules

The X20 system bus controllers are made up of a bus controller fieldbus interface, a bus controller system module and an X20TB12 terminal block.

Bus controller system modules include the base module and the supply modules.

9.4.1 Summary

| Model number | Short description | Page |
|--------------|--|------|
| X20BB80 | X20 bus base, for X20 base module (BC, HB, etc.) and X20 power supply module, X20 end plates (left and right) X20AC0SL1/X20AC0SR1 included | 922 |
| X20PS9400 | X20 power supply module, for bus controller and internal I/O power supply, X2X Link power supply | 926 |
| X20PS9402 | X20 power supply module, for bus controller and internal I/O power supply, X2X Link power supply, supply not electrically isolated | 932 |
| X20cBB80 | X20 bus base, coated, for X20 base module (BC, HB, etc.) and X20 power supply module, X20 end plates (left and right) X20AC0SL1/X20AC0SR1 included | 922 |
| X20cPS9400 | X20 power supply module, coated, for bus controller and internal I/O power supply, X2X Link power supply | 926 |

9.4.2 X20(c)BB80

Data sheet version: 2.35

9.4.2.1 General information

The following modules are used on the bus module:

- Base module (BC, HB, etc.)
- Supply module

The left and right end plates are included in the delivery.

- Bus base

9.4.2.2 Coated modules

Coated modules are X20 modules with a protective coating for the electronics component. This coating protects X20c modules from condensation and corrosive gases.

The modules' electronics are fully compatible with the corresponding X20 modules.

For simplification purposes, only images and module IDs of uncoated modules are used in this data sheet.

The coating has been certified according to the following standards:

- Condensation: BMW GS 95011-4, 2x 1 cycle
- Corrosive gas: EN 60068-2-60, method 4, exposure 21 days

9.4.2.2.1 -40°C starting temperature

The starting temperature describes the minimum permissible ambient temperature when the power is switched off at the time the coated module is switched on. This is permitted to be as low as -40°C. During operation, the conditions as specified in the technical data continue to apply.

Information:

It is important to absolutely ensure that there is no forced cooling by air currents in a closed control cabinet, for example using a fan or ventilation slots.

9.4.2.5 Voltage routing

9.4.3 X20(c)PS9400

Data sheet version: 3.17

9.4.3.1 General information

The supply module is used together with an X20 bus controller. It is equipped with a feed for the bus controller, the X2X Link and the internal I/O supply.

- Supply for the bus controller, X2X Link and internal I/O supply
- Feed and bus controller / X2X Link supply electrically isolated
- Redundancy of bus controller / X2X Link supply possible by operating multiple supply modules simultaneously
- Service interface (RS232)

9.4.3.2 Coated modules

Coated modules are X20 modules with a protective coating for the electronics component. This coating protects X20c modules from condensation and corrosive gases.

The modules' electronics are fully compatible with the corresponding X20 modules.

For simplification purposes, only images and module IDs of uncoated modules are used in this data sheet.

The coating has been certified according to the following standards:

- Condensation: BMW GS 95011-4, 2x 1 cycle
- Corrosive gas: EN 60068-2-60, method 4, exposure 21 days

9.4.3.2.1 -40°C starting temperature

The starting temperature describes the minimum permissible ambient temperature when the power is switched off at the time the coated module is switched on. This is permitted to be as low as -40°C. During operation, the conditions as specified in the technical data continue to apply.

Information:

It is important to absolutely ensure that there is no forced cooling by air currents in a closed control cabinet, for example using a fan or ventilation slots.

9.4.3.3 Order data

| Model number | Short description | Figure |

Table 135: X20PS9400, X20cPS9400 - Technical data

- The specified values are maximum values. For examples of the exact calculation, see section "Mechanical and electrical configuration" of the X20 system user's manual.
- In parallel operation, only 75% of the rated power can be assumed. It is important to make sure that all power supplies operated in parallel are switched on and off at the same time.

9.4.3.5 LED status indicators

For a description of the various operating modes, see "[Diagnostic LEDs](#)" on page 3787.

| Figure | LED | Color | Status | Description |
|---|-----|-----------------------------|---|--|
|  | r | Green | Off | No power to module |
| | | | Single flash | RESET mode |
| | | | Blinking | PREOPERATIONAL mode |
| | | | On | RUN mode |
| | e | Red | Off | No power to module or everything OK |
| | | | Double flash | LED indicates one of the following states: <ul style="list-style-type: none"> The bus controller / X2X Link supply for the power supply is overloaded I/O supply too low Input voltage for bus controller / X2X Link supply too low |
| e + r | | Red on / Green single flash | Invalid firmware | |
| l | Red | Off | The bus controller / X2X Link supply is within the valid limits | |
| | | On | The bus controller / X2X Link supply for the power supply is overloaded | |

9.4.3.6 Pinout

9.4.3.7 Connection examples

With 2 isolated power supplies

With 1 power supply and jumper

9.4.3.8 Derating

The nominal output power for the power supply is 7 W. Depending on the mounting orientation, derating must be taken into account.

9.4.3.9 Using the service interface

The RS232 service interface cannot be used for application purposes. It is only intended for upgrading the firmware of various bus controllers and X2X modules and for storing configurations.

9.4.3.10 Register description

9.4.3.10.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section "[General data points](#)" on page 3790.

9.4.3.10.2 Function model 0 - Standard

| Register | Fixed offset | Name | Data type | Read | | Write | |
|----------|--------------|----------------------|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| 0 | 1 | Status of the module | USINT | • | | | |
| | | StatusInput01 | Bit 0 | | | | |
| | | StatusInput02 | Bit 2 | | | | |
| 2 | 2 | SupplyCurrent | USINT | • | | | |
| 4 | 3 | SupplyVoltage | USINT | • | | | |

Fixed modules require their data points to be in a specific order in the X2X frame. Cyclic access occurs according to a predefined offset, not based on the register address.

Acyclic access continues to be based on the register numbers.

9.4.3.10.3 Function model 254 - Bus controller

| Register | Offset ¹⁾ | Name | Data type | Read | | Write | |
|----------|----------------------|----------------------|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| 0 | 0 | Status of the module | UINT | • | | | |
| | | StatusInput01 | Bit 0 | | | | |
| | | StatusInput02 | Bit 2 | | | | |
| 2 | 2 | SupplyCurrent | UINT | • | | | |
| 4 | 4 | SupplyVoltage | UINT | • | | | |

1) The offset specifies the position of the register within the CAN object.

9.4.3.10.3.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see "[Using I/O modules on the bus controller](#)" on page 3789.

9.4.3.10.3.2 CAN I/O bus controller

The module occupies 1 analog logical slot on CAN I/O.

9.4.3.10.4 Status of the module

Name:

Module status

The following voltage and current states of the module are monitored in this register:

| | |
|----------------------------|--|
| Bus power supply current: | Bus power supply current >2.3 A is displayed as a warning. |
| Bus supply voltage: | Bus supply voltage <4.7 V is displayed as a warning. |
| 24 VDC I/O supply voltage: | I/O supply voltage <20.4 V is displayed as a warning. |

| Function model | Data type | Values |
|----------------------|-----------|------------------------|
| 0 - Standard | USINT | See the bit structure. |
| 254 - Bus controller | UINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|---------------|-------|---|
| 0 | StatusInput01 | 0 | No error |
| | | 1 | Warning in the event of overcurrent (>2.3 A) or undervoltage (<4.7 V) |
| 1 | Reserved | 0 | |
| 2 | StatusInput02 | 0 | I/O power supply above the warning limit of 20.4 V |
| | | 1 | I/O power supply below the warning limit of 20.4 V |
| 3 - x | Reserved | 0 | |

9.4.3.10.5 Bus power supply current

Name:

SupplyCurrent

This register displays the bus power supply current measured at a resolution of 0.1 A.

| Function model | Data type |
|----------------------|-----------|
| 0 - Standard | USINT |
| 254 - Bus controller | UINT |

9.4.3.10.6 Bus supply voltage

Name:

SupplyVoltage

This register indicates the bus supply voltage measured at a resolution of 0.1 V.

| Function model | Data type |
|----------------------|-----------|
| 0 - Standard | USINT |
| 254 - Bus controller | UINT |

9.4.3.10.7 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time |
|--------------------|
| 100 μ s |

9.4.3.10.8 Minimum I/O update time

The minimum I/O update time specifies how far the bus cycle can be reduced so that an I/O update is performed in each cycle.

| Minimum I/O update time |
|-------------------------|
| 2 ms |

9.4.4 X20PS9402

Data sheet version: 3.05

9.4.4.1 General information

The supply module is used together with an X20 bus controller. It is equipped with a feed for the bus controller, the X2X Link and the internal I/O supply.

The module is designed to supply power for smaller X20 systems. Potential groups are able to be formed. An expansion or redundancy of the X2X Link with the X20PS3300 or X20PS3310 supply module is not possible. Expansion of the X20 system with a bus transmitter is not permitted either.

- Supply for the bus controller, X2X Link and internal I/O supply
- Low-cost supply module for small X20 system
- Feed and bus controller / X2X Link supply not electrically isolated
- Expansion or redundancy of bus controller / X2X Link supply not possible by operating multiple supply modules simultaneously

9.4.4.2 Order data

| Model number | Short description | Figure |
|--------------|---|--|
| | System modules for bus controllers |  |
| X20PS9402 | X20 power supply module, for bus controller and internal I/O power supply, X2X Link power supply, supply not electrically isolated | |
| | Required accessories | |

Table 137: X20PS9402 - Technical data

- 1) The specified values are maximum values. For examples of the exact calculation, see section "Mechanical and electrical configuration" of the X20 system user's manual.

9.4.4.4 LED status indicators

For a description of the various operating modes, see "[Diagnostic LEDs](#)" on page 3787.

| Figure | LED | Color | Status | Description |
|---|-------|-------|-----------------------------|--|
|  | r | Green | Off | No power to module |
| | | | Single flash | RESET mode |
| | | | Blinking | PREOPERATIONAL mode |
| | | | On | RUN mode |
| | e | Red | Off | No power to module or everything OK |
| | | | Double flash | LED indicates one of the following states: <ul style="list-style-type: none"> • The bus controller / X2X Link supply for the power supply is overloaded • I/O supply too low • Input voltage for bus controller / X2X Link supply too low |
| | e + r | | Red on / Green single flash | Invalid firmware |

9.4.4.5 Pinout

9.4.4.6 Connection examples

With 2 isolated power supplies

With 1 power supply and jumper

9.4.4.7 Derating for bus controller / X2X Link supply

The rated output current for the bus controller / X2X Link supply is 7.0 W. Derating must be taken into consideration based on mounting orientation.

9.4.4.8 Register description

9.4.4.8.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section ["General data points" on page 3790](#).

9.4.4.8.2 Function model 0 - Standard

| Register | Fixed offset | Name | Data type | Read | | Write | |
|----------|--------------|-------------------------------|-----------|--------|------------|--------|------------|
| | | | | Cyclic | Non-cyclic | Cyclic | Non-cyclic |
| 0 | 1 | Module status | USINT | • | | | |
| | | StatusInput01 | Bit 0 | | | | |
| | | StatusInput02 | Bit 2 | | | | |
| 4 | 3 | SupplyVoltage | USINT | • | | | |

Fixed modules require their data points to be in a specific order in the X2X frame. Cyclic access occurs according to a predefined offset, not based on the register address.

Acyclic access continues to be based on the register numbers.

9.4.4.8.3 Function model 254 - Bus controller

| Register | Offset ¹⁾ | Name | Data type | Read | | Write | |
|----------|----------------------|-------------------------------|-----------|--------|------------|--------|------------|
| | | | | Cyclic | Non-cyclic | Cyclic | Non-cyclic |
| 0 | 0 | Module status | UINT | • | | | |
| | | StatusInput01 | Bit 0 | | | | |
| | | StatusInput02 | Bit 2 | | | | |
| 4 | 4 | SupplyVoltage | UINT | • | | | |

1) The offset specifies the position of the register within the CAN object.

9.4.4.8.3.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see ["Using I/O modules on the bus controller" on page 3789](#).

9.4.4.8.3.2 CAN I/O bus controller

The module occupies 1 analog logical slot on CAN I/O.

9.4.4.8.4 Module status

Name:

Module status

The following module supply voltages are monitored in this register:

Bus supply voltage: Bus supply voltage <4.7 V is displayed as a warning.

24 VDC I/O supply voltage: I/O supply voltage <20.4 V is displayed as a warning.

| Function model | Data type | Values |
|----------------------|-----------|------------------------|
| 0 - Standard | USINT | See the bit structure. |
| 254 - Bus controller | UINT | See the bit structure. |

Bit structure:

| Bit | Name | Value | Information |
|-------|---------------|-------|--|
| 0 | StatusInput01 | 0 | No error |
| | | 1 | Bus supply warning - Undervoltage (<4.7 V) |
| 1 | Reserved | 0 | |
| 2 | StatusInput02 | 0 | I/O power supply above the warning limit of 20.4 V |
| | | 1 | I/O power supply below the warning limit of 20.4 V |
| 3 - x | Reserved | 0 | |

9.4.4.8.5 Bus supply voltage

Name:

SupplyVoltage

This register indicates the bus supply voltage measured at a resolution of 0.1 V.

| Function model | Data type |
|----------------------|-----------|
| 0 - Standard | USINT |
| 254 - Bus controller | UINT |

9.4.4.8.6 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time |
|--------------------|
| 100 μ s |

9.4.4.8.7 Minimum I/O update time

The minimum I/O update time specifies how far the bus cycle can be reduced so that an I/O update is performed in each cycle.

| Minimum I/O update time |
|-------------------------|
| 2 ms |

9.5 Bus modules

In the X20 system, a bus module takes the place of a rack.

Figure 94: The bus module replaces the rack in the X20 system

The bus module is the backbone of the X20 system regarding the bus supply and bus data as well as the I/O supply for the electronics modules. Each bus module is an active bus station, even without an electronics module. There are two variations of the bus module:

- Interconnected I/O supply
- I/O supply isolated to the left (for power supply modules)

9.5.1 Summary

| Model number | Short description | Page |
|--------------|--|------|
| X20BM01 | X20 power supply bus module, 24 VDC keyed, internal I/O supply interrupted to the left | 939 |
| X20BM05 | X20 power supply bus module, with node number switch, 24 VDC keyed, internal I/O supply interrupted to the left | 942 |
| X20BM11 | X20 bus module, 24 VDC keyed, internal I/O supply continuous | 945 |
| X20BM12 | X20 bus module, 240 VAC keyed, internal I/O power supply connected through | 948 |
| X20BM15 | X20 bus module, with node number switch, 24 VDC keyed, internal I/O supply continuous | 951 |
| X20BM21 | X20 power supply bus module, for double-width modules, 24 VDC keyed, internal I/O supply interrupted to the left | 954 |
| X20BM31 | X20 bus module for double-width modules, 24 VDC keyed, internal I/O supply continuous | 956 |
| X20BM32 | X20 bus module for double-width modules, 240 VAC keyed, internal I/O supply continuous | 959 |
| X20cBM01 | X20 power supply bus module, coated, 24 VDC keyed, internal I/O supply interrupted to the left | 939 |
| X20cBM11 | X20 bus module, coated, 24 VDC keyed, internal I/O supply continuous | 945 |
| X20cBM12 | X20 bus module, coated, 240 VAC keyed, internal I/O power supply connected through | 948 |
| X20cBM31 | X20 bus module, coated, for double-width modules, 24 VDC keyed, internal I/O supply continuous | 956 |
| X20cBM32 | X20 bus module, coated, for double-width modules, 240 VAC keyed, internal I/O supply continuous | 959 |

9.5.2 X20(c)BM01

Data sheet version: 2.35

9.5.2.1 General information

The bus module is the base for all power supply modules.

- Basis for all power supply modules
- For creating potential groups
- The internal I/O power supply is interrupted to the left.

9.5.2.2 Coated modules

Coated modules are X20 modules with a protective coating for the electronics component. This coating protects X20c modules from condensation and corrosive gases.

The modules' electronics are fully compatible with the corresponding X20 modules.

For simplification purposes, only images and module IDs of uncoated modules are used in this data sheet.

The coating has been certified according to the following standards:

- Condensation: BMW GS 95011-4, 2x 1 cycle
- Corrosive gas: EN 60068-2-60, method 4, exposure 21 days

9.5.2.2.1 -40°C starting temperature

The starting temperature describes the minimum permissible ambient temperature when the power is switched off at the time the coated module is switched on. This is permitted to be as low as -40°C. During operation, the conditions as specified in the technical data continue to apply.

Information:

It is important to absolutely ensure that there is no forced cooling by air currents in a closed control cabinet, for example using a fan or ventilation slots.

9.5.2.3 Order data

Table 139: X20BM01, X20cBM01 - Technical data

9.5.2.5 Voltage routing

9.5.3 X20BM05

Data sheet version: 2.31

9.5.3.1 General information

The bus modules have node number switches that can be used to set permanent addresses. Placing one of these modules at the beginning of an X20 block ensures a unique address. The addresses of subsequent modules are automatically set in ascending order starting at this address. This simple feature greatly increases the flexibility of applications.

Another advantage: Addresses can be set independently of which specific I/O modules are used. All that is required are the respective bus modules. This provides logistical advantages with respect to cost and the variety of parts.

- The bus module is the base for all X20 supply modules
- For creating voltage groups
- The internal I/O supply is isolated to the left
- Manual node number assignment
- Independent of electronics module
- Manual and automatic addressing can be combined as desired

9.5.3.4 Voltage routing

9.5.3.5 Node number switches

The X2X Link address of the module is set using the node number switches (0x01 to 0xFD).

Setting node number 0x00 causes the X2X Link address to be assigned automatically.

9.5.3.6 Bus modules with node number switches

Symbols are printed on the locking lever of bus modules with node number switches. This provides a way to see from outside that the X20 system mounted in this slot is using node number switches.

9.5.4 X20(c)BM11

Data sheet version: 2.35

9.5.4.1 General information

The bus module is the base for all 24 VDC I/O modules. The internal I/O power supply is connected through.

- Bus module for 24 VDC I/O modules
- The internal I/O power supply is connected through.

9.5.4.2 Coated modules

Coated modules are X20 modules with a protective coating for the electronics component. This coating protects X20c modules from condensation and corrosive gases.

The modules' electronics are fully compatible with the corresponding X20 modules.

For simplification purposes, only images and module IDs of uncoated modules are used in this data sheet.

The coating has been certified according to the following standards:

- Condensation: BMW GS 95011-4, 2x 1 cycle
- Corrosive gas: EN 60068-2-60, method 4, exposure 21 days

9.5.4.2.1 -40°C starting temperature

The starting temperature describes the minimum permissible ambient temperature when the power is switched off at the time the coated module is switched on. This is permitted to be as low as -40°C. During operation, the conditions as specified in the technical data continue to apply.

Information:

It is important to absolutely ensure that there is no forced cooling by air currents in a closed control cabinet, for example using a fan or ventilation slots.

Table 153: X20BM32, X20cBM32 - Technical data

9.5.9.5 Voltage routing

9.6 Bus receivers and Bus transmitters

The X20 system is connected directly to the remote X2X Link backplane via bus receiver X20BR9300. The connection to the next station is established with bus transmitter X20BT9100.

9.6.1 Summary

| Model number | Short description | Page |
|--------------|--|------|
| X20BR7300 | X20 bus receiver, CAN I/O, supply for X2X Link and internal I/O power supply, X20 end cover plates (left and right) X20AC0SL1/X20AC0SR1 included | 964 |
| X20BR9300 | X20 bus receiver, X2X Link, supply for X2X Link and internal I/O power supply, X20 end cover plates (left and right) X20AC0SL1/X20AC0SR1 included | 973 |
| X20BT9100 | X20 bus transmitter, X2X Link, supply for internal I/O supply | 980 |
| X20BT9400 | X20 bus transmitter X2X Link, feed for internal I/O supply, X2X Link supply for X67 modules, reverse polarity protection, short circuit protection, overload protection, parallel connection possible, redundancy operation possible | 986 |
| X20cBR9300 | X20 bus receiver, coated, X2X Link, supply for X2X Link and internal I/O power supply, X20 end cover plates (left and right) X20AC0SL1/X20AC0SR1 included | 973 |
| X20cBT9100 | X20 bus transmitter, coated, X2X Link, supply for internal I/O supply | 980 |

9.6.2 X20BR7300

Data sheet version: 1.07

9.6.2.1 General information

The bus receiver makes it possible to connect X2X Link I/O nodes to CAN I/O. CAN I/O is a transfer protocol based on standard CAN bus that is fully integrated in the B&R system.

Up to 43 logical I/O modules can be connected to the bus receiver. Up to 16 of these can be analog modules.

- Fieldbus: CAN bus
- Automatic firmware update via the fieldbus
- Integrated I/O access in B&R Automation Studio

Information:

Modules that follow a gap in X2X Link node numbers are not configured by the bus receiver. This gap results from unconnected X20 modules.

Information:

Dummy modules and bus modules with an integrated node number switch are not supported by the bus receiver.

Information:

Only the standard function model (see the respective module description) is supported when the bus receiver is used together with multi-function modules it has automatically configured itself.

Information:

A hardware upgrade $\geq 2.0.0.0$ for bus module X20BM01 is required in order to use the bus receiver.

The hardware upgrade is only permitted to be installed in the following versions of Automation Studio!

- Automation Studio 4.2.7.54 to 4.2.x.x
- Automation Studio $\geq 4.3.2.103$
- Automation Runtime ≥ 4.26

A hardware upgrade $\geq 2.0.0.0$ for bus module X20BM01 with Automation Studio versions $< 4.2.7.54$ and Automation Studio versions from 4.3.1.0 to 4.3.2.102 cause faulty behavior on bus module X20BM01.

Unconfigured X20 modules

A specific blinking behavior for LED "r" or "S" indicates X20 modules that are connected to the bus receiver but not configured.

The green LED blinks with a single or double flash. This blinking behavior depends on the respective X20 module.

Information:

In this case, a double flash indicates a missing configuration and not a firmware update.

9.6.2.2 Order data

| Model number | Short description | Figure |
|--------------|---|---|
| | Bus receivers and transmitters |  |
| X20BR7300 | X20 bus receiver, CAN I/O, supply for X2X Link and internal I/O power supply, X20 end cover plates (left and right) X20AC0SL1/ X20AC0SR1 included | |
| | Required accessories | |
| | Bus modules | |
| X20BM01 | X20 power supply bus module, 24 VDC keyed, internal I/O supply interrupted to the left | |
| X20BM05 | X20 power supply bus module, with node number switch, 24 VDC keyed, internal I/O supply interrupted to the left | |
| | Terminal blocks | |
| X20TB12 | X20 terminal block, 12-pin, 24 VDC keyed | |

| Transport | 5 to 95%, non-condensing |
| Mechanical properties | |
| Note | Order 1x terminal block X20TB12 separately. Order 1x power supply bus module X20BM01 separately, X20 end cover plates (left and right) X20AC0SL1/X20AC0SR1 included. |
| Pitch | 12.5 ^{+0.2} mm |

Table 155: X20BR7300 - Technical data

- 1) Power supply modules X20PS3300 and X20PS3310 can be used. The 2 W nominal output power of module X20BR7300 is not included in the calculation of the X2X Link power supply, however.
- 2) CAN I/O data points are processed in Automation Runtime in a separate cycle set to 10 ms (CAN I/O cycle).

9.6.2.4 LED status indicators

| Figure | LED | Color | Status | Description |
|---|---------------------------------|-----------|---|--|
|  | ST ¹⁾ | Green | Off | No power supply |
| | | | Double flash | Mode BOOT (during firmware update) ²⁾ |
| | | | Blinking | Mode PREOPERATIONAL |
| | | | On | Mode RUN |
| | | Red | Double flash | The LED indicates one of the following states: <ul style="list-style-type: none"> • The X2X Link power supply of the power supply is overloaded. • The input voltage for the X2X Link power supply is too low. |
| | | | On | CAN connection reports BusOff status |
| | | | Flickering | Transfer rate detection in progress |
| | | Green/Red | Blinking | I/O power supply too low |
| | | | Blinking green / Single red flash | PREOPERATIONAL mode: CAN connection reports warning limit reached |
| | Steady green / Single red flash | | RUN mode: CAN connection reports warning limit reached | |
| Tx | | Yellow | Off | Bus receiver not transmitting any data via CAN I/O fieldbus |
| | On | | Bus controller transmitting data via the CAN I/O fieldbus | |

- 1) LED "ST" is a green/red dual LED.
- 2) Depending on the configuration, a firmware update can take up to several minutes.

9.6.2.5 Pinout

9.6.2.6 Setting the module's node number

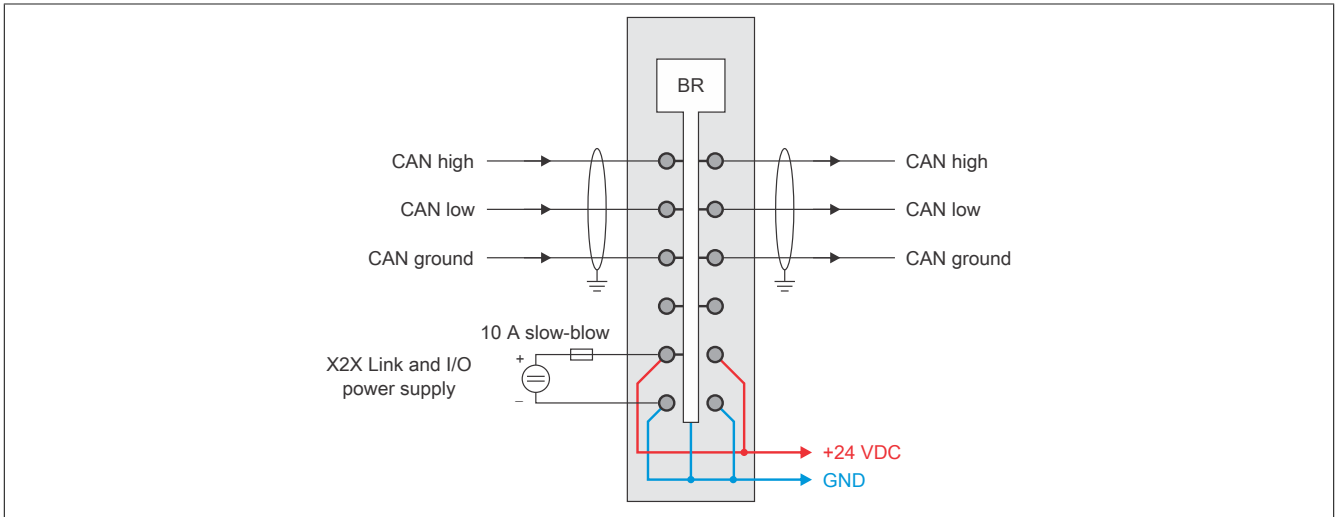

Node number 1 or 2 can be set on the module. By default, the module is set to node number 1. Node number 2 is set on the module by connecting terminal connections 14 and 24 using a jumper (see also "Connection examples", "Example 2: Node number 2" on page 966).

9.6.2.7 Terminating resistor

CAN networks are cabled using a bus structure where both ends of the bus must be wired with a terminating resistor. The terminating resistor must be wired externally (see also "Connection examples", "Example 3: With terminating resistor" on page 967).

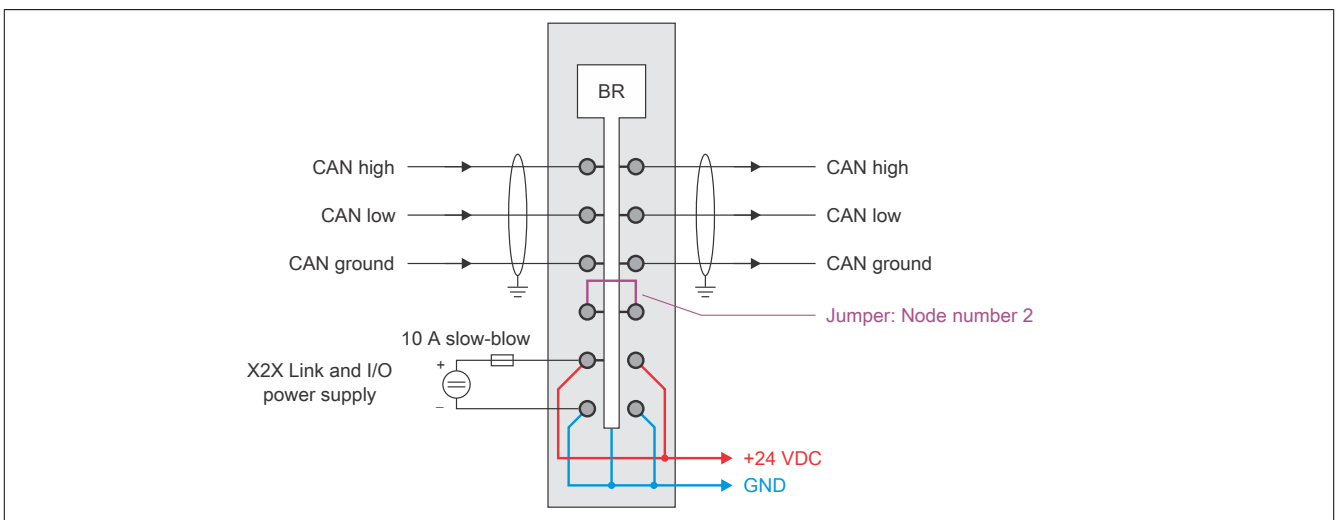

9.6.2.8 Connection examples

Example 1

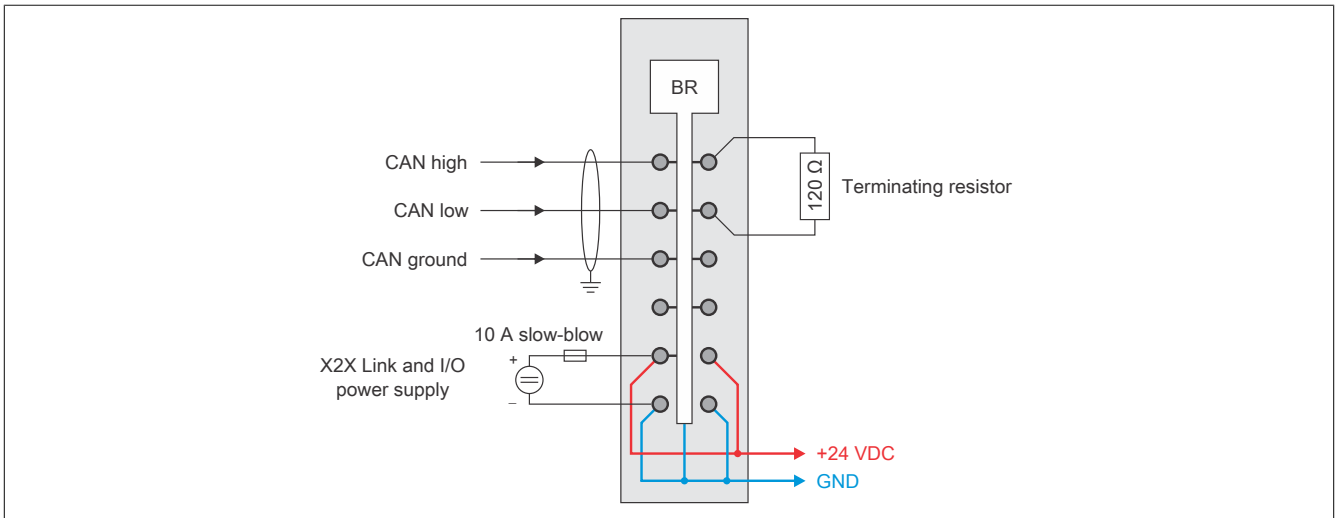

Example 2: Node number 2

By default, the module is set to node number 1. The module is set to node number 2 if terminal connection 14 is connected to 24 using a jumper.

Example 3: With terminating resistor

The terminating resistor must be wired externally.

**9.6.2.9 Automatic transfer rate detection**

After startup, the bus receiver goes into "Listen only" mode. This means the bus receiver behaves passively on the bus and only listens.

The bus receiver attempts to receive valid objects. If receive errors occur, the bus receiver switches to the next transfer rate in the lookup table.

If no objects are received, all transfer rates are tested cyclically. This procedure is repeated until valid objects are received.

Starting transfer rate

The bus receiver begins the search with this transfer rate. The last detected transfer rate is used after a software reset (command code 20).

Lookup table

The bus receiver tests the transfer rate according to this table. Beginning with the starting transfer rate, the controller switches to the next lower transfer rate. At the end of the table, the bus receiver restarts the search from the beginning.

| Transfer rate |
|---------------|
| 1000 kbit/s |
| 500 kbit/s |
| 250 kbit/s |
| 125 kbit/s |
| 50 kbit/s |
| 20 kbit/s |
| 10 kbit/s |

9.6.2.10 SG4

The module comes with preinstalled firmware. The firmware is also part of the Automation Runtime operating system for the PLC. With different versions, the Automation Runtime firmware is loaded onto the module.

The latest firmware is made available automatically when updating Automation Runtime.

9.6.2.11 Logical I/O modules

Up to 43 I/O modules can be connected to the bus receiver (up to 16 of these can be analog modules). This value refers not to the physical but the logical I/O module slots.

Information:

Physical I/O modules can take up more than one digital or analog slot.

The following table lists all X20 modules capable of using CAN I/O and how many logical digital and analog slots are needed.

| Module | Digital module slots | Analog module slots |
|------------------------|----------------------|---------------------|
| X20AI1744, X20AI1744-3 | 0 | 1 |

9.6.2.12 Register description

9.6.2.12.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section ["General data points" on page 3790](#).

9.6.2.12.2 Overview of registers

| Register | Name | Data type | Read | | Write | |
|----------|--------------------------------------|-----------|--------|---------|--------|---------|
| | | | Cyclic | Acyclic | Cyclic | Acyclic |
| 0 | Status of the module | USINT | • | | | |
| | IF1.ST1.StatusInput01 | Bit 0 | | | | |
| | IF1.ST1.StatusInput02 | Bit 1 | | | | |

9.6.2.12.3 Status of the module

Name:

IF1.ST1.StatusInput01 and IF1.ST1.StatusInput02

The following voltage and current states of the module are monitored in this register:

- X2X Link supply current >0.4 A is indicated as a warning.
- X2X Link supply voltage <4.7 V is indicated as a warning.
- 24 VDC I/O supply voltage <20.4 V is indicated as a warning.

| Data type | Values |
|-----------|------------------------|
| USINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|--|-------|---|
| 0 | IF1.ST1.StatusInput01 X2X Link supply current and X2X Link supply voltage | 0 | No error |
| | | 1 | Warning in the event of overcurrent (>0.4 A) or undervoltage (<4.7 V) |
| 1 | IF1.ST1.StatusInput02 I/O supply voltage | 0 | I/O supply voltage greater than or equal to the warning level of 20.4 V |
| | | 1 | I/O supply voltage less than the warning level of 20.4 V |
| 2 - x | Reserved | 0 | |

9.6.3 X20(c)BR9300

Data sheet version: 3.16

9.6.3.1 General information

The bus receiver is used to connect the X20 System to the X2X Link. The module is equipped with a feed for the X2X Link as well as the internal I/O supply.

- X2X Link bus receiver
- Feed for X2X Link and internal I/O supply
- Electrical isolation of feed and X2X Link supply
- Redundancy of X2X Link supply possible by operating multiple supply modules simultaneously
- Operation only on the slot to the far left

9.6.3.2 Coated modules

Coated modules are X20 modules with a protective coating for the electronics component. This coating protects X20c modules from condensation and corrosive gases.

The modules' electronics are fully compatible with the corresponding X20 modules.

For simplification purposes, only images and module IDs of uncoated modules are used in this data sheet.

The coating has been certified according to the following standards:

- Condensation: BMW GS 95011-4, 2x 1 cycle
- Corrosive gas: EN 60068-2-60, method 4, exposure 21 days

9.6.3.2.1 -40°C starting temperature

The starting temperature describes the minimum permissible ambient temperature when the power is switched off at the time the coated module is switched on. This is permitted to be as low as -40°C. During operation, the conditions as specified in the technical data continue to apply.

Information:

It is important to absolutely ensure that there is no forced cooling by air currents in a closed control cabinet, for example using a fan or ventilation slots.

9.6.3.3 Order data

| Model number | Short description | Figure |
|----------------|---|---|
| | Bus receivers and transmitters |  |
| X20BR9300 | X20 bus receiver, X2X Link, supply for X2X Link and internal I/O power supply, X20 end cover plates (left and right) X20AC0SL1/X20AC0SR1 included | |
| X20cBR9300 | X20 bus receiver, coated, X2X Link, supply for X2X Link and internal I/O power supply, X20 end cover plates (left and right) X20AC0SL1/X20AC0SR1 included | |
| | Required accessories | |
| | Bus modules | |
| X20BM01 | X20 power supply bus module, 24 VDC keyed, internal I/O supply interrupted to the left | |
| X20BM05 | X20 power supply bus module, with node number switch, 24 VDC keyed, internal I/O supply interrupted to the left | |
| X20cBM01 | X20 power supply bus module, coated, 24 VDC keyed, internal I/O supply interrupted to the left | |
| | Terminal blocks | |
| X20TB12 | X20 terminal block, 12-pin, 24 VDC keyed | |
| | Optional accessories | |
| | X2X Link cable | |
| X67CA0X99.1000 | Cable for custom assembly, 100 m | |
| X67CA0X99.5000 | Cable for custom assembly, 500 m | |

Table 156: X20BR9300, X20cBR9300 - Order data

Information:

This module is **NOT PERMITTED** to be used together with continuous power supply modules (e.g. X20BM11 or X20BM15) since this can result in problems with X2X Link!

9.6.3.4 Technical data

| Model number | X20BR9300 | X20cBR9300 |

Table 157: X20BR9300, X20cBR9300 - Technical data

- The specified values are maximum values. For examples of the exact calculation, see section "Mechanical and electrical configuration" of the X20 system user's manual.
- In parallel operation, only 75% of the rated power can be assumed. It is important to make sure that all power supplies operated in parallel are switched on and off at the same time.

9.6.3.5 LED status indicators

For a description of the various operating modes, see ["Diagnostic LEDs" on page 3787](#).

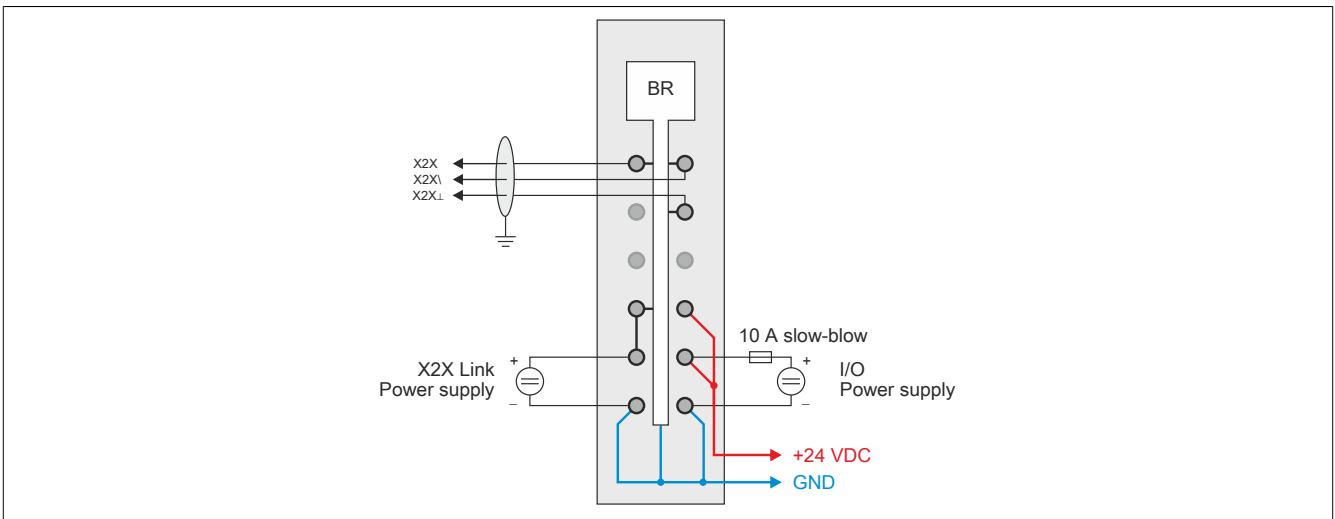

| Figure | LED | Color | Status | Description |
|---|-------|-----------------------------|--|---|
|  | r | Green | Off | No power to module |
| | | | Single flash | RESET mode |
| | | | Blinking | PREOPERATIONAL mode |
| | | | On | RUN mode |
| | e | Red | Off | No power to module or everything OK |
| | | | Double flash | LED indicates one of the following states: <ul style="list-style-type: none"> X2X Link power supply is overloaded I/O supply too low Input voltage for X2X Link supply too low |
| | e + r | Red on / Green single flash | Invalid firmware | |
| | X | Orange | Off | No communication at the X2X Link |
| | | | On | X2X Link communication in progress |
| | l | Red | Off | X2X Link supply in the acceptable range |
| On | | | X2X Link power supply is overloaded Solution: Use an additional feed module X20PS3300 | |

9.6.3.6 Pinout

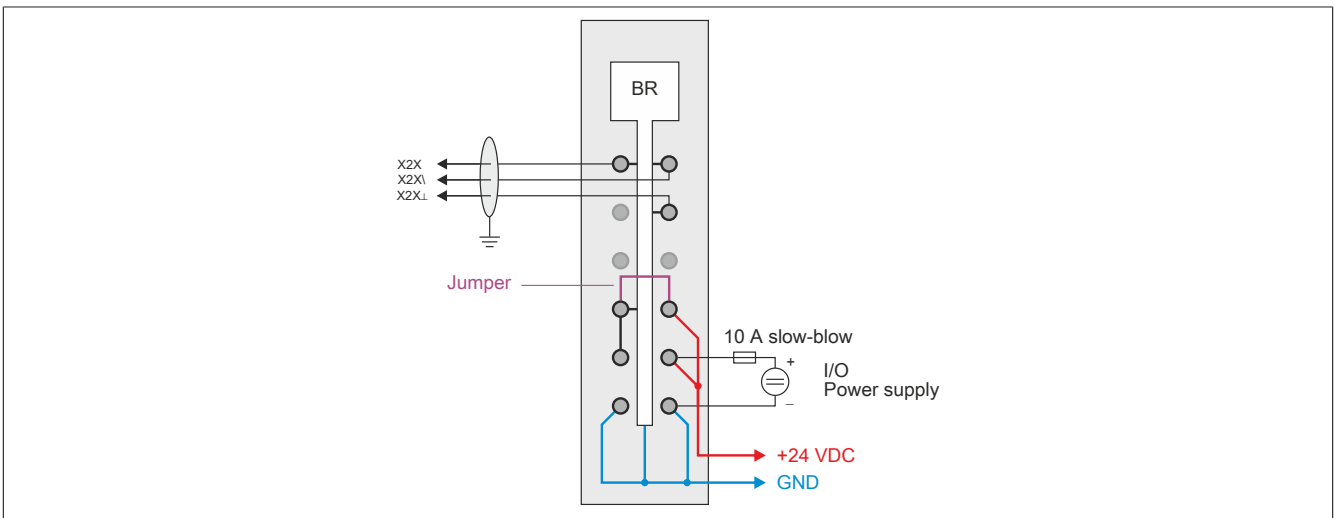

9.6.3.7 Connection examples

With two separate supplies

With a supply and jumper

9.6.3.8 Derating

The nominal output power for the power supply is 7 W. Depending on the mounting orientation, derating must be taken into account.

9.6.3.9 Register description

9.6.3.9.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section "[General data points](#)" on page 3790.

9.6.3.9.2 Function model 0 - Standard

| Register | Fixed offset | Name | Data type | Read | | Write | |
|----------|--------------|----------------------|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| 0 | 1 | Status of the module | USINT | • | | | |
| | | StatusInput01 | Bit 0 | | | | |
| | | StatusInput02 | Bit 2 | | | | |
| 2 | 2 | SupplyCurrent | USINT | • | | | |
| 4 | 3 | SupplyVoltage | USINT | • | | | |

Fixed modules require their data points to be in a specific order in the X2X frame. Cyclic access occurs according to a predefined offset, not based on the register address.

Acyclic access continues to be based on the register numbers.

9.6.3.9.3 Function model 254 - Bus controller

| Register | Offset ¹⁾ | Name | Data type | Read | | Write | |
|----------|----------------------|----------------------|-----------|--------|---------|--------|---------|
| | | | | Cyclic | Acyclic | Cyclic | Acyclic |
| 0 | 0 | Status of the module | UINT | • | | | |
| | | StatusInput01 | Bit 0 | | | | |
| | | StatusInput02 | Bit 2 | | | | |
| 2 | 2 | SupplyCurrent | UINT | • | | | |
| 4 | 4 | SupplyVoltage | UINT | • | | | |

1) The offset specifies the position of the register within the CAN object.

9.6.3.9.3.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see "[Using I/O modules on the bus controller](#)" on page 3789.

9.6.3.9.3.2 CAN I/O bus controller

The module occupies 1 analog logical slot on CAN I/O.

9.6.3.9.4 Status of the module

Name:

Module status

The following voltage and current states of the module are monitored in this register:

| | |
|----------------------------|--|
| Bus power supply current: | Bus power supply current >2.3 A is displayed as a warning. |
| Bus supply voltage: | Bus supply voltage <4.7 V is displayed as a warning. |
| 24 VDC I/O supply voltage: | I/O supply voltage <20.4 V is displayed as a warning. |

| Function model | Data type | Values |
|----------------------|-----------|------------------------|
| 0 - Standard | USINT | See the bit structure. |
| 254 - Bus controller | UINT | See the bit structure. |

Bit structure:

| Bit | Description | Value | Information |
|-------|---------------|-------|---|
| 0 | StatusInput01 | 0 | No error |
| | | 1 | Warning in the event of overcurrent (>2.3 A) or undervoltage (<4.7 V) |
| 1 | Reserved | 0 | |
| 2 | StatusInput02 | 0 | I/O power supply above the warning limit of 20.4 V |
| | | 1 | I/O power supply below the warning limit of 20.4 V |
| 3 - x | Reserved | 0 | |

9.6.3.9.5 Bus power supply current

Name:

SupplyCurrent

This register displays the bus power supply current measured at a resolution of 0.1 A.

| Function model | Data type |
|----------------------|-----------|
| 0 - Standard | USINT |
| 254 - Bus controller | UINT |

9.6.3.9.6 Bus supply voltage

Name:

SupplyVoltage

This register indicates the bus supply voltage measured at a resolution of 0.1 V.

| Function model | Data type |
|----------------------|-----------|
| 0 - Standard | USINT |
| 254 - Bus controller | UINT |

9.6.3.9.7 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

| Minimum cycle time |
|--------------------|
| 100 μ s |

9.6.3.9.8 Minimum I/O update time

The minimum I/O update time specifies how far the bus cycle can be reduced so that an I/O update is performed in each cycle.

| Minimum I/O update time |
|-------------------------|
| 2 ms |

9.6.4 X20(c)BT9100

Data sheet version: 3.18

9.6.4.1 General information

The bus transmitter provides for the seamless expansion of the X20 System. The stations can be up to 100 m away from each other.

- X2X Link bus transmitter
- For seamless expansion of the system
- Up to 100 m segment lengths
- Feed for internal I/O supply
- Operation only on the slot to the far right

Information:

The bus transmitter modules may only be operated with a bus module where the internal I/O supply is connected through (e.g. X20BM11).

If the incoming voltage is used for internal I/O supply, then this potential group must not be supplied by any other module. An I/O module with bus module X20BM01 should be used to separate the potential group.

9.6.4.2 Coated modules

Coated modules are X20 modules with a protective coating for the electronics component. This coating protects X20c modules from condensation and corrosive gases.

The modules' electronics are fully compatible with the corresponding X20 modules.

For simplification purposes, only images and module IDs of uncoated modules are used in this data sheet.

The coating has been certified according to the following standards:

- Condensation: BMW GS 95011-4, 2x 1 cycle
- Corrosive gas: EN 60068-2-60, method 4, exposure 21 days

9.6.4.2.1 -40°C starting temperature

The starting temperature describes the minimum permissible ambient temperature when the power is switched off at the time the coated module is switched on. This is permitted to be as low as -40°C. During operation, the conditions as specified in the technical data continue to apply.

Information:

It is important to absolutely ensure that there is no forced cooling by air currents in a closed control cabinet, for example using a fan or ventilation slots.

9.6.4.3 Order data

| Model number | Short description | Figure |
|----------------|---|---|
| | Bus receivers and transmitters |  |
| X20BT9100 | X20 bus transmitter, X2X Link, supply for internal I/O supply | |
| X20cBT9100 | X20 bus transmitter, coated, X2X Link, supply for internal I/O supply | |

| | e + r | Red on / Green single flash | Invalid firmware | |
| | X | Orange | Off | No communication at the X2X Link |
| On | | | X2X Link communication in progress | |

9.6.4.6 Pinout

9.6.4.7 Connection examples

No feed for internal I/O supply

With feed for internal I/O supply

See also "Supply via bus transmitter" on page 983.

9.6.4.8 Supply via bus transmitter

The bus transmitter has an integrated internal I/O supply feed. This saves a power supply module for the last potential group.

Keep in mind: this potential group is separated from the rest of the potential groups by an I/O module with the x20(c)BM01 bus module.

Figure 95: Protection when supplied via bus transmitter

1) Recommended for line protection.

9.6.4.9 Connection to next X2X Link I/O node
